Centaurium calycosum (Buckley) Fern. Buckley Centaury. [*Erythraea calycosa* Buckley; *E. calycosa* var. *arizonica* Gray; *C. calycosa* var. *arizonica* (Gray) Tidestr.]. Stems erect, angled, 12-50 cm tall, simple or branched above; leaves 2-5 cm long, 4-12 mm wide, oblong to elliptic or lance-linear, or the basal ones spatulate; inflorescence racemose; pedicels longer than the calyx; calyx lobes 8-12 mm long; corolla tube 10-15 mm long, the lobes 7-12 mm long, oblong to elliptic or obovate, fresh pink; capsules 8-14 mm long, cylindrical; $n = 40$. Saline seeps and other moist sites, usually growing with saltgrass, shadscale, greasewood, pickleweed, and alkali saccaton, in the riparian, blackbrush, pinyon-juniper and mountain brush communities at 930 to 2270 m in Garfield, San Juan, and Washington counties; California to Texas, south to Mexico; 12 (viii). This is a beautiful plant, when in full flower, but it is not often collected because of the lateness of flowering (mainly in September and October).

Centaurium exaltatum (Griseb.) Wight ex Piper Great Basin Centaury. [*Cicendia exaltata* Griseb. in Hook; *Centaurium namophilum* var. *nevadense* Broome; *Erythraea nuttallii* Wats.; *C. nuttallii* (Wats.) Heller]. Stems erect, glabrous, sparsely branched above, 4-48 cm tall; leaves linear to lanceolate, acute, 1-5 cm long, 2-10 mm

wide; flowers in terminal, compound cymes; pedicels much longer than the calyx; calyx lobes 6-10 mm long; corolla tube 6-12 mm long, the lobes 3-7 mm long, lanceolate to oblong-elliptic, acute to obtuse, whitish to rose pink; capsule 7-15 mm long, cylindrical to fusiform; $n = 17$. Hanging gardens, seeps, and moist riparian sites, often where saline, usually in riparian or palustrine communities at 930 to 2075 m in Beaver, Box Elder, Cache, Daggett, Duchesne, Garfield, Grand, Kane, Juab, Millard, Salt Lake, San Juan, Uintah, Utah, Washington, and Wayne counties; British Columbia to Idaho, south to Baja California and Colorado; 38 (xi).

Gentiana L.

Annual or perennial herbs; stems usually erect, simple or sparingly branched; leaves opposite, sessile, or sheathing basally; flowers, solitary or in axillary or terminal cymes; calyx 4- or 5-lobed, the tube well developed, often forming an intercalycine membrane between the lobes; corolla plicate, cylindrical, tubular to funnellform or campanulate, the lobes 4 or 5, shorter than the tube, often with teeth or folds in the sinuses, blue, purple, white, or yellow; stamens inserted on the corolla at or below the middle; style short or lacking; stigmas 2; capsule sessile or stipitate, 2-loculed, septicidal.

1. Capsules stipitate; corolla 10-20 mm long, terminal; calyx 7-12 mm long; plants diminutive annuals or biennials *G. prostrata*
- Capsules sessile; corolla 22-50 mm long; calyx 10-30 mm long; plants perennial 2
- 2(1). Leaves mostly basal, linear to oblanceolate, the cauline ones greatly reduced; corolla whitish or pale yellowish, with dark stripes *G. algida*
- Leaves all cauline, the basal ones much reduced; corolla blue to gentian violet 3
- 3(2). Flowers solitary, terminal (rarely 2 or 3); margins of calyx and leaves glabrous *G. calycosa*
- Flowers usually more than one; margins of calyx and leaves puberulent 4
- 4(3). Flowers terminal or subterminal; corolla 3-4.5 cm long; calyx tube 1-1.8 cm long; floral bracts ovate to ovate-lanceolate, often somewhat scarious *G. parryi*
- Flowers several to many, some axillary and well below the stem apex; corolla 2.3-3 (4) cm long; calyx tube 0.4-1 cm long; floral bracts lanceolate to linear . *G. affinis*

Gentiana affinis Griseb. Rocky Mountain Gentian. [*G. forwoodii* Gray]. Perennial herbs; stems 1-5.7 dm tall, usually several, mostly erect; leaves 1.5-3.5 cm long, 6-18 mm wide, all cauline, numerous, ovate, oblong, or broadly lanceolate, puberulent on the margins and in lines below the leaf bases; inflorescence cymose, the flowers several to many; bracts lanceolate; calyx 4-18 mm long, funnellform to campanulate, the tube 4-10 mm long; corolla 2.3-3 (4) cm long, funnellform, strongly plicate, blue to purple or violet, the lobes 3-6 mm long; capsules subequal to the calyx, dehiscing apically. Meadows and streamsides in ponderosa pine, lodgepole pine, aspen, and spruce-fir communities at (1340) 2540 to 3850 m in all Utah counties, except Beaver, Box Elder, Davis, Millard, Morgan, Wayne, and Weber; British Columbia to Montana, south to California and New Mexico; 55 (ix).

Gentiana algida Pallas Arctic Gentian. [*G. romanzovii* Ledeb. ex Bunge]. Plants perennial, the stems 0.5-2 dm

tall, erect or ascending, simple; leaves mainly basal, connate-sheathing, the cauline leaves commonly in 2–3 pairs below the bracts (uppermost leaves), 2–12 cm long, 2–10 mm broad, linear to narrowly oblong; flowers solitary or in terminal cymes; calyx 5-toothed, 15–23 mm long, the teeth unequal, longer or shorter than the tube; corolla funnelform, cream to yellowish green, mottled or striped with purple, 3.5–5.3 cm long, the folds yellowish; pistil stipitate; capsule oblong-elliptic in outline; $2n = 24, 26$. Alpine meadows and slopes with spruce-fir and alpine tundra communities at 3000 to 3965 m in Daggett, Duchesne, San Juan, Summit, and Uintah counties; Alaska and Yukon, south to New Mexico; 14 (ii).

***Gentiana calycosa* Griseb.** Explorer Gentian. [*G. calycosa* ssp. *asepala* Maguire, type from Mt. Agassiz]. Plants perennial, the stems 0.3–2 (3) dm tall, decumbent to ascending or erect; leaves cauline and basal, soon withering, broadly ovate to elliptic-ovate, 1–2 (2.5) cm long, 5–15 (20) mm wide, glabrous; flowers usually solitary (rarely 2 or 3), terminal; calyx 10–18 mm long, funnelform, the lobes 2–8 mm long, ovate to lanceolate, or almost lacking; corolla 30–40 mm long, tubular-funnelform to campanulate, deep blue, usually streaked with green, the lobes 5–10 mm long, rounded, the sinus plaits lacerate; capsule sessile, to 24 mm long; $n = 13$. Meadows in willow, aspen, and spruce-fir communities at 2700 to 3900 m in Daggett, Duchesne, Garfield, Summit, Uintah, Wasatch, and Washington counties; British Columbia and Alberta, south to California, Arizona, and Wyoming; 44 (ix).

***Gentiana parryi* Engelm.** Parry Gentian. [*G. bracteosa* Greene]. Plants perennial, the stems 0.6–3 (4.5) dm tall; leaves oval to ovate or lanceolate, all cauline, 13–32 (40) mm long, 8–21 mm wide, puberulent on the margins and in decurrent lines on the stem; inflorescence cymose, with (1) 2–4 flowers, compact; bracts ovate to oval; calyx 10–18 (23) mm long, campanulate, the lobes 1–8 mm long, lanceolate; corolla 30–40 (50) mm long, tubular-funnelform, blue and streaked with green, the lobes 3–8 mm long, broadly rounded to mucronate apically; capsule ca 20 mm long. Meadows and slopes in mountain brush and spruce-fir communities at 1900 to 3850 m in Garfield, Grand, Iron, Piute, San Juan, and Wasatch counties; Wyoming and Colorado to New Mexico and Arizona; 8 (iii).

***Gentiana prostrata* Haenke ex Jacq.** Moss Gentian. Plants annual or biennial, the stems 2–15 (25) cm long, prostrate or ascending, branched from the base, arising from a slender taproot; leaves chiefly cauline, connate-sheathing, 2–15 mm long (including the sheath), 1–5 mm wide; flowers terminal, solitary; calyx with 4 or 5 lobes, 8–16 mm long, the teeth shorter than the tube; corolla tubular, blue (or the tube whitish), 11–25 mm long; pistil stipitate; capsule lance-ovoid, long-stipitate; $2n = 32–36$. Moist sites in sedge-willow, lodgepole pine, and spruce-fir communities at 2400 to 3850 m in Daggett, Duchesne, Emery, Rich, San Juan, Sevier, Summit, and Uintah counties; Alaska and Yukon, south to California, Arizona, and Colorado; 20 (vii).

Gentianella Moench

Annual or biennial herbs from taproots; stems erect, simple or branched, glabrous; leaves opposite, sessile; inflorescence cymose, terminal and/or axillary; flowers showy; calyx lobes free or united at the base, the sinuses

without an inner membrane; corolla tubular to campanulate, blue or lilac, the lobes entire, without plaits in the sinuses; stamens 4 or 5, inserted on the corolla tube; nectary glands at the base of the tube; pistil sessile, the ovary 1-loculed; stigmas 2, persistent; capsule dehiscent apically; seeds numerous, smooth.

Gillett, J. M. 1957. A revision of the North American species of *Gentianella*. Moench Ann. Missouri Bot. Gard. 44: 195–269.

1. Flowers solitary on a naked peduncle 2–10 cm long, plants less than 13 cm tall *G. tenella*
- Flowers several to many in short-pedunculate clusters, plants often more than 13 cm tall 2
- 2(1). Calyx lobes very unequal, the outer two large and foliaceous, 7–20 mm long, enclosing the smaller more slender ones *G. heterosepala*
- Calyx lobes equal or nearly so 3
- 3(2). Plants caespitose, 2–10 cm tall, much branched, corolla yellowish, whitish, or suffused with pale blue
- *G. tortuosa*
- Plants erect, mainly 10–50 cm tall, often simple; corolla blue, blue purple, or sometimes yellow or whitish
- *G. amarella*

***Gentianella umarella* (L.) Borner** Northern Gentian. [*Gentiana amarella* L.; *G. plebeia* Cham. ex Bunge; *G. strictiflora* A. Nels.; *G. acuta* Michx.; *Gentianella amarella* ssp. *acuta* (Michx.) Hulten]. Annual or biennial, the stems 8–50 cm tall, erect or ascending, simple or more commonly branched, from a taproot; basal leaves oblanceolate to elliptic; cauline leaves ovate to lanceolate, 1–6 cm long, 3–15 mm wide, not connate; flowers several to many in cymes, or axillary, the pedicels shorter than the next lower internode; calyx 5–7 mm long, usually 5-lobed, the lobes longer than the tube; corolla tubular, 9–15 mm long, pink purple, bluish purple, pinkish, blue, or yellowish green (or whitish), the lobes fringed within (at least some); pistil sessile; capsule cylindrical. Meadows and stream banks in aspen, grass-forb, lodgepole pine, spruce-fir, and alpine tundra communities at 2400 to 4050 m in Beaver, Cache, Carbon, Daggett (?), Duchesne, Emery, Garfield, Iron, Piute, Salt Lake, Sanpete, Sevier, Summit, Uintah, Utah, and Wasatch counties; Alaska to the Atlantic, south to California, Arizona, New Mexico, North Dakota, and Vermont; circumboreal; 51 (xv). This taxon is closely allied to *G. heterosepala*, q. v.

***Gentianella heterosepala* (Engelm.) Holub** Engelmann Gentian. [*Gentiana heterosepala* Engelm.; *Gentianella amarella* ssp. *heterosepala* (Engelm.) J. M. Gillett]. Plants annual or biennial, the stems mainly 10–45 cm tall, erect or ascending, simple or more or less branched; basal leaves 10–35 mm long, oblanceolate to spatulate; cauline leaves 2–5.5 cm long, oblanceolate to elliptic; inflorescence cymose, borne in axils of the 4 to 6 pairs of upper leaves; pedicels slender, 2–7 cm long; calyx lobes dimorphic, the outer 2 large and foliaceous, 8–15 mm long, the inner ones linear-lanceolate, mostly hidden by the outer, one of the small sepals almost free, the other two variously connate; corolla 10–20 mm long, tubular-campanulate, bluish, whitish, or yellowish, the lanceolate lobes 4–7 mm long, the lobes fringed within (at least some); pistil sessile; capsule cylindrical. Sagebrush, mountain brush, aspen, lodgepole pine, grass-forb, and spruce-fir communities at 1980 to 3500 m in Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Kane, Piute,

Salt Lake, San Juan, Sanpete, Summit, Uintah, Utah, Wasatch, and Washington counties; Arizona, Colorado, and New Mexico; 85 (xiii).

Gentianella tenella (Rottb.) Borner Lapland Gentian. [*Gentiana tenella* Rottb.]. Annual, the stems 5–20 cm tall, ascending to erect, simple or more commonly branched, from taproots; basal leaves elliptic to obovate; cauline leaves lanceolate to elliptic, 4–10 mm long, 1–4 mm wide, not connate (except for the lower ones); flowers solitary, terminal or axillary, the pedicels longer than the next lower internode; calyx 4–10 mm long, the lobes distinct, dimorphic, the outer lobes foliaceous, ovate to lanceolate, the inner ones lanceolate, slightly shorter than the outer; corolla 7–16 mm long, blue to white, tubular-campanulate, the lobes 2.5–6 mm long, oblong-ovate, each lobe bearing 2 blunt, fimbriate scales; $2n = 10$. Spruce-fir and alpine tundra communities at 2400 to 3800 m in Duchesne, Juab, Garfield, Summit, and Uintah counties; Alaska to Greenland, south to California, Nevada, Arizona, and New Mexico; Eurasia; 10 (i).

Gentianella tortuosa (Jones) J. M. Gillett Jones Gentian. [*Gentiana tortuosa* Jones, type from Panguitch Lake]. Clump-forming annual, mainly 2–10 cm tall; stems much branched, spreading to erect; basal leaves elliptic to spatulate, rounded or obtuse apically, 5–20 mm long, 2–6 mm wide; cauline leaves elliptic, oblong, or lanceolate, 5–35 mm long; flowers solitary in the leaf axils or on short axillary branches; pedicels 3–15 mm long; calyx 5–11 mm long, the tube 1–2 mm long, the lobes linear to oblanceolate, subequal, the margins hyaline; corolla yellowish, white, or blue, 7–16 mm long, funnelform to campanulate, the lobes 3–6 mm long, lanceolate, subequal to the tube, each lobe bearing 2 fringed scales within. Sagebrush, grass-forb, ponderosa pine, limber and bristlecone pine, and spruce-fir communities, usually on Tertiary limestone formations, at 2000 to 3400 m in Emery, Garfield, Iron, Kane, Sanpete, Sevier, Utah, and Wasatch counties; Nevada; 28 (vi).

Gentianopsis Ma

Annual, biennial, or perennial herbs; stems erect, often branched, glabrous; leaves opposite, sessile; inflorescence terminal or axillary; flowers solitary or cymose, 4–merous; calyx usually 4–angled, the lobes with thin, hyaline margins, the two inner ones triangular to ovate, the outer ones linear to lanceolate; corolla large and showy, tubular-funnelform to campanulate, the lobes fimbriate marginally, without folded plaits in the sinuses or fringed scales at the base of the lobe, blue or rarely whitish; stamens epipetalous; pistil stipitate, the ovary 1-loculed; stigmas 2, large; capsule 2-valved, septicial; seeds numerous, papillate.

Ilits, H. H. 1965. The genus *Gentianopsis* (Gentianaceae): transfers and phytogeographic comments. *Sida* 2: 129–154.

- 1. Flowers borne on long slender pedicels 2–16 cm long; plants annual or biennial from taproots *G. detonsa*
- Flowers sessile or short-pedicellate; plants perennial from rhizomes *G. barbellata*

Gentianopsis barbellata (Engelm.) Ilits Barbellate Gentian. [*Gentiana barbellata* Engelm.; *Gentianella barbellata* (Engelm.) J. M. Gillett]. Rhizomatous, acaulescent or short-caulescent perennials, mainly 5–15 cm tall; stems glabrous; leaves mostly basal, oblanceolate,

rounded or obtuse apically, the base connate-clasping, 2–8 cm long, 3–12 mm wide; flowers solitary and terminal, sessile or short-pedicellate; calyx funnelform, 11–25 mm long, the lobes triangular to lanceolate, equal, the sinuses acute, spanned by a membrane bearing 1–6 minute processes; corolla deep blue, narrowly funnelform, 24–45 mm long, the lobes oblong, 15–25 mm long, the lateral margins conspicuously fimbriate, the apex erose-dentate. Spruce-fir and alpine tundra communities, typically on limestone and often in meadows, at 2500 to 3750 m in Duchesne, Grand, Sanpete, and Summit counties; Wyoming south to Arizona and New Mexico; 9 (0).

Gentianopsis detonsa (Rottb.) Ma Meadow Gentian. [*Gentiana detonsa* Rottb.; *Gentianella detonsa* (Rottb.) G. Don; *Gentiana thermalis* Kuntze; *Gentiana elegans* A. Nels.; *Gentianella detonsa* ssp. *elegans* (A. Nels.) J. M. Gillett]. Annual or biennial, mainly 0.5–5 (9) dm tall, from taproots; stems branched from the base or above, rarely simple, glabrous; basal leaves forming a rosette or reduced to 1 pair, obovate-elliptic to spatulate, 2–6.5 cm long, 1–15 mm wide; cauline leaves linear to spatulate; flowers solitary and terminal, on pedicels 1–30 cm long; calyx broadly funnelform, the tube 9–14 mm long, the lobes ovate-triangular, acute, 8–20 mm long; corolla gentian violet, dark blue, or clear blue, narrowly funnelform, 25–60 mm long, the lobes 10–25 mm long, the lateral margins ciliate to fimbriate or toothed, the apex erose to dentate. Meadows in sagebrush, mountain brush, aspen, and spruce-fir communities at 1700 to 3550 m in Carbon, Daggett, Emery, Garfield, Iron, Juab, San Juan, Sanpete, Sevier, Summit, Uintah (?), Utah, and Wasatch counties; Alaska to Newfoundland, south to Mexico; circumboreal; 50 (viii). Our plants belong to var. *elegans* (A. Nels.) N. Holmgren.

Swertia L.

Glabrous perennial herbs; leaves (alternate) opposite or whorled, rarely alternate; flowers 4- or 5-merous, solitary or more often several to numerous in terminal and axillary cymes; calyx lobed nearly to the base; corolla rotate to shallowly campanulate, with short to long, often fringed scalelike processes borne ventrally at the base, the tube short, each lobe with 1 or 2 marginally fringed nectary glands near the middle or below; stamens 4 or 5, attached near the base of the corolla tube, the filaments free or expanded and connate near the base; ovary ovoid, the style one or lacking; capsule 1-loculed; seeds numerous, compound, often wing-margined.

St. John, H. 1941. Revision of the genus *Swertia* (Gentianaceae) of the Americas and the reduction of *Frasera*. *Amer. Midl. Naturalist* 26: 1–29.

- 1. Corolla normally dark blue, the lobes 4 or 5, each with a pair of sparsely fringed nectar pits at the base; stem leaves alternate, mostly of higher elevations . . . *S. perennis*
- Corolla usually greenish white or yellowish green, often purple spotted, the lobes usually 4, each with 1 or 2 large, copiously fringed glands and pits; stem leaves opposite or whorled; plants of middle and lower elevations 2
- 2(1). Leaves whorled, not white-margined, puberulent; glands 2 per corolla lobe *S. radiata*
- Leaves opposite or whorled, usually white-margined, glabrous; glands 1 per corolla lobe 3

- 3(2). Leaves linear; inflorescence a simple, narrow thyrs; plants perennial, known from western Millard County *S. gypsicola*
- Leaves oblong to oblanceolate, mostly 3–18 mm wide; inflorescence broadly paniculate; plants biennial, wide-spread 4
- 4(3). Leaves opposite; glands lobed at the base, sagittate; plants 7–12 dm tall or more, growing in sandy sites in southeastern Utah *S. utahensis*
- Leaves in whorls of 4, glands 2-lobed at apex; plants mainly 1–6 dm tall, growing in various substrates in the southern half of Utah *S. albomarginata*

Swertia albomarginata (Wats.) Kuntze White-margined Swertia. [*Frasera albomarginata* Wats., type from near St. George]. Glabrous perennial, from a well-developed, yellow taproot; stems solitary or few, normally much branched above the base, somewhat glaucous, 2–6 dm tall; leaves in whorls of 4, the bases connate-sheathing, the basal narrowly oblanceolate, mainly 4–11 cm long and 5–9 mm wide, white-margined, the cauline ones reduced and linear; flowers in broad paniculate cymes; calyx 2–6 mm long, the lobes narrowly lanceolate to nearly ovate; corolla white or greenish white, marked with green dots, the lobes 7–11 mm long; gland solitary on each lobe, long and slender, bilobed at the tip, fringed with short, soft, flat, white hairs; coronal scales absent or few; capsule conic, attenuate, 10–17 mm long. Warm desert shrub, sagebrush, pinyon-juniper, and mountain brush communities at 1470 to 2430 m in Beaver, Emery, Garfield, Iron, Kane, Millard, San Juan, Washington, and Wayne counties; Colorado, New Mexico, Arizona, Nevada, and California; 48 (xv).

Swertia gypsicola Barneby White River Swertia. [*Frasera gypsicola* (Barneby) D. Post]. Perennial, glabrous herbs from a branched caudex, and stout yellow root; stems erect, 10–35 cm tall; leaves linear, opposite, connate-clasping, the basal ones crowded, 3.5–8 cm long, the cauline 1.5–3.5 cm long; inflorescence a racemose thyrs of opposite 1- to 3-flowered cymes; calyx 3–4 mm long, the lobes broadly lanceolate, the margins white-scarious; corolla cream with purple spots, the lobes lanceolate 5–8 mm long; glands on each lobe small and circular, the edge with long white fimbriae all around; subapical scales ca 2 mm long, lacerate; capsule 10–12 mm long, oblong. Greasewood and shadscale dominated valley bottoms at ca 1525 m in western Millard County; Nevada; a Great Basin endemic; 1 (0).

Swertia perennis L. Felwort. [*S. fritillaria* Rydb., type from Big Cottonwood Canyon]. Perennial, the stems 1–6 dm tall; basal leaves obovate or oblong-elliptic, petiolate, 4–20 (25) cm long, 1–4.5 cm wide; cauline leaves short-petiolate to sessile, reduced in size upward, clasping but not connate; sepals essentially distinct, 5–12 mm long, narrowly oblanceolate, acuminate; corolla rotate, 10–15 mm long, dark bluish purple to whitish, often spotted; pistil sessile; capsule lance-ovoid; 2n = 28. Meadows, stream banks, and other moist sites in mountain brush, aspen, lodgepole pine, spruce-fir, and alpine tundra communities at 2375 to 3850 m in Daggett, Duchesne, Emery, Salt Lake, Sanpete, Sevier, Summit, Uintah, and Wasatch counties; Alaska to California; Eurasia; 47 (viii).

Swertia radiata (Kellogg) Kuntze Elkweed. [*Tessaranthium radiatum* Kellogg; *Frasera speciosa* Dougl. ex Griseb. in Hook., not *Swertia speciosa* Wallich ex G. Don]. Glabrous to puberulent perennials from a thick

taproot and caudex, the caudex transversely marked with leaf scars and at the summit with marcescent leaf bases; stems simple, erect, stout, 5–20 dm tall, yellowish to bluish green; leaves mostly whorled, slightly sheathing, puberulent to nearly glabrous, the basal ones 2–5 dm long, spatulate or elliptic-oblong to oblanceolate, the cauline ones reduced upward, oblanceolate to lanceolate; inflorescence an open or congested thyrs of whorled cymes; calyx lanceolate, 10–22 mm long; corolla pale green to whitish with purple dots, the lobes 10–25 mm long, obovate to oblanceolate; glands 2 on each lobe, elliptic, the margins long-fimbriate all around; subapical scales 7–9 mm long, deeply lacerate; capsule oblong, 20–25 mm long; 2n = 78. Sagebrush, mountain brush, ponderosa pine, Douglas fir, lodgepole pine, aspen, and spruce-fir communities at 1890 to 3500 m in probably all Utah counties; Washington to South Dakota, south to California, Nevada, Arizona, New Mexico, Texas, and Mexico; 83 (xvi).

Swertia utahensis (Jones) St. John Utah Swertia. [*Frasera paniculata* Torr. in Whipple, not *Swertia paniculata* Wallich; *Frasera utahensis* Jones, type from the Buckskin Mountains, Kane Co., Utah or Coconino Co., Arizona]. Perennial (biennial?) herbs from a thick, yellow taproot and caudex, the caudex with transverse leaf scars and at the summit clothed with persistent leaf bases; stems branched above, 7–15 dm tall; leaves opposite, sheathing, white-margined, often folded and curved, the basal ones 7–20 cm long, 7–20 mm wide, lance-linear to oblanceolate, the cauline ones greatly reduced upward, lanceolate, sessile; inflorescence a broad, pyramidal cluster 15–50 cm or more broad; calyx 3–6 mm long, lanceolate to ovate, acuminate, with white scarious margins; corolla white to greenish yellow, with dark green dots, the lobes 6–10 mm long; gland 1 per lobe, broad, oblong, lobed at the base, fringed with long fimbriae all around; subapical scales lacking; capsule elliptic-ovoid, attenuate, 10–16 mm long. Usually in sandy habitats in salt desert shrub, warm desert shrub, and pinyon-juniper communities at 1220 to 1895 m in Emery, Garfield, Grand, Kane, San Juan, and Wayne counties; New Mexico, Arizona, and Nevada (?); 29 (viii).

GERANIACEAE A. L. Juss.

Geranium Family

Annual or perennial herbs; leaves opposite or alternate, stipulate, simple or compound; inflorescence umbellate; flowers perfect, mostly regular; sepals and petals 5, distinct; stamens 5 or 10, the filaments more or less united at the base; pistil 1, the ovary superior, usually 5-loculed; style 1, with 5 stigmatic lobes; fruit dry, with 1 seed per locule, the valves separating from the base and coiling at maturity; x = 7–14.

- 1. Flowers with a spur adnate to the pedicel; plants cultivated *Pelargonium*
- Flowers lacking a spur; plants rarely if ever cultivated . . . 2
- 2(1). Leaves palmately lobed or divided; stamens usually all with anthers *Geranium*
- Leaves pinnately lobed or dissected; stamens with anthers 5 *Erodium*

Erodium L'Her.

Annual herbs; leaves basal and cauline, pinnately lobed or parted, opposite; pedicels commonly recurved in fruit;

flowers 5-merous; fertile stamens 5, alternating with 5 scalelike staminodia; style column elongate, the styles bearded inside, spirally coiled at maturity; carpel bodies spindle-shaped, indehiscent.

- 1. Leaves with confluent blades, these merely 3-lobed and pinnately veined, plants of Washington County *E. texanum*
- Leaves pinnately dissected, the blade usually bipinnatifid; plants widely distributed *E. cicutarium*

***Erodium cicutarium* (L.) L'Her.** Storksbill. [*Geranium cicutarium* L.]. Stems erect or finally prostrate to decumbent, 0.5-8 dm long (or more), strigulose as well as glandular; leaves 1-12 cm long, doubly pinnately dissected or parted; stipules lanceolate; peduncles 1-15 cm long; pedicels 1-10, typically 6-18 mm long; sepals 3-6 mm long, mucronate and bristle-tipped; petals pink to lilac, 5-7 mm long, spotted; stylar beak 2-4 cm long; carpel bodies 4-5 mm long, stiffly pilose; 2n = 36, 38, 40. Widely distributed herbs of open sites in numerous plant communities at 820 to 2475 m in all or nearly all Utah counties; widespread in western U. S.; adventive from Europe; 70 (vii). This plant was noted by Fremont in 1844, and it is potentially indigenous. Certainly it now appears like a native.

***Erodium texanum* Gray** Stems decumbent-ascending, mainly 0.6-4 dm long, puberulent (not glandular); leaves 2-6 cm long, the blades 0.8-3 cm long, ovate to suborbicular, cordate basally, 3-lobed; stipules lanceolate to triangular; peduncles 1-3 cm long; pedicels 1-3, mainly 3-10 mm long; sepals 5-8 mm long, purple-veined, apiculate, but not bristle-tipped; style column 4-6 cm long; style bodies 6-8 mm long, ascending hairy with stiff straight hairs. Creosote bush, Joshua tree, and shadscale communities at ca 760 to 915 m in Washington County; Nevada, California, Arizona, New Mexico, and Texas; 4 (0).

***Geranium* L.**

Perennial, annual, or biennial herbs; leaves alternate or opposite, or chiefly basal, palmately lobed or divided; flowers often large, showy, borne solitary or in umbels on axillary peduncles; sepals 5; petals 5, soon deciduous; stamens 10, usually all anther-bearing; styles much longer than the ovary, curved or coiling in fruit. Note: Diagnostic criteria have been based previously on such features as kind of pubescence and its position on plant parts, but those features do not appear to be of primary diagnostic value. Thus, keys are difficult to compose that will allow accurate identification of all specimens. Because of these factors the following key is tentative at best.

- 1. Petals 5-10 mm long; plants annual or biennial from slender taproots 2
- Petals mainly 10-26 mm long; plants perennial from caudices or rhizomes 4
- 2(1). Fertile stamens 5; sepals not apiculate; seeds smooth *G. pusillum*
- Fertile stamens 10; sepals apiculate; seeds pitted 3
- 3(2). Beak of stylar column less than 3 mm long, the stigmas less than 1 mm long; pedicels subequal to the calyx at maturity *G. carolinianum*
- Beak of stylar column 4-5 mm long, the stigmas ca 1 mm long; pedicels much surpassing the calyx at maturity *G. bicknellii*

- 4(1). Petals white, the veins sometimes pink or purple, or rarely suffused with pale lavender; style branches 2-5 mm long; plants common and widespread *G. richardsonii*
- Petals pink, rose purple, pink purple, white or shades of lavender and violet; style branches 4.5-7 mm long; plants various 5
- 5(4). Blades of lower leaves usually more than 7 cm broad and 4 cm long from sinus to apex; plants 2-10 dm tall, widespread in northern Utah, less common elsewhere *G. viscosissimum*
- Blades of lower leaves usually less than 7 cm broad and less than 4 cm long from sinus to apex; plants 1-4 (7) dm tall, mainly of the southern 1/2 of Utah ... *G. caespitosum*

***Geranium bicknellii* Britt.** Bicknell Cranesbill. Annual or biennial, the stems 1.5-5 dm tall, erect or decumbent, spreading hairy and often glandular, from a slender taproot; leaf blades cordate to rounded in outline, 1-3.5 cm long from sinus to apex, the segments not distinct; flowers usually 2 per peduncle; fruiting pedicels usually 2-3 times longer than the calyx; sepals 4-8 mm long, aristate; petals pink, 3.5-7 mm long; stylar column 14-20 mm long including the beak, pubescent, the beak 3-6 mm long, pubescent; style branches 1-1.5 mm long. Shady moist roadside at 1830 to 2440 m in Cache, Daggett, Salt Lake, and Utah counties; Alaska and Yukon east to Newfoundland, south to Washington, Michigan, and New York; 3 (0).

***Geranium caespitosum* James** Small-leaf Geranium. [*G. marginale* Rydb., type from Aquarius Plateau]. Perennial, few- to many-stemmed from a definite caudex, mostly 15-70 cm tall; herbage variously retrorse, spreading, or appressed pubescent and often glandular as well, blades of basal leaves palmately 5-lobed, the median lobe mainly 0.8-3.6 cm long, 1.5-7 cm wide, this cuneate basally and usually with 3 abruptly acuminate to obtuse teeth apically, the petioles 3-20 (28) cm long; fruiting pedicels much longer than the calyx; flowers in pairs or not; sepals 6.7-11 mm long, apiculate; petals white, pink, lavender, or pink purple, 6.7-16.5 mm long; stylar column 10-18 mm long, including the beak, this 3-5 mm long, pubescent or glabrous; style branches 4.5-5.5 mm long. Sagebrush, mountain brush, piñon-juniper, ponderosa pine, aspen, and spruce-fir communities, often where moist and shaded, at 1830 to 3465 m in Beaver, Carbon, Duchesne, Garfield, Grand, Iron, Millard, Piute, San Juan, Sanpete, Sevier, Tooele, Washington, and Wayne counties; Colorado, New Mexico, and Arizona; 59 (vii). The small-leaf geranium is typical of the problems of interpretation of perennial geraniums generally; i.e., they tend to merge morphologically (hybridize?) when the taxa meet, and there are few, if any, definitive diagnostic features (including proportion of the petal surface bearing hairs and pubescence type and position elsewhere on the plants). These problems have led to contradictory and often unsatisfactory treatments of our perennial geranium species. Interpretation of the *caespitosum* complex is further complicated by its tangled nomenclatural history, beginning at its inception. The nomenclatural problem was reviewed in part by Osterhout (Bull. Torrey Club 50: 81-84. 1923), who noted the presence of a possibly earlier name for this species. That name, if determined to be properly published, has priority, evidently, over the epithet *caespitosum*. Aside from that problem, the original description of *G. caespitosum*

is brief and does not characterize the species. Further, no type specimen is known. Typification is possible only through interpolation from published notes of the collector (Dr. James on the Long Expedition). This was not established until the concept of the species as it occurs in New Mexico had been misapplied under the name *G. caespitosum* by later authors. The confusion is still evident in recently published works. The complex has been regarded as including three or four taxa treated at specific or infraspecific rank. The main diagnostic feature used in segregation of those taxa includes kind and position of pubescence. Separation of the largely sympatric Utah materials into three groups (that do not seem to represent taxa) is possible only arbitrarily, and it does not seem advisable under the circumstances to treat them at taxonomic rank. Eglandular material in Utah has been regarded as *G. marginale* Rydb. (more or less equivalent with *G. atropurpureum* Heller as far as being eglandular, but probably not the same taxonomically), but passes by degree into the other two possibilities. Plants with glandular pedicels, lower stem internode, and lower petioles are *G. caespitosum* var. *parryi* (Engelm.) W. A. Weber [*G. fremontii* var. *parryi* Engelm.]. Plants of this type are not always separable from dwarf plants of *G. richardsonii*, with which they are partially sympatric. Those with glandular hairs on pedicels and calyces but not on the lower internode or lower petioles are assignable to *G. fremontii* Torr., in a strict sense, as near as I can determine from descriptions and contradictory contemporary treatments. Adding to the confusion, the name *G. fremontii* has been misapplied to the similar but larger *G. viscosissimum* (q.v.), common in northern Utah. Nomenclatural combinations are neither intended nor implied herein.

Geranium carolinianum L. Carolina Cranesbill. Annual or biennial, the stems 1.5–5 dm tall, usually erect, retrorsely hairy and often glandular, from a slender taproot; leaf blades cordate to ovate in outline, 1–4 cm long from sinus to apex, the segments not distinct; flowers 2 or more per peduncle, these very short; fruiting pedicels less than 1.5 times longer than the calyx; sepals 5–8 mm long, apiculate; petals pink, 5–7 mm long; stylar column 10–15 mm long (including beak), pubescent, the beak 1–2 mm long; style branches 1 mm long or less. Open sites at lower middle elevations in Davis, Salt Lake, and Weber counties; widely occurring in North America; 3 (0).

Geranium pusillum L. Slender Cranesbill. Plants annual or biennial, the stems 1–5 dm tall, prostrate to erect, pubescent with appressed or spreading hairs and often glandular, from a slender taproot; leaf blades cordate to orbicular in outline, 1.5–4 (7) cm wide, the segments not distinct; flowers mostly 2 per peduncle, these mainly 2–4 times longer than the calyx; sepals 2.5–4 mm long, not apiculate; petals red violet to lavender, mostly 3–4 mm long; stylar column 6–9 mm long, the beak very short; style branches ca 0.5–0.8 mm long; $2n = 26$. Open sites at ca 1370 to 1525 m in Cache, Salt Lake, and Utah counties; widely established in the U. S.; adventive from Europe; 4 (0).

Geranium richardsonii Fisch. & Trautv. Richardson Geranium. Perennial herbs, the stems usually 1 per caudex branch, 1–10 (13) dm tall, erect, branched above, retrorsely hairy, glandular, or glabrous below, mostly glandular-hairy above, from a caudexlike rhizome; leaf

blades mainly 1–8 cm long from sinus to apex, 1.5–17 cm wide, the segments not distinct, the median one cuneate basally and 3- to 7-lobed or toothed apically; flowers usually 2 per peduncle, this usually 2–4 (or more) times longer than the calyx; sepals 6–11 mm long, apiculate, with stipitate-glandular hairs; petals white to pale lavender, the veins often reddish or purplish, 12–22 mm long, hairy on the inner surface; style column stipitate-glandular, 16–28 mm long, including the beak, this 3–4.5 mm long; style branches 2–5 mm long; $2n = 26$. Mountain brush, piñon-juniper, ponderosa pine, aspen, lodgepole pine and spruce-fir communities at 1735 to 3235 m in probably all Utah counties; Yukon south to California, Arizona, and New Mexico; 182 (xvii). This is the most widely distributed of the native geraniums in Utah. It is sympatric with both *G. viscosissimum* and *G. caespitosum* and is not always reliably separable from either of them. In most cases the white flowers and smaller floral parts distinguishes it from *G. viscosissimum*, but its separation from *G. caespitosum*, especially from those phases with white flowers, is more tenuous.

Geranium viscosissimum Fisch. & Mey. Sticky Geranium. Perennial herbs, the stems often 2 per caudex branch, 2–12 dm tall, erect, branching above, retrorsely puberulent to glandular below, retrorsely hairy to stipitate-glandular above, from a caudexlike rhizome; leaf blades mostly 2–8 cm long from sinus to apex and 3–17 cm wide, the segments not distinct, the median one cuneate basally and 3- to 15-toothed or -lobed apical flowers usually 2 per peduncle, this mainly 2–6 (or more) times longer than the calyx; sepals 7–12 mm long, apiculate, pubescent with glandular or eglandular hairs; petals pink to lavender or purple, 12–26 mm long, the lines usually purplish, hairy on the inner surface; stylar column stipitate-glandular, 20–35 mm long including the beak, this 3–5 mm long; style branches 4.5–7 mm long. Sagebrush, mountain brush, aspen, tall forb, and spruce-fir communities at 1765 to 3145 m in Beaver, Box Elder, Cache, Carbon, Daggett, Davis, Duchesne, Juab, Rich, Salt Lake, San Juan, Sanpete, Summit, Uintah, Utah, Wasatch, and Weber counties; British Columbia to Saskatchewan, south to California, Nevada, and Colorado; 126 (ix). Our specimens have been regarded as var. *nervosum* (Rydb.) C. L. Hitchc. [*G. nervosum* Rydb.], but the original description of that taxon more closely describes *G. richardsonii*. Despite this problem, the relationships of this most beautiful of our geraniums apparently lies to the north. It is replaced south of Sanpete County (with outliers in Beaver and San Juan counties) by phases of *G. caespitosum*, which contain within a broad concept the Fremont geranium, *G. fremontii* Torr. (q.v.), a plant similar in major respects with *G. viscosissimum*. A similar series of glandular versus nonglandular plants occurs within *G. viscosissimum* as is present in *G. caespitosum*, but they have not been considered at taxonomic rank.

Pelargonium L'Her.

Plants herbaceous, perennial (under glass) herbs; leaves alternate or opposite, usually palmately veined and lobed; flowers small to large, showy, borne in umbels on axillary peduncles; sepals 5 produced into a spur adnate to the pedicel; petals 5, the upper 2 differing in size from the lower 3; stamens 10, usually only 5 with anthers; stylar column much longer than the ovary, usually coiling in fruit.

Pelargonium hortorum Bailey Common Geranium. Stems mostly 2–5 dm long, somewhat succulent, fragrant, pubescent; leaves alternate (rarely opposite), the blades 2.5–10 cm broad, orbicular to reniform, shallowly lobed and crenate; flowers several to many in involucrate umbels; petals pink, salmon, red, white, or variously spotted, 10–25 mm long; $2n = 18, 24, 30, 34$. This is the common geranium widely grown as a border plant and as a household and ornamental plant throughout temperate and warm temperate regions of the earth; 4 (0).

GUTTIFERAE A. L. Juss.

St. Johnswort Family

Herbs; leaves opposite, simple, entire, glandular-punctate; stipules lacking; flowers perfect, regular, cymose; sepals 5 (4); petals distinct, 5 (4), yellow; stamens numerous, often in 3–5 clusters, with the filaments united below; pistil 1, the ovary superior, 1– to 5-loculed; styles 3–5, distinct or united; fruit a capsule with 3–5 parietal or axile placentae; $x = 7, 8, 9, 10$. [Clusiaceae Lindl.; Hypericaceae A. L. Juss.].

Hypericum L.

Perennial glabrous herbs; leaves opposite, simple, sessile, entire, glandular-punctate; flowers perfect, regular; ovary 3-loculed or with 3 placentae; capsule dehiscent, many-seeded.

1. Stems procumbent, matforming, rooting at the lower nodes, 3–25 cm long; leaves 3–11 mm long, without black glandular punctae; flowers few, cymose, solitary, or occasionally axillary; petals salmon colored, 2–4 mm long *H. anagaloides*
- Stems erect, from creeping rootstocks, 20–70 cm long; leaves 10–35 mm long, with black glandular punctae; flowers several to numerous; petals yellow, 7–14 mm long *H. formosum*

Hypericum anagaloides C. & S. Plants small, slender stemmed annuals; stems 5–25 cm long, the branches ascending; leaves 5– to 7-veined, lacking glandular punctae marginally, elliptic to orbicular; cymes 1– to 3-flowered or solitary in leaf axils; sepals elliptic, unequal; petals 3–5 mm long, salmon colored; stamens 15–21; capsule to 3 mm long. Wet meadows and bogs in spruce-fir, lodgepole pine, and aspen communities at 2800 to 3400 m in Duchesne and Summit counties; British Columbia to Montana, south to Arizona and California; 5 (i).

Hypericum formosum H.B.K. [*H. scouleri* Hook.]. Erect herbaceous perennials, with horizontal rootstocks; herbage glandular-punctate; stems 20–70 cm tall, simple below, occasionally branched above; leaves 1–3.5 cm long, oval or elliptic, or sometimes oblong-ovate, obtuse to acuminate; flowers few to many in branching cymes; sepals 2–5 mm long, ovate, glandular punctate; petals 6–15 mm long; stamens numerous; capsule ca 8 mm long; $n = 8$. Stream banks and meadows in sagebrush, mountain brush, lodgepole pine, pinyon, ponderosa pine, and aspen communities at 1370 to 3090 m in Box Elder, Cache, Daggett, Duchesne, Emery, Garfield, Grand, Juab, Kane, Millard, Morgan, Salt Lake, San Juan, Summit, Tooele, Uintah, Utah, Wasatch, and Washington counties; Washington to Wyoming, south to California, Arizona, and New Mexico; 31 (vii).

HALORAGACEAE R. Br. in Flinders

Water-milfoil Family

Aquatic or semiaquatic, herbaceous perennials; leaves whorled or alternate, finely dissected; flowers regular, small, unisexual or perfect, solitary in the upper leaf axils or more often in terminal spikes, 3– or 4-merous; sepals obsolete or 4 and persistent in fruit; petals 2–4, small, or sometimes wanting; stamens 4 or 8, the filaments slender, distinct; anthers large; pistil 1, the ovary inferior, 1– to 4-loculed, with (1) 2–4 distinct styles; fruit indehiscent, nutlike or drupe-like; $x = 7$.

Mriophyllum L.

Stems slender, floating and submersed or growing on mud; leaves whorled or alternate, finely pinnately divided; flowers unisexual, mostly in terminal spikes; calyx with 4 short lobes or lacking; petals 2–4 when present; stamens 8 or sometimes 4; anthers large; fruit bony, splitting into 2–4 (1-seeded) nutlets.

1. Pistillate and staminate floral bracts strongly lobed or dissected, mostly much longer than the flower and fruit *M. verticillatum*
- Pistillate floral bracts shortly toothed; staminate bracts entire, all floral bracts equaling the flowers or shorter (the pistillate sometimes longer) *M. exalbescens*

Mriophyllum exalbescens Fern. [*M. spicatum* ssp. *exalbescens* (Fern.) Hulten; *M. spicatum* var. *exalbescens* (Fern.) Jepson]. Stems 3–8 dm long, loosely erect; leaves whorled, 1–3 cm long, with segments in 4–12 pair; inflorescences submersed or sometimes emergent, the spikes 3–10 cm long, upper flowers staminate, the lower pistillate; bracts whorled, entire or the lower ones deeply lobed, shorter than or exceeding the flowers; stamens 8 fruit 2–3 mm long. Ponds, lakes, reservoirs, or in mud at 1370 to 2745 m in Cache, Daggett, Duchesne, Garfield, Millard, Rich, Sanpete, Sevier, Uintah, Utah, Wasatch, and Washington counties; widespread in North America; 31 (ii).

Mriophyllum verticillatum L. Stems 3–10 dm long; leaves 1–4 cm long, with 9–15 pairs of segments, whorled; flowers whorled, in an interrupted spike, 4–12 cm long; bracts usually much longer than the flowers and pinnatifid; staminate flowers with petals, these yellow green, deciduous; pistillate flowers lacking petals, but with persistent sepals; fruit 2–3 mm long; $2n = 28$. Our few collections from Salem Pond and the Millrace in Provo, Utah County; widespread in North America; circumboreal; 3 (0).

HAMAMILIDACEAE R. Br. in Abel

Witch-hazel Family

Trees; leaves alternate, simple; stipules deciduous; flowers in heads or clustered, typically monoecious; flowers regular, bracteate, usually sessile; calyx tube present, the lobes present or absent; petals typically lacking; stamens numerous, in globular masses; pistil 1, the ovary 2-carpeled; styles 2; fruit a 2-beaked, 2-loculed woody capsule, usually with 1 or 2 seeds per locule; $x = 8, 12, 15, 16$.

Liquidambar L.

Monococious trees with corky branches; leaves palmately 3- to 7-lobed, fragrant when bruised; flowers apetalous; staminate flowers intermixed with small scales in globose heads disposed in terminal racemes; pistillate flowers in pedunculate globose heads, consisting of coherent 2-loculed, 2-beaked pistils subtended by scales; fruiting head globose, woody.

Liquidambar styraciflua L. Sweetgum. Trees to 20 m tall or more; bark grayish brown, furrowed, commonly with corky ridges on the branchlets, often exuding gum (that is said to be pleasant to chew); leaves palmately lobed, mainly 4-10 cm long and about as wide, brilliantly colored in autumn, truncate to subcordate at the base; fruiting head woody, subglobose, mainly 2-3 cm in diameter, borne on peduncles mainly 2-5 cm long; capsules woody, each producing 1 or 2 seeds and many abortive seeds resembling sawdust. Commonly cultivated ornamental trees of great beauty, especially in autumn, in much of lower elevation Utah; Indiana to New York, south to Texas and Florida; Mexico and Central America; 11 (0).

HIPPOCASTANACEAE DC.

Horsechestnut Family

Contributed by Kaye Hugie Thorne

Perennial shrubs or trees with large winter buds covered by resinous scales; leaves opposite, palmate, estipulate; flowers irregular; calyx 5-lobed or free; petals 4-5, distinct, an irregular disk between petals and stamens; stamens 4-9, distinct; pistil 1, the ovary superior, 3-carpellate (rarely 1 or 2 by abortion), each locule with 2 ovules; style and stigma simple; fruit a leathery capsule opening by 3 valves; seed solitary; x = 20.

Aesculus L.

Deciduous trees or shrubs; leaves opposite, palmate; inflorescence an erect terminal panicle; flowers perfect, showy, white, pink, red, yellow, or yellow green, sometimes spotted; sepals 5-lobed; petals 4 or 5, clawed, equal or unequal; stamens 5-8; ovary superior, 3-loculed; fruit a leathery capsule, globose, smooth, prickled or spiny; seed large lustrous dark brown with a white hilum.

- 1. Flowers scarlet to flesh pink; leaflets cuneate-obovate, to 16 cm long; fruit smooth, sometimes with a few small prickles *A. x carnea*
- Flowers white, yellow, or greenish-yellow, sometimes spotted red or yellow; leaflets obovate, elliptic, to 32 cm long; fruit prickled or spiny 2
- 2(1). Flowers white, spotted red or yellow; leaflets obovate to 32 cm; panicle to 33 cm long; fruit spiny *A. hippocastanum*
- Flowers yellow or greenish yellow 3
- 3(2). Flowers yellow, to 3 cm long, petals unequal; stamens included; fruit smooth *A. octandra*
- Flowers greenish yellow to yellow; petals equal; stamens exserted; fruit with prickles *A. glabra*

Aesculus x carnea Hayne in Guimpel, Otto & Hayne. Red Horsechestnut. Trees to 25 m tall; leaflets usually 5, subsessile, cuneate-obovate, 7-16 cm long, dark green above, lighter green beneath, twice serrate; inflorescence to 20 cm long; flowers scarlet, deep red, or flesh-colored,

the claws shorter than or equal to the sepals; petals glandular, villous on the margins; stamens exserted; fruit subglobose, 3-4 cm across, smooth or occasionally with a few small prickles. Cultivated ornamental in lower elevation portions of Salt Lake and Utah counties; sporadic in cultivation elsewhere in the U. S.; 10 (0). This is a hybrid between *A. hippocastanum* and *A. pavia*. Cultivars include "Briotii," with scarlet flowers and "rosea" with pink flowers.

Aesculus glabra Willd. Ohio Buckeye. Trees to 10 m high; leaflets 5, subsessile, elliptic-obovate, cuneate, acuminate, 8-12 (14) cm long, serrulate, green above, lighter green and pubescent beneath when young; inflorescence to 15 cm long; flowers yellow to greenish yellow, 2-3 cm long, the claws slightly longer than the sepals; petals equal; stamens exserted; fruit obovoid, with prickles. Cultivated ornamental in Cache, Salt Lake, and Utah counties; widely grown in the the U. S.; indigenous to the eastern U. S.; 15 (0). Variants include var. *arguta* (Buckley) Robins. [*A. arguta* Buckley] the Texas buckeye, which has leaflets ovate-elliptic and attenuate at both ends.

Aesculus hippocastanum L. Common Horsechestnut. Tree to 25 m tall; leaflets 5-7, subsessile, cuneate-obovate, acuminate, twice serrate 10-24 cm long, dark green above, rusty tomentose beneath when young; inflorescence to 30 cm long; flowers white, usually red spotted or tinged, the claws equal to or shorter than the sepals; stamens exserted; fruit subglobose spiny, 3-6 cm across; 2n = 40. Widely cultivated as a street tree and in landscape plantings in Cache, Salt Lake, Utah, and Weber counties; widely grown in the U. S.; introduced from Europe; 17 (0). Cultivars include "alba", flowers pure white; "Baumannii," flowers white double; "rosea" flowers pink; and "rubicundula" flowers red.

Aesculus octandra Marshall Sweet Buckeye. Trees to 30 m long; leaflets 5, elliptic, or narrow elliptic to obovate, cuneate, acuminate, twice serrate, green above, light to yellow green beneath pubescent when young; inflorescence to 15 cm long; flowers yellow, ca 3 cm long; petals distinctly unequal, the claws longer than the sepals; stamens usually included; fruit subglobose, 5-6 cm across, smooth. Cultivated shade and ornamental trees in Cache, Salt Lake, Utah, and Weber counties; native to the American midwest; 9 (0).

HIPPURIDACEAE Link

Marestail Family

Aquatic or amphibious herbs from elongate rhizomes; stems wholly or partly submersed; leaves whorled, entire, linear, sessile; flowers inconspicuous, perfect or sometimes unisexual, in the upper leaf axils; calyx reduced to a rim at the top of the inferior ovary; petals none; stamen 1; pistil 1, 1-carpellate; fruit drupelike; x = 16.

Hippuris L.

Stems simple, mostly submersed, erect; leaves in whorls of 6 or more; flowers axillary, mostly perfect; sepals very small; stamen on top of the ovary, this 1-loculed, 1-ovuled; style filiform, placed in a groove in the anther; fruit 1-seeded, indehiscent.

Hippuris vulgaris L. Common Marestail. Stems erect, typically 1-4 dm tall (at least as regards the aerial portion, the submersed portion often much longer). 1.5-5 mm thick; leaves narrow, entire, spreading, simple, in whorls

of (6) 8–12, with the internodes progressively shorter upward, the middle stem leaves often the longest, mostly 6–30 (50) mm long, 1–2 mm wide, in many whorls; flowers mostly perfect; staminal filament persistent, 0.5–1 mm long; fruit black, 1.5–2.5 mm long; $2n = 32$. Streams, lakes, and ponds at 1370 to 2810 m in Cache, Duchesne, Garfield, Grand, Kane, Millard, Rich, Sanpete, Sevier, Summit, Uintah, Utah, Wasatch, and Wayne counties; widespread in North America; circumboreal and in South America; 28 (i).

HYDROPHYLLACEAE R. Br.

Waterleaf Family

Perennial, biennial, or annual herbs, or shrubs; leaves simple or pinnatifid; flowers perfect, regular, 5–merous, commonly in cymes, these mostly scorpioid; calyx lobes 5, similar or dissimilar, sometimes accrescent in fruit; corolla lobes 5; stamens 5, exerted or included; pistil 1, 2 carpellate, the ovary superior, 1–loculed or more or less completely 2–loculed; styles 2, or if 1 then 2–cleft; fruit a longitudinally dehiscent capsule; seeds 1 to many; $x = 5–13$.

Atwood, N. D. 1976. The Hydrophyllaceae of Utah. Great Basin Nat. 36: 1–55.

- 1. Plants aromatic shrubs; leaves leathery, evergreen; known from Washington County *Eriodictyon*
- Plants annual or perennial herbs; leaves not leathery or evergreen 2
- 2(1). Calyx lobes dimorphic, the 3 outer ones conspicuously enlarged, cordate and veiny in fruit, the 2 inner ones linear; known from Washington County *Tricardia*
- Calyx lobes subequal, or if somewhat unequal, not as above 3
- 3(1). Plants acaulescent; flowers solitary at ends of elongate, naked peduncles *Hesperochiron*
- Plants mostly caulescent; flowers in scorpioid cymes or solitary in leaf axils 4
- 4(3). Ovary unilocular 5
- Ovary more or less bilocular 7
- 5(4). Plants perennial; stamens exerted *Hydrophyllum*
- Plants annual; stamens included 6
- 6(5). Herbage glabrate; stems sharply angled and armed with minute, reflexed prickles; seeds usually 1 *Nemophila*
- Herbage viscid and scented; stems not as above; seeds 7–15 *Eucrypta*
- 7(4). Stamens unequally inserted on the corolla tube; flowers axillary, solitary in small dense leafy clusters *Nama*
- Stamens equally inserted on the corolla tube; flowers mostly in cymes 8
- 8(7). Corolla pale yellow, marcescent, flowers long-pedicellate, the pedicels and flowers ca 1 cm long, pendulous *Emmenanthe*
- Corolla blue, purple, or white, or if yellow, less than 1 cm long *Phacelia*

Emmenanthe Benth.

Plants annual, villous and glandular; leaves alternate, sessile or nearly so, oblong, pinnatifid; inflorescence with pendulous flowers on filiform pedicels; corolla pale yellow, marcescent; sepals shorter than the calyx; capsules unilocular, oblong, compressed; seeds numerous, reticulate, compressed.

Emmenanthe penduliflora Benth. Whispering-bells. Annual, 1.9–6.4 dm tall; stems erect, hirsute and glandular-viscid; leaves alternate, pinnatifid; inflorescence of scorpioid terminal cymes, hirsute; sepals ovate to lanceolate, 6–10 mm long, hirsute; corolla light yellow, campanulate, 8–12 mm long, 6–10 mm broad, pendulous; stamens included, subequal, usually inserted at the base of the corolla tube; style included, 2–cleft at the apex; ovules numerous, pendulous; seeds ca 15, dark brown, 1.4–2.5 mm long; $2n = 36$. Mixed shrub and pinyon-juniper communities, or in burned areas, at ca 1220 to 2380 m in Washington County; Arizona, Nevada, and California; 6 (i).

Eriodictyon Benth.

Aromatic, evergreen shrubs from underground rootstocks; leaves dark green, resinous above and tomentose beneath; inflorescence with numerous scorpioid cymes in terminal panicles; corolla white to purple, deeply lobed, funnellform; sepals subequal, deeply divided; stamens included; style divided to the base; capsules 4–valved, cartilaginous; seeds 2–6, ridged longitudinally, flattened.

Eriodictyon angustifolium Nutt. Yerba-santa. Evergreen, glabrous and glutinous shrubs, 5–20 dm tall; leaves alternate, linear, 4–8 cm long, 2–5 cm broad, revolute, thick, entire to toothed; inflorescence of terminal, branched, scorpioid cymes; calyx-lobes subequal, linear, 3 mm long; corolla white, deciduous, narrowly campanulate, 5–6 mm long; stamens included; style divided to base; seeds 6 or fewer. Warm desert shrub, juniper, pinyon-juniper, and mountain brush communities in open, sandy or gravelly soils at 730 to 2135 m in Washington County; Nevada and Arizona; 36 (iii).

Eucrypta Nutt.

Annual, fragile, glandular herb; leaves pinnatifid, the lower petioled, upper auriculate-clasping; corolla white to blue or yellowish, campanulate; calyx divided at least half its length, shorter than the corolla; stamens included; style divided only at the apex; capsules unilocular, ovoid, enclosed by the enlarged calyx; seeds dimorphic, brown to black.

Eucrypta micrantha (Torr.) Heller Desert Eucrypta. [*Phacelia micrantha* Torr.; *P. pinetorum* Jones, type from Deep Creek Mts.; *Ellisia micrantha* (Torr.) Brand; *Nyctelea pinetorum* (Jones) Tides.]. Annual, 0.5–2.5 dm tall; stems weak, diffuse; leaves pinnatifid, the lower leaves petiolate, the upper auriculate clasping; inflorescence of terminal or axillary cymes; pedicels filiform; calyx-lobes oblong to spatulate, 1.5–2 mm long, stipitate-glandular; corolla campanulate, purplish, blue or white, the tube yellow, 2–4 mm long and broad; stamens included; style included, bifid at apex; mature capsule unilocular; seeds 5–15, dimorphic, brown to black; $2n = 12, 18, 24$. Shaded or protected areas in the desert or canyons from the creosote bush community upward to the pinyon-juniper zone at 760 to 1375 m in Juab, Kane, and Washington counties; Texas, west to California; 17 (v).

Hesperochiron Wats.

Acaulescent perennials from a thick root; leaves simple, petioled, in a basal rosette; flowers long-petioled, solitary in the leaf axils; corolla white to blue, funnellform to rotate; sepals unequal, ciliate; stamens included, in-

serted on the tube of the corolla; filaments basally dilated; style bifid at the apex; capsule unilocular; seeds numerous, dark brown, pitted.

1. Corolla rotate or bowl-shaped, densely long-hairy within, the lobes mostly longer than the tube; flowers few, 1–5 (7); plants usually in the foothills or mountains in moist areas, rarely in alkaline or saline sites; plants not known from Summit County *H. pumilus*
- Corolla funnelliform or campanulate, subglabrous or short-hairy within, the lobes equaling or usually shorter than the tube; flowers more numerous, rarely as few as 5, plants mostly of alkaline or saline soils at lower elevations, reported from Summit County *H. californicus* (Benth.) Wats.

***Hesperochiron pumilus* (Griseb.) Porter** [*Villarsia pumila* Griseb.; *Capnorea pumila* (Dougl.) Greene; *C. watsoniana* Greene]. Dwarf, acaulescent perennials, 2–12 cm tall, short-villous; leaves in a basal rosette, petiole, simple, linear to oblanceolate, 1.5–5 cm long; peduncles solitary in the axils, erect; sepals linear to oblong, usually unequal, 3–8 mm long; corolla rotate white to light blue, 0.5–1.6 cm long, densely hairy within; stamens included, inserted unequally on the corolla tube, the filaments dilated below; style included, 2-cleft at apex; mature capsule unilocular; seeds numerous, dark brown, alveolate; $2n = 16$. Moist ground along streams and in meadows, in mountain brush and aspen communities and in desert springs, mostly between 1675 and 2595 m in Box Elder, Emery, Juab, Millard, Rich, Salt Lake, Sanpete, Summit, Uintah, Utah, Washington, and Weber counties; Washington to Montana, south to California and Arizona; 11 (ii).

Hydrophyllum L.

Perennial herbs; stems erect, succulent, from horizontal rhizomes, these bearing fleshy fibrous or tuberous roots; leaves pinnately compound, mostly basal, oblong, ovate or oval in outline; petioles slightly dilated and clasping at the base, ciliate; inflorescence composed of 1 to several globose or lax cymes, short pubescent or strigose and hispid; calyx divided nearly to the base, the lobes linear, oblong or lanceolate; corolla campanulate purplish to blue, white or violet; stamens 5, exserted; style 1, exserted 5–10 mm, cleft 1–2 mm; stigmas capitate; ovules attached to the front of the 2 large parietal placentae; seeds 1–3, brown, subglobose, reticulate.

1. Flowers in dense capitate clusters; peduncles shorter than the petioles of the subtending leaves; anthers short-oblong, 0.6–1 mm long *H. capitatum*
- Flowers in open clusters; peduncles longer than the petioles of the subtending leaves; anthers linear to oblong, 1–2 mm long 2
- 2(1). Leaflets acuminate, with 8–12 acuminate teeth; cymes lax in fruit *H. fendleri*
- Leaflets obtuse to abruptly acute, with 3–6 obtuse to acute teeth, cymes compact in fruit *H. occidentale*

***Hydrophyllum capitatum* Dougl. ex Benth.** Plants 1–5 dm high, from short rhizomes, these bearing a fascicle of tuberous roots; stems short; leaves pinnately compound, ovate to oval in outline, strigose, the blade 2.5–10 cm long, 2–13 cm wide, the primary divisions 5–7, obovate to oblong or lanceolate, the lobes and divisions acute, obtuse or mucronate; inflorescence of 1 to several globose

cymes, the peduncles 1–5 cm long, shorter than the subtending leaves, mostly recurved in fruit; pedicels 2–5 mm long; sepals obtuse or abruptly acute, 3–4 mm long, 1.5 mm broad or less, ciliate and strigose; corolla 5–9 mm long, purplish, blue or white; stamens exserted 5 mm; style exserted 5–10 mm; seeds normally 2, light brown, 2–3 mm in diameter; $2n = 18$.

1. Cymes lax (at least in fruit); pedicels 7–19 mm long, reflexed in fruit; plants low (2.5 dm tall or less) and more or less acaulescent *H. capitatum* var. *alpinum*
- Cymes capitate even in fruit; pedicels 2.5–5 mm long, not reflexed in fruit; plants usually taller (1–5 dm high) and caulescent *H. capitatum* var. *capitatum*

Var. *alpinum* Wats. [*H. alpinum* Greene ex Brand]. Sagebrush, pinyon-juniper, aspen, spruce-fir, and grassy meadow communities at 2010 to 2570 m in Deep Creek, Goose Creek, and Raft River mts. in Box Elder, Juab, and Tooele counties; Oregon and Idaho, south to California and Nevada; 8 (i).

Var. *capitatum* [*H. densiflorum* Nutt.; *H. pumilum* Geyer ex Hook.; *H. capitatum* var. *pumilum* (Geyer) Hook.; *H. capitatum* var. *pumilum* subvar. *densum* Brand; *H. capitatum* var. *alpinum* Wats. subvar. *laxum* Brand]. Mountain brush, aspen, sagebrush, and mixed conifer communities at 1340 to 2745 m in Beaver, Box Elder, Carbon, Davis, Duchesne, Emery, Salt Lake, Sanpete, Sevier, Summit, Utah, Wasatch, and Weber counties; Washington to Idaho, south to Colorado; 62 (iii).

***Hydrophyllum fendleri* (Gray) Heller** [*H. occidentale* var. *fendleri* Gray; *H. albifrons* var. *fendleri* (Gray) Brand]. Perennial, 2–9 dm tall from short rhizomes, these bearing fleshy fibrous roots; stems erect, retrorse-hispid; leaves pinnately compound, ovate or oval in outline, strigose, the blade 6–30 cm long, with 9–13 primary divisions, these ovate to lanceolate, acuminate, coarsely serrate or incised; inflorescence of 1 to several lax cymes; peduncles 3–17 cm long, often branched, mostly longer than the subtending leaves (at least in fruit); pedicels 2–7 mm long; sepals linear to lanceolate (in fruit), 4–6 mm long, 1–2 mm broad, ciliate and strigose, often hispid dorsally, corolla 6–10 mm long, white to violet; stamens exserted 4–6 mm; style exserted 5–7 mm; seeds 1–3, light brown, 2.5–3 mm in diameter; $2n = 18$. Moist ground in mountain brush and ponderosa pine communities at ca 2684 m in the Abajo Mts., San Juan County; British Columbia to Idaho, south to Oregon and Colorado; 1 (i).

***Hydrophyllum occidentale* (Wats.) Gray** Western Waterleaf. [*H. macrophyllum* var. *occidentale* Wats.; *H. occidentale* var. *watsonii* Gray, type from the Wasatch Mts.; *H. watsonii* (Gray) Rydb.]. Perennial, 1–6 dm tall, rhizome bearing fleshy fibrous roots; stems erect, short pubescent to more or less retrorse-hispid; leaves pinnately compound, oblong in outline, strigose, the blade 5–28 cm long, with 7–15 primary divisions, these broadly oblong to ovate, obtuse, incised or lobed; inflorescence with one to several globose cymes, peduncles 5–27 cm long, usually exceeding the subtending leaves; pedicels 2–5 mm long; sepals narrowly lanceolate, 3.5–5 mm long, 1–2 mm wide, strigulose dorsally to hispid ciliate on the margins; corolla 7–10 mm long, white to violet; stamens exserted 4–6 mm; style exserted 5–8 mm; seeds 1–2, brown, 2.5–3.1 mm in diameter; $2n = 18$. Mountain brush, sagebrush, pinyon-juniper, aspen, and spruce-fir

communities at 1525 to 3050 m in Beaver, Iron, Juab, Millard, Salt Lake, Sanpete, Sevier, Tooele, Utah, and Washington counties; Oregon south to California, east to Arizona; 49 (v).

Nama L.

Low, branching annuals; leaves alternate, entire, hirsutulous to hispid, retrorse to erect; inflorescence of terminal nonscorpoid cymes; sepals subequal, linear to lanceolate; corolla purple, or lavender, deciduous, tubular to funnelliform; stamens included, borne unequally on the corolla tube; style included, divided to the base or 2-lobed at the apex; mature capsule falsely bilocular by intrusion of the placentae; ovules numerous; seeds numerous, brown, mostly reticulate.

1. Style shallowly 2-lobed at the apex; corolla tubular, 3–5 mm long *N. densum*
- Style divided to the base; corolla mostly 8–15 mm long or, if shorter, the shorter stem hairs retrorse (corolla 4–7 mm long in *N. retrorsum*) 2
- 2(1). Leaves mostly in clusters at the ends of the branches and in a basal rosette; herbage hirsutulous or pilose *N. demissum*
- Leaves well distributed along the stem; herbage hirsute or hispid 3
- 3(2). Stems erect, fastigiate; shorter stem hairs retrorse; corolla 4–7 mm long *N. retrorsum*
- Stems more or less spreading; stem hairs ascending; corolla 7–15 mm long *N. hispidum*

Nama demissum Gray [*Conanthus demissus* (Gray) Heller; *N. demissum* var. *deserti* Brand]. Diffusely branched annuals, 2–14 cm tall, hirsute; leaves entire, 1–3.2 cm long, 1–5 mm wide; flowers solitary to several, subsessile; sepals linear to lanceolate, 5–8 mm long; corolla broadly funnelliform, 8–16 mm long, 6–11 mm wide; style divided to base, 3–5 mm long; seeds mostly 10–15, 0.5 mm long, dark brown, pitted and reticulate; $2n = 14$. Desert shrub communities in open gravelly or sandy sites, at 670 to 1560 m in Beaver, Millard, Tooele, and Washington counties; Arizona, Nevada, and Mexico; 21 (ii).

Nama densum Lemmon Compact Nama. [*Nama demissa* Wats.; *Conanthus parviflorus* Greenman]. Dichotomously branched annuals, the branches prostrate, or under harsh conditions simple and depauperate, spreading hirsute, 1–10 cm across; leaves oblanceolate, 0.4–3 cm long, 1–5 mm wide, entire; flowers sessile and solitary in the upper leaf axils; calyx-lobes linear, 3.8–7 mm long, 1–3 mm wide; corolla funnelliform, white to lavender, 3–7.2 mm long, the tube long, the lobes short; style 0.5–2 mm long, 2-lobed at the apex; capsule 2–3.5 mm long; seeds ca 15, 0.5–0.9 mm long, dark brown to blackish, pitted and reticulate; $2n = 14, 28$. Sandy soils or sometimes loose gravel in juniper, sagebrush, and desert shrub communities at 1430 to 1865 m in Box Elder, Duchesne, Grand, Juab, Kane, Millard, San Juan, Tooele, Uintah, and Washington counties; Idaho and Washington, south to California; 21 (iii). Our plants belong to var. *parviflorum* (Greenman) C. L. Hitchc. [*Conanthus parviflorus* Greenman].

Nama hispidum Gray [*Marilaunidium tenue* Small; *M. hispidum* (Gray) Kuntze; *Conanthus hispidus* (Gray) Heller]. Leafy, branched annuals, 1–3 dm tall; stems

more or less spreading, hispid; leaves 1–7 cm long, 2–6 mm wide, entire, revolute, finely glandular and with somewhat appressed, nonglandular hairs, oblanceolate to spatulate; flowers solitary to several in terminal cymes; sepals linear to lanceolate, 5–8 mm long; corolla purple, broadly funnelliform, 8–14 mm long, 7–8 mm wide; style 2–5 mm long, cleft to the base; seeds numerous, 0.5 mm long, yellowish brown, reticulate; $2n = 14$. Sandy shore and drainage bottoms adjacent to Lake Powell, at ca 1220 m, in Kane County; California to Texas; 4 (iv).

Nama retrorsum J. T. Howell Leafy branched annuals, 1–3 dm tall; stems erect, fastigiate, hirsute, the shorter stem hairs retrorse; leaves 1.5–5 cm long, 2–5 mm wide, entire; flowers sessile and solitary in the upper leaf axils; sepals linear, 5 mm long, hirsute; corolla purple, funnelliform, 4–7 mm long; seeds 0.6–0.8 mm long. Mixed desert shrub, mostly in sand, at 1460 to 2135 m in Garfield, Grand, Kane, and San Juan counties; northeastern Arizona; 14 (v).

Nemophila Nutt. ex Barton

Delicate annuals, 0.5–3 dm tall; stems sharply angled (obscurely so in *N. parviflora*), glabrous, except for small, reflexed prickles; leaves alternate or opposite, 0.7–2.9 cm long, 1.5–4 cm wide, pinnately divided, sparsely hispid; flowers solitary in the upper leaf axils, pedicellate; calyx divided nearly to the base, the lobes linear to lanceolate, 3 mm long, 1–2 mm wide, with reflexed auricles; corolla narrowly campanulate, purplish or white, 1.5–2.9 mm wide; stamens included, equally inserted on the corolla; style 0.5–1 mm long; seeds usually 1–4, globose, 2–3 mm long, brick-red, pitted.

1. Leaves all alternate; seeds usually 1; calyx 3 mm long; style cleft only at the apex; capsule shorter than the strongly accrescent calyx; plants widespread *N. breviflora*
- Leaves all opposite; seeds mostly 2–4; calyx 1–3 mm long; style cleft ca 1/2 its length; capsule exceeding the calyx; presently known from Cache and Weber counties *N. parviflora*

Nemophila breviflora Gray [*Viticella breviflora* (Gray) Macbr.; *N. petrophila* L. O. Williams]. Stems weak, 0.5–2 dm long, sharply angled; leaves alternate, pinnately divided, 0.7–3 cm long, 1.5–3.9 cm broad, sparsely hispid; sepals broadly campanulate, linear to lanceolate, 3 mm long, 1–2 mm broad; corolla narrowly campanulate, white or purplish, 1.5–2.9 mm broad, shorter than the calyx; style 0.5–1 mm long, cleft at the apex; mature capsule exceeded by the accrescent calyx; seed usually 1, globose, 2–4 mm in diameter, deeply pitted in rows; cucullus reduced, persistent; $2n = 18$. Mountain brush, sagebrush, and aspen communities at 1460 to 2715 m in Box Elder, Cache, Carbon, Daggett, Juab, Salt Lake, Summit (type from Parleys Park), Utah, Wasatch, and Weber counties; California east to Colorado, north to Montana and southern British Columbia; 22 (i). This inconspicuous plant is typically in the understory of aspen and maples in moist, rich soil.

Nemophila parviflora Dougl. ex Benth. [*N. inconspicua* Henderson; *N. explicata* A. Nels.; *N. parviflora* var. *typica* Brand subvar. *inconspicua* Brand; *Viticella parviflora* var. *austinac* (Eastw.) Macbr.]. Stems obscurely angled, 0.5–3 dm long; leaves all opposite, 1–1.5 cm long, 2–2.4 mm broad, sparsely hispid; sepals lanceolate, the auricles 0.2–0.4 mm long; corolla campanulate,

white or bluish, 1.5–3 mm broad, barely exceeding the calyx; style 0.6–0.8 mm long, cleft ca 1/2 its length; mature capsule exceeding the calyx; seeds mostly 2–4, ovoid, 2–2.5 mm long, shallowly pitted; cucullus deciduous; 2n = 18. Mountain brush community at ca 1525 m in Cache and Weber counties; British Columbia and Idaho, south to California; 1 (0). Our plants are referable to *var. austinae* (Eastw.) Brand [*N. austinae* Eastw.].

Phacelia A. L. Juss.

Herbaceous, annual, biennial or perennials, mostly pubescent and with glandular hairs; leaves mostly alternate, the lower sometimes opposite, entire to pinnately compound; flowers few to numerous in variously disposed scorpioid cymes, or apparently in lax racemes; calyx divided nearly to the base; corolla tubular to broadly campanulate, blue, purplish, violet or white, mostly deciduous, a few species with a tardily deciduous corolla; stamens included or exerted, equally inserted at the base of the corolla tube, with a pair of scales attached to the base of the corolla and filaments; style included or exerted, bifid, mostly pubescent; capsule unilocular (or nearly bilocular by intrusion of the placentae); seeds 1 to numerous, variously roughened, boat-shaped, terete, angled or flattened.

- 1. Stamens exerted from the corolla for more than 2 mm . . . 2
- Stamens included in the corolla or exerted up to 2 mm . . . 3
- 2(1). Seeds excavated on the ventral surface, on 1 or both sides of a prominent ridge Key 1
- Seeds not excavated ventrally Key 2
- 3(1). Ovules 4; seeds 2–4 in each capsule Key 3
- Ovules mostly 10 or more; seeds mostly 6 or more (rarely 4 in *P. demissa*) Key 4

Key 1.

Stamens exerted from the corolla;
Seeds excavated on the ventral surface.

- 1. Corolla small, 4 mm long or less, white, blue, or lavender, the lobes erose; plants of southern Utah *P. alba*
- Corolla more than 4 mm long, white or variously colored 2
- 2(1). Corolla tubular, pale 3
- Corolla campanulate, purple, lavender, or white (appearing tubular in some pressed specimens) 5
- 3(2). Seeds 3.5–4 mm long; cauline leaves sessile or nearly so, auriculate; plants of Emery, Wayne, and Washington counties *P. rafaensis*
- Seeds shorter than 3 mm, black 4
- 4(3). Inflorescence thyrsoid; stems solitary or branched from near the base; plants of Washington and Iron counties *P. palmeri*
- Inflorescence open; stems branched throughout, especially at base; plants of Kane and San Juan counties *P. constancei*
- 5(2). Leaves pinnately compound to doubly so, finely dissected 6
- Leaves simple or, if compound, not finely so, the divisions over 5 mm wide 7
- 6(5). Mature seeds 2.4 mm long, excavated only along 1 side of the ridge; leaves lacking stipitate glands; plants of Utah County *P. argillacea*

- Mature seeds over 2.4 mm long, excavated on both sides of the ridge; leaves strigose and stipitate-glandular; plants of Uintah County *P. glandulosa*
- 7(5). Corolla distinctly bicolored, the tube yellow or white and the lobes blue 8
- Corolla not distinctly bicolored, blue, purple, or white 10
- 8(7). Cauline leaves sessile, auriculate; plants robust, 0.8–5.8 dm tall, endemic in Sanpete and Sevier counties *P. utahensis*
- Cauline leaves distinctly petiolate; plants not especially robust, less than 2.7 dm tall 9
- 9(8). Stems branched at the base; leaves simple, strigose and glandular; corolla tube white; seeds corrugated on the margins and on the ridge, the dorsal surface smooth; plants of San Juan and Grand counties *P. howelliana*
- Stems simple or branched above; leaves essentially glabrous; corolla tube yellowish; seeds mostly lacking corrugations, the dorsal surface deeply pitted, plants to be expected in southeastern Utah *P. splendens* Eastw.
- 10(7). Corolla lavender; seeds lacking ventral corrugations; plants of Kane and San Juan counties *P. integrifolia*
- Corolla blue or purple; seeds corrugated ventrally 11
- 11(10). Mature seeds corrugated only on the ridge; pubescence of the stems densely hispid, glandular above; plants of Washington County *P. ambigua*
- Mature seeds with the margins and ridge corrugated; pubescence of stems mostly glandular, sometimes finely so 12
- 12(11). Mature seeds light to dark brown; anthers yellow; corolla deep blue, broadly campanulate; stems mostly branched throughout; plants broadly distributed *P. crenulata*
- Mature seeds reddish; anthers yellow or blue; corolla pale blue, the lobes not widely spreading; stems solitary, or branching at the base; plants of eastern Kane and Garfield counties *P. mammillarensis*

Key 2.

Stamens exerted from the corolla;
seeds not excavated ventrally.

- 1. Leaves pinnately compound, the segments variously toothed 2
- Leaves entire to shallowly lobed or pinnate, the segments entire 3
- 2(1). Plants perennial; basal leaves mainly entire (sometimes with 1 or 2 lateral lobes); corolla white to lavender *P. hastata*
- Plants biennial or short-lived perennial; basal leaves pinnately dissected, with 1–4 pairs of lateral lobes; corolla white to cream *P. heterophylla*
- 3(1). Plants annual, of Washington County; stems growing up through shrubs; seeds typically 4, corolla broadly campanulate deciduous *P. vallis-mortae*
- Plants biennial or perennial, of broad distribution; stems stout; seeds 8–18; corolla pelviform, marcescent 4
- 4(3). Corolla hairy within; stem bases with marcescent leaves; inflorescence virgate *P. sericea*
- Corolla glabrous within; stem bases not with marcescent leaves; inflorescence compact, shortly if at all virgate *P. franklinii*

Key 3.

Stamens included in the corolla; ovules 4.

1. Leaves pinnately compound; plants long bristly hispid, especially in the inflorescence 2
- Leaves simple to crenate or lobed, seldom compound; plants with short, spreading hairs or more often with viscid, stipitate-glandular hairs and often scented 3
- 2(1). Corolla broadly campanulate, 6–12 mm long, 8–10 mm wide; pedicels short and stout, 1–1.5 mm long; calyx 5–8 mm long, about twice as long as the capsule and subequal to the corolla; plants growing up through shrubs *P. vallis-mortae*
- Corolla tubular-campanulate, 4–7 mm long; pedicels more slender and averaging 2 mm long; calyx 7–10 mm long, 3–4 times longer than the capsule and longer than the corolla *P. cryptantha*
- 3(1). Leaves simple or with 1 or 2 small lobes near the base; seeds not deeply excavated, less than 2 mm long; plants non-odorous, with spreading hairs and some glands above *P. austromontana*
- Leaves regularly lobed or crenate; seeds deeply excavated on both sides of a prominent ventral ridge, 2.6–3.4 mm long; plants scented, stipitate-glandular throughout and with some spreading hairs 4
- 4(3). Corolla 3–4 mm long, campanulate, the lobes mauve to blue (drying white in fruit); sepals narrowly oblanceolate, 2.5–4 mm long, ca 1 mm wide; plants brittle, breaking easily when picked; capsule 2.5–3.5 mm long; seeds 2–2.5 mm long *P. coerulea*
- Corolla 5–6 mm long, rotate to campanulate, pale violet or white; sepals oblanceolate to spatulate, 3–6 mm long, 1.5–3.3 mm wide; plants not brittle; capsule 3.3–3.7 mm long; seeds 2.7–3.4 mm long *P. anelsonii*

Key 4.

Stamens included in the corolla; ovules 10 or more.

1. Flowers 4–merous (less commonly 5–merous); corolla white, ca 1.5 mm long, persistent and surrounding the lower 1/2 of the capsule, this 1.5–3 mm long; plants of salt flats *P. tetramera*
- Flowers 5–merous and not with the above combination of characters 2
- 2(1). Flowers all yellow or tinged with lavender in age, marcescent; plants of saline areas *P. lutea*
- Flowers blue, lavender, violet, purple, or white (the tube yellow in some species), mostly deciduous 3
- 3(2). Leaves orbicular to reniform; pedicels in fruit surpassing the calyx; corollas white; plants of limestone cliffs in Washington County *P. laxiflora*
- Leaves not orbicular to reniform; pedicels various; corollas typically not white; plants of various substrates and sometimes of Washington County 4
- 4(3). Seeds transversely corrugated, numerous (10 or more) 5
- Seeds terete or angled and mostly foveolate or reticulate, but not excavated ventrally 7
- 5(4). Corolla 7–17 mm long, more than twice the calyx length; plants of Washington County *P. fremontii*
- Corolla 2–4.5 mm long, shorter than or equaling the calyx 6
- 6(5). Stems with black, capitate glands, at least above; calyx lobes spatulate; plants disjunct in widely scattered localities, rare *P. affinis*

- Stems lacking capitate glands; calyx lobes linear to oblanceolate; plants widespread *P. icesiana*
- 7(4). Corolla campanulate to rotate or pelviform 8
- Corolla tubular or tubular-campanulate 9
- 8(7). Style branches 2–3 mm long; stems 0.3–1.5 dm tall; corolla 4–6 mm long, campanulate; leaves mostly entire *P. curtipetes*
- Style branches 4.5–8 mm long; stems 1–5 dm tall; corolla 6–9 mm long, open-campanulate; leaves entire or with 1–4 lobes *P. linearis*
- 9(7). Ovules 8–16 per ovary 10
- Ovules 20 or more per ovary 11
- 10(9). Leaves oblong to elliptic; style and branches 1.5 mm long; filaments glabrous; flowers in dense sessile clusters; plants of Kane and Washington counties *P. cephalotes*
- Leaves broadly ovate to orbicular; style including branches 1.5–4 mm long; filaments sparsely hairy; flowers in racemes, these 1–4 m long; plants more broadly distributed *P. demissa*
- 11(9). Corolla 8–14 mm long; style including branches 5–5 mm long; plants of Garfield, Kane, and Washington counties *P. pulchella*
- Corolla 8 mm long or less; style, including branches, 3 mm long or less; plants of various distribution 12
- 12(11). Stem pubescence finely glandular-puberulent 13
- Stem pubescence glandular-villous or glandular-hirsutulous, or if glandular-puberulent, the leaves dentate to crenate 14
- 13(12). Staminal filaments glabrous; style, including branches, 2.5–3 mm long; corolla 3–4.5 mm long; plants of San Juan and Wayne counties *P. indecora*
- Staminal filaments sparsely hairy below; style, including branches, 1.5–2 mm long; corolla 5–6 mm long; plants to be expected in western Utah *P. parishii* Gray
- 14(12). Leaves coarsely toothed; seeds 60–100, 0.5 mm long *P. rotundifolia*
- Leaves entire to repand, crenate, or dentate; seeds 60 or fewer (if 60 then less than 0.5 mm long) 15
- 15(14). Leaves dentate to crenate; style, including branches, 2–3 mm long; capsule 4–6 mm long; seeds 40–50, 1–1.3 mm long; plants to be expected in Washington County *P. peirsoniana*
- Leaves entire; style, including branches, 1.5 mm long; capsule 2.5–4 mm long; seeds 22–37 or 60 per capsule, 1 mm long or shorter 16
- 16(15). Corolla tubular, marcescent; seeds ca 60, 0.3–0.4 mm long, reticulate; plants to be expected in Washington County *P. saxicola* Gray
- Corolla tubular-campanulate, deciduous; seeds 22–36 per capsule, 0.6–1 mm long, pitted; plants of western Utah and Uintah County *P. incana*

Phacelia affinis Gray Annual, 0.5–3 dm tall; stems densely pubescent and stipitate-glandular, at least above, the glands mostly black; leaves mainly in the lower half, pinnately divided, oblong to lanceolate, 1–5 cm long, petiolate, the petioles to 4 cm long; inflorescence of elongate, scorpioid cymes, the flowers subsessile, or the pedicel to 2 mm long on the lowest flowers; sepals oblanceolate to spatulate, 3–4 mm long in flower, 6–10 mm long in fruit; corolla pale lavender or white with a pale yellowish tube, narrowly campanulate, 3–5 mm long; stamens included, unequal; filaments glabrous; style in-

cluded, 1–2 mm long; capsule 4–5 mm long, shorter than the tube; ovules 13–40; seeds ovate to oblong, brown, reticulate and transversely corrugated, 0.7–1.2 mm long; $2n = 22, 24$. Blackbrush, creosote bush, mountain brush, and pinyon-juniper communities at 915 to 1800 m in Kane, Millard, and Washington counties; California to Arizona, south to Mexico; 8 (v).

Phacelia alba Rydb. [*P. neomexicana* var. *alba* (Rydb.) Brand; *P. neomexicana* var. *coulteri* (Greenman) Brand subvar. *foliosissima* Brand; *P. glandulosa* ssp. *euglandulosa* Brand var. *elatior* Brand, in part]. Annual, 0.5–7 dm tall; stems simple to branched, erect or ascending, leafy, hirsute to setose and stipitate-glandular; leaves pinnatifid to subbipinnatifid, 2–10 cm long, 2–8 cm broad, short-hairy and somewhat glandular, the lowermost long-petiolate, the upper sessile or subsessile; inflorescence of dense, terminal, compound scorpioid cymes, the lower ones often simple, densely glandular and puberulent to hirsute, the cymes 1–2 cm long in flower, to 8 cm long in fruit, the flowers subsessile, or the pedicels to 1 mm long; sepals linear to oblanceolate, 3.5–4 mm long; corolla white to lavender or pale blue, tubular-campanulate, 3–4 mm long and wide, the lobes pubescent, erose-denticulate; stamens definitely exerted 2–4 mm; style exerted, divided to below the middle; capsule 3–3.3 mm long, ovoid to subglobose, puberulent and glandular; ovules 4; seeds 4, or 1 or 2, light to dark brown, 2.4–3 mm long, uniformly alveolate and cymbiform, the ventral surface shallowly excavated on both sides of the ridge, lacking corrugations, the margins thick and entire. Sagebrush, pinyon-juniper, mountain brush, ponderosa pine, aspen, and spruce-fir communities at 1370 to 2930 m in Garfield, Kane, Iron, Piute, Sevier, Washington, and Wayne counties; Wyoming, south to Arizona and New Mexico; 29 (viii).

Phacelia ambigua Jones [*P. crenulata* var. *ambigua* (Jones) Macbr.]. Annual, 1.5–4 dm tall; stems erect, usually branched from the base, spreading-hispid, puberulent, and somewhat stipitate-glandular; leaves irregularly lobed to subpinnate, 0.5–13 cm long, 0.5–4.5 cm wide, long-petiolate to nearly sessile above, strigose to hispid and somewhat glandular; inflorescence of terminal, scorpioid cymes, these elongating to 12 cm in fruit; sepals elliptic to oblanceolate 2.7–5.1 mm long, 1–1.3 mm wide, puberulent, hispid, and stipitate-glandular; corolla purple or dull lavender, 4–10 mm long and broad, pubescent; stamens and style exerted 4–10 mm; style bifid, pubescent below; capsule 3–3.5 mm long, puberulent and glandular; ovules 4; seeds 4, ovate, reddish to brown, 2.5–3.3 mm long, 1.3–1.8 mm wide, alveolate, cymbiform, the ventral surface excavated on both sides of the ridge, this corrugated on one side. Joshua tree, creosote bush, and other warm desert shrub communities at 820 to 1525 m in Washington County; Nevada, Arizona, and California; 33 (ii).

Phacelia anelsonii Macbr. Erect, scented annual, 1.5–5 dm tall, usually simple, with brownish, stipitate-glandular hairs and some nonglandular ones; leafy throughout; leaves short-petiolate below, becoming sessile above, 1.5–8 cm long, pinnately lobed; inflorescence of simple or compound scorpioid cymes, usually terminal, but sometimes on leafy lateral branches, the individual cymes 1–5 cm long, setose and stipitate-glandular; sepals oblanceolate to spatulate, 3–6 mm long, surpassing the capsule; corolla rotate to campanulate, lavender to white,

6 mm long and wide; stamens included, the anthers yellow; style cleft to below the middle, included, 3.5–4.8 mm long, shorter than the stamens, glandular and puberulent near the base; capsule 3.5–3.7 mm long, glandular-spotted throughout and pilose on the upper half; ovules 4; seeds oblong, pale brown, the margins entire, the ventral surface strongly alveolate, divided by a prominent ridge, this corrugated along one side, the dorsal surface alveolate, 2.7–3.4 mm long, 1–1.3 mm wide. Creosote bush and Joshua tree communities at 760 to 1220 m in Washington County; Nevada and California; 9 (ii).

Phacelia argillacea Atwood Clay *Phacelia*. Winter annual, 1–3.6 dm tall, simple to much branched; stems finely pubescent, leafy; leaves deeply pinnatifid, 0.8–5 cm long, 5–25 mm wide, strigose, petiolate; inflorescence of compound, scorpioid cymes, stipitate-glandular and with nonglandular hairs; sepals oblanceolate to spatulate, 2–3.8 mm long, 1 mm wide; corolla blue to violet, campanulate, 4–5.5 mm long and wide, the lobes pubescent; stamens and style exerted 6–7 mm; style bifid 2/3 its length; capsule subglobose, 3.2–3.3 mm long, glandular; mature seeds 4, ovate to elliptic, 2.4 mm long, 1.1 mm wide, pitted, the ridge curved and more or less excavated along one side, brown. Steep hillsides in a sparse juniper-pinyon and mountain brush community, on Green River Shale, at ca 2015 m in Spanish Fork Canyon (type locality), Utah County; endemic; 7 (i).

Phacelia austromontana J. T. Howell Annual, 0.5–2 dm tall, widely branched from the base, hirsute and glandular; leaves entire or few-toothed, 1–3 cm long, linear, lanceolate, or oblong; inflorescence of few- to many-flowered cymes; sepals unequal, linear to oblanceolate, hirsute and glandular; corolla lavender or pale blue, open campanulate, 3–5 mm long; stamens subequal to the corolla; style included, pubescent at the base, 3–4 mm long; capsule 3–3.4 mm long, ovate, puberulent, beaked; seeds 2–4, coarsely pitted, pale brown, 1.4–1.8 mm long; $2n = 18$. Ponderosa pine and mountain brush communities at ca 2135 m in Washington County (Oak Grove, Cottam 8831 UT); Nevada and California; 1 (0).

Phacelia cephalotes Gray Annual, 0.5–1.3 dm tall; stems long, almost prostrate, glandular-villous; leaves entire, oblong, ovate to elliptic, petiolate, hirsutulous and glandular, the lower petioles longer than the blade, 0.5–1.8 cm long; inflorescence of compact, sessile or subsessile scorpioid cymes, these terminal on the branches of the stems; sepals oblanceolate, 3–4 mm long in flower, to 8 mm long in fruit; corolla lavender, inconspicuous, 3–5 mm long, the tube yellowish; stamens and style included; capsule ovate, 3–4 mm long, shorter than the calyx; seeds 8–12, oblong, angular, the angles denticulate, pitted, 1–1.5 mm long; $n = 11$. Salt desert shrub and juniper communities, mainly on the Chinle Formation, at 1065 to 1525 m in Kane, San Juan, and Washington (type locality) counties; Arizona; a Plateau endemic; 9 (v).

Phacelia coerulea Greene Annual, 0.5–6 dm tall; stems erect, simple or branched throughout, sparsely to densely stipitate-glandular and mostly with some stiff nonglandular hairs as well; leaves deeply sinuate to pinnatifid, oblong to ovate, strigose and glandular, the margins crenate, petiolate; inflorescence terminal on the main stem and on secondary branches; sepals oblanceolate to spatulate, 2.5–4 mm long; corolla pale mauve to

blue (drying white), 3–4 mm long, campanulate, the tube yellowish; stamens mostly included, though sometimes exerted 1–2 mm; anthers yellow, the filaments bluish; style subequal to the stamens, deeply cleft; capsule globose, 2.5–3.5 mm long; ovules 4; mature seeds 4, dark brown, 2–2.5 mm long, the ventral surface pitted and divided by a prominent ridge, this corrugated along one side, the margins usually corrugated and the dorsal surface pitted, with 0.3–0.4 mm of the margin slightly elevated and smoother than the pitted center. Creosote bush and other warm desert shrub communities at 760 to 915 m in Washington County; Nevada and California to Texas and south to Mexico; 1 (0).

Phacelia constancei Atwood Erect biennial herb, 1.5–4.3 dm tall; stems coarse, 1 to several, reddish, hirsutulous to hirsute and finely glandular; leaves basal and cauline, linear to lanceolate, revolute, the lower short-petiolate or sessile and larger than the upper, the upper sessile; inflorescence of terminal cymes; sepals elliptic to oblanceolate, 3–4 mm long; corolla white to pale lavender, 5–6 mm long; stamens exerted 3–4 mm; seeds 4, black, 2.5–2.8 mm long, 1–1.2 mm wide, elliptic, the margins corrugated, the ventral surface finely pitted, excavated and divided by a prominent ridge, this corrugated along one side, the dorsal surface finely pitted; $n = 11$. Salt desert shrub and juniper communities at 1370 to 3050 m in Garfield, Kane, and San Juan Counties; Arizona; 21 (xv).

Phacelia crenulata Torr. Annual, 0.3–8.3 dm tall; stems simple or more commonly branched, stipitate-glandular with short or long trichomes, and usually with some nonglandular hairs intermixed; leaves oblong-elliptic to suborbicular, subtentire to deeply lobed, the lower lobes sometimes almost distinct, the lower ones the largest, petiolate, the upper mostly reduced and finally sessile; inflorescence scorpioid, terminal on stems and branches; sepals elliptic to oblanceolate, 3–10 mm long; corolla blue violet to purple, campanulate, 4–7 mm long; stamens exerted 3–11 mm; style exerted, bifid 1/2 its length, glandular-pubescent below; capsule globose to subglobose, 2.6–4.1 mm long, 2.8–3.2 mm wide, puberulent to glandular; seeds 4, elliptic to oblong, brown, 2.8–4 mm long, 1.3–3.2 mm wide, pitted, the ventral surface corrugated on the margins and one side of the ridge; $2n = 22$. Three varieties are recognized.

1. Leaves linear; plants of eastern Kane County
 *P. crenulata* var. *angustifolia*
- Leaves variously shaped, but seldom if ever all linear . . . 2
- 2(1). Stems greenish yellow, with uniformly and finely glandular and more or less appressed non glandular hairs; plants widespread in Utah . . . *P. crenulata* var. *corrugata*
- Stems usually reddish, pubescent with long to short stipitate-glandular hairs; plants of south-central Utah
 *P. crenulata* var. *crenulata*

Var. *angustifolia* Atwood Salt desert shrub community at 1220 to 1830 m in eastern Kane County; endemic; 13 (vii).

Var. *corrugata* (A. Nels.) Brand [*P. corrugata* A. Nels.]. Salt and cool desert shrub, pinyon-juniper, and mountain brush communities at 1065 to 2595 m in Beaver, Carbon, Duchesne, Emery, Garfield, Grand, Juab, Kane, Millard, San Juan, Tooele, Uintah, and Wayne counties; Nevada, Colorado, Arizona, and New

Mexico; 167 (xli). This variety intergrades with var. *crenulata*, but is generally distinctive. It is replaced in Washington County by *P. ambigua* Jones.

Var. *crenulata* [*P. orbicularis* Rydb., type from the Henry Mts.]. Salt and cool desert shrub and pinyon-juniper communities in Beaver, Emery, Garfield, Piute, and Sevier counties; California, Arizona, and Nevada; 28 (viii).

Phacelia cryptantha Greene Annual, 1–4 dm tall; stems simple or branched, glandular-puberulent and hispid, at least above; leaves pinnately compound, reduced above, the leaflets toothed; inflorescence of terminal cymes, to 5 cm in fruit; sepals 4–7 mm long in flower, to 10 mm long in fruit, linear-oblongeolate, with spreading, hispid hairs and densely puberulent to glandular; corolla lavender, tubular-campanulate, 4–7 mm long; pedicels slender and evident, especially in fruit, 2–4 mm long, densely retrorsely pubescent; stamens included, 4–7 mm long; style 3–4 mm long, pubescent below; capsule globose, 2–2.5 mm long, densely pubescent with short and long hairs; $2n = 22$. Joshua tree, creosote bush, other warm desert shrub, chaparral, and pinyon-juniper communities at 760 to 1220 m in Washington County; Arizona, Nevada, and California; 4 (i).

Phacelia curvipes Torr. ex Wats. Annual, diffusely branched from the base, the branches spreading to ascending, hirsute, hirsutulous, and sometimes shortly glandular above, 3–15 cm tall; leaves mostly basal, oblong to oblong-ovate, mostly entire, occasionally with 1–3 lobes, the lower the larger and definitely petiolate, the upper smaller and with short petioles; cymes laxly few-to many-flowered, pedicellate, the pedicels short in flower, to 1.5 cm long in fruit, spreading or deflexed; sepals linear to linear-oblongeolate, 3–10 mm long, hirsute, somewhat unequal; corolla lavender to pale bluish, the throat yellowish, open campanulate, 3.5–6 mm long, deciduous; stamens and style included, 2–5 mm long, sparingly hairy; capsules 4–5 mm long, ovoid, flattened; seeds 6–17, oblong, pitted, 0.8–1.2 mm long. Warm desert shrub, pinyon-juniper, and mountain brush communities at 1350 to 2170 m in Washington County; Nevada, California, and Arizona; 8 (v).

Phacelia demissa Gray Brittle *Phacelia*. Annual, branched from the base (except in depauperate plants), mostly broader than high, 0.3–2 dm tall; stems brittle and succulent when fresh, densely glandular villous, usually reddish; leaves mostly cauline, broadly ovate to orbicular, 1–2.6 cm long, entire to undulate, the lower ones long-petiolate, the upper short-petiolate; inflorescence of terminal or axillary, sessile scorpioid cymes; sepals oblong to oblanceolate, 5–7 mm long in fruit; corolla lavender to purple with a yellow tube, easily deciduous, 3.5–9 mm long, tubular-campanulate when fully open, sessile to short-pedicellate; stamens included; style included, hairy, shortly bifid; capsule oblong, 2.5–4 mm long, finely pubescent; ovules 4–20; seeds ovate to elliptic, 1.1–1.5 mm long, brown to reddish, pitted-reticulate; $2n = 24$. Two varieties are known.

1. Plants densely glandular-villous to glandular-puberulent throughout, averaging 7–10 (20) cm tall, diffusely branched, corolla tube pale yellow; sepals equaling or somewhat surpassing the capsule, but not twice as long; seeds mostly 10–16, 1.1–1.3 mm long
 *P. demissa* var. *demissa*

- Plant finely but not densely glandular-puberulent throughout, the leaves mostly glabrous except on the margins, plants mostly less than 5 (10) cm tall and not diffusely branched; corolla tube bright yellow, often more showy than the otherwise colored lobes; sepals twice as long as the capsule; seeds 4–12, 1.2–1.5 mm long..... *P. demissa* var. *minor*

Var. *demissa* [*P. demissa* var. *heterotricha* J. T. Howell, type from Piute County; *P. nudicaulis* Eastw., type from Moab]. Salt desert shrub, mainly on Mancos Shale, Tropic Shale, and igneous gravels at 1220 to 2200 m in Carbon, Emery, Grand, Kane, Piute, Sevier, and Wayne counties; endemic; 53 (xviii).

Var. *minor* Atwood Salt desert shrub community on Morrison, Duchesne River, and Mancos Shale formations at 1430 to 1895 m in Daggett, Duchesne, and Uintah counties; endemic; 19 (iv).

***Phacelia franklinii* (R. Br.) Gray** [*Eutoca franklinii* R. Br.]. Annual or biennial, 1.9–4.4 dm tall, hirsute-puberulent to spreading-hirsute and viscid; stems solitary, or with several subsidiary ones; leaves both basal and cauline, pinnatifid or subpinnatifid, 1.5–7 cm long, petiolate, especially the lower; inflorescence terminal on the stems and branches, scattered along the plant, but concentrated upward; corolla purplish, broadly campanulate, 6–9 mm long and somewhat wider, pubescent externally; stamens exerted ca 2 mm; style exerted, cleft to just above the middle; ovules 26–46; seeds ca 17, 1–1.3 mm long, dark brown to blackish, pitted-reticulate; $2n = 22$. Sagebrush, aspen, and spruce-fir communities at 2315 to 2715 m in Wasatch counties; Alaska and Yukon, south to Idaho and Wyoming; 10 (ii).

***Phacelia fremontii* Torr. in Ives** Annual, 0.4–2.6 dm tall; stems 1 to several from the base, nearly erect to ascending, puberulent to hirsutulous, retrorsely hairy below, somewhat glandular above; leaves pinnately divided, mostly basal, petiolate, the blade oblong to elliptic, 2–6 cm long; flowers in terminal cymes, the flowers pedicellate, the pedicel 1–4 mm long; sepals linear to oblanceolate, 4–6 mm long in flower and to 9 mm in fruit, longer than the capsule; corolla lobes lavender, violet to blue (rarely white), the tube bright yellow, tubular-funnelform to funnelform-campanulate, 6–16 mm long; stamens included, unequal, 4–6 mm long; style included, 3.5–5.5 mm long, pubescent to near the middle; ovules ca 12–40, oblong to obovate, ca 1 mm long, angular, brown, corrugated and alveolate-reticulate; $2n = 26$. Joshua tree, creosote bush, chaparral, and pinyon-juniper communities at 700 to 1375 m in Washington County; Arizona, Nevada, and California; 34 (vi).

***Phacelia glandulosa* Nutt.** [*Eutoca glandulosa* Hook.]. Biennial herbs, 0.6–3.6 dm tall; stems simple or branched, erect, stout, densely stipitate-glandular and spreading hirsute; leaves lanceolate to oblong in outline, pinnatifid, 1–7 (10) cm long, 0.5–3 cm wide, glandular and densely hirsute, the lower petiolate, the upper subsessile; inflorescence of congested terminal cymes, these stipitate-glandular and hirsute, the cymes to 10 cm in fruit; sepals elliptical to oblanceolate, 3–4 mm long, 1.2–1.4 mm wide; corolla blue to purplish, 5–7 mm long and somewhat broader, the lobes pubescent and more or less crenate; stamens and style exerted 5–9 mm, the style bifid 3/4 its length, the lower 1/4 pubescent; capsule subglobose, 3.5–4 mm long, 3.2–3.3 mm wide, glandular and hirsute; mature seeds elliptic to oblong, brown,

2.4–3.3 mm long, 1.1–1.4 mm wide, pitted, the ventral surface excavated on both sides of the ridge. Salt and mixed desert shrub and pinyon-juniper communities on the Green River Formation at 1525 to 1925 m in Grand (?) and Uintah counties; Idaho and Montana, south to Colorado; 4 (0).

***Phacelia hastata* Dougl. ex Lehm.** [*P. leucophylla* Torr. in Frem., *P. hastata* var. *leucophylla* (Torr.) Cronq.; *P. alpina* Rydb.; *P. heterophylla* var. *alpina* (Rydb.) A. Nels. in Coult. & Nels.]. Perennial, 2–4.5 dm tall; stems 1 to several, erect to ascending, strigose and hispid; leaves entire or sometimes with 1–2 lateral pairs of lobes near the base, lanceolate to ovate or oblanceolate, in a well-developed basal rosette; inflorescence of scorpioid cymes, simple or branched; sepals elliptic to linear-lanceolate, 3–6 mm long, strigose and hirsute to hispid; corolla campanulate, white to lavender or purple, 4–6 mm long; stamens exerted, filaments hairy at the middle; style exerted, pubescent at the base, bifid ca 1/3 the length; capsule ovoid, ca 3 mm long; seeds 1–2, oblong, 2–2.6 mm long, brown; $n = 11$. Sagebrush, mountain brush, ponderosa pine, Douglas fir, aspen, spruce-fir, and grass-forb communities at 1340 to 3510 m in all Utah counties; British Columbia and Alberta to California, Colorado, and Nebraska; 115 (ix). Segregation of our material as var. *alpina* (Rydb.) Cronq. can be applied only arbitrarily, and it seems best to treat all Utah specimens as portions of a polymorphic var. *hastata*.

***Phacelia heterophylla* Pursh** Biennial or perennial, 2–6 dm tall; stems simple, sometimes branched, erect, stout, strigose to hispid, not silvery but sometimes also glandular; leaves basal and cauline, the lower petiolate, entire or with 1–4 pairs of lobes; inflorescence somewhat virgate, typically branched, densely pilose to spreading-hispid; sepals lanceolate to oblong, 3–6 mm long, unequal; corolla dirty white to purplish, campanulate, 4–7 mm long; capsule ovoid, 2–3 mm long, pubescent; seeds 1 or 2, 2–2.5 mm long, brown; $n = 11$. Sagebrush, mountain brush, aspen, and spruce-fir communities at 1370 to 3295 m in all Utah counties except, Davis, Daggett, Morgan, Rich, and Wayne; Washington to Montana south to Mexico; 72 (vi).

***Phacelia howelliana* Atwood** Annual, 0.9–2.3 dm tall; stems mostly branched and leafy at the base, glandular and hirsute; leaves oblong to oval, 2–6 cm long, 1–2.5 cm wide, irregularly crenate to lobed, strigose and slightly glandular, the petiole to 5 cm long; inflorescence of branched scorpioid cymes; pedicels to 2 mm long; sepals linear to narrowly oblanceolate, 3.5–4.5 mm long, 1–1.2 mm wide, glandular and hirsute; corolla 5–6 mm long, 6–7 mm wide, rotate to funnelform, the lobes pale violet to blue, the tube white; stamens and style exerted 3–4 mm, the style shorter than the stamens, bifid 3/4 its length, the lower 1/4 pubescent; capsule oblong to subglobose, glandular and hirsutulous, especially near the apex; seeds 4, brown, 3.2–4 mm long, 1.4–1.8 mm wide, elliptic, the margins corrugated, involute to flattened, the ventral surface pitted, excavated and divided by a prominent ridge, this sometimes curved to one side and barely corrugated, the dorsal surface reddish brown, smooth and surrounded by a lighter margin. Salt and warm desert shrub and pinyon-juniper communities at 1125 to 1525 m in Grand, San Juan (type from Bluff), and Wayne counties; Arizona; a Plateau endemic; 10 (v).

***Phacelia incana* Brand** Annual, 5–15 cm tall; stems simple to more often branching at the base or throughout,

glandular-villous, the hairs spreading; leaves mostly cauline, elliptic to ovate, entire, 1–1.4 cm long, 3–8 (13) mm wide, petiolate; flowers in terminal, elongate cymes, laxly few-flowered; sepals linear to spatulate or oblanceolate, 3.5–6 mm long; corolla white to pale lavender, small, 3.5–4.5 mm long, tubular-campanulate; stamens included, the filaments hairy at base; style included, 1–1.7 mm long, shortly bifid, pubescent; capsule oblong, 3–4 mm long, shorter than the calyx; seeds 12–26, angular, 0.8–0.9 mm long, brown. Salt and cool desert shrub, sagebrush, and pinyon-juniper communities at 1400 to 2320 m in Beaver, Juab, Kane, Millard, Sanpete, Tooele (type from Dugway), and Uintah counties; Idaho, Nevada, Wyoming, and Colorado; 13 (i).

Phacelia indecora J. T. Howell Bluff Phacelia. Annual, 3–14 cm tall; stems erect to spreading, branched, glandular; leaves elliptic to oblong, 4–26 mm long, hirsutulous and glandular; sepals oblanceolate, 3–5 mm long; corolla narrowly campanulate, pale blue, 3–4 mm long, the lobes pubescent, the tube pale yellow and streaked with blue lines; capsule elliptic, 3–4 mm long; seeds ca 40. Salt desert shrub community at ca 1370 m in San Juan (type from Bluff County); endemic; 1 (0). Some have contended that this is only a depauperate specimen of *P. lemmonii* (q.v.), but the characters outlined by Howell, a student of the genus, seem more important than reduction to synonymy would indicate. The continued recognition here points attention to the elusive Bluff plant and future workers can search for it.

Phacelia integrifolia Torr. Annual or winter annual, 1–6 dm tall; stems simple or somewhat branched, densely stipitate-glandular and spreading-hirsute; leaves simple, crenate to somewhat cleft, oblong to ovate or lanceolate, strigose, finely glandular and with spreading, setose hairs, the lower leaves the largest, petiolate, the upper smaller, short-petiolate to sessile; inflorescence terminal, elongate; sepals oblanceolate to elliptic, 3–4.5 mm long in flower, 4.4–6.5 mm long in fruit; corolla lavender to bluish, 5–6.5 mm long and broad, tubular-campanulate; stamens and style exerted 5–6 mm, the style bifid 2/3–3/4 its length, puberulent below; capsule ovoid to globose, 3.2–5.3 mm long, pubescent; mature seeds 4, oblong to elliptic, dark brown to black, 3.1–4.5 mm long, 1.7–2.2 mm wide, the transverse ridges on the dorsal surface quite distinct, the ventral surface lacking corrugations, the ridge often curved to one side; $n = 22$. Blackbrush, other warm desert shrub and shrub-grass, and mountain brush communities at 1190 to 1710 m in Kane and San Juan counties; Arizona to Texas and Mexico; 15 (vii).

Phacelia ivesiana Torr. in Ives Annual, 0.4–2.7 dm tall, hirsutulous and mostly finely glandular (rarely dark or black); stems prostrate or ascending, branched; leaves pinnately divided or lobed, oblong to lanceolate, 1–5 cm long, basal and cauline; inflorescence of laxly flowered terminal scorpioid cymes; sepals oblong to oblanceolate, 2–4 mm long in flower, elongating to 7 mm in fruit; corolla white, inconspicuous, 2–4 mm long, the tube yellowish; stamens included, the filaments glabrous; style included, divided 1/4 the length, glabrous; capsule oblong, 3–4.5 mm long, pubescent, especially apically; seeds 8–15, brown, 1–1.5 mm long, corrugated transversely and alveolate; $n = 22$. Two varieties are treated.

1. Style 2–3 mm long; leaves subpinnatifid, staminal filaments sparingly hairy; corolla usually 4–6.5 mm long, the lobes lavender; plants of Box Elder County
P. ivesiana var. *glandulifera*

— Style 0.7–2 mm long; leaves merely pinnatifid, rarely subpinnatifid; staminal filaments glabrous; corolla mostly 2.5–4 mm long, the lobes white; plants widespread
P. ivesiana var. *ivesiana*

Var. *glandulifera* A. Nels. [*P. glandulifera* (A. Nels.) Piper; *P. ivesiana* f. *glandulifera* (A. Nels.) Brand]. Sagebrush and juniper communities, often of tuffaceous outcrops, in Box Elder County; Washington to Wyoming, south to California and Nevada; 1 (i).

Var. *ivesiana* Creosote bush, other warm desert shrub, cool desert shrub, sagebrush, and pinyon-juniper communities at 760 to 2410 m in all Utah counties, except Box Elder, Cache, Davis, Morgan, Salt Lake, Summit, Utah, and Wasatch; California to Wyoming, south to New Mexico and Arizona; 96 (xviii).

Phacelia laxiflora J. T. Howell [*P. perityloides* var. *laxiflora* (J. T. Howell) Cronq.]. Perennial, with branched, often trailing stems, the stems 4–20 cm long, glandular-puberulent; leaves orbicular-reniform, 1–3 cm long, 0.5–3.5 cm wide, glandular-hirsutulous, dentate to shallowly lobed, cordate basally, petiolate, the petiole 1–4 cm long; flowers 5–merous on laxly flowered racemes, the pedicels 1–7 mm long; sepals 2–4 mm long in flower, elongating to 8 mm long in fruit; corolla tubular-campanulate, 6–8 mm long, white; stamens included, somewhat unequal; style 4 mm long, glabrous except at the ovary base; ovules numerous; mature seeds not developed. North exposures on limestone cliffs in crevices and at bases of cliffs in shaded areas along the Virgin River Gorge in Washington County at 965 m; adjacent Mohave County, Arizona; 2 (ii).

Phacelia lemmonii Gray Annual, 0.5–2.5 dm tall; stems erect, glandular-pubescent, little branched; leaves cauline or basal, petiolate below to sessile above, elliptic to ovate, entire to toothed; cymes terminal on the main stems and branches; flowers short-pedicellate, the pedicels stout, ca 1 mm long in flower and 3–5 mm long in fruit; sepals linear-oblong to spatulate, 2.5–4 mm wide; anthers included; style hardly divided, 1.5–3 mm long; capsule ellipsoid-cylindric; seeds ca 35–60, ovoid to elliptic, 0.4–0.5 mm long, coarsely pitted; $n = 44, 48$. Pinyon-juniper community (an understory species) or in moist sites, at 1830 to 2105 m in Beaver and Kane counties; Arizona, Nevada, and California; 3 (i).

Phacelia linearis (Pursh) Holz. [*Eutoca heterophylla* Torr., type from Valley of the Great Salt Lake]. Annual, 1–5 dm tall; stems erect, simple or branched, densely pubescent, the hairs minute; leaves linear to lanceolate, 2–7 cm long, entire or with 1–4 lobes, the cauline short-petiolate below to sessile above; inflorescence of cymes from the leaf axils, mostly above the stem middle, the cymes many-flowered and crowded; sepals linear to oblanceolate, 3–6 mm long in flower, to 12 mm long in fruit, united basally, with spreading stiff hairs marginally; corolla bluish to purple or white, broadly campanulate, showy, 8–10 mm long, 8–17 mm wide; stamens and styles included or exerted 1–2 mm, the filaments hairy; style bifid 1/3 the length, pubescent; capsule ovoid to oblong, 5–7 mm long; seeds mostly 6–15, oval to oblong, 1.4–1.6 mm long, dark brown to black, pitted; $2n = 22$. Sagebrush, mountain brush, and pinyon-juniper communities at 1370 to 2440 m in Beaver, Box Elder, Cache, Davis, Juab, Kane, Millard, Salt Lake, Sanpete, Sevier, Summit, Tooele, Utah, Wasatch, and Washington counties; British Columbia and Alberta, south to California, Nevada, and Wyoming; 52 (i).

Phacelia lutea (H. & A.) J. T. Howell [*Eutoca lutea* H. & A.; *Miltitzia lutea* (H. & A.) DC.; *Emmenanthe lutea* (H. & A.) Gray; *E. foliosa* Jones, type from Deep Creek, Tooele (?) County]. *M. foliosa* (Jones) Brand; *P. foliosa* (Jones) Phil.; *E. salina* A. Nels.; *M. salina* (A. Nels.) Rydb.; *P. salina* (A. Nels.) J. T. Howell]. Annual from a slender taproot, 2–10 cm tall; stems 1 to several, hirsutulous to finely glandular; leaves oblong, elliptic to oblanceolate, 0.5–3 cm long, entire to pinnately lobed; inflorescence of compact to laxly flowered cymes; sepals linear to oblanceolate, 3–7 mm long, hirsutulous; corolla yellow (sometimes tinged with lavender), 3–5 mm long, tubular-campanulate; stamens and style included, the filaments glabrous; style hairy below; capsule elliptic, oval, or oblong, pubescent, 3–6 mm long; seeds 7–20, 1–2 mm long, corrugated, pitted, brown; $2n = 24$. Salt and mixed desert shrub communities, often in saline substrates, at 1370 to 1680 m in Sanpete and Tooele counties; Oregon to Montana, south to California, Arizona, and Colorado; 2 (0). Our plants belong to var. *scopolina* (A. Nels.) Cronq. [*Emmenanthe scopolina* A. Nels.; *M. lutea* var. *scopolina* (A. Nels.) Brand; *M. scopolina* (A. Nels.) Rydb.; *P. scopolina* (A. Nels.) J. T. Howell].

Phacelia mammillarensis Atwood Nipple Phacelia. Annual, 0.9–5 dm tall; stems erect, simple or branched below, stout, yellowish or green, densely stipitate-glandular; leaves simple, oblong to lanceolate, irregularly crenate to dentate, 1–7 cm long, 0.5–3 cm wide, stipitate-glandular, spreading-setose and strigulous; lower leaves petiolate to sessile upward; inflorescence of terminal or lateral, compact, scorpioid cymes, these stipitate-glandular, puberulent, and spreading-hispid; sepals elliptic to oblanceolate, 4–6 mm long, 1–2 mm wide; corolla tubular-funnelform, the lobes pale blue to white, 5–8 mm long; stamens and style exerted 5–10 mm, the anthers lavender, the style divided ca 1/2 the length, the lower 1/4 pubescent; capsule subglobose, 4–5 mm long, pubescent; seeds 4, 3 mm long, 1.5 mm wide, brown, pitted dorsally, the ventral surface pitted, excavated and divided by a prominent ridge, one side of the ridge and the margins corrugated. Salt and mixed desert shrub communities at 1220 to 1830 m in eastern Kane (type locality) and Garfield counties; endemic; 18 (xiii).

Phacelia palmeri Torr. ex Wats. Palmer Phacelia. [*P. foetida* Goodding, type from Diamond Valley; *P. palmeri* var. *foetida* (Goodding) Brand; *P. integrifolia* var. *palmeri* (Torr.) Gray]. Robust biennial, 2–9 dm tall, viscid, mephitic; stems usually solitary or branched from the base, erect, wandlike, densely stipitate-glandular, hirsute and pilose (hairs heteromorphic); leaves basal (largest) and with well-developed cauline leaves, oblong to lanceolate, irregularly sinuate, crenate, or pinnatifid, short-petiolate; inflorescence dense, with many short, scorpioid cymes along the stems; sepals oblong to spatulate, 4–5 mm long, 1–1.8 mm wide, glandular and with spreading hirsute hairs; corolla tubular, pale lavender or white, 5–7 mm long; stamens and style exerted, the style bifid 2/3 the length, pubescent below; ovules 4; seeds 4, elliptic, black, 2.5 mm long, 1.5 mm wide, excavated on both sides of the prominent ridge, this corrugated on one side, pitted, the margins and furrows or grooves corrugated (in part), the dorsal surface longitudinally pitted and transversely ridged; $2n = 22$. Salt desert shrub community, mainly on volcanic debris and the Moenkopi Formation, at 790 to 1265 m in Washington County (type locality); Nevada and Arizona; a Virgin-Coronado endemic; 19 (viii).

Phacelia peirsoniana J. T. Howell Annual, 1–2.5 dm tall; stems simple or more often branched, glandular-vilous; leaves simple, mostly cauline, the blade crenate to dentate, 1–5 cm long, cordate to truncate, petiolate; inflorescence of laxly flowered, terminal cymes; sepals linear-oblanceolate to spatulate, 3–4 mm long in flower, strongly accrescent and to 8 mm long in fruit; corolla tubular-campanulate, lavender or violet, 4–6 mm long, 3–4 mm wide; stamens and style included, the filaments hairy below; style 2–3 mm long; capsule oblong, 4–6 mm long; seeds ca 4, ovoid or angular, 1–1.3 mm long, pitted-reticulate; $2n = 24$. Sagebrush and pinyon-juniper community at ca 1370 m in upper Beaverdam Wash, Washington County; Nevada and California; 1 (0).

Phacelia pulchella Gray [*P. pulchella* f. *luteola* Brand]. Annual, branched from the base, 0.5–2 dm tall; stems spreading to erect, leafy, succulent and brittle, finely glandular; leaves cauline, entire to toothed, oblong to orbicular, 1–3 cm long, 1–2 cm wide; inflorescence terminal, laxly flowered below to compact apically; sepals oblanceolate to spatulate, 3–5 mm long in flower, to 8 mm long in fruit, corolla violet to purple, the tube yellow, campanulate, 6–15 mm long and as broad, deciduous; stamens included; style included, bifid apically, 3.5–5 mm long; capsule oblong to ovoid, 3–5 mm long, hirsutulous above; seeds 28–50, oblong to elliptic, 0.5–1 mm long, brown, pitted; $2n = 24$. Two varieties are present.

1. Leaves mostly entire or repand, corolla lobes purple; seeds mostly less than 35 per capsule; plants of western Kane and Washington counties . . . *P. pulchella* var. *pulchella*
- Leaves commonly crenate to dentate; corolla lobes of paler color, more violet; seeds mainly over 35 per capsule; plants of eastern Kane and Garfield counties
..... *P. pulchella* var. *sabulonum*

Var. *pulchella* Creosote brush, blackbrush, other warm desert shrub, and pinyon-juniper communities at 850 to 1830 m in Kane and Washington (type locality) counties; Arizona; 21 (viii). Some plants in Washington county are intermediate to var. *gooddingii* (Brand) J. T. Howell.

Var. *sabulonum* J. T. Howell Mixed desert shrub communities at 1155 to 1375 m in eastern Garfield and Kane (type locality) counties; endemic; 12 (viii).

Phacelia rafaelsensis Atwood Erect biennial herbs, 0.8–5.4 dm tall; stems stout, simple or sometimes branched at the base, olive-green to brownish, glandular and hirsute; basal leaves petiolate, dentate, crenate, or pinnatifid, 2–7 cm long, 5–15 mm wide, strigose to hirsute, the cauline ones sessile, undulate to crenate or dentate, oblong-lanceolate, 1–10 cm long, 0.5–3.5 cm wide, strigose to hirsute and sparsely stipitate-glandular; inflorescence mainly terminal, paniculate, some axillary; flowers almost sessile; sepals oblanceolate to spatulate, 3–4 mm long in flower, 5–6 mm long in fruit, 1–1.7 mm wide, glandular and hirsute; corolla tubular, pale and grooved, with the lobes somewhat spreading, 5–6 mm long; stamens and style exerted 3–5 mm, the anthers dull; style bifid 3/4 its length, the lower half pubescent; capsule subglobose, 4–5 mm long, stipitate-glandular and hirsute; mature seeds 4, elliptic to oblong, 3.5–4 mm long, 1.5–2 mm wide, the ventral surface alveolate, paler than the dorsal surface, excavated on both sides of a prominent ridge, this sometimes corrugated along one side, the margins usually entire, the dorsal surface brown

and less deeply pitted, the surface often smoothish. Salt desert shrub and pinyon-juniper communities, mainly on the Carmel, Chinle, Summerville, and Moenkopi (Sinbad member) formations at 1065 to 1830 m in Emery, Wayne (type locality), and Washington counties; Arizona; a Plateau endemic; 38 (xxiv). The Washington county plants are allopatric with *P. palmeri*.

Phacelia rotundifolia Torr. ex Wats. Limestone Phacelia. Annual, 0.3–2 dm tall; stems simple or more commonly branched from below, stipitate-glandular and spreading hirsute; leaves rotund, mostly if not all cauline, coarsely toothed, 4–21 mm long and broad, petiolate, the petiole to 4 cm long, the lower ones longer than the blade; inflorescence of terminal or axillary cymes; sepals linear, 3–6 mm long, 1 mm wide; corolla pale lavender or white, tubular, inconspicuous; stamens included, the filaments glabrous; style included, bifid; capsule oblong, shorter than the calyx, 4 mm long; ovules numerous, sometimes more than 100; seeds 0.4–0.5 mm long, brown, pitted; $2n = 24$. Mixed desert shrub communities at 850 to 1525 m in Kane and Washington (probable type locality) counties; Arizona, Nevada, and California; 14 (iii).

Phacelia sericea (Graham) Gray [*Eutoca sericea* Graham]. Stout, erect perennial, 1–5 dm tall; stems 1 to several, the pubescence silky, the hairs appressed to spreading; leaves pinnatifid, the segments also cleft or entire, the lower well developed, reduced upward; inflorescence a dense terminal thyrse, usually elongate, the cymes many, compact, short; corolla dark purple or blue, persistent, campanulate, 5–7 mm long and as broad, pubescent; stamens long-exserted, the filaments hairy at the base; style long-exserted, bifid 1/2 the length; capsule ovoid, 4–6.5 mm long, pubescent; ovules 20–40; seeds 10–20, oblong, 1–2 mm long, brown to black, reticulate and grooved longitudinally; $2n = 22$. Sagebrush, aspen, and spruce-fir communities at 2285 to 3540 m in Beaver, Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Juab, Piute, Rich, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, and Utah counties; Alaska south to Nevada and Colorado; 80 (v). Our plants belong to var. *ciliosa* Rydb, but var. *sericea* has been reported from the La Sal Mts.

Phacelia tetramera J. T. Howell Diminutive annual, freely branched, prostrate or forming mats, spreading-hirsutulous; leaves oblanceolate, petiolate, the blade 0.5–2 cm long, mostly entire or some leaves toothed; cymes numerous, terminal, or in upper leaf axils, few-flowered, the flowers 4–merous (rarely some 5–merous), short-pedicellate to sessile; corolla white, persistent, 1–1.5 mm long, 1/2 as long as the sepals; stamens included; style shorter than the stamens, 0.3–0.4 mm long, slightly lobed; seeds 6–10, 0.7–1 mm long, pitted, reticulate, and corrugated; $2n = 22$. Samphire community, where definitely saline, at ca 1310 m in Weber County; Nevada, Oregon, and California; 1 (0).

Phacelia utahensis Voss Stout, erect biennials, 0.8–5.8 dm tall; stems mostly solitary, brownish to yellowish, densely stipitate-glandular, finely pubescent and with some spreading, non-glandular hairs; leaves well developed, both basal and cauline, crowded, short-petiolate below, but most leaves sessile, especially upward, the upper also auriculate, the largest to 13 cm long, crenate to pinnately lobed; inflorescence of many, densely flowered cymes, elongated on the upper portion of stems and branches; sepals linear-oblanceolate, 3–4 mm long, ca 1

mm wide; corolla showy, bluish lavender, the tube yellowish, broadly campanulate, 4–5 mm long, ca 6 mm wide; stamens exserted 9–10 mm; filaments violet, the anthers yellow; style exserted ca 10 mm, bifid 3–4 the length, setose and glandular below; capsule globose, 3.5–4.1 mm long, 2.6–3.5 mm wide, glandular and setose; mature seeds 4, elliptical, dark (reddish), 3–3.5 mm long, the dorsal surface faintly pitted, the ventral surface excavated on both sides of the ridge, often paler than the dorsal surface, pitted with the markings in excavations longer (transversely) than those of the ridge or margins, the ridge sometimes faintly corrugated on one side. Salt desert shrub community on the Arapien Shale Formation at 1675 to 1740 m in Sanpete (type locality) and Sevier counties, and probably on the Mancos Shale Formation in Carbon County; endemic; 17 (vi).

Phacelia vallis-mortae Voss Annual, 2–5 dm tall; stems diffusely branched, weak, supported by shrubs, spreading-hispid and glandular above; leaves pinnately divided, evenly distributed from base upward, somewhat reduced above, to 6 cm long, spreading-hispid; cymes terminal on the main stem and branches, densely flowered, the pubescence dense and coarse, of hispid and glandular hairs; sepals linear-oblanceolate, 4–6 mm long in flower, to 13 mm in fruit, hispid, several times longer than the capsule; corolla lavender to violet, broadly campanulate, 7–12 mm long and broad; stamens barely included to slightly exserted (1–2 mm); style bifid to the middle; capsule globose, 3–4 mm long; seeds mostly 4, ovoid, 2.5–3 mm long, brown, pitted; $2n = 22$. Joshua tree, creosote bush, and other warm desert shrub, chaparral, and pinyon-juniper communities at 790 to 1220 m in Washington County; Arizona, Nevada, and California; 17 (vii).

Tricardia Torr. ex Wats.

Perennial from a taproot; stems branched from the base; leaves mostly basal, entire; cauline leaves alternate; flowers in short, naked, terminal cymes; calyx cleft almost to the base, the sepals heteromorphic, the three outer lobes cordate and enlarged, veiny in fruit, the 2 inner ones narrow; corolla broadly urceolate-campanulate, white and purple; stamens equally inserted on the corolla tube, included, the filaments unequal and with a pair of appendages; style included, bifid; ovules 8; seeds 4–8.

Tricardia watsonii Torr. ex Wats. Stems 1 to several from a stout caudex, erect to ascending, 0.5–4 dm long, loosely villous when young, finally glabrate; leaves mostly basal, elliptic to elliptic-ovate, 2–9 cm long, petiolate, the cauline ones smaller and with shorter petioles, ovate to lanceolate; inflorescence of terminal cymes; sepals very unequal, the outer 4–9 mm long in flower, 10–25 mm long in fruit; corolla white with a purple ring around the throat and onto the lobes, 5–8 mm long; capsule compressed, 7–10 mm long; seeds 4–8, brown, 3–5 mm long, oblong, pitted; $2n = 16$. Joshua tree, creosote bush, other warm and cool desert shrub communities at 730 to 1100 m in Washington County; Arizona, Nevada, and California; 8 (iii).

JUGLANDACEAE A. Richard ex Kunth Walnut Family

Trees with alternate pinnately compound leaves; flowers monoecious, the staminate in long drooping catkins,

the pistillate solitary or few in a cluster; staminate calyx 2- to 5-lobed, the stamens 3-40; pistillate flower bracteate and usually with 2 bracteoles, the calyx 4-lobed and with 4 small petals; pistil 1, the ovary inferior, 1- or incompletely 2- to 4-loculed; styles 2; fruit drupaceous; x = 16.

- 1. Pith transversely partitioned; husk of fruit indehiscent; leaflets at midleaf the largest *Juglans*
- Pith not partitioned; husk of fruit splitting and deciduous; leaflets at leaf apex the largest *Carya*

Carya L.

Trees; pith continuous; leaves odd-pinnate, the terminal 3 the largest; staminate catkins borne in peduncled groups of 3; staminate calyx 2- or 3-lobed, subtended by a bract; stamens 3-10; pistillate flowers solitary or few to several, each subtended by a 4-lobed perianthlike involucre; fruit with dehiscent exocarp.

Carya illinoensis (Wangenh.) K. Koch Pecan. [*Juglans illinoensis* Wangenh.]. Trees with spreading branches and rounded crowns; bark deeply furrowed; leaflets 11-17, oblong-lanceolate, the lateral ones falcate, the terminal on a petiole ca 2-4 mm long; fruits in spikes of 3-10, ellipsoid or cylindrical; nuts 2-5 cm long, brown, smooth, short-pointed, the kernel edible. Commonly grown shade and nut tree in Washington County and less common elsewhere in Utah; introduced from the eastern U. S.; 2 (i). The shagbark hickory, *Carya ovata* (Miller) K. Koch, has been successfully grown in Utah, but is not known in contemporaneous plantings.

Juglans L.

Trees; pith chambered; leaves pinnate, the largest leaflets at about midleaf; staminate flowers in pendulous sessile catkins; stamens 8-40, closely subtended by a bract; bracteoles 2; sepals usually 4; pistillate flowers solitary or several in clusters, each with a bract and 2 bracteoles; sepals 4; fruit with an indehiscent exocarp.

- 1. Leaflets entire or nearly so, usually 5-9; bark whitish, often smooth *J. regia*
- Leaflets serrate or crenate-serrate, usually 9-19 (23); bark blackish, often furrowed 2
- 2(1). Pith dark brown; bark with smooth ridges; fruit ovoid to ellipsoid, usually longer than broad *J. cinerea*
- Pith light brown; bark with rough ridges; fruit subglobose, little if any longer than broad 3
- 3(2). Fruit more than 35 mm in diameter; leaflets 11-23; trees commonly grown and widespread *J. nigra*
- Fruit less than 35 mm in diameter; leaflets mainly 9-13; trees uncommon in Washington County *J. major*

Juglans cinerea L. Butternut. Trees to 20 m or more; bark grayish brown to black, with smooth ridges; pith dark brown; leaflets 11-19, lanceolate to elliptic, long-acuminate; fruit ellipsoid-oblong, 4-7 cm long, tapering to the apex; endocarp ellipsoid to ovoid, longer than thick. Sparingly grown shade and nut tree in Utah; introduced from the eastern U. S.; 4 (0).

Juglans major (Torr.) Heller Arizona Walnut. [*J. rupestris* var. *major* Torr.]. Trees to 15 m tall or more; bark grayish to brown, furrowed on older stems; pith light brown; leaflets usually 9-13, rarely more, lanceolate, acuminate apically, coarsely dentate-serrate; fruit subglo-

bose, 2.5-3.5 cm thick; endocarp about as long as broad, with a small edible kernel. Cultivated shade and ornamental tree in Washington County; introduced from the southwestern U. S.; 4 (ii). This species is known from a grove along Beaver Dam Wash, where it was probably initially planted, but is now established.

Juglans nigra L. Black Walnut. Trees to 25 m or more; bark black, the ridges rough; leaflets 11-23, lanceolate to oblong-lanceolate, serrate; fruit subglobose, mostly 4-8 cm thick, abruptly pointed; endocarp subglobose, about as long as thick; 2n = 32. Widely and commonly grown shade and nut tree, persistent and escaping in much of lower elevation Utah; introduced from the eastern U. S.; 13 (i). The wood is considered to be the premier cabinet wood in North America. It finishes easily and well, and is in great demand.

Juglans regia L. English Walnut. Trees to 15 m or more; bark whitish, smooth or furrowed in age; leaflets 5-9, ellipsoid to oblong-lanceolate, entire; fruit subglobose, mostly 4-9 cm thick; endocarp subglobose, with prominent ridges margining the sutures, the shell moderately thin and the edible kernel large; 2n = 32. Rather widely grown nut tree in Utah; persisting but not known to escape; introduced from Eurasia; 10 (0).

KRAMERIACEAE Dumort.

Ratany Family

Shrubs with divaricate branches; herbage grayish pubescent; leaves alternate, simple, entire, estipulate; flowers perfect, irregular, solitary, axillary; pedicels usually with 2 opposite foliaceous bracts; sepals 4 or 5, unequal; petals 5, the upper 3 long-clawed, distinct or partially connate and often purplish in color, the 2 others broad, thick, sessile, usually greenish and glandlike; stamens 4, free or adnate to claw of upper petal, the anthers dehiscent by pores; pistil 1, the ovary superior, 1-loculed; style 1; ovules 2; fruit an indehiscent pod, armed with prickles; x = 6.

Krameria L.

A single genus with characteristics of the family.

- 1. Branchlets modified as thickened thorns 0.8-1.2 mm in diameter at base; spines of fruit barbed at apex only *K. grayi*
- Branchlets not modified as thorns or, if so, less than 0.6 mm in diameter; spines of fruit with barbs scattered or, rarely, barbless *K. parviflora*

Krameria grayi Rose & Painter White Ratany. Shrubs, branched, 2.5-6 dm tall, 1-3 mm wide; leaves 5-7 (25) mm long, 1-3 mm wide, lance-ovate to lanceolate, elliptic or oblong, more or less spinulose-tipped, tomentose on both surfaces; pedicels not glandular-pubescent; upper petals 2.5-3.5 mm long, 0.3-0.5 mm wide, yellowish with a purplish tip; sepals 4.5-6.5 mm long, villous-pilose dorsally, pilose to glabrate within, purplish; prickles of the fruit 2-6 mm long at maturity, each with a whorl of barbs at the apex; pods subglobose, 6-10 mm in diameter, hirsute over the surface and on the bases of the prickles. Blackbrush and creosote communities at 670 to 1170 m in western Washington County; California, Nevada, Arizona, New Mexico, Texas, and Mexico; 4 (i).

Krameria parvifolia Benth. Range Ratany. [*K. glandulosa* Rose & Painter; *K. parvifolia* var. *glandulosa* (Rose & Painter) Macbr.; *K. imparata* (Britt.) Macbr.]. Shrubs, intricately branched, 2–6 dm tall and as wide; leaves 3–15 mm long, 0.3–1 mm wide, linear to oblong, callous- to spinulose-tipped, tomentose on both surfaces; pedicels glandular or not; upper petals 2.5–2.8 mm long, retrorsely barbed along the rachis; pods subglobose, 5–9 mm in diameter, pilose-hirsute on the surface. Joshua tree, blackbrush, creosote bush, and bursage communities, 750 to 1070 m in Washington County; California, Nevada, Arizona, New Mexico, Texas, and Mexico; 21 (i). The materials demonstrate variation in glandular condition of pedicels, sepals, and bracts. The variation seems to be haphazard, with little or no correlation with other features or ecology. Hence, included herein as synonyms are those names involved with recognition of glandular and nonglandular phases.

LABIATAE A. L. Juss.

Mint Family

Often aromatic, annual or perennial herbs or shrubs, ordinarily with square or 4–angled stems; leaves simple, opposite or rarely whorled; flowers perfect, mostly irregular, borne in various types of cymose inflorescence; calyx of 5 united sepals, regular or irregular, usually 5–lobed, or the lobes obscure; corolla of 5 united petals, usually bilabiate, 5–lobed, or apparently 4–lobed by fusion of the upper 2 lobes; stamens 4, in 2 unequal pairs, or only 2 by abortion; pistil 1, the ovary superior, 2–carpelled, falsely 4–loculed and 4–lobed; style 1, usually bifid apically; fruit a schizocarp, breaking at maturity into 4, 1–seeded, nutlets; x = 5–11+. [Lamiaceae Lindl].

1. Stamens with functional anthers 2 2
 — Stamens with functional anthers 4 6
 2(1). Shrubs or herbs of western and southwestern Utah, or widely cultivated; inflorescence a capitate broadly bracteate cyme, or with one or more verticillasters below the terminal one; connective between the anther sacs elongate, only 1 branch usually bearing an anther sac *Salvia*
 — Shrubs or herbs of various distribution but, if as above, the anther sacs not widely separated by a connective, the flowers variously arranged 3
 3(2). Corolla regular or nearly so; plants of palustrine habitats *Lycopus*
 — Corolla distinctly irregular, 2–lipped; plants not or rarely of palustrine habitats 4
 4(3). Plants shrubs; herbage with a feltlike tomentum; plants of sandy sites in southeastern Utah *Poliomintha*
 — Plants herbaceous, annual to perennial, glabrous or variously hairy, but not with a feltlike tomentum; plants not of deep sand, distribution various 5
 5(4). Flowers in dense subglobose clusters, these terminal and solitary or several and axillary, forming interrupted verticillasters; calyx teeth about equal. *Monarda*
 — Flowers seldom more than 6, in axillary clusters, but these not dense or subglobose, the clusters usually many; calyx more or less 2–lipped *Hedeoma*
 6(1). Calyx teeth 10, hooked at apex; stems densely white-woolly *Marrubium*
 — Calyx teeth 5 or fewer, not hooked apically; stems usually not white-woolly 7

7(6). Calyx 2–lipped, the lips entire 8
 — Calyx not 2–lipped, or if so the lips lobed or toothed 9
 8(7). Plants shrubs; calyx inflated in fruit, not crested or gibbous on the back *Salazaria*
 — Plants herbs; calyx with a gibbous or helmetlike crest on the back *Scutellaria*
 9(7). Corolla seemingly 1–lipped, or 2–lipped with the upper lip cleft to the base; ovary merely 4–lobed, not cleft to the base, the nutlets laterally attached 10
 — Corolla either evidently bilabiate or nearly regular; ovary cleft to the base, the nutlets basally attached 11
 10(9). Lobes of the upper lip of corolla well separated, displaced onto the lateral margins of the lower lip, the central lobe of lower lip much larger than the other 4 lobes *Teucrium*
 — Lobes of the upper lip of corolla adjacent, only slightly displaced, appearing as three minute lobes *Ajuga*
 11(9). Corolla regular or nearly so, obscurely 2–lipped 12
 — Corolla definitely 2–lipped 13
 12(11). Anther sacs parallel; flowers either in terminal spikes or in dense axillary clusters *Mentha*
 — Anther sacs divergent; flowers in terminal globose clusters *Monarda*
 13(11). Calyx enlarging into a flaring, veiny funnel ca 2.5 cm wide; plants glabrous *Molucella*
 — Calyx not especially enlarging, not as above; plants pubescent or glabrous 14
 14(13). Bracts spinose-toothed to entire; upper calyx tooth ovate, twice as broad as the others *Dracocephalum*
 — Bracts, if present, not spinose-toothed; calyx regular, slightly irregular, or if 2–lipped, not as above 15
 15(14). Plants low perennials or subshrubs with creeping stems rooting at the nodes; calyx bilabiate; stamens exerted *Thymus*
 — Plants mostly erect annuals or perennials, usually not rooting at the nodes or the calyx and stamens otherwise 16
 16(15). Anther sacs parallel or nearly so 17
 — Anther sacs widely divergent or placed end to end 19
 17(16). Leaves palmately 3– to 5–cleft *Leonurus*
 — Leaves merely toothed 18
 18(17). Leaves ovate to ovate-deltoid, definitely petiolate; flowers many, densely crowded in continuous or interrupted spikes; upper (inner) pair of stamens longer than the lower *Agastache*
 — Leaves lanceolate to oblong-lanceolate, sessile; flowers in rather loose spike-like racemes, but not very numerous; upper (inner) pair of stamens shorter than the lower *Physostegia*
 19(16). Flowers, at least some, in clusters in axils of upper leaves, or in a single terminal leafy-bracted cluster 20
 — Flowers in dense or somewhat interrupted spikes, these leafy-bracteate, if at all, only at the base 22
 20(19). Flowers subtended by short, setaceous, conspicuously hirsute-ciliate bracts; stems erect *Satureja*
 — Flowers without such bracts; stems decumbent 21
 21(20). Upper pair of stamens longer than the lower; calyx teeth ca one-third as long as the tube; plants perennial *Glecoma*
 — Upper pair of stamens shorter than the lower; calyx teeth ca one-half as long as the tube; plants annual or biennial *Lamium*

- 22(19). Calyx definitely 2-lipped, flowers in dense uninterrupted spikes, the bracts ovate to reniform, not at all leaflike *Prunella*
- Calyx teeth equal or nearly so; spikes rather interrupted, the bracts rather leaflike 23
- 23(22). Calyx 5- to 10-veined; lower stamens longer than the upper *Stachys*
- Calyx 15-veined; upper stamens longer than the lower *Nepeta*

Agastache Clayton

Perennial herbs; stems leafy and tall, arising from creeping rootstocks; leaves ovate or deltoid-ovate, crenate-serrate, petiolate; flowers in dense sessile clusters, these spicate or paniculate; calyx tubular or campanulate, 5-toothed, the teeth subequal or the upper somewhat longer, often whitish or colored other than green; corolla purplish, rose, or whitish, 2-lipped, the upper lip erect, concave, 2-lobed, the lower somewhat spreading and 3-cleft; stamens 4, the anther sacs parallel or nearly so.

- 1. Upper lip of corolla prominently thrust forward, 2-2.5 mm long; stamens all parallel, both pair exerted similarly from the corolla tube; plants not definitely known for Utah, but to be sought in Grand and San Juan counties *A. pallidiflora* (Heller) Rydb.
- Upper lip of corolla not prominently thrust forward, 1-1.5 mm long; lower pair of stamens ascending under upper lip, the upper pair thrust down and crossing the lower *A. urticifolia*

Agastache urticifolia (Benth.) Kuntze Horse-nettle. [*Lophanthus urticifolius* Benth.]. Stems 6-15 (20) dm tall, glabrous or nearly so; leaves 3.5-8 cm long, mostly ovate or deltoid-ovate, usually glabrous above, the lower surface glabrous to pubescent, green but paler than the upper; inflorescence verticillate, 4-15 cm long, 2-3 cm thick, spikelike or paniculate; calyx 4-10 mm long, green or rose, at least on the teeth and summit of the tube, this 4-7 mm long, the teeth 2.5-5 mm long, deltoid-lanate; corolla white to rose or violet, the tube ca 8-13 mm long, the upper lip 1-1.5 mm long, not prominently thrust forward; lower stamens ascending under the upper lip, the upper stamens thrust down and crossing the lower; n = 9. Sagebrush, mountain brush, ponderosa pine, aspen, and spruce-fir communities at 1650 to 3300 m in all Utah counties, except Daggett, Emery, Grand, Morgan, Summit, Uintah, and Wayne; British Columbia, south to California and Colorado, 106 (xiii).

Ajuga L.

Annual or perennial herbs; stems decumbent and often stoloniferous; leaves coarsely toothed or incised, rarely entire; inflorescence terminal, spikelike and consisting of 2 to many whorls, dense, or interrupted below; calyx not bilabiate; corollas blue, white, or rose, withering and often persisting in fruit, the upper lip obsolete and reduced to 3 minute toothlike lobes; stamens 4.

Ajuga reptans L. Carpet-bugle. Low perennial herbs, spreading by leafy stolons, matforming; flowering stems to 3 dm tall, nearly glabrous; leaves obovate to oblong-spattulate, 2-5 cm long, the larger ones commonly sinuate-dentate, the lower ones tapering to a broad petiole, the upper ones sessile; flower sessile, in whorls of 2-6 in the axils of bracteate leaves, aggregated into a terminal leafy spike; calyx 4-6 mm long, sparsely villous, the 5

lobes ovate-triangular, somewhat shorter than the tube; corolla blue to purplish, the upper lip very short, bilobed, the lower lip elongate and dilated, the lateral lobes shorter and narrower than the broad, bilobed midlobe; stamens 4, unequal, included; n = 16, 32. Cultivated ornamental ground cover, persisting and occasionally escaping, mainly below ca 1600 m, in Cache, Davis, Salt Lake, and Weber counties; introduced from Europe, widely cultivated in the U. S.; 4 (0).

Dracocephalum L.

Annual, biennial, or short-lived perennial herbs; stems erect; leaves petiolate, sharply serrate or the lower incised; flowers blue to rose pink, crowded in dense terminal or axillary clusters, with conspicuous spinulose-pectinate bracts; calyx campanulate-tubular, 5-toothed, the upper tooth enlarged; corolla tube enlarging above, 2-lipped, the upper lip spreading and 3-lobed, the middle lobe larger and sometimes notched apically; stamens 4, paired, the upper pair longer, the anthers with 2 divergent sacs.

- 1. Calyx 6-8 mm long, the teeth 1-2 mm long, bracts entire or nearly so, narrow *D. thymiflorum*
- Calyx 9-15 mm long, the teeth 4-6 mm long, bracts aristately toothed, broad *D. parviflorum*

Dracocephalum parviflorum Nutt. [*Moldavica parviflora* (Nutt.) Britt.]. Stems 1-6 dm tall, more or less hairy; leaves lanceolate to oblong or occasionally ovate, 1-6 cm long, coarsely serrate, the upper with spinulose teeth, more or less puberulent, at least below; bracts ovate or oblong, pectinate with awn-pointed teeth; calyx 9-15 mm long; corolla bluish to pale rose, scarcely longer than the calyx; n = 7. Common in sagebrush, pinyon-juniper, mountain brush, ponderosa pine, aspen-tall forb, and lodgepole pine communities at 1470 to 3300 m in Cache, Daggett, Duchesne, Garfield, Grand, Iron, Juab, Kane, Millard, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, Washington, and Weber counties; New England to Alaska, south to Arizona and New Mexico; 55 (vii).

Dracocephalum thymiflorum L. [*Moldavica thymiflora* (L.) Rydb.]. Stems 1-5 dm tall, pubescent with minute incurved hairs; leaves lanceolate to oblong or the lower ovate, 1-4 cm long, entire to serrate, the upper nearly entire, or with a few minute teeth, more or less puberulent; bracts ovate to lanceolate, entire or with a few teeth; calyx 6-8 mm long; corolla bluish, slightly exceeding the calyx, pubescent; n = 7. Pinyon-juniper and sagebrush community at ca 2670 m in Sevier County (Welsh et al. 13762 BRY); sporadic in North America; adventive from Eurasia; 1 (i).

Glecoma L.

Low creeping perennial herbs; stems leafy; leaves long-petiolate, orbicular or reniform, crenate; flowers rather large, blue or purple, in small axillary clusters; calyx tubular, somewhat unequally 5-toothed; corolla tube exerted, enlarged above, 2-lipped, the upper lip erect, 2-lobed or emarginate; stamens 4, paired, the upper pair longer; anther sacs divergent.

Glecoma hederacea L. [*Nepeta glecoma* Benth.; *N. hederacea* (L.) Trev.]. Fibrous-rooted perennial from slender stolons and rhizomes; stems lax, 1-4 dm long,

retroscaly scabrous to glabrous or nearly so, pilose at the nodes; leaves rotund-cordate to reniform, glabrous to hirsute, the margins crenate, 1–3 cm long; flowers shortly pedicellate; calyx narrow, tubular, 5–6 mm long, hirtellous, scabrous, the upper teeth the longer; corolla blue violet, purple-maculate, (9) 13–23 mm long, those with reduced anthers the shorter; $2n = 18$, 36. Cultivated, escaping, and established in moist disturbed habitats at ca 1400 to 1590 in Box Elder, Salt Lake, and Utah counties; native of Eurasia, now well established in the U. S.; adventive from Eurasia; 8 (0).

Hedeoma Pers.

Aromatic annual or perennial herbs; stems erect or ascending; leaves small, entire or toothed, sessile or petiolate; flowers in small cymes or solitary in axils of upper leaves; calyx tubular, 13-ribbed, gibbous at the base, pubescent, 5-toothed; corolla blue or purple, 2-lipped, the upper lip erect, entire or 2-lobed, the lower 3-lobed and spreading; stamens 4, usually only 1 pair fertile.

1. Calyx teeth connivent at maturity, the aperture closed *H. drummondii*
 — Calyx teeth spreading, the calyx bilabiate *H. nana*

Hedeoma drummondii Benth. Mock Pennyroyal. Annual or perennial; stems few to numerous, ascending to decumbent, 0.6–6 dm tall, densely pubescent with retrorse tightly curled hairs; leaves linear to elliptic-oblong or ovate, 5–14 mm long, 1–4 mm wide, entire or obscurely crenate, rounded to attenuate at the base, glabrate above, densely pubescent below and on the margins; axillary cymes crowded or well spaced along the inflorescence; flowers 1–5 per cyme; calyx 5–7 mm long, conspicuously saccate for ca 2/3 its length, the tube above the distended region constricted and tapering to the neck, completely or almost closing the orifice following anthesis, the teeth convergent; corolla blue or whitish in the throat, 7–15 mm long, the upper lip ligulate, straight, concave and subgaleate, ca 1.5 mm long, the lower lip spreading, 2.5–5 mm wide; $2n = 34$, 36. Mixed desert shrub, sagebrush, mountain brush, and pinyon-juniper communities at 1130 to 2600 m in Beaver, Duchesne (?), Garfield, Grand, Iron, Kane, Millard, San Juan, Sevier, Tooele, and Washington counties; North Dakota and Montana, south to Texas, Arizona, and Northern Mexico; 35 (x).

Hedeoma nana (Torr.) Briq. [*H. dentata* var. *nana* Torr.]. Annual or perennial; stems few to very numerous, ascending to erect, 3–20 cm tall, cinereous puberulent with retrorse hairs; leaves ovate to elliptic, 4–10 mm long, 1.5–5 mm wide, entire, obtuse to acute at the base, puberulent on one or both sides, not especially ciliate; axillary cymes well spaced along the inflorescence; flowers 1–4 per cyme; calyx 4–5 mm long, tapering from the opening to the base, the teeth more or less spreading, the upper 3 triangular-subulate, the lower pair linear-acicular and longer; corolla 6–8 mm long, pale purple, the upper lip concave, ca 1 mm long, the lower lip spreading, blotched white and purple lined; $2n = 36$. Hanging gardens and warm desert shrub communities at 915 to 1190 m in Kane, San Juan, and Washington counties; Arizona, Nevada, and California; 4 (ii).

Lamium L.

Annual or perennial herbs; stems leafy, branching; leaves mostly toothed, orbicular to ovate; flowers verticil-

late in axillary or terminal clusters, purplish red; calyx tubular-campanulate, usually 5-nerved, 5-toothed, the teeth sharp-pointed, equal or the upper longer; corolla 2-lipped, the tube somewhat longer than the calyx, the upper lip erect, concave and usually entire, more or less hairy, lower lip spreading, 3-lobed, the middle lobe enlarged and notched, the lateral lobes small; stamens 4, the upper pair shorter; anthers divergent, with 2 sacs, ascending under upper lip.

1. Upper leaves sessile or clasping *L. amplexicaule*
 — Upper leaves petiolate *L. purpureum*

Lamium amplexicaule L. Dead-nettle. Weedy annuals; stems branched from the base, more or less decumbent, 1–4 dm tall, sparsely pubescent; leaves broadly ovate to rounded, truncate, or cordate basally, coarsely crenate, the lower petioled, the upper sessile, 1–2.5 cm wide; flowers in axillary and terminal clusters; calyx pubescent, 4–5 mm long, the teeth erect; corolla purplish red, 12–16 mm long, the tube very slender, the upper lip pubescent; $2n = 18$. Lawns, fields, roadsides, and other disturbed sites at 850 to 1700 m in Cache, Davis, Salt Lake, Utah, Washington, and Weber counties; adventive from Europe, now widely established in much of the U. S.; 14 (i).

Lamium purpureum L. Red Henbit. Weedy annuals; stems commonly branched below, decumbent to ascending, 1–4 dm tall; leaves all petiolate, the upper ones only shortly so, the blades broadly ovate, usually acutish apically, cordate basally; corolla lilac, 10–16 mm long, the tube rather stout, the lateral lobes reduced to short teeth; $2n = 18$. Ditch banks, roadsides, and other disturbed sites at ca 1600 m in Cache, Morgan, and Salt Lake counties; adventive from Europe; now widely established in the U. S.; 7 (0).

Leonurus L.

Perennial herbs; stems erect, leafy; leaves petiolate, the blades 3- to 5-cleft or -parted; flowers pink, purple, or white, borne in dense axillary clusters near the stem apex; calyx tubular-campanulate, 5-veined, with 5, nearly equal, triangular-aristate teeth; corolla strongly 2-lipped, the upper lip erect and slightly concave, entire, the lower lip spreading, 3-lobed, the central lobe larger, truncate or emarginate; stamens 4, paired, the upper pair shorter, ascending under the upper lip; anthers with 2 parallel sacs.

Leonurus cardiaca L. Motherwort. Perennial herbs with erect, strigose stems 3–6 dm tall or more; leaves palmately 3- to 5-cleft, the lobes entire or toothed, the lower leaves broadly ovate, 2–10 cm long and about as broad, the upper mostly narrower; calyx 6–8 mm long, the teeth spreading or reflexed, subequal; corolla 6–10 mm long, pale purple, rose, or whitish, densely pubescent without, especially on back of upper lip; $2n = 18$. Ruderal weed of disturbed sites at lower elevations, but widely established in the mountain brush, mixed conifer, and aspen zones at 1000 to 2250 m in Beaver, Cache, Davis, Duchesne, Juab, Millard, Salt Lake, Summit, Tooele, Uintah, Utah, Wasatch, and Washington counties; adventive from Asia, now widely established in the U. S.; 32 (ii). This plant was formerly cultivated as a home remedy.

Lycopus L.

Perennial, mostly stoloniferous herbs resembling *Mentha*, but not fragrant; leaves mostly toothed or pinnatifid;

floral bracts similar to the leaves and much longer than the dense axillary whorls of small, mostly white flowers; calyx campanulate to ovoid, 4- to 5-toothed, naked in the throat; corolla more or less campanulate; stamens 2, distant, the upper pair of sterile rudiments or wanting.

- 1. Leaves pinnatifid, at least the lower ones; calyx teeth awn-tipped; corolla equaling or slightly surpassing the calyx; plants lacking stolons *L. americanus*
- Leaves serrate or the lower rarely incised; calyx teeth acuminate; corolla slightly exceeding the calyx; plants stoloniferous *L. asper*

***Lycopus americanus* Muhl. ex Barton** American Bugleweed. [*L. sinuatus* L.]. Stems erect, slender, 2–9 dm tall, glabrous or sparingly appressed pubescent with dark hairs; leaves petiolate, to ca 10 cm long and 3 cm wide, the lower primary ones incised or pinnatifid, lanceolate to narrowly ovate or oval, the upper ones lanceolate, sinuate to sharply toothed; bracts short; calyx teeth with long subulate tips; corolla white, the tube scarcely longer than the calyx teeth, the filaments exerted; nutlets 1–1.5 mm long, 0.6–1 mm wide, with entire or barely undulate angles; $n = 11$. Marshes and other wet sites in palustrine and riparian habitats at 1350 to 2550 m in Box Elder, Cache, Duchesne, Grand, Salt Lake, Uintah, and Utah counties; Newfoundland to British Columbia, south to Florida, Texas, New Mexico, and California; 14 (i).

***Lycopus asper* Greene** Rough Bugleweed. [*L. lucidus* sensu American authors, not Turcz. ex Benth.]. Erect perennials with stolons and elongate turions; stems 2–8 dm tall, simple or rarely branched above; leaves lanceolate or oblong-lanceolate to elliptic, 2–8 cm long, 1–3 cm wide, acute or acuminate apically, tapering to the subsessile base, sharply and evenly serrate; calyx 2–3 mm long, the lobes lance-subulate, acuminate, longer than the tube, hispidulous marginally; corolla white, slightly longer than the calyx; rudimentary stamens slender; nutlets 1.6–2.1 mm long, 1.4–1.8 mm broad, truncate apically; $n = 11$. Marshes and other wet sites at 1400 to 1800 m in Box Elder, Cache, and Duchesne, Grand, Salt Lake, Uintah, and Utah counties; Alaska to Saskatchewan, south to California, Texas, and Missouri; 31 (i).

***Marrubium* L.**

Perennial herbs; stems several, erect, simple or branched, woolly, with bitter juice; leaves petiolate, toothed, rugose; flowers small, white, in dense axillary clusters; calyx cylindrical, 5- to 10-veined, regularly 5- or 10-toothed, the teeth acute or aristate, spreading or recurved, nearly equal; corolla 2-lipped, the upper lip erect, entire or emarginate, the lower lip spreading, 3-cleft, its middle lobe often emarginate; stamens 4, included, didynamous, the upper pair shorter; anthers 2-loculed; style shortly cleft; ovary deeply 4-lobed, smooth.

***Marrubium vulgare* L.** Common Horehound. Stems erect, stout, white-woolly, especially below, 2–10 dm tall; leaves 1–5 cm long, oval to nearly orbicular, crenate-dentate, rugose veined, obtuse to rounded apically, narrowed to a subcordate base, woolly beneath, caescent above, the petioles 1–2 cm long; flowers in dense axillary clusters, whitish; calyx teeth usually 10, subulate, recurved; $2n = 34$. Disturbed sites throughout the state, where especially common on sheep backgrounds, road sides, and trails, at 850 to 2600 m; adventive from

Eurasia, now widely established in North America; 61 (x).

***Mentha* L.**

Aromatic perennial herbs from rhizomes; stems erect, often diffusely branched; leaves opposite, punctate, toothed, usually petiolate; flowers in dense axillary clusters or in terminal spikes; calyx campanulate to cylindrical, 10-veined, regular or slightly 2-lipped, 5-toothed; corolla funnelliform or campanulate, 2-lipped, the tube shorter than the calyx, the upper lip entire or emarginate, the lower lip 3-lobed; stamens 4, equal, included or exerted; nutlets ovoid, smooth.

- 1. Flowers in dense axillary whorls; plants indigenous in moist habitats *M. arvensis*
- Flowers mainly in terminal spikes; plants cultivated, persisting, and escaping 2
- 2(1). Leaves sessile or subsessile; spikes narrow, mostly interrupted *M. spicata*
- Leaves petiolate; spikes thick, dense 3
- 3(2). Calyx hirsute; leaves lanceolate, acute *M. piperita*
- Calyx glabrous; leaves ovate, obtuse *M. citrata*

***Mentha arvensis* L.** Field Mint. [*M. canadensis* L.; *M. borealis* Michx.]. Stems 1.5–8 dm tall, ascending to erect, simple or branched; leaves short-petiolate, the blades elliptic to lanceolate, ovate, or oval, 1–8 cm long, 0.7–3 cm wide, once to twice serrate, acuminate, acute, obtuse or rounded apically, usually glandular-punctate; calyx 2–3 mm long, pubescent and often glandular, the triangular teeth shorter than the tube; corolla purplish to pinkish or white, 4–6 mm long; $2n = 24, 36, 72, 90$. Moist places, especially along stream and ditch banks, at 750 to 3000 m in all Utah counties; circumboreal, widely distributed in North America; 114 (xxv). Our plants belong to var. ***glabrata* (Benth.) Fern.** [*M. canadensis* var. ***glabrata* Benth.**].

***Mentha citrata* Ehrh.** Bergamot Mint; Lemmon Mint. Stems 3–6 dm tall, from leafy-bracted stolons, usually purplish; leaves with the odor of lemon when crushed, petiolate, the blades mainly 2–6 cm long, 1.5–4 cm wide, ovate to oval, obtuse or the upper acute, rounded or subcordate basally, thin, rather shallowly serrate; flower whorls in thick dense terminal spikes, sometimes also some in the upper leaf axils; spikes mostly 2–2.5 cm long; calyx teeth subulate, glabrous, shorter than the tube; corolla rose, about twice as long as the calyx; $2n = 36, 48$. Cultivated spice plant, escaping and established along irrigation canals in Washington County; introduced from Europe; sparingly established in the western U.S.; 2 (0). This plant is sometimes regarded as *M. piperita* var. ***citrata* (Ehrh.) Jacq.**

***Mentha piperita* L.** Peppermint. Stems mainly 3–8 dm tall, often from leafy-bracteate stolons; leaves petiolate, the blades lance-ovate to elliptic, 1.5–6 cm long, 1–3 cm wide, serrate, glandular-punctate; calyx 2.5–4 mm long, the tube glandular, the lance-acuminate teeth hispid, shorter than the tube; corolla pink purple to white, 4–5 mm long. Stream and ditch banks, bottom lands, and moist roadsides at 1200 to 1800 m in Salt Lake, Tooele, Utah, and Washington counties; cultivated spice plant, escaping and established; widespread in North America; introduced from Europe; 9 (i). Peppermint is considered to have been derived by hybridization between the European species *M. aquatica* L. and *M. spicata* L.

Mentha spicata L. Spearmint. Stems mainly 3–10 dm tall or more, usually branched, often from leafy-bracteate stolons; leaves sessile or subsessile, the blades 2–8 cm long, 0.6–2.5 cm broad, lanceolate to lance-oblong, elliptic, or ovate, serrate, glandular-punctate; calyx 1.5–2 mm long, the tube glandular, the lance-acuminate teeth hispid, subequal to the tube; corolla pink to white, 3–4 mm long. Cultivated aromatic herbs, escaping, and now established along stream and canal banks and in other moist sites at 100 to 1900 m in Box Elder, Cache, Emery, Millard, Salt Lake, Tooele, Utah, Wasatch, Washington and Weber counties; introduced from Europe, now widely distributed in North America; 22 (i).

Molucella L.

Annual herbs, glabrous; leaves coarsely toothed, rounded, petiolate; flowers several, in axils of upper leaves; calyx with lobes wholly united into a flaring funnel shaped structure; corolla white or pinkish, the upper lip concave or galeate, including the stamens; stamens 4, paired; nutlets truncate at the apex.

Molucella laevis L. Stems erect, mainly 2–8 dm tall, simple or branched; leaves 2–5 cm long, suborbicular, coarsely toothed, the teeth broadly rounded; petioles subequal to the blade; flowers fragrant, several in the axils of upper leaves, subtended by several slender spreading or reflexed spines; calyx campanulate, the lobes united into a broadly dilated, funnellform, membranous, reticulately veined structure 2–3.5 cm long, subtended by several spines; corolla included, white, tipped with pink, 2-lipped, the upper lip arched and including the stamens. Creosote bush to pinyon-juniper communities at 960 to 1850 m in Washington County; cultivated ornamental, introduced from Asia, escaping in the southwestern U. S.; 10 (iii).

Monarda L.

Erect or ascending herbs or shrubs; leaves odoriferous, ovate to lanceolate or linear, entire or toothed; flowers in a few verticils closely subtended by bracts to form head-like clusters, these in interrupted spikes and/or terminating the branches; calyx tubular, 13- to 15-veined, usually hairy in the throat; corolla elongated, strongly 2-lipped, with a slightly expanded throat; lips linear or oblong, somewhat equal, the upper lip erect and arched, entire or slightly notched, the lower lip spreading and 3-lobed apically, the lateral lobes ovate and obtuse, the middle lobe narrower and emarginate; stamens 2, elongated, ascending.

1. Heads solitary and terminal, rarely 2; upper corolla lip somewhat arcuate, but usually erect and straight; stamens exerted *M. fistulosa*
- Heads 2 or more, forming an interrupted spike; upper corolla lip sicklelike; stamens usually not exerted *M. pectinata*

Monarda fistulosa L. Beebalm. Stems 3–10 dm tall, rarely branched, retrorsely pubescent above or spreading hairy, or glabrous below or throughout; leaves 3.5–9 cm long, 1–3.5 cm broad, ovate to ovate-lanceolate or lanceolate, serrate to entire, softly hirtellous to glabrate; petioles 2–10 mm long; glomerules 15–25 mm broad, the outer bracts subfoliar, frequently tinged pinkish, reflexed; calyx 7–12 mm long, sometimes tinged pinkish,

puberulent, the teeth acuminate, ca 1 mm long, the throat hirsute within; corolla lavender to rose purple, 2.5–3.8 cm long, pubescent, the tube 1.5–2.5 cm long, enlarged upwards; n = 17, 18. Mountain brush, pinyon-juniper, and ponderosa pine communities at 2050 to 2600 m in San Juan County; British Columbia to Manitoba, south to Arizona, Texas, and Georgia; 3 (0). Our indigenous plants belong to var. *mentifolia* (Graham) Fern. [*M. mentifolia* Graham]. The species is known from cultivation in Utah County; 1 (i).

Monarda pectinata Nutt. Plains Beebalm. Stems mainly 2–3 dm tall, commonly branched, retrorsely hairy; leaves 2–5 cm long, 6–12 mm wide, oblong to oblong-lanceolate, glabrous or sparingly puberulent, remotely serrate to subentire; petioles 5–15 mm long; glomerules 1.5–2.5 cm broad; foliar bracts nearly or quite glabrous, straight and flat, divergent from the base, greenish, 2–7 mm wide, acuminate to a spinose slender bristle, the margins regularly pectinate-ciliate; calyx tube 6–8 mm long, puberulent or glabrous, the throat hirsute, the slender teeth 2–3 mm long, often colored; corolla pink or nearly white, the tube 8–14 mm long, the lips subequal and usually shorter than the tube; n = 18. Pinyon-juniper, ponderosa pine, and sagebrush communities at 1400 to 1700 m in Kane, San Juan, and Washington counties; Colorado and Nebraska, south to Arizona, New Mexico, and Texas; 6 (ii). The plants are strongly and pervasively scented.

Monardella Benth.

Aromatic perennial herbs; stems usually branched; leaves elliptic or oblong, entire or denticulate; flowers borne in a terminal head subtended by broad, often colored, bracts; calyx tubular, nearly equally 5-toothed, the tube usually 15-veined, glabrous in the throat, the upper lip erect, 2-cleft, the lower 3-parted, all lobes linear to narrowly oblong; corolla white with purple spots or rose colored, the tube longer than the calyx, the lobes oblong-linear, subequal; stamens 4, exerted; nutlets smooth, oblong.

Monardella odoratissima Benth. [*Madronella oblongifolia* Rydb, type from Mt. Nebo; *Madronella sessilifolia* Rydb., type from Washington County; *M. parvifolia* Greene]. Plants clumpforming; stems mostly woody below, ascending to erect, puberulent above, 2–4 dm tall; leaves 2–3 cm long, narrowly to broadly lanceolate or oblong, tapering to a subsessile base, green but puberulent; bracts broadly ovate to orbicular, subequal to the calyces, rounded or obtuse apically, membranous and rose-purple to whitish, pubescent on veins and ciliate; calyx 5–8 mm long, 13-veined; corolla pale purple to rose, ca 15 mm long, the tube surpassing the calyx, the lobes very slender. Sagebrush, mountain brush, pinyon-juniper, ponderosa pine, aspen, tall forb, and spruce-fir communities at 2170 to 3700 m in all or nearly all Utah counties; Washington east to Wyoming, south to California and New Mexico; 148 (xiii).

Nepeta L.

Aromatic perennial herbs; stems leafy and branched; leaves truncate or subcordate basally, rather coarsely toothed; flowers cymose, white to purplish mottled, borne in interrupted spikes; calyx tubular or campanulate, the tube somewhat constricted above, the 5 teeth deltoid, subulate, subequal in length, but the lower 3 basally joined; corolla tube longer than the calyx,

2-lipped, the upper lip erect, notched, the lower lip spreading and 3-lobed, the middle lobe larger; stamens 4, paired, the upper pair longer, exerted; anthers with 2 divergent sacs; nutlets smooth.

Nepeta cataria L. Catnip. Stems erect, 3–10 dm tall, with ascending branches, canescent-tomentose; leaves ovate to oblong, 2–9 cm long, 0.8–6 cm wide, usually cordate basally, coarsely crenate-serrate, with petioles 1–4 cm long; calyx urceolate, very pubescent, ca 6 mm long, the teeth subulate; corolla whitish, spotted with purple, 7–12 mm long; $2n = 18, 30, 34, 36$. Usually in moist sites in sagebrush, mountain brush, and pinyon-juniper communities at 1400 to 2300 m in Box Elder, Cache, Davis, Kane, Millard, Piute, Salt Lake, Sanpete, Tooele, Uintah, Utah, Wasatch, Washington, and Weber counties; adventive from Europe, now widely distributed in North America; 54 (iii).

Physostegia Benth.

Perennial herbs; stems erect, leafy; leaves sessile, toothed; flowers purple to rose pink, in terminal, showy, spikelike racemes; calyx campanulate-tubular, more or less inflated, the 5 teeth subequal, short; corolla with the tube dilated upward, 2-lipped, the upper erect and slightly concave, entire, the lower lip spreading and 3-lobed, the middle lobe emarginate; stamens 4, paired, the uppermost pair shorter, ascending under the upper lip, the anther sacs parallel; nutlets smooth.

1. Flowers usually less than 15 mm long; leaves thin in texture *P. parviflora*
 — Flowers mainly 20–25 mm long or more; leaves firm in texture *P. virginiana*

Physostegia parviflora Nutt. ex Gray Obedient Plant. [*Dracocephalum nuttallii* Britt.]. Stems arising from vertical rhizomes, simple, or branched above, mainly 2–10 dm tall; leaves 3–10 cm long, 5–20 mm wide, the lower gradually reduced and deciduous, linear-oblong to elliptic-oblong, sessile, serrate or subentire, those near the inflorescence lanceolate or lance-ovate; flowers subsessile in closely flowered racemes 2–8 cm long; calyx 4–6 mm long, finely glandular-puberulent, shortly and unevenly toothed; corolla lavender-purple, 12–16 mm long, the lips 3–5 mm long. Stream terraces and other palustrine and riparian sites in Cache and Rich counties; British Columbia to Saskatchewan, south to Oregon, Idaho, and Nebraska; 4 (0).

Physostegia virginiana (L.) Benth. [*Dracocephalum virginianum* L.]. Stems simple or branched above, 2–7 dm tall or more; leaves 3–10 cm long, 5–15 mm wide, gradually reduced upwards, linear-elliptic, sessile, sharply serrate, the uppermost becoming nearly linear; flowers subsessile in closely flowered racemes 2–15 cm long; calyx 5–8 mm long, finely glandular-puberulent, the teeth 1.5–2.5 mm long, unequal; corolla lavender-purple, 20–25 mm long or more, the lips 5–10 mm long. Cultivated ornamental, persisting, and to be expected in moist disturbed sites in lower elevations portions of Utah County; eastern U. S.; 2 (0).

Poliomnitha Gray

Hoary canescent shrubs; leaves entire; flowers pink, purple, or white, clustered in the leafy upper axils; calyx tubular, 13– to 15-veined, the tube shaggy-pilose, the teeth equal or nearly so, the throat strongly constricted;

corolla 2-lipped, the upper lip erect and emarginate, the lower lip 3-cleft, more or less constricted in the tube with coarse ascending hairs; fertile stamens 2, ascending against the upper lip; nutlets smooth, oblong.

Poliomnitha incana (Torr.) Gray Purple Sage. [*Hedeoma incana* Torr.]. Shrubs, mainly 3–10 dm tall; leaves sessile, 1–3 cm long, linear to oblong, densely white-tomentose with simple hairs, veinless, the upper floral bracts usually shorter than the flowers; calyx 15-veined, oblong, or cylindrical, densely white villous, 6–7 mm long, the subulate teeth conspicuous; corolla 10–14 mm long, lavender to whitish, with purple dots on the lower lip, the tube pilose at the summit. Sandy sites, often on stabilized dunes with ephedra, blackbrush, rabbitbrush, other mixed desert shrub, and pinyon-juniper communities at 1300 to 2000 m in Emery, Garfield, Grand, Kane, San Juan, and Wayne counties; California and Nevada to Texas; 104 (xiii).

Prunella L.

Perennial herbs from tap or fibrous roots and often with rhizomes, pubescent with multicellular hairs; leaves petiolate, crenate to entire; flowers short-pedicellate, borne in clusters aggregated into dense spikelike inflorescences, the bracts entire, ciliate; calyx 2-lipped, the upper lip shallowly 3-toothed, the lower lip deeply cleft into 2 narrow teeth; corolla bilabiate, the upper lip entire or nearly so, the lower lip 3-lobed; stamens with anthers 4, the filaments notched near the apex, the anthers glabrous.

Prunella vulgaris L. Heal-all. Stems 0.6–5 dm long, ascending to erect or simple; leaf blades lance-ovate to oblong or elliptic, 2–9 cm long, 0.7–4 cm broad, minutely puberulent to glabrous; spikes 1–2 cm broad, 2–8 cm long; calyx 6–10 mm long, sparsely villous, purplish, the lower teeth subequal to the tube; corolla pink purple to pink or white, 12–18 mm long, glabrous. Wet meadows, streambanks, and other moist sites in ponderosa pine, cottonwood, lodgepole pine, aspen, and spruce communities at 1370 to 3400 m in Duchesne, Emery, Garfield, Iron, Kane, Morgan, Rich, Salt Lake, Summit, Uintah, Utah, Wasatch, and Weber counties; widespread in temperate North America; Eurasia; 23 (iv). Our materials have been assigned to var. *lancoolata* (Barton) Fern. [*P. pennsylvanica* var. *lancoolata* Barton].

Salazaria Torr.

Divariately branched shrubs; stems canescent, spinose; leaves small, entire or rarely toothed, shortly petiolate; flowers in loose spikelike racemes; calyx equally 2-lobed, the lips entire, becoming inflated and globular in fruit; corolla purple, 2-lipped, the upper lip arched, the lower with recurved sides and small lateral lobes; anthers ciliate, the upper pair of stamens 2-loculed, the lower pair 1-loculed; nutlets tuberculate.

Salazaria mexicana Torr. Bladder Sage; Paperbag Bush. Rounded shrubs, mainly 3–10 dm tall, the soft twigs pubescent; leaves green, 1–1.5 cm long, glabrous or minutely hispidulous, oblong or broadly lanceolate; racemes 5–10 cm long; calyx 8 mm long in anthesis, in fruit becoming inflated papery and 1–2 cm long; corolla 15–18 mm long, pubescent externally, the throat pale, the lips dark purple; nutlets olive brown, peltate on raised gynobases, tessellately tubercled. Joshua tree, blackbrush, mixed desert shrub, and pinyon-juniper commu-

nities at 940 to 1400 m in Washington County, California to Texas and Mexico; 24 (vii).

Salvia L.

Herbs or shrubs, usually strongly aromatic; leaves opposite, sometimes mostly basal, entire or toothed; flowers in terminal bracteate spikelike racemes; calyx tubular to campanulate or ovoid, 2-lipped, the upper lip entire or 3-toothed, the lower with 2 lobes; corolla tubular, strongly 2-lipped, the upper lip concave, entire or 2-notched, the lower lip longer than the upper, 3-toothed and spreading; stamens 2, the connective between the anther sacs well developed and usually longer than the filament, bearing 1 sac terminal on 1 branch, the other lacking a sac and deflexed; style 2-cleft apically, the ovary deeply 4-parted; nutlets smooth.

1. Flowers 4–6 cm long, bright red; cultivated herbs *S. splendens*
- Flowers less than 2.5 cm long, not bright red; cultivated or indigenous herbs or shrubs 2
- 2(1). Plants shrubs or subshrubs 3
- Plants herbaceous 4
- 3(2). Leaves white-woolly beneath; cultivated garden sage *S. officinalis*
- Leaves not white-woolly; indigenous shrubs of south-central and western Utah *S. dorrii*
- 4(2). Corolla pale yellow; herbage floccose woolly, eventually partly glabrate *S. aethiopsis* L.
- Corolla blue to white or marked with yellow; herbage coarsely hairy to subglabrate 5
- 5(4). Leaves dissected, mainly basal; lower anther sac fertile; plants annual, indigenous in Washington County *S. columbariae*
- Leaves not dissected, not mainly basal; anther sacs various; plants annual or perennial, variously distributed 6
- 6(5). Leaves ovate, coarsely dentate, the lower ones 6–25 cm long *S. scalarea*
- Leaves oblong to lanceolate or linear, entire or denticulate, mainly less than 10 cm long 7
- 7(6). Corolla 15 mm long or more, the tube evidently exerted; calyx puberulent to tomentose *S. azurea*
- Corolla less than 15 mm long, the tube scarcely exerted; calyx only minutely hairy on the veins *S. reflexa*

Salvia azurea Lam. Perennial herbs; stems erect, 3–16 dm tall, glabrous or pubescent with reflexed hairs; leaves 5–10 cm long, lanceolate to oblong or linear, obtuse to acute, tapering to a very short petiole, serrate to entire; inflorescence elongate, spikelike, composed of numerous verticels, these dense above, remote below; bracts subulate; calyx oblong-campanulate, 6–9 mm long, slightly 2-lipped, the upper lip very broad and obtuse, the lower lobes narrower and all similar; corolla deep blue to nearly white, 15–20 mm long; anterior part of connective deflexed, ca 4 mm long, linear. Cultivated ornamental, escaping and persisting in disturbed sites at 1400 to 1800 m in Box Elder, Cache, Salt Lake, and Utah counties; South Carolina to Florida, west to Nebraska, Colorado, Texas, and Mexico; 5 (0).

Salvia columbariae Benth. Chia. Annual; stems branching and leafy at the base, 1–5 dm tall, cinereous with short retrorse hairs; basal leaves 3–12 cm long, the

petioles subequal to the blades, oblong-ovate, pinnatifid or bipinnatifid into toothed or incised divisions; flowers in capitate verticels 1–3 cm wide, terminating the stems and branches; bracts suborbicular, awn-tipped, green or often suffused with purple; calyx ca 1 cm long, purplish, arcuate, the middle spinose tooth of the upper lip with small lateral lobes and a large emarginate middle lobe; corolla purplish or white; stamens with upper arm of connective linear and lacking an anther, the lower branch deflexed and with a fertile anther. Creosote bush, Joshua tree, blackbrush, and pinyon-juniper communities at 800 to 1200 m in Washington County; California, Nevada, Arizona, and Mexico; 16 (v).

Salvia dorrii (Kellogg) Abrams Dorr Sage. [*Audibertia dorrii* Kellogg; *Audibertiella argentea* Rydb.; *S. pilosa* Merriam; *S. carnosa* Dougl.; *S. carnosa* var. *pilosa* Jepson]. Low rounded shrubs, mainly 3–8 dm tall, densely scurfy-canescens, punctate-glandular; leaves 10–25 mm long, 7–15 mm wide, obovate to spatulate or oval, rounded or emarginate apically, abruptly narrowed to a slender petiole, this 5–8 mm long; inflorescence of (1) 2–5 verticels 1.5–2.5 cm wide; bracts oblong-elliptic to round, purplish or greenish, conspicuously ciliate, pilose or glabrous on the back; calyx ca 6 mm long, the lower lip deeply 2-toothed, the upper entire; corolla blue, 10–12 mm long, the upper lip erect and 2–3 mm long, the lower 3-lobed with the middle lobe erose; stamens conspicuously exerted, the upper ones short and sterile. Creosote bush, Joshua tree, blackbrush, shadscale, sagebrush, mountain brush, and pinyon-juniper communities at 830 to 2600 m in Beaver, Box Elder, Iron, Juab, Kane, Millard, Tooele, and Washington counties; Idaho, Nevada, Arizona, and California; 60 (xiv). Our materials are assignable to ssp. *dorrii*, but some of the plants with nearly glabrous bracts from Washington County approach ssp. *argentea* (Rydb.) Munz.

Salvia officinalis L. Garden Sage. Subshrubs, mainly 2–7 dm tall, more or less white woolly; leaves oblong, 2–5 cm long, petiolate, entire or crenate, acute or obtuse, the surface rugose; inflorescence racemose, the racemes mostly simple, with few interrupted verticels; bracts ovate to ovate-lanceolate, acuminate; calyx campanulate, membranaceous, purplish tinged, somewhat 2-lipped, the 2 lower teeth longer than the 3 upper ones, all subulate-acuminate; corolla 12–20 mm long, purple, blue, or white, with a hairy ring inside; 2n = 14. Cultivated spice plant, rarely escaping, but long persisting at 1300 to 1600 m in Salt Lake and Utah counties; introduced from Europe; 5 (0).

Salvia reflexa Hornem. [*S. lanceolata* Willd.]. Annuals; stems simple to much branched, 2–7 dm tall, pubescent or glabrous; leaves 2.5–5 cm long, 4–12 mm wide, lanceolate to linear, obtuse to acute apically, tapering to a slender petiole to 15 mm long, irregularly serrate to subentire; flowers 1–3 per whorl, the winged pedicels 2–3 mm long, borne in a slender interrupted spike; bracts lanceolate, deciduous, 2–5 mm long; calyx 4–8 mm long, deeply 2-lipped, minutely hairy on the veins, cleft ca one-half to the base, the upper lip entire; corolla blue to whitish, only slightly exerted, the tube 4–4.5 mm long, the erect upper lip 2.5–3 mm long, the lower lip rounded, 4.5–5 mm wide; 2n = 20. Desert shrub, sagebrush, pinyon-juniper, and riparian sites, often in disturbed lands, at 1300 to 1800 m in Beaver, Grand, Salt Lake, Uintah, Utah, and Wayne counties; Wisconsin to Montana, south to Arkansas, Texas, Arizona, and Mexico; 8 (0).

Salvia sclarea L. Coarse biennials; stems erect, 5–15 dm tall, spreading hairy, with the hairs gland-tipped above; lowermost leaves long-petiolate, the blades 7–20 cm long, ovate to ovate-oblong, rugose, with toothed margins, subcordate basally; cauline leaves reduced upwards; inflorescence freely branched, with the verticels of flowers scattered along the branches; bracts conspicuous, 1–3 cm long, broadly ovate, caudate-acuminate, purplish tinged; calyx 2-lipped, glandular, the upper lip well developed, aristate, lateral teeth 1.5–3 mm long, well separated from the shorter central tooth; corolla blue to white, or marked with yellow, 15–30 mm long, the upper lip strongly arched, more or less galeate, longer than the tube and lower lip; stamens exerted; $2n = 22$. Disturbed sites at 1400 to 2000 m in Cache, Salt Lake, and Wasatch counties; widespread in the western U. S.; adventive from Europe; 3 (0).

Salvia splendens Sellow Annual herbs; stems erect, mainly 2–9 dm tall, commonly branched, glabrous or the upper parts villous with colored hairs; leaves 5–8 cm long, ovate, petiolate, acuminate, dentate; inflorescence terminating the branches, racemose or paniculate, the verticels 2- to 6-flowered; bracts ovate, acuminate, 12–16 mm long, reddish; calyx campanulate, mainly 2–3 cm long, with 3 broadly ovate acute teeth, scarlet; corolla 4–5 cm long, scarlet or the tube yellowish, glabrous to villous, with a hairy ring inside; $n = 8, 22$. Cultivated ornamental in greenhouses and gardens at lower elevations in Utah; introduced from Brazil; 2 (0).

Satureja L.

Perennial herbs; stems leafy, erect, hirsute; leaves oval to narrowly ovate, subentire; flowers white to purple, usually rose colored, in dense cymes, these terminal and headlike or forming an interrupted spike; calyx tubular, 2-lipped, the upper with 3 short teeth; corolla 2-lipped, the upper lip mostly erect, somewhat concave, entire or emarginate, the lower lip spreading and 3-lobed; stamens 4, paired, the upper slightly shorter; anthers with 2 divergent sacs; nutlets smooth.

Satureja vulgaris (L.) Fritsch [*Clinopodium vulgare* L.]. Stems 1–5 dm tall, from rhizomes, simple, more or less hairy; leaves 1–4 cm long, 6–15 mm wide, ovate, entire or minutely denticulate; flowers in dense axillary and terminal clusters; calyx 8–9 mm long, villous-hirsute, the lobes subulate-aristate; corolla 8–12 mm long, purple or white, pubescent externally; $2n = 20, 40$. Sagebrush, mountain brush, and ponderosa pine communities at ca 2300 m in Washington County; Manitoba to Nova Scotia, south to Arizona, New Mexico, and North Carolina; Eurasia; 3 (ii).

Scutellaria L.

Perennial herbs, commonly rhizomatous, not aromatic; leaves opposite, entire or toothed; flowers 1–3 in leaf axils or in bracteate racemes or spikes; calyx campanulate in flower, splitting to the base at maturity, strongly 2-lipped, the lips entire, the upper longer lip usually falling away, in fruit with an appendage or scale; corolla blue, violet, or white, well exerted, 2-lipped, dilated above the throat, the upper lip arched, entire or emarginate, the lower lip spreading or deflexed, with a large central lobe and two small lateral ones; stamens 4, in 2 pairs, ascending under the upper lip, ciliate or bearded; nutlets variously marked.

- 1. Leaves crenate, thin, mostly 3–9 cm long, corolla dull blue; plants common *S. galericulata*
- Leaves entire or subentire, firm, mostly less than 3 cm long; corolla blue; plants uncommon to rare 2
- 2(1). Plants 0.5–1 dm tall; stems retrorsely pubescent *S. nana*
- Plants usually 1–3 dm tall; stems with hairs spreading or ascending *S. antirrhinoides*

Scutellaria antirrhinoides Benth. Skullcap. Perennial herbs; stems 1–3 dm tall or more, puberulent with ascending incurved hairs, and more or less glandular puberulent; leaves 1–2 (3) cm long, the blades oblong-ovate to oblong-elliptic, entire; petioles 5–20 mm long; flowers solitary in axils of upper leaves; corolla violet blue, the tube and galea 12–22 mm long, the throat closed. Mountain brush community at 1500 to 2000 m in Morgan and Weber counties; Washington to Idaho, south to California; 2 (0).

Scutellaria galericulata L. Perennial herbs; stems 1.5–6 dm tall, commonly pubescent on angles with short curly hairs, sometimes also glandular pubescent; leaves 3–6 cm long or more, oblong-ovate to lanceolate, truncate to subcordate basally, acute, crenate-serrate, glabrous above or nearly so, paler and pubescent or glabrous beneath; petioles 1–3 mm long; flowers solitary in axils of upper leaves; corolla blue, 14–22 mm long; $n = 8, 16$. Moist meadows and streamside communities at 1800 to 2700 m in Beaver, Box Elder, Cache, Davis, Garfield, Piute, Salt Lake, Sevier, Uintah, Utah, Wasatch, and Weber counties; Alaska to Newfoundland, south to California, Arizona, Wisconsin, and California; 21 (iv).

Scutellaria nana Gray Perennial herbs; stems 5–10 cm tall, branched near the base, densely and finely retrorsely puberulent; leaves 1–2 cm long, 3–7 mm wide, oblanceolate to oblong-ovate, or elliptic, entire; flowers solitary in leaf axils; corolla blue, with a pale tube, 14–22 mm long. Sagebrush and pinyon-juniper communities at 1800 to 2300 m in Iron and Washington counties; Oregon and Idaho, south to California and Nevada; 4 (iii). Our plants are assignable to var. *sapphirina* Barneby.

Stachys L.

Perennial herbs from rhizomes; stems erect, leafy; leaves oblong, sessile or nearly so, toothed; flowers few to many, borne in whorls, in dense or interrupted terminal spikes, or also in upper leaf axils; calyx turbinate or campanulate, 5- to 10-veined, enlarged somewhat at maturity, the 5 teeth nearly equal, more or less spinulose apically; corolla white, pallid, or rose purple, 2-lipped, the upper lip erect, entire or notched, lower lip spreading, 3- or rarely 2-lobed; stamens 4, the upper pair shorter, ascending under the upper lip; nutlets ovoid or oblong.

- 1. Lower leaves with petioles ca 6 mm long or longer; pubescence of cobwebby, soft-woolly hairs 2
- Lower leaves sessile or with petioles to 4 mm long; pubescence pilose or canescent, not soft woolly; plants of various distribution 3
- 2(1). Leaves definitely bicolorled; spikes ultimately much interrupted; plants of Washington County *S. albens*
- Leaves not much bicolorled, about as pale above as beneath; inflorescence compact; plants cultivated and escaping *S. byzantina*

- 3(1). Leaves 15–40 mm wide, toothed, clothed with spreading, pilose hairs; plants widespread *S. palustris*
 — Leaves 7–12 mm wide, entire or very finely toothed, clothed with silvery strigose-canescens hairs; plants of Kane County *S. rothrockii*

Stachys albens Gray Stems stout, 3–10 dm tall, simple or branched, densely cobwebby; leaves 3–12 cm long, narrowly to broadly ovate-oblong, cordate basally, villous-tomentose (especially beneath), crenate-serrate, the petioles 0.6–5 cm long; spikes 1–2 dm long, more or less interrupted at maturity; calyx 5–7 mm long, woolly, the deltoid-ovate teeth cuspidate; corolla white or pinkish, with purple veins, the tube 6–8 mm long, the upper lip 3.5–5.5 mm long, the lower 5–8 mm long. Riparian, creosote bush, pinyon-juniper, mountain brush, and aspen communities at 800 to 2100 m in Washington county; Nevada and California; 10 (v).

Stachys byzantina C. Koch. Woolly Betony; Lambs-ears. [*S. olympica* authors, not Koch; *S. lanata* Jacq, not Crantz]. Stems 2.5–8 dm tall, simple or branched at the base; leaves 4–9 (10) cm long, 1.5–3.5 cm wide, the petioles 0.5–3 cm long, the blades lanceolate to ovate or elliptic; entire to finely toothed; white woolly on both sides; spikes 3–15 cm long, compact or the lower vertical separated; calyx 8–12 mm long, the tube ca 3–4 mm long; corolla pink to purple, densely woolly. Cultivated ornamental, escaping and persisting, in sagebrush community at 2257 m in Summit County; introduced from Asia; 2(0).

Stachys palustris L. Marsh Betony. [*S. asperrima* Rydb. Type from Jordan, Salt Lake County]. Stems 1.5–8 dm tall, spreading hirsute or villous, especially above; leaves 4–8 cm long, ovate-oblong, villous or pilose with spreading hairs, crenate-serrate; calyx 5–9 mm long, hispidulose, the deltoid teeth cuspidate; corolla pale rose, veined with deeper red, the tube subequal to the calyx, (8) 10–15 mm long, the lower lip 6–8 mm long, villous on the back; n = 32. Riparian or palustrine communities at 1500 to 2800 m in Cache, Daggett, Duchesne, Garfield, Iron, Kane, Piute, Rich, Salt Lake, Uintah, Utah, Wasatch, and Weber counties; widely distributed in North America; circumboreal; 21 (iii). Our plants have been assigned to var. *pilosa* (Nutt.) Fern. [*S. pilosa* Nutt.].

Stachys rothrockii Gray Stems 1–3.5 dm tall, simple or branched from the summit of a caudex, strigose-canescens or tomentose; leaves 2–6 cm long, 7–12 mm wide, sessile or subsessile, oblong or narrowly elliptic-lanceolate, entire or finely toothed; spikes 8–15 cm long; calyx 6–8 mm long, the deltoid lobes shortly cuspidate; corolla whitish, with purple lines, 10–13 mm long, the lower lip 3–4 mm long, the upper lip 4–5 mm long, woolly villous externally. Tropic Shale outcrops in pinyon-juniper and salt desert shrub communities at 1615 to 2200 m in Kane County; New Mexico and Arizona; 4 (ii).

Teucrium L.

Perennial herbs; leaves simple, serrate; flowers terminal, in slender spikes; calyx saccate, toothed or deeply 5-lobed; corolla pinkish, bluish, or nearly white, the upper lip very short, deeply notched, the lower lip conspicuous and spreading, with small lateral lobes; stamens 4, paired; nutlets roughened.

Teucrium canadense L. American Germander. Stems 3–8 dm tall, erect, branching mostly above, if at all,

spreading hairy throughout, more or less glandular upward; leaves 4–9 cm long, ovate, oblong, or lanceolate, serrate, villous, at least beneath; calyx 5–7 mm long, villous to tomentose, the teeth unequal, shorter than the tube; corolla 7–15 mm long, rose to purplish, or sometimes cream colored; n = 16. Riparian and palustrine habitats at 1400 to 2100 m in Cache and Utah counties; widespread in North America and Mexico; 2 (0). Our plants have been assigned to var. *occidentale* (Gray) McClintock & Epling [*T. occidentale* Gray]. They are characterized by having glandular hairs, especially in the inflorescence.

Thymus L.

Shrubs or subshrubs; stems decumbent to erect; leaves small, entire; flowers verticillate in axils of upper leaves; calyx 2-lipped, 10– to 13-veined, villous at the throat within, the upper lip 3-toothed, the lower one more deeply cleft into 2 narrow lobes; corolla 2-lipped, the upper lip nearly flat, the lower 3-lobed and spreading; stamens 4, mostly exerted, subequal or the lower pair the longer.

Thymus serpyllum L. Thyme. Stems 10–25 cm tall, the slender branches somewhat woody, with dense whitish pubescence; leaves 3–10 mm long, petiolate, elliptic to lanceolate, ovate, or obovate; inflorescence dense and often headlike or racemose and interrupted, the whorls rather loosely several- to many-flowered; calyx ca 3 mm long, hairy in the throat, the teeth of upper lip lanceolate, of the lower lip subulate and ciliate; corolla lilac or purplish, ca 4 mm long. Cultivated ornamental, persisting, but not established, at lower elevation regions of Salt Lake and Utah counties; introduced from Europe; 4 (0). Another species, *Thymus vulgaris* L., with the leaves sessile rather than petiolate is to be expected in cultivation in Utah.

LEGUMINOSAE A. L. Juss.

Legume Family

Herbs, shrubs, or trees; leaves alternate, pinnately or palmately compound, or simple, stipulate; flowers perfect, irregular or regular, usually borne in racemes; calyx 5-lobed; petals 5 (a banner, 2 wings, and 2 keels) or fewer, less commonly reduced to 1 (banner), or lacking; stamens 10 or 5, or numerous, diadelphous, monadelphous, or distinct; pistil 1, the ovary superior, 1- or 2-loculed, 1-carpeled, the style and stigma 1; fruit (pod) a legume or loment, sessile, subsessile, stipitate, or with a gynophore, dehiscent or indehiscent; x = 5–14. [Fabaceae Lindl.].

1. Flowers regular, in dense heads or compact spicate racemes; stamens 5 or numerous (Mimosoideae) . . . Key 1

- Flowers irregular (only slightly so in some); stamens 10 or fewer 2
- 2(1). Corolla not papilionaceous, sometimes nearly regular, the upper petal enclosed by the others; stamens 10 or fewer, commonly distinct (Caesalpinoideae) Key 2
- Corolla papilionaceous, the upper petal (banner) enclosing the wing and keel petals in bud, much reduced in *Amorpha*, or lacking in *Dalea*, *Psorothamnus*, and *Parryella*; stamens 10 or 5 (Papilionoideae) 3
- 3(2). Plants woody; trees, shrubs, or woody vines Key 3
- Plants herbaceous perennials or annuals 4
- 4(3). Leaves even-pinnate Key 4
- Leaves odd-pinnate or simple 5
- 5(4). Leaflets 3 only Key 5
- Leaflets 5 or more, or the leaves simple Key 6

Key 1.

Flowers regular; stamens 5 or numerous (Mimosoidea).

- 1. Plants herbaceous; flowers whitish, in compact heads; stamens shortly exerted *Desmanthus*
- Plants woody, either trees or shrubs; flowers variously colored, in racemes or spikes or, if in heads, the stamens long-exserted 2
- 2(1). Trees, unarmed, cultivated; flowers in umbellate heads; stamens long-exserted, the filaments commonly 20–30 mm long *Albizia*
- Trees or shrubs, armed, indigenous; flowers in spicate racemes; stamens included or shortly exerted, the filaments less than 5 mm long 3
- 3(2). Spines recurved; pods flat, 10–20 mm broad, brown at maturity *Acacia*
- Spines straight; pods spirally coiled or if flattened, less than 10 mm broad and yellowish to tan at maturity *Prosopis*

Key 2.

Corolla not papilionaceous (Caesalpinoideae).

- 1. Leaves simple, the blades rotund-ovate; flowers pink, appearing before the leaves *Cercis*
- Leaves once or twice compound; flowers yellow, white, or greenish, appearing after the leaves 2
- 2(1). Shrubs or herbs; flowers with yellow petals, the stamens exerted or not; plants indigenous in eastern Utah or cultivated and naturalized in Washington County *Caesalpinia*
- Trees; flowers with yellow, white, or greenish yellow petals, the stamens included or not much exerted; distribution broad 3
- 3(2). Leaves subsessile, the pinnae in 1 or 2 pairs and with numerous leaflets 2–4 mm long and 0.5–1 mm wide; flowers bright yellow *Parkinsonia*
- Leaves typically petiolate, the pinnae various, but leaflets not both numerous and 2–4 mm long; flowers white or greenish yellow 4
- 4(3). Leaves once to twice pinnate; branches often armed; flowers greenish yellow, borne in spicate racemes; pods long and straplike *Gleditsia*
- Leaves bipinnate; branches unarmed; flower white, long-stalked, in open panicles; pods thick *Gymnocladus*

Key 3.

Trees, shrubs, or woody vines (Papilionoideae).

- 1. Leaves even-pinnate, the rachis produced apically as a bristle; flowers yellow *Caragana*
- Leaves simple or odd-pinnate; flowers variously colored 2
- 2(1). Leaves simple or the lower ones 3-foliolate; plants shrubs; flowers yellow, solitary or borne in erect racemes 3
- Leaves compound; plants varying in one or more ways from above 4
- 3(2). Calyx split above, hence 1-lipped, with 5 minute teeth; flowers borne in erect racemes; plants known from Washington County *Spartium*
- Calyx bilabiate, the upper lip 2-lobed, the lower 3-lobed; flowers mostly solitary, axillary; plants known from Weber County *Cytisus*
- 4(2). Plants twining woody vines; flowers large and showy, borne in terminal, pendulous racemes *Wisteria*
- Plants trees or shrubs; flowers various, usually borne in axillary, erect or pendulous racemes 5
- 5(4). Leaflets 3; flowers yellow, borne in pendulous racemes *Laburnum*
- Leaflets 5 or more; flower white, pink, indigo, or yellow, borne in erect or spreading racemes 6
- 6(5). Herbage glandular-punctate; indigenous shrubs with petals indigo or lacking 7
- Herbage not glandular-punctate; cultivated or indigenous shrubs or trees; petals white, pink, or yellow or, if indigo (as in *Amorpha*), the corolla reduced to a single petal (the banner) 8
- 7(6). Petals lacking; leaflets linear; plants of Grand and San Juan counties *Parryella*
- Petals present; leaflets broad; plants of southern and southeastern Utah *Psorothamnus*
- 8(6). Petal 1, the banner only present, indigo; sparingly cultivated shrubs *Amorpha*
- Petals 5, white, pink, or yellow; shrubs or trees, sparingly to commonly cultivated 9
- 9(5). Plants shrubs; pods bladderly-inflated; flowers yellow; ornamental and roadside plants *Colutea*
- Plants trees or shrubs; pods flat or terete; flowers white or pink 10
- 10(9). Branches armed with stipular spines or internodal hispid processes; staminal filaments diadelphous; petals pink or white *Robinia*
- Branches unarmed; staminal filaments distinct; petals white 11
- 11(10). Leaf bases hollow, covering superposed buds; pods flat, not constricted between the seeds *Cladrastis*
- Leaf bases solid, not covering buds; pods terete, constricted between the seeds *Sophora*

Key 4.

Leaves even-pinnate (Papilionoideae).

- 1. Flowers yellow; fruit ripening below ground, tardily dehiscent, constricted between the seeds *Arachis*
- Flowers white, pink, red, lavender, or cream; fruit borne above ground, not constricted between the seeds 2

- 2(1). Style strongly dilated; sepals foliaceous; plants cultivated *Pisum*
- Style not strongly dilated; sepals not foliaceous; plants indigenous or cultivated 3
- 3(2). Style bearded down one side; wings of corolla essentially free from the keel *Lathyrus*
- Style bearded in a tuft or ring at apex; wings of corolla adherent to the keel *Vicia*

Key 5.

Leaflets three (Papilionoideae).

- 1. Leaves palmate, the terminal leaflet neither stalked nor jointed 2
- Leaves pinnate, the terminal leaflet stalked or jointed 4
- 2(1). Flowers golden yellow, the banner orbicular, large; legumes narrowly oblong, erect or ascending; staminal filaments distinct *Thermopsis*
- Flowers ochroleucous to white or pink to pink purple, the banner not orbicular, moderate to small in size; staminal filaments diadelphous 3
- 3(2). Leaflets usually toothed; flowers mostly in heads, commonly pink or white *Trifolium*
- Leaflets entire; flowers not in heads, commonly ochroleucous or pink *Astragalus*
- 4(1). Herbage glandular-punctate; indigenous plants with usually linear to oblanceolate leaflets 5
- Herbage not glandular-punctate; indigenous or cultivated plants with spatulate to obovate or oblanceolate to ovate leaflets 6
- 5(4). Plants caulescent, with 5 or more developed internodes; pods not included in the calyx at maturity *Psoraleidum*
- Plants acaulescent or short-caulescent, usually with fewer than 5 developed internodes; pods included in the calyx at maturity *Pediomelum*
- 6(4). Leaflets entire 7
- Leaflets toothed (except in some *Trifolium* species) . . . 9
- 7(6). Flowers in umbels, loosely capitate, or solitary in leaf axils, (white) yellow or suffused with orange *Lotus*
- Flowers in interrupted racemes or panicles, purplish . . . 8
- 8(7). Leaflets stipellate; pods several-seeded, several to many times longer than broad *Phaseolus*
- Leaflets lacking stipels; pods 1-seeded, only somewhat longer than broad *Lespedeza*
- 9(6). Flowers usually in heads; corolla persistent, investing the fruit; fruit straight *Trifolium*
- Flowers usually in racemes; corolla not persistent; fruit straight or curved to coiled 10
- 10(9). Leaflets toothed along the distal 1/2 or more; racemes elongate, several times longer than broad ... *Melilotus*
- Leaflets toothed along the distal 1/3 only (except in some *Trigonella*); racemes compact or loose, seldom more than twice longer than broad 11
- 11(10). Fruit straight or falcately curved, prominently veined on the valves; flowers yellow; terminal leaflet with an apical spinose cusp, rarely as much as twice longer than broad; plants rare *Trigonella*
- Fruit coiled or curved, veined or not; flowers pink, lavender, whitish, or yellow; terminal leaflet seldom strongly cuspidate apically, usually more than twice longer than broad, plants common *Medicago*

Key 6.

- Leaflets (4) 5 or more, or leaves simple (Papilionoideae).
- 1. Leaves palmately compound, with usually 5-11 leaflets, long-petiolate 2
 - Leaves pinnately compound or, if rarely palmately compound (as in some *Lotus* species), sessile or with only 4 leaflets 4
 - 2(1). Herbage not glandular-dotted; leaflets usually 7-11, variously shaped; stamens monadelphous; pods several-seeded *Lupinus*
 - Herbage glandular-dotted; leaflets usually 5, broadly obovate-spatulate; stamens usually diadelphous; pods 1-seeded 3
 - 3(2). Plants caulescent, usually with 5 or more developed internodes; pods not included within the calyx at maturity *Psoraleidum*
 - Plants subcaulescent to short-caulescent, usually with fewer than 5 developed internodes; pods included within the calyx at maturity *Pediomelum*
 - 4(1). Herbage glandular-dotted 5
 - Herbage not glandular-dotted 6
 - 5(4). Racemes spicate; legumes 1-seeded, not bearing appendages; stamens 5; petals (except banner) inserted on staminal tube *Dalea*
 - Racemes not spicate; legumes several-seeded, bearing hooked appendages; stamens 10; petals not inserted on staminal tube *Glycyrrhiza*
 - 6(4). Terminal leaflet of lower leaves several times larger than the lateral; inflorescence a many-flowered head closely subtended by foliose involucreal bracts; flowers yellow; introduced, rare *Anthyllis*
 - Terminal leaflet not much larger than the lateral; inflorescence a raceme or an umbel, lacking foliose bracts (except in *Lotus*); flower color various 7
 - 7(6). Margin of leaflets toothed; corolla persistent, investing the fruit *Trifolium*
 - Margin of leaflets entire; corolla usually deciduous ... 8
 - 8(7). Flowers in umbels, loosely capitate, or solitary in leaf axils; petals yellow, often suffused with orange, or pink 9
 - Flowers in racemes or cymes; petals usually not yellow 10
 - 9(8). Leaflets 3-5; flowers yellow *Lotus*
 - Leaflets 9-23; flowers pink to pink purple ... *Coronilla*
 - 10(8). Keel petals much longer than the wings; fruit a flattened loment 11
 - Keel petals subequal to the wings or shorter; fruit a legume (a terete loment in *Sophora*) 12
 - 11(10). Fruit 4- to several-seeded, not spiny (except in *H. boreale* var. *gremiale*); plants indigenous ... *Hedysarum*
 - Fruit 1- to 2-seeded, more or less spiny-toothed; plants adventive, cultivated and escaping . *Onobrychis*
 - 12(10). Stipules spiny; flowers dirty whitish *Petteria*
 - Stipules various, but not spiny; flowers seldom if ever dirty whitish 13
 - 13(12). Staminal filaments distinct; fruit a terete to somewhat flattened loment; plants with blue or white flowers, usually of sandy sites *Sophora*
 - Staminal filaments diadelphous or monadelphous; fruit a legume; plants from a caudex and/or taproot, rarely rhizomatous; habitats various 14

- 14(13). Keel with a porrect beak; ventral suture of legume forming a partial or complete partition; plants usually acaulescent *Oxytropis*
- Keel beakless, or the beak diverging from the floral axis; ventral suture usually not produced internally, the dorsal usually produced in bilocular fruits; plants usually caulescent 15
- 15(14). Stamens monadelphous; flowers blue *Galega*
- Stamens diadelphous; flowers pink purple, pink, lavender, ochroleucous, red, white, or variously suffused, but not blue 16
- 16(15). Flowers red orange when fresh; plants adventive *Sphaerophysa*
- Flowers pink, pink purple, lavender, or white to ochroleucous; plants indigenous, or rarely adventive *Astragalus*

Acacia Miller

Armed trees; leaves alternate, often clustered on short axillary shoots, bipinnate, petiolate, the pinnae bearing several leaflets; internodal spines curved; stipules small and deciduous; flowers numerous, borne in elongate spikes; calyx 5-lobed; corolla regular, 5-lobed, inconspicuous; stamens numerous, included, distinct; ovary substipitate; pods flattened, indehiscent.

Acacia greggii Gray Catclaw Acacia. Small trees to 4 m tall, the branches armed with curved internodal spines; leaves to ca 4 cm long, with 2 pairs of pinnae, each with 4-6 pairs of obovate to oblong leaflets 3-6 mm long, puberulent on both surfaces; petioles 2-5 mm long, bearing a solitary gland between the lower pair of pinnae; spikes mostly 3-6 cm long (including peduncles); flowers fragrant, 2-2.5 mm long; petals greenish, like the sepals; legumes flattened, oblong, usually curved, 5-10 cm long, 10-20 mm wide, constricted between the seeds; seeds 5-7 mm broad, nearly circular. Warm desert shrub, drainage-terrace vegetation, at ca 870 m in Washington County; Nevada, California, Arizona, New Mexico, Texas, and Mexico; 10 (iii). Our material belongs to var. *arizonica* Isely.

Albizia Durazz.

Unarmed trees; leaves alternate, not clustered, bipinnate, petiolate, the several pairs of pinnae each with numerous oblique leaflets; stipules small and caducous; flowers several to many, in umbellate heads; calyx tubular, 5-lobed; corolla united, funneliform, the 5 lobes shorter than the tube; stamens numerous, united into a tube basally, long-exserted; pods flattened, dehiscent.

Albizia julibrissin Durazz. Silk-tree; Mimosa. Small tree to 3 m tall or more and as broad or broader; leaves to 25 cm long or more (including petiole), with 5-10 (15) pairs of pinnae, each with 12-25 (30) pairs of leaflets 7-15 mm long, puberulent, if at all, on rachis and leaflet margins; petioles 3-6 cm long, each with a single large flattened gland; calyx 3-3.5 mm long; corolla 7.5-9.5 mm long, cream to greenish; staminal filaments exserted 20-30 mm, brightly rose pink to reddish in color; pods 12-20 cm long, 15-25 mm wide, oblong, flattened, membranous; $2n = 26$. Cultivated ornamental at lower elevations in much of Utah, but frost sensitive; introduced from Asia; 7 (i).

Amorpha L.

Cultivated shrubs; leaves alternate, odd-pinnate, the leaflets marked with dots, usually with stipules; flowers purple, borne in terminal spicate racemes; calyx 5-toothed, persistent; banner present (wings and keel lacking), wrapped around the stamens and style; stamens 10, monadelphous at the base only, otherwise distinct; pods 1- to 2-seeded, tardily dehiscent.

1. Plants usually less than 1 m tall; petioles short, usually shorter than width of lowest leaflets *A. canescens*
- Plants usually more than 1 m tall; petioles elongate, longer than the width of the lowest leaflets *A. fruticosa*

Amorpha canescens Pursh Lead Plant. Subshrub, the erect branches, mostly 4-10 dm tall, the herbage densely white-villous; leaves subsessile, 2.5-12 cm long, with 15-51 leaflets, these elliptic to lance-elliptic or oblong, green above, white-hairy beneath; racemes clustered, paniculate; calyx tube white-villous; pods white-villous, the style almost as long as the body. Cultivated ornamental in some communities in northern Utah (Reimchussel s.n., BRY); introduced from the Great Plains; indigenous from Canada south to Texas and New Mexico; 2 (0).

Amorpha fruticosa L. False Indigo; Bastard Indigo. Shrub to 3 m tall or more, the herbage sparingly pubescent to glabrate; leaves long-petioled, with 13-35 leaflets, these elliptic to oblong, green on both sides, the lower only somewhat paler and strigulose; racemes clustered, paniculate; calyx tube glabrous; pods glabrous, the style much shorter than the body; $2n = 40$. Cultivated ornamental and botanical curiosity in northern Utah; introduced from eastern U. S.; indigenous in much of eastern North America and southwestward to Arizona; 5 (0).

Anthyllis L.

Cultivated herbaceous perennial; leaves odd-pinnate; stipules small, adnate to the petiole, the lowermost somewhat sheathing; flowers many, borne in pedunculate heads or headlike clusters; calyx tubular, 5-lobed; corolla papilionaceous; stamens 10, monadelphous; pods invested by the accrescent calyx, 1- or few-seeded.

Anthyllis vulneraria L. Kidney Vetch, Woundwort. Stems arising from a caudex, 8-30 cm tall, decumbent to erect; leaves 2-7 cm long, odd-pinnate, with usually 5-9 leaflets, the terminal leaflet of lowermost leaves much larger than the lateral ones; peduncles 5-16 cm long, usually with a foliose bract below the inflorescence; heads 1 to few, each closely subtended by foliose bracts; flowers 10-15 mm long, sessile, yellow (or suffused with red); calyx pilose, much inflated at maturity; $2n = 12$. Introduced forage and reseeding plant, known from Sanpete County, but to be expected elsewhere; indigenous to Eurasia; 1 (0).

Arachis L.

Cultivated annual herbs; leaves even-pinnate, lacking tendrils; stipules prominent, long-attenuate, adnate to the petiole and almost sheathing the stem; flowers yellow, papilionaceous, few or solitary in the axils, sessile, hypanthium elongating and pushing the developing ovary underground; stamens diadelphous, usually 9 and 1; pods maturing underground, indehiscent, constricted between the seeds.

Arachis hypogaea L. Peanut. Stems from a taproot, mostly 20–50 cm tall; leaves mostly 4–15 cm long, even-pinnate, with 2 pairs of leaflets, 2.2–6 cm long, 0.8–2.5 cm wide, entire; stipules 20–35 mm long; flowers yellow, soon withering, usually only the lowermost producing fruits. Sparingly cultivated plants, rarely escaping but not persisting, in Utah; introduced from Brazil (?); 2 (i).

***Astragalus* L.**

Plants annual or perennial, caulescent or acaulescent, from a taproot, a caudex commonly developed, rarely with a rhizome; leaves alternate, odd-pinnate, trifoliate, or simple; stipules adnate to the petiole base, sometimes connate-sheathing around the stem; flowers papilionaceous, in axillary racemes, each subtended by a single bract; bracteoles 1 or 2 or lacking, attached at base of calyx or on pedicel; calyx 5-toothed; petals 5, pink, lavender, pink purple, orcholeucous, or white, or variously suffused, the keel shorter than the wings, rounded to attenuate apically; stamens diadelphous; ovary enclosed in the staminal sheath, the style glabrous; pods variable in size, shape, and dehiscence, unilocular to bilocular, sessile, subsessile, or stipitate (or with a gynophore). Note: This is a large and complex genus, certainly the largest genus of flowering plants in Utah, and because of this, the keys to species are constructed as to reflect political geographic subdivisions of the state. This makes it possible to identify unknown plants without the effort of struggling through a single interminably long key. Keys and descriptions are based on some 5000 specimens from Utah, a quarter of them collected by the author.

- 1. Plants of northwestern Utah (i.e., Box Elder, Cache, Davis, Juab, Morgan, Salt Lake, Tooele, Utah, and Weber counties) Key 1
- Plants not from northwestern Utah 2
- 2(1). Plants of south-central and southwestern Utah (i.e., Beaver, Iron, Millard, Piute, Sanpete and Sevier counties) Key 2
- Plants not from south-central and southwestern Utah ... 3
- 3(2). Plants of Washington County Key 3
- Plants not of Washington County 4
- 4(3). Plants of northeastern Utah (i.e., Daggett, Duchesne, Rich, Summit, Uintah, and Wasatch counties) Key 4
- Plants of east-central and southeastern Utah 5
- 5(4). Plants of Carbon, Emery, and Wayne counties Key 5
- Plants of Garfield, Grand, Kane, and San Juan counties . 6
- 6(5). Plants of Grand and San Juan counties Key 6
- Plants of Garfield and Kane counties Key 7

Key 1.

Plants of Box Elder, Cache, Davis, Juab, Morgan, Salt Lake, Tooele, and Weber counties.

- 1. Plants prostrate; leaves to 1 cm long, with spinulose-tipped leaflets all decurrent, usually of high elevations *A. kentrophyta*
- Plants of various habit; leaves often more than 1 cm long, not or rarely spinose, the lateral ones usually jointed to the rachis; distribution various 2

- 2(1). Leaves all simple; plants strictly acaulescent; dwarf, mat-forming plants of high elevations in Cache County *A. spatulatus*
- Leaves with (3) 5–25 leaflets or more, or only the uppermost simple; plants caulescent or acaulescent, of low to high elevations 3
- 3(2). Plants rushlike or sprawling, with slender leaflets, or the uppermost leaves often simple, the terminal leaflet confluent with the rachis 4
- Plants not rushlike, the leaflets various but usually not slender and with the uppermost leaves simple, the terminal leaflet jointed to the rachis 8
- 4(3). Flowers 15–19 mm long; stems arising from a superficial woody caudex 5
- Flowers less than 10 mm long; stems arising from a slender, subrhizomatous, subterranean caudex 6
- 5(4). Flowers ochroleucous; calyx brown; legumes long-stipitate, pendulous *A. lonchocarpus*
- Flowers bicolor, pink purple with white wing-tips; calyx purplish; legumes sessile, erect *A. toanus*
- 6(4). Pods bladdery-inflated; pubescence of malpighian (dolabriform) hairs; stems usually sprawling *A. ceramicus*
- Pods oblong, not inflated; pubescence of basifixed hairs; stems erect 7
- 7(6). Caudex superficial; leaflets and leaf rachis commonly expanded into flat, grasslike blades; ovules 10–16; pods mostly 10–17 mm long, 3–3.7 mm broad; plants of moist meadows and streambanks, rare *A. diversifolius*
- Caudex subterranean; leaflets and leaf rachis usually very narrow; ovules more than 17; pods 25–45 mm long, 2.5–3.3 mm broad; plants of dry hillsides, common *A. convallarius*
- 8(3). Calyx tube less than 4 mm long (longer in some *A. filipes*), campanulate or short-cylindric 9
- Calyx tube more than 4 mm long (as short as 3.6 mm in some *A. anserinus*), cylindric to long-cylindric ... 19
- 9(8). Plants acaulescent, with a distinctive thatch of persistent leaf bases; pods bladdery inflated; dwarf, at high elevations in western ranges and in the south-central plateau, rare *A. platytropis*
- Plants short- to long-caulescent, not with marcescent leaf bases; pods various; of low to high elevations ... 10
- 10(9). Plants annual, from slender taproots, usually of low elevation arid sites 11
- Plants perennial, with well-developed caudices; commonly montane 12
- 11(10). Pods bladdery-inflated, unilocular; flowers 3 or more per raceme; plants of sandy sites *A. geyeri*
- Pods curved-oblong, bilocular or nearly so; flowers often 1 or 2 per raceme; plants of various soils *A. nuttallianus*
- 12(10). Stipules all distinct, not connate-sheathing around the stem 13
- Stipules connate-sheathing around the stem, at least the lowermost 14
- 13(12). Pods bladdery-inflated, bilocular; leaflets oblanceolate or broader; flowers pale; plants not growing up through shrubs *A. lentiginosus*
- Pods oblong, not inflated, unilocular; leaflets narrowly oblong; flowers dirty purplish; plants growing up through shrubs *A. pinonis*
- 14(12). Pubescence malpighian; pods falcately curved, bilocular *A. falcatus*

- Pubescence basifixed, pods straight, unilocular 15
- 15(14). Flowers usually some shade of pink or lavender, sometimes as below; pods stipitate or sessile, neither strongly flattened nor bisulcate 16
- Flowers ochroleucous, pods stipitate, either laterally flattened or bisulcate; inflorescence several times longer than broad 17
- 16(15). Keel with a prominent upturned beak, pods and ovaries sessile, laterally compressed; plants common *A. miser*
- Keel merely rounded apically; pods and ovaries stipitate, 3-angled; plants rare *A. alpinus*
- 17(15). Leaflets linear to oblong, plants mainly 4–9 dm tall; pods long-stipitate, the stipes 6–9 mm long; plants of northwestern Box Elder County *A. filipes*
- Leaflets oblong to lanceolate or oblanceolate; plants mainly less than 4 dm tall; pods with stipes less than 4 mm long, plants of broad or other distribution 18
- 18(17). Stipules turning black on drying; flowers usually 15 or fewer; pods strongly laterally compressed *A. tenellus*
- Stipules not turning black on drying; flowers usually many more than 15, pods bisulcate *A. bisulcatus*
- 19(8). Plants acaulescent or subacaulescent, the internodes seldom apparent, the stems then prostrate; herbage usually grayish hairy 20
- Plants caulescent, the internodes not obscured by leaf bases and stipules (subacaulescent in *A. megacarpus*); stems usually erect or ascending (reclining in *A. chamaemerisus*); herbage commonly green (grayish hairy in *A. anserinus*) 28
- 20(19). Wing tips bilobed; plants with malpighian hairs; flowers commonly 12 mm long or less *A. calycosus*
- Wing tips entire; pubescence basifixed; flowers usually 15 mm long or more 21
- 21(20). Plants strictly acaulescent, clothed below with a persistent thatch of leaf bases and stipules 22
- Plants either not strictly acaulescent or the thatch not, or only poorly, developed 23
- 22(21). Flowers ochroleucous, the keel purple-tipped; pods thinly long-pilose, the valves apparent through the pubescence *A. eurekaensis*
- Flowers pink purple throughout; pods densely woolly-villous, the valves obscured by hairs *A. neuberryi*
- 23(21). Flowers 9–11.2 mm long, pink purple; pods stramineous, the valves apparent through the thin villous vesture; plants of northwestern Box Elder County *A. anserinus*
- Flowers 14–20 mm long or more, variously colored; pods various; plants of broad or other distribution 24
- 24(23). Leaves very densely hirsute-tomentose, with the longer hairs straight and spirally twisted; pods bilocular, densely woolly-hairy *A. mollissimus*
- Leaves variously pubescent, but if densely tomentose, the hairs all fine, sinuous, and cottony, none straight and spirally twisted 25
- 25(24). Pubescence of leaves, and commonly of entire plant, softly villous-tomentose, consisting of fine, cottony, contorted or entangled hairs; pods both villous-tomentose and hirsute 26
- Pubescence of leaves various but not of extremely fine entangled hairs; pods merely strigose, or both villous-hirsute and tomentose 27
- 26(25). Leaflets mostly obovate and obtuse; flowers bright pink purple *A. utahensis*
- Leaflets various but where the range of this and the preceding overlap (in Box Elder County), either elliptic or the petals whitish *A. purshii*
- 27(25). Pods hirsute and tomentose, the valves obscured by the long hairs; plants uncommon in northwestern Utah *A. piutensis*
- Pods strigillose to strigose, the valves not obscured by the short hairs; plants common in northwestern Utah *A. argophyllus*
- 28(19). Plants subacaulescent, inflorescences with 1–4 pink purple flowers, soon surpassed by the leaves; pods unilocular, 25–60 mm long, bladderly-inflated *A. megacarpus*
- Plants caulescent; inflorescences with typically 5 to many ochroleucous to pink purple flowers, often surpassing the leaves; pods uni- or bilocular, often less than 25 mm long, or flowers not pink purple, bladderly-inflated or not 29
- 29(28). Stems arising from slender rhizomelike caudex branches; flowers subsessile in headlike racemes, erect or ascending; pods erect, long-pilose, less than 12 mm long *A. agrestis*
- Stems arising from a woody caudex; flowers variously arranged but, if headlike, commonly spreading; pods various but, if erect, not long-pilose and often over 12 mm long 30
- 30(29). Pubescence of herbage consisting largely or entirely of malpighian hairs; pods erect, oblong-cylindric, fully bilocular; flowers ochroleucous; plants flowering in June and July *A. canadensis*
- Pubescence of herbage consisting of basifixed hairs; pods not as above; flowers variously colored; plants flowering in springtime 31
- 31(30). Stipules connate-sheathing, at least some 32
- Stipules all distinct 34
- 32(31). Stems and leaves long-hairy; plants with nodding white flowers; pods pendulous, stipitate, the body narrowly oblong, straight, glabrous, bilocular *A. drummondii*
- Stems and leaves merely strigose; flowers ochroleucous; pods differing 33
- 33(32). Pods and ovaries glabrous, the body more than 12 mm long when mature, curved, trigonous, bilocular; plants of foothills and mountains, not with odor of selenium *A. scopulorum*
- Pods and ovaries usually strigose, the body often less than 12 mm long when mature, straight, bisulcate, unilocular; plants of low elevations in clay soils *A. bisulcatus*
- 34(31). Flowers small, the banner 12 mm long or less 35
- Flowers larger, the banner 12.5–28 mm long 37
- 35(34). Plants cushionlike, grayish hairy; pods stramineous, the valves easily discerned through the thin villous vesture; known from northwestern Box Elder County *A. anserinus*
- Plants of various habitat, but not both cushionlike and grayish hairy; pods of various shape and vesture, but not villous; distribution various 36
- 36(35). Pods narrowly lanceolate to lance-elliptic in outline, never inflated, semibilocular; plants of western Box Elder County *A. iodanthus*
- Pods greatly inflated, bilocular; plants of various distribution *A. lentiginosus*

- 37(34). Flowers ochroleucous, or less commonly pink purple; pods either bladderly-inflated or leathery and dorsoventrally compressed, borne on a stipelike gynophore (a stalk of receptacular origin), usually jointed to the pod 38
- Flowers pink purple or bicolorled, not or seldom ochroleucous; pods bladderly inflated or not, sessile or nearly so (short-stipitate in *A. chamaemeniscus*) 39
- 38(37). Pods bladderly-inflated, 1-loculed, commonly more than 30 mm long, the stipe (gynophore) more than 2 mm long in flower *A. oophorus*
- Pods leathery, subunilocular, never bladderly, dorsoventrally compressed, 15-30 mm long, the stipe (gynophore) 2 mm long or less in flower ... *A. beckwithii*
- 39(37). Flowers reddish violet to pink purple; pods triquetrous, bilocular, the valves leathery, cross-reticulate; plants known from Beaver and Iron counties *A. chamaemeniscus*
- Flowers pink purple or bicolorled; pods various, but not both triquetrous and bilocular or leathery and cross-reticulate; plants widespread 40
- 40(39). Flowers usually bicolorled, borne in compact racemes; pods oblong in outline, leathery, unilocular *A. cibarius*
- Flowers usually pink purple, borne in short to elongate racemes; pods bladderly-inflated, membranous to papery, bilocular *A. lentiginosus*

Key 2.

Plants of Beaver, Iron, Millard, Piute, Sanpete, and Sevier counties.

1. Plants mat-forming to erect, with leaflets all spinulose-tipped and decurrent along the rachis *A. kentrophyta*
- Plants various but not with both spinulose tips on leaflets and the leaflets all decurrent 2
- 2(1). Leaves simple, the blades oval to orbicular *A. asclepiadoides*
- Leaves plurifoliolate or, if some simple, not as above 3
- 3(2). Plants rushlike or sprawling, the terminal leaflet confluent with the rachis and the upper leaves often simple 4
- Plants various, but seldom rushlike, the terminal leaflet jointed to the rachis and all leaves commonly plurifoliolate 9
- 4(3). Flowers less than 10 mm long; stems arising from a slender subterranean, subrhizomatous caudex 5
- Flowers 12-20 mm long; stems arising from a superficial caudex 6
- 5(4). Pods bladderly-inflated; pubescence of malpighian hairs; stems usually sprawling *A. ceramicus*
- Pods narrowly oblong, not inflated; pubescence basifixed; stems erect *A. convallarius*
- 6(4). Flowers ochroleucous or very pale fresh pink 7
- Flowers pink purple or bicolorled 8
- 7(6). Racemes commonly shorter than the subtending leaves; calyx not brown; pods sessile, curved; plants in rounded clumps, not especially rushlike *A. tetrapteris*
- Racemes much longer than subtending leaves; calyx brown; pods long-stipitate, pendulous, straight; plants rushlike *A. lonchocarpus*
- 8(6). Uppermost leaves often simple; flowers bicolorled; pods sessile, erect, plants of western Millard County *A. toamsii*
- Uppermost leaves usually with tiny leaflets; flowers uniformly pink purple; pods stipitate, pendulous; plants of Sevier County *A. coltonii*
- 9(3). Plants annual, usually growing in sand; pods bladderly-inflated *A. geyeri*
- Plants perennial, of various soils; pods various 10
- 10(9). Pubescence of herbage consisting largely or entirely of malpighian hairs 11
- Pubescence of herbage consisting of simple basifixed hairs 15
- 11(10). Plants acaulescent; stipules all distinct 12
- Plants caulescent; stipules connate, at least those at the lowermost nodes 13
- 12(11). Wing tips deeply cleft apically; flowers usually bicolorled, or varicolorled in populations; pods bilocular, oblong *A. calycosus*
- Wing tips entire; flowers ochroleucous suffused with purple; pods unilocular, obliquely ovoid; plants of eastern Sevier County *A. consobrinus*
- 13(11). Flowers yellowish; pods erect; plants erect, with odor of selenium *A. flavus*
- Flowers pink purple or ochroleucous; pods ascending; plants spreading, not with odor of selenium 14
- 14(13). Racemes 1- to 3-flowered; flowers pink purple; leaflets 7-11; plants rare in Sanpete (?) County *A. sesquiflorus*
- Racemes 7- to many-flowered; flowers ochroleucous or suffused with dull purple; leaflets 11-17; plants of Beaver and Iron counties *A. humistratus*
- 15(10). Flowers small, the banner 12 mm long or less 16
- Flowers larger, the banner 12.5-20 mm long or more 30
- 16(15). Stipules all distinct, not even the lowermost connate 17
- Stipules connate into a sheath, at least at the lowermost nodes 21
- 17(16). Flowers 5.5-8.5 mm long, bicolorled; pods narrowly oblong, 3-angled, stipitate, the stipe 1.4-2 mm long *A. straturensis*
- Flowers over 8.5 mm long or, if shorter, not bicolorled; pods either bladderly-inflated or sessile, or both 18
- 18(17). Flowers dull purplish; pods oblong in outline; caudex usually subterranean; plants growing up through sagebrush *A. pinonis*
- Flowers ochroleucous to pink purple; pods bladderly-inflated; caudex superficial 19
- 19(18). Flowers very small, ochroleucous, the banner 5.2-8 mm long; pods diaphanous, unilocular; plants of the Sevier Valley and less commonly around seeps and springs in western valleys *A. wardii*
- Flowers larger, or purplish, or the pods not especially diaphanous, or else bilocular; plants of various distribution 20
- 20(19). Pods with a stipe 1-2.5 mm long, unilocular; flowers usually pink-purple; plants of plateaus in Wayne, Garfield, and Piute counties *A. serpens*
- Pods sessile, bilocular; flowers ochroleucous tinged purplish; plants mainly of western Beaver and Iron counties *A. lentiginosus*
- 21(16). Stipules turning black on drying; flowers ochroleucous; pods stipitate, the body strongly laterally flattened *A. tenellus*

- Stipules not turning black on drying; flowers variously colored; pods stipitate or sessile, the body not as above 22
- 22(21). Plants subcaulescent, the internodes obscured by stipule and leaf bases 23
- Plants short- to long-caulescent, the internodes apparent though sometimes short 25
- 23(22). Flowers ochroleucous; plants of lake shores and ridges in eastern Iron County *A. limocharis*
- Flowers pink purple, with white wing tips; plants of ridge tops in western Beaver and Sanpete counties ... 24
- 24(23). Leaflets glabrous above; pods unilocular; plants of Sanpete County *A. montii*
- Leaflets strigose above; pods semibilocular; plants of western Beaver County *A. platytropis*
- 25(22). Plants erect or ascending; pods stipitate, pendulous . 26
- Plants prostrate to decumbent or erect; pods short-stipitate to subsessile or sessile, usually not pendulous 27
- 26(25). Flowers deflexed, numerous; plants with odor of selenium *A. bisulcatus*
- Flowers ascending to spreading; plants lacking odor of selenium *A. australis*
- 27(25). Plants high montane or alpine dwarfs with bladderly-inflated pods, known from Tertiary igneous gravels in Iron, Garfield, Piute, and Sevier counties . *A. perianus*
- Plants of high to low elevations, spreading, the pods oblong or merely turgid 28
- 28(27). Flowers 4.5–6 mm long; peduncles capillary; pods sausage-like; plants of Iron and Piute counties *A. brandegei*
- Flowers 5.9–11 mm long; peduncles not capillary; pods and distribution various 29
- 29(28). Plants erect; keel with an elongate erect beak; pods oblong, not at all inflated *A. miser*
- Plants spreading-decumbent, keel tip merely rounded; pods inflated *A. subcinereus*
- 30(15). Plants acaulescent or subcaulescent; herbage grayish or silvery pubescent 31
- Plants caulescent (except subcaulescent in some *A. megacarpus*); herbage usually green 42
- 31(30). Plants strictly acaulescent; leaflets 3–11, or flowers 1–6 per raceme, or both; thatch of persistent leaf bases and stipules often obscuring the caudex branches 32
- Plants not strictly acaulescent or, if so, the leaflets more than 11, or flowers more than 8, or both; thatch of persistent leaf bases and stipules poorly developed or lacking 36
- 32(31). Herbage pubescent with malpighian hairs (even though the attachment just above the base); flowers ochroleucous, tinged with purple, the keel purple-tipped; plants local in south-central Utah 33
- Herbage pubescent with basifixed hairs; flowers ochroleucous or pink purple, the keel purple-tipped; plants more widely distributed 34
- 33(32). Leaflets (1) 3–5, ovate to obovate, obtuse to emarginate; plants of Sevier County *A. loanus*
- Leaflets 5–9, lanceolate to obovate, typically acute; plants not known from Sevier County *A. welshii*
- 34(32). Pods merely strigulose, the hairs not over 1 mm long; flowers and fruit included in the short foliage; plants of central Millard County *A. uncialis*
- Pods long-hirsute, with stiff hairs mainly 2.5–4.5 mm long, flowers and fruit variously included or surpassing the foliage; plants of various or other distribution 35
- 35(34). Petals commonly ochroleucous, sometimes faintly suffused with purple; valves of pod scarcely obscured by curly hairs *A. eurekaensis*
- Petals pink purple; valves of pod obscured by contorted underhairs *A. newberryi*
- 36(31). Herbage pubescent with malpighian hairs; pods strigose to strigillose; plants of Iron County *A. amphioxys*
- Herbage pubescent with basifixed hairs; pods variously pubescent; plants of broad or other distribution 37
- 37(36). Leaves very densely hirsute with the longer hairs spirally twisted; pods bilocular, densely long-hairy *A. mollissimus*
- Leaves variably pubescent, if densely tomentose, the hairs all extremely fine, sinuous, and cottony, none straight and spirally twisted; pods unilocular, variously hairy 38
- 38(37). Pubescence of leaves (and commonly of entire plant) softly villous-tomentose, composed of extremely fine, cottony, or contorted and entangled hairs; pods both villous-tomentose and hirsute *A. utahensis*
- Pubescence of leaves various, composed either of straight, appressed of narrowly ascending hairs, or of spreading-incurved and sometimes sinuous and contorted hairs; pods strigulose, villous, or hirsute 39
- 39(35). Pods strigose to strigulose, the valves not obscured by the pubescence *A. argophyllum*
- Pods hirsute or tomentose or both, the valves usually obscured by the pubescence 40
- 40(39). Valves of pod hirsute with lustrous hairs, not obscured by the hairs; plants of sandy sites at low elevations in Millard County *A. callithrix*
- Valves of pods shaggy-hirsute and tomentose, almost or quite concealed by the hairs; plants of various distribution 41
- 41(40). Leaf pubescence appressed or nearly so; petals not very strongly graduated, the banner 17–21 and the keel 15–19 mm long; pods 20–35 mm long; ovules 27–36; plants widespread *A. piutensis*
- Leaf pubescence mostly ascending; petals strongly graduated, the banner 18–22.5 and the keel 12–13.5 mm long; pods to 12 mm long; ovules 14–16; plants local in Utah County *A. desereticus*
- 42(30). Plants subcaulescent; inflorescences with 1–4 pink purple flowers, soon surpassed by the leaves; pods unilocular, 25–70 mm long, bladderly-inflated *A. megacarpus*
- Plants caulescent; inflorescences with 5 to many ochroleucous to pink purple flowers, often surpassing the leaves; pods uni- or bilocular, often less than 25 mm long, bladderly-inflated or not 43
- 43(42). Stems arising from slender, rhizomelike caudex branches; flowers subsessile in headlike racemes, erect or ascending; pods erect, long-pilose, less than 12 mm long *A. agrestis*
- Stems arising from a woody caudex; flowers variously arranged but, if in headlike racemes, usually spreading; pods various but, if erect, not long-pilose and often over 12 mm long 44
- 44(43). Stipules connate into a sheath, at least at the lowermost nodes (Note: go to couplet 29, Key 1)

—	Stipules all distinct	45	3(2).	Pods and ovaries stipitate, at maturity bladderly-inflated; pubescence malpighian; stems from elongated rhizomelike caudex branches	<i>A. ceramicus</i>
45(44).	Plants odoriferous selenophytes of clay soils; flowers ochroleucous; pods leathery-woody, cylindrical to ovoid, spreading to ascending	46	—	Pods and ovaries sessile or subsessile, oblong in outline, not inflated, pubescence basifixed; stems from a superficial to deep-seated caudex	4
—	Plants not with odor of selenium, of various soils; flowers ochroleucous, pink purple, or bicolored; pods inflated, often bladderly and membranous but, if leathery, of different shape	47	4(3).	Stipules connate into a sheath, at least at lowermost nodes; plants of northwestern Washington County	<i>A. convallarius</i>
46(45).	Calyx ochroleucous or whitish, as pale as the petals; pods cylindrical, steeply ascending; plants of eastern Sevier County		—	Stipules all distinct; plants of eastern Washington County	<i>A. lancearius</i>
—	Calyx of somewhat different hue from the petals; pods normally spreading-ascending and ellipsoid or broadly cylindrical; plants of Beaver, Iron, Millard, and western Sevier counties		5(1).	Plants slender, diminutive annuals with tiny flowers and curved bilocular pods	<i>A. nuttallianus</i>
47(45).	Pods and ovaries long-hairy, at maturity plumply ovoid, flowers ochroleucous, steeply ascending; plants introduced in Sanpete County, but to be expected elsewhere		—	Plants perennial and otherwise commonly differing from above	6
—	Pods and ovaries strigose to glabrous, at maturity variously shaped; flowers ochroleucous, pink purple, or bicolored, seldom steeply ascending; plants indigenous and widespread	48	6(5).	Pubescence of herbage consisting largely or entirely of malpighian hairs	7
48(47).	Flowers ochroleucous	49	—	Pubescence of herbage consisting of basifixed hairs (incipiently malpighian in some <i>A. piutensis</i>)	11
—	Flowers pink purple or bicolored	50	7(6).	Flowers pink purple, more than 12 mm long; pods 20–30 mm long or more	<i>A. amphioxys</i>
49(48).	Pods bladderly-inflated, unilocular, usually more than 30 mm long at maturity; stipe more than 2 mm long, subequal to the calyx tube		—	Flowers variously colored but, if pink-purple, usually less than 12 mm long or pods shorter than 12 mm long	8
—	Pods leathery, subunilocular, never bladderly, dorsiventrally compressed, 15–30 mm long; stipe 2 mm long or less in flower		8(7).	Plants acaulescent, wing petals deeply cleft apically; pods bilocular	<i>A. calycosus</i>
50(48).	Flowers bicolored, the wing tips white, borne in subcapitate racemes; pods oblong, leathery, sessile		—	Plants with well developed stems; wing petals entire apically; pods uni- or bilocular	9
—	Flowers pink purple, borne in open racemes; pods various, but not as above	51	9(8).	Flowers ochroleucous, nodding at anthesis; pods erect, bilocular, oblong-cylindric	<i>A. canadensis</i>
51(50).	Pods and ovaries bilocular, sessile or nearly so; plants widespread and common		—	Flowers ochroleucous to pink purple, ascending at anthesis; pods erect to spreading, variously shaped, unilocular	10
—	Pods and ovaries subunilocular or unilocular, shortly to moderately stipitate; plants of rather restricted range in Beaver, Iron, and western Millard counties	52	10(9).	Stems prostrate-spreading; pods curved, not bisulcate ventrally; plants not with odor of selenium	<i>A. humistratus</i>
52(51).	Pods bladderly-inflated, unilocular, usually more than 30 mm long; stipe subequal to the calyx tube, this more than 7 mm long		—	Stems erect or ascending; pods straight, bisulcate ventrally; plants with odor of selenium	<i>A. flavus</i>
—	Pods leathery, subunilocular, never bladderly, dorsiventrally compressed 15–30 mm long; stipe shorter than the calyx tube, this less than 7 mm long		11(6).	Flowers small, the banner 12 mm long or less	12
			—	Flowers larger, the banner 12.5–25 mm long or more	15
			12(11).	Flowers 6.5–8.5 mm long, bicolored; pods narrowly oblong, 3–angled, stipitate, the stipe 1.4–2 mm long	<i>A. straturensis</i>
			—	Flowers over 8.5 mm long or, if shorter, not bicolored; pods bladderly-inflated, sessile or subsessile	13
			13(12).	Plants subacaulescent, usually less than 5 cm tall; flowers 1–5; rare in sandy sites in eastern Washington County	<i>A. striatiflorus</i>
			—	Plants caulescent, usually over 20 cm tall; flowers numerous; plants of various habitats and distribution	14
			14(13).	Pods bilocular, diaphanous; lowermost stipules distinct	<i>A. lentiginosus</i>
			—	Pods unilocular, opaque and usually mottled; lowermost stipules shortly connate-sheathing	<i>A. subcinereus</i>
			15(11).	Plants strictly acaulescent or subacaulescent; herbage grayish, silvery hairy, thinly pilose and green	16
			—	Plants caulescent, herbage usually green	23
			16(15).	Plants strictly acaulescent	17
			—	Plants subacaulescent	18
			17(16).	Caudex branches obscured by a thatch of persistent leaf bases, herbage grayish or silvery hairy; leaflets 11 or fewer	<i>A. neuberryi</i>

Key 3.

Plants of Washington County.

1.	Plants rushlike or sprawling, the terminal leaflet confluent with the rachis and the upper leaves often simple	2
—	Plants various, but seldom rushlike, the terminal leaflet jointed to the rachis and all leaves plurifoliate	5
2(1).	Flowers more than 12 mm long, the petals ochroleucous or suffused with pale pink; pods curved, dorsiventrally compressed	<i>A. tetrapterus</i>
—	Flowers less than 12 mm long, the petals variously colored; pods neither curved nor dorsiventrally compressed	3

- Caudex simple, not obscured by persistent leaf bases, herbage green; leaflets often more than 11, at least on some leaves *A. holmgreniorum*
- 18(16). Leaflets more than 21 on at least some mature leaves; pods strigose or strigulose *A. tephrodes*
- Leaflets fewer than 21 on all leaves or the pods densely villous 19
- 19(18). Leaves very densely hirsute with the longer hairs spirally twisted; pods bilocular, densely long-hairy *A. mollissimus*
- Leaves variably pubescent, if densely tomentose, the hairs all extremely fine, sinuous, and cottony, none straight and spirally twisted; pods unilocular, variously hairy 20
- 20(19). Pods densely long-hairy 21
- Pods merely strigose or strigulose 22
- 21(20). Leaflets oval to orbicular, rounded apically, white cottony-hairy; calyx tube more than 4 mm wide (when pressed) *A. utahensis*
- Leaflets elliptic to obovate, obtuse or acute to rounded apically, silvery strigose; calyx tube less than 4 mm wide *A. pituitensis*
- 22(20). Leaflets mostly acute; pods brightly mottled; plants of rocky ledges and talus of sandstone canyons and escarpments *A. zionis*
- Leaflets obtuse to acute; pods not mottled; plants mostly of humus in mountain brush and upwards *A. argophyllus*
- 23(15). Stipules connate-sheathing, at least at the lowermost nodes 24
- Stipules all distinct 25
- 24(23). Petals ochroleucous, the keel purple-tipped; pods pendulous, the body oblong-cylindric, bisulate; plants with odor of selenium *A. bisulcatus*
- Petals pink purple or ochroleucous; pods erect, the body ovoid, not bisulate *A. ampullarius*
- 25(23). Plants odoriferous selenophytes, usually of clay soils; flowers ochroleucous or pink purple with white wing-tips; pods oblong-cylindric, ascending or spreading 26
- Plants not odoriferous selenophytes, of various soils; flowers variously colored; pods various 27
- 26(25). Flowers bicolorous; calyx suffused dark purple; pods erect-ascending *A. preussii*
- Flowers ochroleucous; calyx greenish; pods ascending-spreading *A. praelongus*
- 27(25). Pods and ovaries stipitate, the stipe at maturity subequal to or surpassing the calyx 25
- Pods and ovaries sessile or nearly so 29
- 28(27). Stems decumbent to ascending, pods bladderly-inflated, unilocular, the body usually over 25 mm long; flowers ochroleucous or pink purple *A. oophorus*
- Stems typically erect; pods not or only somewhat inflated, bilocular, the body usually less than 20 mm long; flowers ochroleucous or pink purple *A. eremiticus*
- 29(27). Pods bladderly-inflated, ovoid or merely curved-oblong, bilocular, sessile; flowers variously colored, but not usually bicolorous *A. lentiginosus*
- Pods not bladderly, oblong, usually curved, bi- or unilocular; flowers commonly bicolorous 30
- 30(29). Flowers borne in subcapitate racemes; pods dorsiventrally compressed, unilocular *A. cibarius*
- Flowers borne in elongate racemes; pods laterally or trigonously compressed, bilocular *A. ensiformis*

Key 4.

Plants of Daggett, Duchesne, Rich, Summit, Uintah, and Wasatch counties.

- 1. Plants matforming or erect, with leaflets all spinulose-tipped and decurrent along the rachis *A. kentrophyta*
- Plants various, but not with the leaflets both spinulose-tipped and decurrent on the rachis 2
- 2(1). Leaves simple, oval to orbicular; plants with odor of selenium *A. asclepiadoides*
- Leaves various but, if simple, linear to linear-oblongate; plants with or without odor of selenium 3
- 3(2). Leaves simple (rarely with leaflets on some leaves), the blades grasslike; plants caulescent 4
- Leaves plurifoliolate, or rarely trifoliolate, or only the uppermost simple; plants various but, if acaulescent, never as above 5
- 4(3). Leaves not over 8 cm long; racemes with flowers usually fewer than 8, less than 3.5 cm long in fruit *A. spatulatus*
- Leaves usually more than 8 cm long; racemes with flowers usually more than 8, more than 4.5 cm long in fruit *A. chloodes*
- 5(3). Plants rushlike or sprawling, the terminal leaflet confluent with the rachis, and some of the upper leaves often simple (see also *A. duchesnensis*) 6
- Plants various, but seldom rushlike, the terminal leaflet jointed to the rachis and all leaves plurifoliolate (except in some *A. detritalis*, *A. aretioides* and *A. gilviflorus*) 10
- 6(5). Flowers 10 mm long or less; stems arising from a slender subterranean subrhizomatous caudex 7
- Flowers 15–20 mm long or more; stems arising from superficial canidices 8
- 7(6). Pods bladderly-inflated; pubescence of malpighian hairs; stems usually sprawling *A. ceramicus*
- Pods narrowly oblong, not inflated, pubescence of basifixed hairs; stems commonly erect *A. convallarius*
- 8(6). Flowers pink purple; pods leathery-woody, laterally compressed; plants selenophytes of clays and silts, restricted to Uintah County *A. saurinus*
- Flowers ochroleucous to yellow; pods various, but not as above; plants selenophytes or not, from Uintah or Daggett counties 9
- 9(8). Pods stipitate, pendulous; plants not with odor of selenium, usually 3.5 dm tall or more, known only from Uintah County *A. hamiltonii*
- Pods sessile or subsessile, ascending; plants seleniferous, less than 3.5 dm tall, known only from Daggett County *A. nelsonianus*
- 10(5). Plants annual, usually growing in sand; pods bladderly-inflated *A. geyeri*
- Plants perennial, of various soils; pods various 11
- 11(10). Pubescence of herbage consisting largely or entirely of malpighian hairs 12
- Pubescence of herbage consisting of basifixed hairs 18
- 12(11). Plants acaulescent or subacaulescent, the herbage grayish or whitish pubescent 13
- Plants caulescent, the herbage commonly green 16

- 13(12). Flowers ochroleucous, borne sessile among the leaves; leaves trifoliolate; plants of Rich and Summit counties *A. gilviflora*
- Flowers pink purple or pale and suffused with purple, pedunculate; leaves with 5 or more leaflets on at least some leaves (trifoliolate in *A. aretioides*) plants of Daggett, Duchesne, and Uintah counties 14
- 14(13). Leaves with leaflets 3, silvery strigose; flowers 6–8 mm long; plants local in Daggett County .. *A. aretioides*
- Leaves simple or with 3–17 leaflets, strigose but not silvery; flowers 13–20 mm long or more; plants more widely distributed 15
- 15(14). Plants strictly acaulescent; leaflets narrowly oblong, spinulose-tipped; pods linear-oblong *A. detritalis*
- Plants subacaulescent, leaflets obovate, rounded to obtuse apically; pods ellipsoid *A. chamaeleuce*
- 16(12). Plants selenophytes, usually of clay soils; flowers yellowish; pods unilocular *A. flavus*
- Plants not selenophytes, of various soils; flowers ochroleucous or pink purple; pods bilocular 17
- 17(16). Flowers pink purple, erect or steeply ascending at anthesis; stems from a caudex; plants known from Daggett County *A. adsurgens*
- Flowers ochroleucous, nodding at anthesis; stems from creeping rhizomes *A. canadensis*
- 18(11). Flowers small, the banner 12 mm long or less 19
- Flowers larger, the banner 12.5–25 mm long or more 29
- 19(18). Stipules all distinct, not even the lowermost connate 20
- Stipules connate-sheathing, at least at the lowest nodes 24
- 20(19). Plants dwarf, arising from a deeply seated caudex and elongate rhizomelike branches; flowers ochroleucous; pods bladderly-inflated, strigose, unilocular; plants of Green River Shale, Uintah, Wasatch, and Utah counties *A. lutosus*
- Plants differing from above, the caudex superficial; flowers pink purple or ochroleucous; pods various but, if bladderly-inflated, bilocular or spreading-hairy 21
- 21(20). Flowers ochroleucous, suffused faintly with purple; pods bladderly-inflated, strigose to glabrous; plants of Wasatch and Summit counties *A. lentiginosus*
- Flowers pink purple or bicolored; pods not inflated or, if so, spreading-hairy; plants of Summit, Duchesne, and Uintah counties 22
- 22(21). Pods strigulose with black and white hairs; plants of willow communities at ca 2730 m on the north slope of Uinta Mts. *A. robbinsii*
- Pods strigose to pilose with usually whitish hairs; plants of low elevations in the Uinta Basin 23
- 23(22). Leaflets linear to narrowly oblong; calyx teeth broadly triangular, 1 mm long or less; pods pendulous, straight, strigose *A. duchesnensis*
- Leaflets oblanceolate to obovate; calyx teeth narrowly subulate, more than 2 mm long; pods sessile, inflated, spreading, curved, long-pilose *A. pubentissimus*
- 24(19). Plants dwarf, less than 6 cm tall; caudex branches with a persistent thatch of marcescent stipules; flowers minute, 6.5 mm long or less; pods bladderly-inflated; known from Rich County *A. jejunus*
- Plants taller; caudex branches not as above; flowers commonly larger; pods not bladderly-inflated, distribution various 25
- 25(24). Stipules turning black on drying; flowers ochroleucous; pods short-stipitate, strongly laterally flattened *A. tenellus*
- Stipules not turning black on drying; flowers pink purple or ochroleucous; pods various but, if as above, the flowers pink-purple 26
- 26(25). Plants odoriferous selenophytes; flowers pink purple or ochroleucous, the keel purple-tipped, numerous, nodding at anthesis; pods bisulcate ventrally *A. bisulcatus*
- Plants not smelling of selenium; flowers pink purple or ochroleucous; pods not bisulcate ventrally 27
- 27(26). Flowers ochroleucous; pods long-stipitate more than 20 mm long at maturity, laterally compressed but not flattened; plants known from Wasatch and Duchesne counties *A. australis*
- Flowers pink purple or, if stipitate, less than 15 mm long and flattened laterally 28
- 28(27). Pods and ovaries sessile or substipitate, the body flattened; plants known from Duchesne County ... *A. wingatanus*
- Pods and ovaries sessile or substipitate, the body various, but not strongly flattened; distribution various *A. miser*
- 29(18). Plants acaulescent or subacaulescent; herbage grayish or silvery hairy 30
- Plants caulescent (subacaulescent in some *A. megacarpus*); herbage usually green 34
- 30(29). Leaves very densely hirsute-tomentose, with the longer hairs straight and spirally twisted; pods bilocular, densely woolly-hairy *A. mollissimus*
- Leaves variously pubescent but, if densely tomentose, the hairs all fine, sinuous, and cottony, none straight and spirally twisted 31
- 31(30). Plants strictly acaulescent or subacaulescent; flowers pink purple on ascending-erect peduncles; pods only moderately pilose-hirsute; known only from central Uintah County *A. equisoleensis*
- Plants subacaulescent to shortly caulescent; flowers ochroleucous or pink purple but, if the latter, the peduncles often reclining (at least in fruit); pods strigose, villous, or densely woolly-hairy; distribution various, but usually not of central Uintah County (except for some *A. purshii*) 32
- 32(31). Pubescence of leaves various but not of extremely fine entangled hairs; pods merely strigose *A. argophyllus*
- Pubescence of leaves softly villous-tomentose, consisting of fine, cottony, contorted or entangled hairs; pods both villous-tomentose and hirsute 33
- 33(32). Leaflets mostly obovate and obtuse; flowers bright pink purple *A. utahensis*
- Leaflets either elliptic and acute or petals ochroleucous *A. purshii*
- 34(29). Plants subacaulescent; flowers pink purple, 1–5 per raceme; pods bladderly-inflated, unilocular, commonly over 30 mm long *A. megacarpus*
- Plants differing in one or more ways from above 35
- 35(34). Plants odoriferous selenophytes, usually of clay soils at lower elevations; flowers nodding at anthesis 36
- Plants not with odor of selenium, usually of loamy soils at moderate elevations 37
- 36(35). Pods and ovaries strigose, at maturity ventrally bisulcate, mostly less than 15 mm long *A. bisulcatus*

- Pods and ovaries glabrous, at maturity trigonous, not bisulcate, mostly over 15 mm long *A. racemosus*
- 37(35). Stems arising from slender, rhizomelike caudex branches; flowers subsessile in headlike racemes, erect or ascending; pods erect, long-pilose, less than 12 mm long *A. agrestis*
- Stems arising from a caudex; flowers variously arranged but, if in headlike racemes, spreading; pods not erect, usually more than 15 mm long 38
- 38(37). Flowers in compact, headlike racemes; petals bicolored; pods oblong, dorsiventrally compressed *A. cibarius*
- Flowers in elongate racemes or, if somewhat shortened, the petals pink purple or the pods bladderly-inflated 39
- 39(38). Flowers ochroleucous; pods stipitate, pendulous *A. scopulorum*
- Flowers pink purple; pods sessile, spreading *A. lentiginosus*

Key 5.

Plants of Carbon, Emery, and Wayne counties.

- 1. Plants mat-forming or erect, with leaflets all spinulose-tipped and decurrent along the rachis *A. kentrophyta*
- Plants various, but not with both leaflets spinulose-tipped and decurrent along the rachis 2
- 2(1). Leaves simple, oval to orbicular; pods erect, inflated, stipitate *A. asclepiadoides*
- Leaves usually plurifoliolate, at least some (simple in *A. spatulatus*); pods various, but not as above 3
- 3(2). Leaves simple; plants pulvinate-caespitose, of Emery County *A. spatulatus*
- Leaves plurifoliolate, at least some; plants of various distribution 4
- 4(3). Plants rushlike or sprawling, the terminal leaflet confluent with the rachis, some of the uppermost leaves sometimes simple 5
- Plants various, but not or seldom rushlike, the terminal leaflet jointed to the rachis and all leaves plurifoliolate (rarely the lowermost simple) 14
- 5(4). Pubescence of herbage consisting largely or entirely of malpighian hairs 6
- Pubescence of herbage consisting of basifixed hairs 7
- 6(5). Flowers 10 mm long or less; stems arising singly from elongate, rhizomelike caudex branches; pods bladderly-inflated, stipitate; plants not with odor of selenium *A. ceramicus*
- Flowers 15 mm long or more; stems arising several together from a subterranean caudex; pods laterally compressed, sessile; plants with odor of selenium *A. woodruffii*
- 7(5). Flowers 10 mm long or less 8
- Flowers 11–25 mm long or more 10
- 8(7). Flower numerous; calyx densely pilose; pods short, spreading-ascending *A. moenocoppensis*
- Flowers 12 or fewer; calyx merely strigose; pods narrowly oblong, declined to pendulous 9
- 9(8). Pods and ovaries stipitate; flowers bright pink purple; plants of sandy washes, known only from the Waterpocket Fold *A. harrisonii*

- Pods and ovaries sessile; flowers dull purplish; plants of different distribution *A. convallarius*
- 10(7). Flowers ochroleucous; calyx brown; pods stipitate, pendulous; plants often over 50 cm tall *A. lonchocarpus*
- Flowers pink to pink purple; calyx often cyaneus, not brown; pods various, usually sessile or, if stipitate, less than 40 cm tall 11
- 11(10). Plants tall selenophytes; flowers 20 mm long or more; plants of clay or silt in San Rafael Swell *A. rafaensis*
- Plants not with odor of selenium; flowers 17 mm long or less; plants of various soils and distribution 12
- 12(11). Pods and ovaries sessile or nearly so; petals pale pink or tinged with purplish; plants of San Rafael Swell and southward *A. episcopus*
- Pods and ovaries stipitate, at maturity the stipe 3–6 mm long or more; petals mostly bright pink purple; plants usually west or east of the San Rafael Swell proper 13
- 13(12). Caudex superficial; flowers spreading to declined at anthesis; plants mostly west of the San Rafael Swell proper *A. coltonii*
- Caudex subterranean; flowers ascending at anthesis; plants east of the San Rafael Swell proper *A. nidularius*
- 14(4). Plants definitely annual; flowers usually less than 8 mm long; pods bladderly-inflated and unilocular, or curved-oblong and bilocular 15
- Plants perennial, though sometimes flowering the first year, but the flowers then mostly over 8 mm long; pods various 16
- 15(14). Pods bladderly-inflated unilocular; stems and peduncles often 1 mm wide or more *A. geyeri*
- Pods curved-oblong, bilocular; stems and peduncles filiform, mostly less than 1 mm thick *A. nuttallianus*
- 16(14). Herbage pubescent largely or entirely with malpighian hairs 17
- Herbage pubescent with basifixed hairs 25
- 17(16). Plants caulescent; pods short, ascending; stipules connate, at least the lowermost 18
- Plants acaulescent or subacaulescent; pods various; stipules all distinct 19
- 18(17). Plants odoriferous selenophytes, of low elevations; pods unilocular *A. flavus*
- Plants not smelling of selenium, of moderate to high elevations; pods bilocular *A. adsurgens*
- 19(17). Wing tips deeply cleft apically; flowers usually bicolored or varicolored in populations; pods bilocular, oblong *A. calycosus*
- Wing tips entire; flowers various in color; pods unilocular, variously shaped 20
- 20(19). Leaflets (1) 3–5 (more in *A. welshii*); plants strictly acaulescent, the caudex branches obscured by a thatch of persistent leaf bases; pods spreading-hairy 21
- Leaflets mostly more than 5, at least on some leaves; plants various but, if strictly acaulescent, the thatch poorly or not developed; pods strigose 22
- 21(20). Leaflets 1–3 on most leaves; flowers pink purple; pods with hairs to 2 mm long; plants rather widespread in the region *A. musiniensis*
- Leaflets 5–11 on most leaves; flowers ochroleucous or tinged purplish; pods with hair 2–2.5 mm long; plants of western Wayne and Garfield counties *A. welshii*

- 22(20). Flowers ochroleucous, tinged purplish, 11–12.5 mm long; pods laterally compressed only near the apex; plants of western Emery and Wayne counties *A. consobrinus*
- Flowers pink purple or bicolored, mostly 15–25 mm long; pods laterally compressed throughout or dorsiventrally so 23
- 23(22). Pods laterally compressed, straight, persistent; flowers often pale or dull purplish; plants common in the vicinity of the San Rafael swell *A. cymboides*
- Pods dorsiventrally compressed, usually curved, deciduous; flowers pink purple or bicolored; plants common to uncommon in the region 24
- 24(23). Flower usually bicolored; walls of pod at least 1 mm thick, the endocarp and exocarp separated by a thick mesocarp; plants rare in the region *A. chamaeleuce*
- Flowers usually bright pink purple; walls of pod less than 1 mm thick, becoming leathery when ripe; plants common *A. amphioxys*
- 25(16). Flowers small, the banner 12 mm long or less 26
- Flowers larger, the banner 12.5–15 mm long or more 39
- 26(25). Stipules all distinct, not even the lowermost connate 27
- Stipules connate-sheathing at least at the lowermost nodes 32
- 27(26). Flowers 5 mm long or less, 2–5, borne on linear-filiform peduncles; plants sprawling, usually of volcanic gravels *A. brandegei*
- Flowers commonly 7 mm long or more, usually more than 5, borne on substantial poduncles; plants ascending to erect, never really sprawling, seldom if ever of volcanic soils (except *A. serpens*) 28
- 28(27). Plants subcaulescent, the stems shorter than the inflorescence; stipules prominent *A. desperatus*
- Plants caulescent, the stems longer than the inflorescence; stipules hardly prominent 29
- 29(28). Pods strongly mottled, bladdery-inflated, merely strigose; plants known from western Wayne County *A. serpens*
- Pods not or slightly mottled, inflated but hardly bladdery, villous with spreading hairs; plants mostly along the sandy eastern portion of the region 30
- 30(29). Racemes with 10 or more flowers; plants rare in the region *A. pubentissimus*
- Racemes with 10 or fewer flowers; plants rare to locally common 31
- 31(30). Pods 5–8 mm in diameter, curved-oblong; ovules 10–19; plants rare in the region *A. sabulomum*
- Pods 8–11 mm in diameter, ovoid-ellipsoid; ovules 20–28; plants locally common *A. pardalinus*
- 32(26). Stipules turning black on drying; flowers ochroleucous; pods short-stipitate, strongly laterally flattened; plants of the high plateau sections *A. tenellus*
- Stipules not turning black on drying; flowers various; pods various but, if as above, the flowers pink purple or plants of low elevations 33
- 33(32). Stems shorter than the inflorescences; flowers pink purple, numerous; pods erect, sessile *A. moencoppensis*
- Stems longer than the inflorescences or, if shorter, the flowers 10 or fewer per raceme; pods seldom erect 34
- 34(33). Plants odoriferous selenophytes; flowers ochroleucous, numerous, nodding at anthesis; pods bisulcate ventrally *A. bisulcatus*
- Plants not smelling of selenium; flowers pink purple or sometimes ochroleucous, ascending at anthesis; pods not bisulcate ventrally 35
- 35(34). Pods and ovaries stipitate, the body flattened or triquetrous 36
- Pods and ovaries sessile or subsessile, the body various but not strongly flattened 37
- 36(35). Pods not strongly compressed; wing petals bilobed; plants of high elevation in Emery County *A. australis*
- Pods strongly compressed; wing petals entire; plants of lower elevations in Carbon and Emery counties *A. wingatanus*
- 37(35). Plants with elongate clambering stems, known from moist meadows in western Wayne, Piute, and Sevier counties *A. bodinii*
- Plants with short to elongate, erect to sprawling stems, of different distribution or habitat 38
- 38(37). Plants with sprawling stems, commonly of pinyon-juniper and desert shrublands; pods mostly 15 mm long or less; known from lower elevations Carbon and Emery counties *A. flexuosus*
- Plants with upright stems, usually of aspen or spruce-fir woodlands; pods laterally compressed, usually 15 mm long or more *A. miser*
- 39(25). Plants acaulescent or subcaulescent; herbage grayish or silvery hairy 40
- Plants caulescent (subcaulescent in *A. megacarpus*); herbage usually green 43
- 40(39). Herbage merely strigose; flowers 13–15 mm long, stipules prominent; pods hirsute *A. barnebyi*
- Herbage tomentose to strigose; flowers 15–25 mm long; stipules not prominent; pods variously pubescent 41
- 41(40). Leaves very densely hirsute-tomentose, with the longer hairs straight and spirally twisted; pods bilocular, densely woolly-hairy *A. mollissimus*
- Leaves variously pubescent but, if densely tomentose, the hairs all fine, sinuous, and cottony, none straight and spirally twisted 42
- 42(41). Pubescence of leaves softly villous-tomentose, consisting of fine, cottony, contorted or entangled hairs; pods both villous-tomentose and hirsute *A. utahensis*
- Pubescence of leaves strigose, not of fine entangled hairs; pods strigose *A. argophyllus*
- 43(39). Plants subcaulescent; flowers pink purple, 1–5 per raceme; pods bladdery-inflated, unilocular, often more than 30 mm long *A. megacarpus*
- Plants differing in one or more ways from above 44
- 44(43). Plants odoriferous selenophytes, usually of clay soils at low elevations; flowers ochroleucous and nodding or the calyx purple and flowers ascending 45
- Plants not smelling of selenium, of various soil types and elevations; flowers not with either of the combinations noted above 48
- 45(44). Flowers ochroleucous, nodding at anthesis; calyx whitish, cream, or greenish; pods woody 46
- Flowers pink purple or bicolored, ascending at anthesis; calyx purple; pods leathery 47
- 46(45). Calyx and petals concolorous both whitish to cream; pods cylindric, sessile, steeply ascending; plants of Carbon County *A. pattersonii*
- Calyx and petals discolorous, the calyx often greenish, the petals ochroleucous; pods spreading ascending or, if steeply ascending, stipitate *A. praelongus*

- 47(45). Pods horizontally spreading or declined, borne on ascending to reclining peduncles; stems seldom more than 10 cm long, plants rare *A. castwoodae*
- Pods erect or steeply ascending, borne on erect peduncles; stems mostly much more than 10 cm long; plants common *A. prussii*
- 48(44). Stems arising from slender, rhizomelike caudex branches; flowers subsessile in headlike racemes, erect or ascending; pods erect, long-pilose, less than 12 mm long *A. agrestis*
- Stems arising from a caudex; flowers variously arranged, but not or rarely headlike, spreading at anthesis; pods not as above 49
- 49(45). Flowers pink to pink purple; pods sessile, bilocular *A. lentiginosus*
- Flowers ochroleucous; pods stipitate, uni- or bilocular 50
- 50(49). Stipules connate-sheathing at least some; pods bilocular, triquetrous, 3–5 mm wide *A. scopulorum*
- Stipules all distinct; pods unilocular, bladderly-inflated, 10–30 mm wide *A. oophorus*

Key 6.

Plants of Grand and San Juan counties.

- 1. Leaves simple, oval to orbicular *A. asclepiadoides*
- Leaves usually plurifoliolate (simple in *A. spatulatus*) 2
- 2(1). Leaves simple; plants pulvinate-caespitose, of Grand County *A. spatulatus*
- Leaves usually plurifoliolate; plant seldom as above, of various distribution 3
- 3(2). Plants rushlike or sprawling, the terminal leaflet of at least uppermost leaves confluent with the rachis, some of the uppermost leaves often simple 4
- Plants various but seldom rushlike, the terminal leaflet jointed to the rachis in all leaves, and all leaves plurifoliolate (rarely the lowermost simple) 8
- 4(3). Pubescence of herbage consisting of malpighian hairs; pods bladderly-inflated *A. ceramicus*
- Pubescence of herbage consisting of basifixed hairs; pods not bladderly-inflated 5
- 5(4). Flowers 10 mm long or less 6
- Flowers 12 mm long or more 7
- 6(5). Stems shorter than the inflorescence; flowers numerous, pink purple; pods spreading-ascending *A. moencoppensis*
- Stems longer than the inflorescences, flowers usually 15 or fewer, dull pink-purple; pods spreading-pendulous *A. concallarius*
- 7(5). Flowers ochroleucous; calyx brown; plants commonly 50 cm tall or more *A. lonchocarpus*
- Flowers pink purple; calyx greenish or blackish; plants commonly less than 45 cm tall, local in White Canyon, San Juan County *A. nidularius*
- 8(3). Plants definitely annual (see also *A. sabulonum*); flowers usually less than 8 mm long; pods bladderly-inflated and unilocular, or curved-oblong and bilocular 9
- Plants perennial, though sometimes flowering the first year, but the flowers then mostly more than 8 mm long; pods various 10
- 9(8). Pods bladderly-inflated, unilocular; stems and peduncles often 1 mm thick or more *A. geyeri*
- Pods curved-oblong, bilocular or nearly so; stems and peduncles filiform, mostly less than 1 mm thick *A. nuttallianus*
- 10(8). Herbage pubescent largely or entirely with malpighian hairs 11
- Herbage pubescent with basifixed hairs 19
- 11(10). Plants caulescent selenophytes; pods erect, less than 12 mm long *A. flavus*
- Plants acaulescent or subacaulescent, not smelling of selenium; pods various 12
- 12(11). Stems diffuse and prostrate, sometimes matted; racemes 1- to 3-flowered *A. sesquiflorus*
- Stems various, but not as above; racemes commonly with more than 3 flowers 13
- 13(12). Plants strictly acaulescent, flowers less than 12 mm long, or leaflets 5 or fewer or, if more the pods strongly bicarinate 14
- Plants subacaulescent (see also *A. piscator*); flowers various; leaflets 5 or more on at least some leaves ... 16
- 14(13). Flowers 12 mm long or less; wing petals bilobed apically; pods bilocular *A. calycosus*
- Flowers 18–25 mm long, wing petals entire apically; pods unilocular 15
- 15(14). Leaflets 5–11; pods laterally compressed, strongly bicarinate at maturity; plants of the Canyonlands of Utah *A. piscator*
- Leaflets (1) 3–5; pods dorsiventrally compressed, not bicarinate at maturity; plants seldom in the canyonlands proper *A. musiniensis*
- 16(13). Pods narrowly oblong to oblong-ellipsoid, straight, laterally compressed when ripe; flowers typically pale *A. cymboides*
- Pods obliquely ovoid to ellipsoid, mostly curved, if straight then dorsally compressed; flowers pale or bright pink purple 17
- 17(16). Walls of pod at least 1 mm thick, the exocarp and endocarp separated by a thick mesocarp, petals mostly bicolor, plants flowering earlier than the following, when sympatric (as sometimes with *A. amphioxys*) *A. chamaeleuce*
- Walls of pod much less than 1 mm thick, becoming leathery when ripe; petals pink purple or bicolor . . . 18
- 18(17). Pods persistent or tardily deciduous, mostly lance-ovoid in outline; plants rare in San Juan County ... *A. missouriensis*
- Pods readily deciduous, ellipsoid in outline; plants common *A. amphioxys*
- 19(10). Flowers small, the banner 12 mm long or less 20
- Flowers larger, the banner 12.5–25 mm long or more 33
- 20(19). Stipules all distinct, not even the lowermost connate 21
- Stipules connate-sheathing at least at the lowermost node 26
- 21(20). Plants subacaulescent, the stems shorter than the inflorescences; stipules prominent 22
- Plants caulescent, the stems longer than the inflorescences; stipules inconspicuous 23
- 22(21). Pods spreading hairy, unilocular, dorsally compressed; plants widespread *A. desperatus*
- Pods strigose, bilocular, laterally compressed; plants of the Cedar Mesa Sandstone, San Juan County ... *A. monumentalis*

- 23(21). Stems arising from elongate rhizomelike caudex branches; pods narrowly oblong, pendulous; plants of San Juan County *A. cronquistii*
- Stems from a superficial caudex; pods ovoid to ellipsoid, mostly spreading; plants of various distribution 24
- 24(23). Petals whitish, with pink veins; pods ovoid-acuminate, strongly beaked, strigose; plants of Colorado River Canyon east from Moab *A. uetherillii*
- Petals pink purple or less commonly ochroleucous; pods ellipsoid to ovoid-ellipsoid, spreading hairy; plants of various distribution 25
- 25(24). Flowers 8.8–11.7 mm long, commonly more than 10 per raceme; pods mostly more than 8 mm in diameter; plants of the Tavaputs escarpment *A. pubentissimus*
- Flowers 5.8–8.2 mm long, commonly fewer than 10 per raceme; pods less than 8 mm in diameter; plants of San Juan County *A. sabulonum*
- 26(20). Stipules turning black on drying; flowers ochroleucous; pods short-stipitate; strongly laterally flattened *A. tenellus*
- Stipules not blackening on drying; flowers various; pods various but, if as above, the flowers pink purple 27
- 27(26). Stems shorter than the inflorescences; flowers pink purple, numerous; pods erect, sessile *A. moencoppensis*
- Stems longer than the inflorescences or, if shorter, the flowers 10 or fewer per raceme; pods seldom erect 28
- 28(27). Plants odoriferous selenophytes; flowers ochroleucous, numerous, nodding at anthesis; pods bisulcate ventrally *A. bisulcatus*
- Plants not smelling of selenium; flowers pink purple or sometimes ochroleucous, ascending at anthesis; pods not bisulcate ventrally 29
- 29(28). Pods sessile or subsessile, the body oblong 30
- Pods stipitate or the body bladderly-inflated 31
- 30(29). Plants with sprawling or slender and erect stems; pods mostly less than 18 mm long, subterete; mostly of mountain brush and pinyon-juniper communities *A. flexuosus*
- Plants with erect stems; pods laterally compressed usually 19 mm long or more; mostly in aspen or spruce-fir communities *A. miser*
- 31(29). Flowers 8 mm long or less; pods strongly laterally flattened; plants mostly in pinyon-juniper woodlands *A. wingatanus*
- Flowers 8.5–11.5 mm long; pods various, but not as above; plants of various habitats 32
- 32(31). Herbage fresh green; racemes usually with fewer than 10 flowers; pods narrowly oblong, not inflated; plants of the Tavaputs Plateau, Grand County *A. alpinus*
- Herbage often cinereous; racemes with more than 10 flowers; pods bladderly-inflated; plants of lower elevations in San Juan County *A. fucatus*
- 33(19). Plants acaulescent or subacaulescent; herbage often grayish or silvery hairy 34
- Plants caulescent; herbage often green 37
- 34(33). Flowers 15 mm long or less; pods merely strigose, linear-oblong; plants of sandstone formations in San Juan County *A. cottamii*
- Flowers more than 15 mm long; pods variously pubescent, ovoid-ellipsoid to ellipsoid; plants of various habitats and distributions 35
- 35(34). Leaflets mostly 17 or more per leaf, densely hirsutomentose, with longer hairs straight and spirally twisted; pods bilocular, densely woolly-hairy *A. mollissimus*
- Leaflets mostly 15 or fewer, mostly strigose; pods unilocular 36
- 36(35). Leaflets mostly acute; pods brightly mottled; plants of rocky ledges and talus of sandstone canyons and escarpments *A. zionis*
- Leaflets obtuse to acute; pods not mottled; plants mostly of humus in mountain brush and upwards *A. argophyllus*
- 37(33). Plants odoriferous selenophytes, usually of clay soils 38
- Plants not smelling of selenium, usually not of clay soil 44
- 38(37). Stipules connate into a bidentate sheath, at least at the lowermost nodes; flowers pink purple, declined at anthesis; pods stipitate, pendulous, bisulcate *A. bisulcatus*
- Stipules all distinct, even at the lowermost nodes; flowers variously colored but, if declined at anthesis, ochroleucous; pods sessile or stipitate, ascending to spreading, not bisulcate 39
- 39(38). Calyx tube purple; petals pink purple or bicolored, rarely whitish; pods leathery-inflated 40
- Calyx tube green to whitish, not purplish; petals ochroleucous to whitish 41
- 40(39). Pods horizontally spreading or declined, borne on ascending to reclining peduncles; stems seldom more than 10 cm long; plants rare *A. eastwoodae*
- Pods erect or steeply ascending, borne on erect peduncles; stems mostly much longer than 10 cm; plants locally common *A. preussii*
- 41(39). Flowers declined at anthesis; pods ascending to erect, 9 mm in diameter or less, leathery-woody in texture 42
- Flowers spreading to ascending; pods spreading to declined, usually over 10 mm in diameter, leathery in texture 43
- 42(41). Calyx and petals concolorous, both whitish to cream-colored; pods cylindrical, sessile, steeply ascending; plants not definitely known from the region but nearby in Colorado *A. pattersonii*
- Calyx and petals discolorous, the calyx greenish, the petals ochroleucous; pods spreading-ascending or, if steeply ascending, stipitate; plants common in the region *A. praelongus*
- 43(41). Flowers 17–18 mm long, the petals whitish; calyx tube 5.5–6.3 mm long; plants of Paradox and Morrison formations, La Sal Mts. *A. iselyi*
- Flowers 28–31 mm long, the petals ochroleucous; calyx tube 11.5–14 mm long; plants of the Mancos and Morrison formations north of the Colorado River *A. sabulosus*
- 44(37). Stems arising from slender, rhizomelike caudex branches; flowers subsessile in headlike racemes, erect or ascending; pods erect, long-pilose, less than 12 mm long *A. agrestis*
- Stems arising from a caudex; flowers variously arranged, but seldom headlike and ascending to spreading; pods more than 12 mm long, spreading to pendulous 45

- 45(44). Pods and ovaries sessile, spreading, either bladderly-inflated or curved-oblong to straight, bilocular *A. lentiginosus*
- Pods and ovaries stipitate, descending to pendulous, not much inflated or curved, uni- or bilocular 46
- 46(45). Flowers ochroleucous; pods bilocular, plants fresh green *A. scopulorum*
- Flowers pink purple; pods unilocular; plants more or less cinereous *A. coltonii*

Key 7.

Plants of Garfield and Kane counties.

1. Plants mat-forming or erect, with leaflets all spinulose-tipped and decurrent along the rachis *A. kentrophyta*
- Plants various, but not with leaflets both spinulose-tipped and decurrent along the rachis 2
- 2(1). Leaves simple, oval to orbicular *A. asclepiadoides*
- Leaves plurifoliolate, at least some 3
- 3(2). Plants annual (see also *A. subulonium*); flowers commonly less than 8 mm long; pods curved-oblong and bilocular or bladderly-inflated and ovoid 4
- Plants perennial, though sometimes flowering the first year, and then differing in one or more respects from above 6
- 4(3). Pods bladderly-inflated, unilocular; plants of eastern Garfield County *A. geyeri*
- Pods curved oblong, bilocular; plants of Kane and Garfield counties 5
- 5(4). Keel tips rounded, leaflets truncate-retuse on all leaves; pods deciduous, dehiscing at both ends after falling *A. enoryanus*
- Keel tips pointed; leaflets not truncate-retuse on all leaves; pods persistent, dehiscent at tip only *A. nuttallianus*
- 6(3). Plants with terminal leaflets confluent with the rachis, the uppermost leaves sometimes simple 7
- Plants with terminal leaflets jointed to the rachis, the leaves all plurifoliolate (or the lowermost simple) 16
- 7(6). Pubescence of herbage consisting largely or entirely of malpighian hairs 8
- Pubescence of herbage consisting of basifixed hairs 9
- 8(7). Flowers 10 mm long or less; stems arising singly from elongate, rhizomelike caudex branches; pods bladderly-inflated, stipitate *A. ceramicus*
- Flowers 15 mm long or more; stem arising several together from a subterranean caudex; pods laterally compressed sessile *A. woodruffii*
- 9(7). Flowers ochroleucous, or whitish tinged with pink, 15 mm long or more 10
- Flowers pink purple, bicolored, or pale, 12 mm long or less 11
- 10(9). Inflorescences usually shorter than the subtending leaves; calyx not brown; pods sessile, curved; plants clump-forming not slender and tall, of western Kane County *A. tetrapterus*
- Inflorescence much longer than the subtending leaves; calyx brown; pods long-stipitate, pendulous, straight; plants tall and slender, widespread *A. lonchocarpus*
- 11(9). Stems shorter than the inflorescences; flowers numerous; calyx densely pilose; pods short, spreading-ascending *A. moencoppensis*

- Stems shorter or longer than the inflorescences; flowers few to numerous; calyx merely strigose; pods various but not as above 12
- 12(11). Flowers dull pink purple, usually 10 mm long or less; pods narrowly oblong, sessile, the body 4 mm wide or less *A. convallarius*
- Flowers pale to bright pink purple, usually over 10 mm long, or pods more than 5 mm wide 13
- 13(12). Pods and ovaries sessile; petals pale; plants west and south of the Henry Mts. 14
- Pods and ovaries stipitate, at maturity the stipe 3–6 mm long or more; plants west or east of those mountains 15
- 14(13). Calyx short-cylindric, the tube longer than broad, suffused purplish or very pale, white-strigose; ovules 16–26 *A. episcopus*
- Calyx campanulate, the tube about as long as broad, not purplish, black-strigose; ovules 8–14 *A. lancearius*
- 15(13). Caudex superficial; flowers spreading or declined at anthesis; plants west of the Henry Mts. *A. coltonii*
- Caudex subterranean; flowers ascending at anthesis; plants east of the Henry Mts. *A. nidularius*
- 16(6). Herbage pubescent, largely or entirely, with malpighian hairs 17
- Herbage pubescent with basifixed hairs 25
- 17(16). Plants caulescent; pods short, ascending 18
- Plants acaulescent or subacaulescent; pods various 20
- 18(17). Plants erect or descending, flowers mostly more than 12 mm long, odoriferous selenophytes *A. flavus*
- Plants prostrate-spreading, flowers less than 12 mm long; not smelling of selenium 19
- 19(18). Racemes 1– to 3-flowered; flowers pink purple; leaflets 7–11; plants of sandstone escarpments and ledges, mostly at lower elevations *A. sesquiflorus*
- Racemes 7– to many-flowered, flowers dull purplish; leaflets 11–17; plants mostly of higher plateaus *A. humistratus*
- 20(17). Plants subacaulescent, with one or more internodes usually apparent; caudex branches only rarely with persistent leaf bases 21
- Plants strictly acaulescent, the caudex branches usually with a persistent thatch of leaf bases 22
- 21(20). Flowers usually bicolored; walls of pods at least 1 mm thick, the exocarp and endocarp separated by a thick mesocarp; plants rare in the region, flowering earlier than the next *A. chamaeleuce*
- Flowers usually bright pink purple; walls of pod less than 1 mm thick, becoming leathery when ripe; plants common *A. amphioxys*
- 22(20). Flowers mostly less than 12.5 mm long; pods less than 17 mm long 23
- Flowers more than 15 mm long; pods more than 20 mm long 24
- 23(22). Flowers pink to pink purple, or bicolored, or ochroleucous, the wing petals emarginate apically; pods linear-oblong, bilocular *A. calycosus*
- Flowers ochroleucous, the wing petals entire apically; pods ovoid-ellipsoid, unilocular *A. consobrinus*
- 24(22). Leaflets 1–3 on most leaves; flowers pink purple; pods with hairs to 2 mm long; plants mostly east of the high plateaus *A. musiniensis*
- Leaflets 5–11 on most leaves; flowers ochroleucous or tinged purplish; pods with hairs 2–2.5 mm long; plants of western Garfield County *A. welschii*

- 25(16). Flowers small, the banner 12 mm long or less 26 — Stems longer than the inflorescences or, if shorter, the flowers 10 or fewer, or the pods not spreading-ascending; calyx merely strigose 38
- Flowers larger, the banner 12.5–25 mm long or more 40 38(37). Pods oblong, not inflated; plants of aspen and spruce-fir communities at higher elevations *A. miser*
- 26(25). Flowers 6 mm long or less; pods unilocular, borne on slender peduncles, resupinate; stems sprawling; plants usually of volcanic gravels *A. brandegei* — Pods inflated to bladderly-inflated; plants commonly of ponderosa pine, pinyon-juniper, or desert shrub communities at moderate to lower elevations 39
- Flowers over 6 mm long, and the plants differing in other ways, usually not of volcanic gravels (or seldom so) 27 39(38). Calyces and stems silvery canescent, the hairs appressed; pod bladderly-inflated, more than 12 mm in diameter; ovules 21–32; plants of sandy sites at low elevations in eastern Garfield County *A. fucatus*
- 27(26). Plants with stipules all distinct, not even the lowermost connate 28 — Calyces and stems not silvery canescent, the hairs spreading; pods moderately inflated, less than 13 mm in diameter; ovules 10–20; plants of moderate elevations in Kane and Garfield counties *A. subcinereus*
- Plants with stipules connate-sheathing, at least the lowermost 33 40(25). Plants acaulescent or subacaulescent; herbage often grayish or silvery-hairy 41
- 28(27). Plants subacaulescent; stipules prominent; stems shorter than the inflorescences 29 — Plants caulescent; stipules not conspicuous; stems longer than the inflorescences 30
- Plants caulescent; herbage often green 48 29(28). Pods spreading-hairy unilocular, dorsally compressed; plants widespread along canyons of the Colorado *A. desperatus* — Pods strigose, bilocular, laterally compressed; plants of Cedar Mesa Sandstone, eastern Garfield County *A. monumentalis*
- 30(28). Pods bladderly-inflated, diaphanous, strigose to glabrous 31 — Flowers 15 mm long or less, pink purple; pods curved, 10–12 mm long, densely spreading-hairy; plants rare and local, Garfield County *A. barnebyi*
- Pods only moderately inflated, opaque, spreading-hairy 32 — Flowers more than 15 mm long; pods curved or straight, more than 12 mm long, variously hairy; plants of various distribution 42
- 31(30). Flowers ochroleucous; pods sessile, glabrous, or nearly so, usually not mottled *A. wardii* — Plants strictly acaulescent; caudex branches with a thatch of persistent stipules 43
- Flowers pink purple; pods strigose, short-stipitate, strongly mottled *A. serpens* — Plants subacaulescent; caudex branches with thatch poorly developed or lacking 45
- 32(30). Pods 5–8 mm in diameter, curved-oblong; ovules 10–19; plants of eastern Kane County *A. sabulonum* 43(42). Flowers ochroleucous, 15–23 mm long; pods lance-ovoid, strigose; plants known only from the Henry Mts. *A. henrimontanensis*
- Pods 8–11 mm in diameter, ovoid-ellipsoid; ovules 20–28; plants of eastern Garfield County *A. pardalinus* — Flowers ochroleucous or pink purple, 18–25 mm long or more; pods spreading-hairy or villous; plants of various distribution but not as above 44
- 33(27). Plants subacaulescent, the stems shorter than inflorescences; pods bladderly-inflated; growing in sand, on beaches, or volcanic gravels 34 — Flowers ochroleucous, sometimes suffused with purple; valves of pod scarcely obscured by the curly hairs *A. curekensis*
- Plants caulescent, the stems shorter or longer than the inflorescences, when shorter, the pods not inflated; growing in various soil types and habitats 36 — Flowers pink purple; valves of pod obscured by contorted under hairs *A. newberryi*
- 34(33). Flowers ochroleucous or pink; plants of beaches in western Kane County or of the Table Cliff Plateau vicinity *A. linnocharis* 45(42). Leaflets mostly 17 or more per leaf, densely hirsute-tomentose, with longer straight hairs spirally twisted; pod bilocular, densely woolly hairy *A. mollissimus*
- Flowers pink purple to whitish; plants of sandy sites at low elevations or of volcanic gravels at high elevations 35 — Leaflets mostly fewer than 17 per leaf, variously hairy, but not with longer straight hairs spirally twisted; pod unilocular, variously hairy 46
- 35(34). Flowers 8–9 mm long, the banner not strongly veined; plants of volcanic gravels at high elevations in western Garfield County *A. perianus* 46(45). Leaflets oval to obovate, rounded apically; pods woolly hairy *A. utahensis*
- Flowers 10–12 mm long, the banner strongly veined; plants of sandy sites at low elevations in Kane County *A. striatiflorus* — Leaflets oblanceolate to elliptic, obtuse to acute apically; pods merely strigose 47
- 36(33). Stipules turning black on drying; flowers ochroleucous; pods short-stipitate, strongly laterally flattened *A. tenellus* 47(46). Leaflets mostly acute; pods brightly mottled; plants of rocky ledges and talus of sandstone canyons and escarpments, mostly at lower elevations *A. zionis*
- Stipules not blackening on drying; flowers various; pods various, but not as above 37 — Leaflets obtuse to acute; pods not mottled; plants of loamy soils in mountain brush and upward *A. argophyllus*
- 37(36). Stems shorter than the inflorescences; flowers pink purple, numerous; calyx densely villous; pods spreading-ascending, sessile *A. moenicoppensis* 48(40). Plants odoriferous selenophytes, usually of clay soils 49
- Plants not smelling of selenium, usually not of clay soil 52 49(48). Calyx tube purple; petals pink purple or bicolored, flowers erect-ascending at anthesis; pods leathery-inflated, ascending *A. prussii*

- Calyx tube greenish or whitish, not purplish; petals ochroleucous, or keel tip purple, descending at anthesis; pods various 50
- 50(49). Stipules connate into a bidentate sheath, at least at the lowermost nodes; pods stipitate, pendulous, bisulcate *A. bisulcatus*
- Stipules all distinct, even at the lowermost nodes; pods sessile or shortly stipitate, ascending to spreading, not bisulcate 51
- 51(50). Calyx and petals concolorous, both whitish to cream colored; pods cylindric, sessile, steeply ascending; plants rare in the Henry Mts. and Capitol Reef *A. pattersonii*
- Calyx and petals discolorous, the calyx greenish, the petals ochroleucous; pods broadly ellipsoid, sessile or shortly stipitate, spreading-ascending; plants common *A. praelongus*
- 52(48). Plants subcaulescent; flowers pink purple, 1–5 per raceme; pods bladderly-inflated, unilocular, often more than 30 mm long *A. megacarpus*
- Plants differing in one or more respects from above 53
- 53(52). Stems arising from slender, rhizomelike caudex branches; flowers subsessile in headlike racemes, erect or ascending; pods erect, long-pilose, less than 12 mm long *A. agrestis*
- Stems arising from a superficial or subterranean caudex; flowers variously arranged, but seldom headlike and ascending to spreading; pods more than 17 mm long, spreading to pendulous 54
- 54(53). Stipules connate-sheathing, at least at the lowermost nodes; caudex subterranean 55
- Stipules all distinct, even at the lowermost nodes; caudex superficial to subterranean 56
- 55(54). Pods and ovaries long-stipitate; plants known from clay soils of the Chinle formation *A. ampullarius*
- Pods and ovaries sessile or subsessile; plants known from sandy alluvium *A. hallii*
- 56(54). Pods and ovaries stipitate, the stipe at maturity subequal to or surpassing the calyx 57
- Pods and ovaries sessile or nearly so 58
- 57(56). Stems decumbent to ascending; pods bladderly-inflated, unilocular, the body mostly more than 25 mm long; flowers ochroleucous; plants commonly of higher middle elevations *A. oophorus*
- Stems erect; pods not or only somewhat inflated, bilocular, the body usually less than 20 mm long; flowers ochroleucous or pink purple; plants of lower elevations *A. eremiticus*
- 58(56). Flowers borne in subcapitate racemes; pods curved-oblong, dorsiventrally compressed, unilocular *A. cibarius*
- Flowers usually in elongate racemes; pods ovoid to curved-oblong, bilocular, compression variable 59
- 59(58). Plants from a subterranean caudex, usually less than 25 mm tall; pods curved-oblong, laterally or trigonously compressed; known from the Kaiparowits, Henry Mts., and Circle Cliffs regions, at moderate elevations *A. malacoides*
- Plants from a superficial caudex, often more than 25 cm tall; pods curved-oblong and dorsiventrally compressed, or bladderly-inflated and ovoid; widespread *A. lentiginosus*

Astragalus adsurgens Pallas Standing Milkvetch. [*A. striatus* Nutt. ex T. & G.; *A. nitidus* Dougl. ex Hook.; *A.*

nitidus var. *robustior* (Hook.) Jones]. Perennial, caulescent, 15–45 cm tall, from a branching caudex; pubescence malpighian; stems decumbent-ascending to erect; stipules 6–10 mm long, at least the lowermost connate-sheathing; leaves 6–12 cm long; leaflets 15–23, 13–28 mm long, 3–9 mm wide, oblong to elliptic, acute or obtuse; peduncles 6–16 cm long; racemes 16– to 50-flowered, the flowers ascending at anthesis, the axis 1.5–13 cm long in fruit; bracts 2–5 mm long; pedicels 0.8 mm long; bracteoles 0; calyx 5.8–10.5 mm long, the tube 4.4–7 mm long, short-cylindric, strigulose, the teeth 1.4–4.2 mm long, subulate; flowers 13–16 mm long, pink purple; pods erect, sessile, ovoid-oblong, 7–12 mm long, 2.3–3.8 mm thick, bilocular; ovules 9–16; $2n = 32$. Juniper-sagebrush communities at 2000 to 3175 m in Carbon, Daggett, Emery, Sanpete, and Sevier counties; Alaska east to Manitoba and south to Washington, Idaho, Colorado, Nebraska, and Iowa; Eurasia; 18 (iii). Our material belongs to ssp. *robustior* (Hook.) Welsh [*A. adsurgens* var. *robustior* Hook.].

Astragalus agrestis Dougl. ex G. Don Field Milkvetch. [*A. dasyglottis* Fisch., ex DC., not Pallas; *A. goniatius* Nutt. ex T. & G.; *A. hypoglottis* var. *polyspermus* T. & G.; *A. agrestis* var. *polyspermus* (T. & G.) Jones]. Perennial, caulescent, 9–43 cm tall, from a subterranean caudex and long rhizomelike caudex branches; pubescence basifixed; stems erect to decumbent-clambering; stipules 4–11 mm long, at least the lowermost connate-sheathing; leaves 2–10 cm long; leaflets 13–23, 4–18 mm long, 2–5 mm wide, narrowly elliptic to lance-oblong, obtuse to retuse or acute, strigulose above and below; peduncles 1.5–15 cm long; racemes subcapitate, 5– to 15-flowered, the flowers ascending-erect at anthesis, the axis 0.5–2.5 mm long in fruit; bracts 3–7 mm long; pedicels 0.5–1.5 mm long; bracteoles 0; calyx 7–12.5 mm long, the tube 5–7.8 mm long, cylindric, villous, the teeth 2.5–5.5 mm long, linear; flowers 17–24 mm long, pink purple, ochroleucous, or almost white; pods short-stipitate, the stipe 0.3–1 mm long, the body 7–10 mm long, 2.8–4.5 mm thick, unilocular, oblong-ellipsoid, silky-villous; ovules 14–26; $2n = 16$. Meadows and openings in sagebrush and aspen at 1850 to 3050 m in Box Elder, Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Juab, Kane, Rich, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, and Wayne counties; Yukon east to Ontario and south to California, Nevada, New Mexico, Nebraska, and Iowa; 77 (xvi).

Astragalus alpinus L. Alpine Milkvetch. Perennial, caulescent, 2–30 cm tall, from a subterranean caudex and rhizomatous caudex branches; pubescence basifixed; stems decumbent to ascending; stipules 1.5–8 mm long, at least the lowermost connate-sheathing; leaves 3–15 cm long; leaflets 15–26, 6–20 mm long, 2–10 mm wide, ovate to elliptic or oblong, retuse to rounded, strigulose above and below; peduncles 3–15 cm long; racemes 5– to 17-flowered, the flowers erect to declined at anthesis, the axis 0.5–5 cm long in fruit; bracts 1–2.5 mm long; pedicels 0.5–2.3 mm long; bracteoles 0; calyx 3.2–6.3 mm long, the tube 2–3.5 mm long, campanulate, strigulose, the teeth 1–3.2 mm long; flowers 9–12 mm long, pink purple; pods pendulous, stipitate, the stipe 2–5 mm long, the body oblong-lanceolate in outline, 10–17 mm long, 1.5–4 mm thick, strigulose, semibilocular; ovules 5–11; $2n = 16$, 32. Aspen and coniferous woods at 2430 to 2730 m in Box Elder (Raft River), Grand (on Tavaputs

Plateau), and Salt Lake (at Brighton) counties; Alaska to Nova Scotia and south to Oregon, Nevada, New Mexico, Wisconsin and Vermont; Eurasia; 3 (0).

Astragalus amphioxys Gray Crescent Milkvetch. Perennial (rarely flowering the first year), subcaulescent to shortly caulescent, 2–35 cm tall, from a weak caudex; pubescence malpighian; stems lacking or up to 20 cm long, the internodes often concealed by stipules; stipules 2–13 mm long, all distinct or the lowermost sometimes connate-sheathing; leaves 2–13 mm long; leaflets (1) 5–21, 3–20 mm long, 1–9 mm wide, elliptic to obovate or oblanceolate, obtuse to acute, strigose on both sides; peduncles 2–15 (20) cm long; racemes 2- to 13-flowered, the flowers ascending at anthesis, the axis 1–6.5 cm long in fruit; bracts 2.5–8 mm long; pedicels 0.6–2.5 mm long; bracteoles 0–2; calyx 6.3–14.2 mm long, the tube 5.2 mm long cylindrical, strigose, usually purplish, the teeth 1.1–4.5 mm long, subulate; flowers 16.5–31 mm long, pink purple, rarely white; pods ascending, sessile, 1.5–5 cm long, 5–12 mm thick, usually curved, mostly dorsiventrally compressed, unilocular, strigose; ovules 42–70; $2n = 22$. Two rather feeble and sympatric varieties are present.

1. Banner twice as long as the calyx or less; keel 14.3–19 mm long *A. amphioxys* var. *amphioxys*
 — Banner more than twice as long as the calyx; keel 17–25 mm long *A. amphioxys* var. *vespertinus*

Var. *amphioxys* [*A. shortianus* var. (?) *minor* Gray; *Xylophacos amphioxys* (Gray) Rydb.; *X. aragaloides* Rydb. type from St. George; *X. melanocalyx* Rydb., type from the Beaver Dam Mts.; *A. amphioxys* var. *melanocalyx* (Rydb.) Tidestr.; *A. marcus-jonesii* Munz]. Creosote bush, Joshua tree, blackbrush, indigo bush, salt desert shrub, pinyon-juniper, and less commonly in mountain brush communities at 670 to 2000 m in Emery, Garfield, Grand, Iron, Kane, San Juan, Washington, and Wayne counties; Nevada, Arizona, and New Mexico; 148 (xxxix).

Var. *vespertinus* (Sheldon) Jones [*A. vespertinus* Sheldon]. Desert shrub, sagebrush, pinyon-juniper, and rarely in mountain brush communities at 670 to 1530 m in Emery, Garfield, Grand, Kane, San Juan, Washington, and Wayne counties; Colorado, Arizona, Nevada, and New Mexico; 144 (xlv).

Astragalus ampullarius Wats. Gumbo Milkvetch. [*Tragacantha ampullaria* (Wats.) Kuntze; *Phaca ampullaria* (Wats.) Rydb.]. Perennial, shortly caulescent, 2–28 cm tall, from a deep subterranean caudex; pubescence basifixed; stems prostrate-ascending, radiating; stipules 2–6 mm long, at least the lowermost connate-sheathing; leaves 3–14 cm long; leaflets 7–15 (19), 4–15 mm long, 2–12 mm wide, obovate, rounded to emarginate, strigose on both sides or glabrous above; peduncles 0.5–9.5 cm long; racemes 5- to 30-flowered, the flowers ascending at anthesis, the axis 1.2–13 cm long in fruit; bracts 1.5–3 mm long; pedicels 1–3 mm long; bracteoles 2; calyx 4.8–7.5 mm long, the tube 4.2–6 mm long, short-cylindrical, black strigose, the teeth 0.5–1.5 mm long, broadly triangular; flowers 13.5–22 mm long, pink purple with white wing tips, or ochroleucous; pods ascending-erect, stipitate, the stipe 9–19 mm long, the body ovoid to subglobose, inflated, 12–20 mm long, 8–11 mm thick, subunilocular, glabrous or nearly so; ovules ca. 12. Clay soils of the Chinle and Tropic (?) Shale formations at 970 to 1650 m in Kane (west of the Cockscomb, the type

from near Kanab) and Washington counties; Mohave and Coconino counties, Arizona; 13 (iii). The gumbo milkvetch is one of the most unusual of the vast array of species in Utah. Its propensity for the variegated, saline shales of the Chinle Formation near Kanab has long been known. The hypogeous caudex and short, prostrate-ascending stems, which persist in rosette form with marcescent stems and pods of previous years circular-reclining, bleached and skeleton-like, are quite unlike any of the taxa within the region. Phases of *A. eremiticus*, q.v., with inflated ovoid-oblong pods resemble *A. ampullarius*, but the caudex is typically superficial, the stipules are all distinct, and the stems commonly are erect (except in *A. eremiticus* var. *ampullarioides*, q.v.).

Astragalus anserinus Atwood, Goodrich, & Welsh Goose Creek Milkvetch. Dwarf, tufted or matted, shortly caulescent, perennial herbs from a slender taproot; stems 3–11 cm long, decumbent-spreading; herbage villous-tomentose; stipules all free; leaves 1–4 cm long; leaflets 5–15, 3.2–6.5 mm long, obovate; peduncles 1.1–2.4 cm long; racemes with 3–7 flowers, the axis 1–5 mm long, little if at all elongating in fruit; bracteoles lacking; bracts ca 2 mm long, lance-subulate; pedicels 0.6–1.2 mm long; calyx tube 3.6–4.8 mm long, the teeth 1.1–1.8 mm long, subulate; flowers 9–11.2 mm long, pink purple; pods sessile, 9–12 mm long, 5–7 mm wide, deciduous from within the calyx, dorsiventrally compressed, falcately curved, conspicuously trigonous-beaked, thinly villous; ovules 16–20. Sagebrush, rabbitbrush, and juniper communities, on white tuffaceous outcrops at 1525 to 1590 m in northwestern Box Elder (type from Goose Creek) County; Nevada and Idaho; 6 (0).

Astragalus aretioides (Jones) Barneby Cushion Orophaca. [*A. sericoleucus* var. *aretioides* Jones]. Perennial, pulvinate-caespitose, from a branching caudex; pubescence malpighian; stems almost entirely concealed by stipules; stipules 3.5–7 mm long, connate-sheathing, hyaline, glabrous dorsally or nearly so; leaves 0.6–2 cm long, palmately trifoliate, the leaflets 3–7.5 mm long, 1.2–1.8 mm wide, spatulate to elliptic, acute, silvery strigose on both sides; peduncles 7–15 mm long; racemes 2- or 3-flowered, the flowers ascending, the axis very short; bracts 2–3 mm long; pedicels 1–1.5 mm long; bracteoles 0; calyx 3.3–4.2 mm long, the tube 2.1–2.3 mm long, campanulate, densely long-strigose, the teeth 1.2–2 mm long; flowers 6–8 mm long, pink purple (rarely white); pods ascending, sessile, 4–5 mm long, 1.2–2 mm thick, densely hairy, unilocular. White tuffaceous outcrops of the Browns Park Formation at ca 1769 m in Daggett County; Montana and Wyoming; 3 (0).

Astragalus argophyllus Nutt. ex T. & G. Meadow Milkvetch. Perennial, acaulescent to subcaulescent, 1.5–12 cm tall, arising from a superficial caudex; pubescence basifixed; stems obsolete or to 10 cm long, prostrate; stipules 2–10 mm long, all distinct; leaves 1.5–12 cm long; leaflets 7–21, 2–12 mm long, 1–6 mm wide, elliptic, oblanceolate or obovate, acute to obtuse, pilose above and below; peduncles to 9 cm long; racemes 1- to 6-flowered, the flowers ascending at anthesis, the axis little elongating in fruit; bracts 1.8–6.5 mm long; pedicels 1.2–3.8 mm long, bracteoles 0–2; calyx 9–16.8 mm long, the tube 6.5–11.8 mm long, cylindrical, pilose with mixed black and white hairs, the teeth 1.5–6 mm long, linear; flowers 15–25 mm long, pink purple; pods ascending, sessile, 1.5–3.7 mm long, 5–13 mm thick,

1. Flowers pink purple or bicolored; plants of western Beaver, Juab, and Millard counties
 *A. beckwithii* var. *purpureus*
 — Flowers ochroleucous, concolorous; plants of central to northwestern Utah *A. beckwithii* var. *beckwithii*

Var. *beckwithii* [*Tragacantha beckwithii* (T. & G.) Kuntze; *Phaca beckwithii* (T. & G.) Piper; *Phacomene beckwithii* (T. & G.) Rydb.]. Juniper-pinyon, sagebrush, bunch-grass, and mountain brush communities at 1330 to 2300 m in Beaver, Carbon, Box Elder, Davis, Millard, Morgan, Piute, Salt Lake, Sevier, Tooele (type from W of Lone Rock); Utah, and Weber counties; Nevada; 90 (xii). Plants of var. *beckwithii* are indistinguishable in anthesis from those of *A. oophorus* var. *caulescens*, with which they are sympatric in part of their range (q.v.).

Var. *purpureus* Jones [*A. artemisiarum* Jones; *Phaca artemisiarum* (Jones) Rydb.; *Phacomene artemisiarum* (Jones) Rydb.]. Pinyon-juniper and cool-desert shrublands at 1370 to 2200 m in western Beaver, Juab (type from Deep Creek Mts.), Millard, and Tooele counties; Nevada; 34 (vi).

***Astragalus bisulcatus* (Hook.) Gray** Two-grooved Milkvetch. Perennial, caulescent, 15–70 cm tall, from a caudex; pubescence basifixed; stems erect; stipules 2.5–10 mm long, at least the lowermost connate-sheathing; leaves 3–13.5 cm long; leaflets (7) 15–35, 5–33 mm long, 1.5–11 mm wide, lance-oblong to oblong, elliptic or oblanceolate 2–16 cm long; racemes 25– to 80–flowered, the flowers declined at anthesis, the axis 3–25 cm long in fruit; bracts 2.5–6 mm long; pedicels 1–3.5 mm long; bracteoles 0–2; calyx 3.5–9.6 mm long, gibbous-saccate, the tube 2.8–5.7 mm long, obliquely campanulate, sparingly strigose, the teeth 1–3 mm long, subulate; flowers 8–18 mm long, ochroleucous, whitish, or pink purple, the keel-tip usually purple; pods pendulous, stipitate, the stipe about equaling the calyx tube, the body ellipsoid, 6.5–20 mm long, 2–4.5 mm thick, dorsiventrally compressed, bisulcate, unilocular, strigose or glabrous; ovules 5–15; $2n = 24$. The two-grooved milkvetch is an ill-scented primary indicator of selenium in most areas, but non-scented populations are known. Three distinctive varieties are present in Utah.

1. Flowers bright pink purple; calyx purple; plants of Daggett, Uintah and Grand counties
 *A. bisulcatus* var. *bisulcatus*
 — Flowers ochroleucous or whitish, the keel often purple-tipped; calyx ochroleucous, whitish, or greenish; distribution various 2
 2(1). Flowers 8–11 mm long; body of pod 6.5–9.5 mm long, prominently reticulate; plants usually montane in Utah
 *A. bisulcatus* var. *haydenianus*
 — Flowers 10–18 mm long; body of pod 10–17 mm long, smooth or faintly reticulate; plants usually not montane
 *A. bisulcatus* var. *major*

Var. *bisulcatus* [*Phaca bisulcata* Hook.; *Tragacantha bisulcata* (Hook.) Kuntze; *Diholcos bisulcatus* (Hook.) Rydb.]. River terraces at 1530 to 2200 m in Daggett, Grand, and Uintah counties; Alberta east to Manitoba and south to Idaho, New Mexico, and Kansas; 20 (v).

Var. *haydenianus* (Gray) Barneby [*A. haydenianus* Gray ex Brandege; *Tragacantha haydeniana* (Gray) Kuntze; *Diholcos haydenianus* (Gray) Rydb.]. Sagebrush-mountain brush communities at 2130 to 3265 m in

Carbon, Duchesne, Grand, San Juan, Sanpete, Sevier, Uintah, and Utah counties; Wyoming, Colorado, New Mexico, and Arizona; 20 (v).

Var. *major* (Jones) Welsh [*A. haydenianus* var. *major* Jones, type from Johnson, Kane County; *A. scobatinatulus* Sheldon; *Diholcos scobatinatulus* (Sheldon) Rydb.]. Pinyon-juniper, sagebrush, mountain brush, and salt desert shrub at 1530 to 2440 m elevation in Beaver, Garfield, Juab, Kane, Rich, Sanpete, Sevier, and Washington counties; Wyoming, Colorado, and Arizona; 30 (viii). This taxon was included within an expanded var. *bisulcatus* by Barneby (1964), who considered it as being taxonomically negligible. However, var. *major* differs in about the same manner and degree as do other varieties in *Astragalus*. It is the dominant type within Utah. A population of var. *major* from north of Glendale in western Kane County lacks the characteristic odor of selenium commonly associated with all varieties of *A. bisulcatus*.

Astragalus bodinii Sheldon Bodin Milkvetch. [*Phaca bodinii* (Sheldon) Rydb.; *A. debilis* sensu authors, not Gray (?); *A. yukonis* Jones; *P. yukonis* (Jones) Rydb.; *A. bodinii* var. *yukonis* (Jones) J. Boivin]. Perennial, caulescent, 15–80 cm long, from a superficial or buried caudex; pubescence basifixed; stems straggling on other plants; stipules 1–7 mm long all connate-clasping; leaves 2.5–8.5 cm long; leaflets 7–17, 2–12 mm long, 1–7 mm wide, oblanceolate to obovate, ovate or elliptic, rounded to emarginate or acute, strigose beneath, glabrous above; peduncles 1.5–10 cm long; racemes 3– to 15–flowered, the flowers ascending at anthesis, the axis 0.5–9 cm long in fruit; bracts 0.5–2.5 mm long; pedicels 0.7–2.2 mm long; bracteoles 0; calyx 4.5–5.2 mm long, the tube 3.4–3.8 mm long, campanulate, black-strigose, the teeth 1.5–1.8 mm long, subulate; flowers 9.5–10.2 mm long, pink purple; pods ascending to spreading, stipitate, the stipe (gynophore) to 1 mm long, the body ellipsoid, 5.5–10 mm long, 3–4.5 mm thick, somewhat trigonous, unilocular, strigose; ovules 2–10; $2n = 24, 32$. Wet meadows at 2000 to 2300 m in Rabbit Valley near Loa, Wayne County and along Otter Creek in Piute and Sevier counties; Alaska east to Newfoundland and south to Alberta and Manitoba, and from Wyoming, Nebraska, and Colorado; 11 (iii). Of the great number of species present in Utah, only a handful are true mesophytes. Included in that category are *A. agrestis*, *A. argophyllus* var. *argophyllus*, *A. bodinii*, *A. canadensis*, and *A. diversifolius*. They grow almost exclusively in meadows or other sites that are moist through much of the year. The habitat has been exploited to an extent almost unknown in more arid situations and is seldom explored botanically because of the exploitation, fencing, and private ownership. Despite that exploitation, *A. bodinii* has persisted from its initial discovery by Lester F. Ward (602, US, BRY) in Rabbit Valley, Utah on 18 August, 1875. Possibly *A. bodinii* will yet be found in other meadowlands of the state.

Astragalus brandegei T. C. Porter in Port. & Coult. Brandege Milkvetch. Perennial, though sometimes flowering as an annual, caulescent, 5–35 (40) cm long, from a branching caudex; pubescence basifixed; stems prostrate-spreading, very slender; stipules 1.5–5 mm long, at least the lowermost usually connate-clasping; leaves 2–11.5 cm long; leaflets 5–15, 6–27 mm long, 0.5–2.6 mm wide, linear-filiform to narrowly oblong, acute to obtuse, strigose beneath, glabrous above; peduncles 2.5–14 cm long, very slender; racemes 1– to

5-flowered, the flowers ascending at anthesis, the axis 0.5–6 cm long in fruit; bracts 1–2 mm long; pedicels 1.2–4 mm long; bracteoles 2; calyx 2.7–4 mm long, the tube 1.8–2.5 mm long, campanulate, black-strigose, the teeth 0.9–2 mm long, subulate; flowers 4.5–6 mm long, ochroleucous or tinged violet; pods pendulous to ascending, sessile or subsessile, the body obovoid to oblong-ellipsoid, 10–18 mm long, 3.5–5 mm thick, slightly dorsiventrally compressed, semibilocular, strigose; $n = 11$. Volcanic gravels in mixed shrublands or pinyon-juniper at 1650 to 2430 m in Carbon, Emery, Garfield, Iron, Piute, and Wayne counties; Colorado, New Mexico, and Arizona; 10 (v). This is a cryptic plant that is seldom collected, because of its inconspicuous, tiny flowers, slender peduncles, and slender prostrate stems; 10 (v).

Astragalus callithrix Barneby Callaway Milkvetch. Perennial, subcaulescent, 2–11 cm tall, from a caudex; pubescence basifixed; stems lacking or to 10 cm long, prostrate, the internodes often concealed by stipules; stipules 2–5 mm long, all distinct, leaves 2–11 cm long; leaflets 9–21, 2–13 mm long, 1.5–10 mm wide, obovate, suborbicular, or lanceolate, obtuse to truncate or emarginate, villous on both sides; peduncles 2–8 (12) cm long; racemes 5– to 15-flowered, the flowers ascending at anthesis, the axis 0.5–6 cm long in fruit; bracts 3–7.5 mm long; pedicels 1–1.5 mm long; bracteoles 0–2; calyx 6.8–13.3 mm long, the tube 5.5–10.8 mm long, cylindrical, villous-pilose, purplish, the teeth 1–3.2 mm long; flowers bright pink purple, 16–26 mm long; pods ascending-spreading, sessile, oblong-ovoid, 10–20 mm long, 5–7.5 mm thick, dorsiventrally compressed, curved, long hairy (the valves not obscured), unilocular; ovules 24–34. Sandy flats and dunes in mixed desert shrublands and juniper communities at 1550 to 1710 m in western Millard County; Nye County, Nevada; a Great Basin endemic; 11 (vi).

Astragalus calycosus Torr. ex Wats. Torrey Milkvetch. Perennial low acaulescent herbs, 1–12 cm tall, from a branching caudex; pubescence malpighian; stems lacking or to 2 cm long, the internodes concealed by stipules, these 1.5–6 mm long, all distinct; leaves 1–8 (12) cm long; leaflets 3–13, 2–19 mm long, 1–7 mm wide, obovate, oblanceolate, or elliptic, obtuse to acute, silvery strigose on both sides; peduncles 0.5–10 cm long, rarely longer; racemes 1– to 8-flowered, the flowers ascending to spreading at anthesis, the axis 0.2–2.5 cm long in fruit; bracts 0.5–2 mm long; pedicels 0.7–3 mm long; bracteoles lacking or minute; calyx 5–8.5 mm long, the tube 4–6.7 mm long, campanulate to short-cylindrical, strigose, the teeth 1–4.2 mm long, subulate; flowers 10–16.5 mm long, varicolored, ochroleucous to shades of pink and purple, with white or pale wing-tips, the wings bilobed apically; pods ascending, sessile, narrowly oblong, usually curved, 8–25 mm long, 3–4.5 mm thick, laterally compressed, bilocular, strigose; $2n = 22$. Rather widespread and distinctive, the plants of Torrey milkvetch are separable into three varieties, two rare and one common.

- 1. Leaves with 5–13 leaflets along a rachis usually more than 1 cm long; scapes erect-ascending, usually over 7 cm long; raceme axis usually over 2 cm long; plants of Washington County *A. calycosus* var. *scaposus*
- Leaves with 3–13 leaflets along a rachis usually less than 1 cm long; scapes ascending or decumbent, 1–7 cm long; raceme axis less than 2 cm long; plants of various distribution 2

- 2(1). Leaflets 7–13, mostly 2–6 mm long; plants alpine in extreme west-central Utah, rare *A. calycosus* var. *mancus*
- Leaflets 3–7, mostly 5–19 mm long; plants of lower elevations, widespread, except in the northeastern third of Utah *A. calycosus* var. *calycosus*

Var. *calycosus* [*Tragacantha calycosa* (Torr.) Kuntze; *Hamosa calycosa* (Torr.) Rydb.; *A. brevicaulis* A. Nels.]. Mixed desert shrublands, pinyon-juniper, and ponderosa pine woods at 1430 to 2730 m in Beaver, Box Elder, Emery, Garfield, Iron, Juab, Kane, Millard, Piute, San Juan, Sanpete, Sevier, Tooele, Utah, Washington, and Wayne counties; Wyoming, Idaho, Nevada, California, and Arizona; 155 (xxv).

Var. *mancus* (Rydb.) Barneby [*Hamosa manca* Rydb.; *A. mancus* (Rydb.) Wheeler]. Ridgetops at 2650 to 3660 m in Deep Creek Mts., Juab County, Nevada; 6 (i).

Var. *scaposus* (Gray) Jones [*A. scaposus* Gray; *Hamosa scaposa* (Gray) Rydb.; *A. caudicans* Greene]. Ridgetops at ca 2730 m in Beavertdam Mts., Washington County; Nevada, Arizona, Colorado, and New Mexico; 1 (0).

Astragalus canadensis L. Canada Milkvetch. Perennial, caulescent, 1.5–12 dm tall, erect or ascending; stipules 3–12 mm long or more, at least the lowermost connate-sheathing; leaves 4–30 cm long; leaflets 13–35, 10–52 mm long, 6–16 mm wide, lanceolate, lance-oblong, or elliptic, obtuse to emarginate, strigose on both sides, or glabrous above; peduncles 4–22 cm long; racemes many-flowered, the flowers spreading-declined at anthesis, the axis 2.5–16 cm long in fruit; bracts 1.5–10 mm long; pedicels 0.5–3.5 mm long; bracteoles 0–2; calyx 4.6–10.5 mm long, the tube 4–8.5 mm long, short-cylindrical, strigose, the teeth 1.2–4.4 mm long, subulate or triangular; flowers 13.5–17.5 mm long, ochroleucous; pods erect, sessile or subsessile, cylindrical, 10–20 mm long, 2.9–5.2 mm thick, bilocular, strigose or glabrous; ovules 16–28; $2n = 16$. Two varieties are known from Utah. These are peculiar among our many low-elevation species in flowering in midsummer.

- 1. Pods and ovaries glabrous, terete at maturity, not sulcate dorsally; calyx teeth 2.5–4.4 mm long; plants mostly 4–12 dm tall *A. canadensis* var. *canadensis*
- Pods and ovaries pubescent, sulcate dorsally at maturity; calyx teeth mostly 1–2.5 mm long; plants 1–5 dm tall *A. canadensis* var. *brevidens*

Var. *brevidens* (Gand.) Barneby [*A. mortonii* f. *brevidens* Gand.]. Meadows, stream banks, lake shores and hillsides at 1830 to 2300 m in Box Elder, Cache, Daggett, Rich, and Summit counties; Montana, Idaho, Oregon, California, Nevada, Wyoming, and Colorado; 10 (v).

Var. *canadensis* [*A. carolinianus* L.]. Stream terraces and lake shores at 1370 to 1600 m in Cache, Piute, Salt Lake, Utah, and Wasatch counties; British Columbia east to Ontario and south to Washington, New Mexico, Texas, Louisiana, Alabama, and South Carolina; 6 (i).

Astragalus ceramicus Sheldon Painted Milkvetch. [*Phaca picta* Gray; *A. pictus* (Gray) Gray, not Boiss. & Gaill.; *A. pictus* var. *foliolosus* Gray; *A. pictus* var. *angustus* Jones, type from Montezuma Canyon, San Juan County; *A. pictus* var. *magnus* Jones, type from Silver Reef, Washington County; *Tragacantha picta* (Gray) Kuntze; *A. angustus* var. *pictus* (Gray) Jones; *A. angustus* var. *ceramicus* (Sheldon) Jones; *A. ceramicus* var. *jonesii*

Sheldon; *A. angustus* (Jones) Jones]. Perennial, caulescent, 3–40 cm tall, from elongate rhizomelike caudex branches and deeply buried caudex; pubescence malpighian; stems sprawling to erect; stipules 1.5–9 mm long, at least some connate-sheathing; leaves 2–17 cm long; leaflets 3–13 or only 1, the terminal continuous with the rachis, 3–30 mm long, 0.5–3 mm wide, filiform to narrowly oblong, obtuse to retuse or acute; peduncles 0.7–7.5 cm long; racemes 2– to 15-flowered (rarely more), the flowers ascending to declined at anthesis, the axis 1–12 cm long in fruit; bracts 1–2.5 mm long; pedicels 0.7–3.1 mm long; bracteoles 0; calyx 3.1–4.2 mm long, the tube 2.1–3.3 mm long, campanulate, strigose, the teeth 1–2.4 mm long, subulate; flowers 6.3–9.5 mm long, dull purplish to pink or rarely whitish; pods pendulous, stipitate, the stipe 1–3.3 mm long, the body bladderly-inflated, ellipsoid to glabrous, unilocular; ovules 12–29; $2n = 22$. Sandy soils in pinyon-juniper, sagebrush, stream bank, grassland, and mixed desert shrub communities at 1270 to 2360 m in Beaver, Emery, Garfield, Grand, Juab, Kane, Millard, San Juan, Tooele, Uintah, Washington and Wayne counties; Idaho to Montana and North Dakota, south to Arizona, New Mexico, and Oklahoma; 94 (xix). Our highly variable materials belong to var. *ceramicus*. Specimens from the Uinta Basin have the long leaves typical of the Great Plains phase.

Astragalus chamaeleuce Gray in Ives Cicada Milkvetch. [*Phaca pygmaea* Nutt.; *Tragacantha pygmaea* (Nutt.) Kuntze; *A. cicadae* var. *laccoliticus* Jones, type from Henry Mts.; *A. pygmaea* var. *laccoliticus* (Jones) Jones]. Perennial, acaulescent to subacaulescent, 2–10 cm tall, from a caudex; pubescence malpighian; stems lacking or to 6 cm long and prostrate the internodes mostly obscured by stipules; stipules 2–7 mm long, all distinct; leaves 2–10 cm long; leaflets 5–17, 4–15 mm long, 2–10 mm wide, obovate to oblanceolate, obtuse to truncate or emarginate, strigose on both sides; peduncles 1–8 cm long; racemes 2– to 11-flowered, the flowers spreading-ascending, the axis 0.9–2 cm long in fruit; bracts 2–5 mm long; pedicels 1–3.5 mm long, short-cylindrical, strigose, the teeth 1.5–2.9 mm long; flowers ochroleucous or tinged purplish to pink purple; pods ascending, sessile, oblong-ovoid or ellipsoid, 2–4 cm long, 7–16 mm thick, the fleshy valves ca 3 mm thick, shrinking in ripening, the papery exocarp ultimately lustrous, separating from the veins beneath and appearing quite smooth, mottled, strigose, unilocular; ovules 37–46; $2n = 22$. Juniper-pinyon, sagebrush, mixed desert shrub, and grassland communities at 1530 to 2130 m in Daggett, Duchesne, Emery, Garfield, Grand, and Uintah counties; Colorado and Wyoming; 30 (xi). The cicada milkvetch is the only subacaulescent species of *Astragalus* of its type with malpighian hairs known from the Uinta Basin. To the south of there it is rare, and mingles with both *A. amphioxys* and *A. cymboides*. Mature fruit is necessary for positive identification of *A. chamaeleuce* from those entities. It flowers earlier than either of those species where they are sympatric, and typically bears mature fruit when the others are in full anthesis. The phase from west of the Henry Mts., with pods oval instead of oblong in outline are within the circumscriptions of *A. cicadae* var. *laccoliticus* Jones and probably deserve taxonomic recognition. The plants are intermediate between *A. consobrinus* and *A. chamaeleuce*.

Astragalus chamaemeniscus Barneby Ground-crescent Milkvetch. Perennial, caulescent, from a woody shallowly subterranean caudex, the stems 3–18 cm long,

reclining and radiating; pubescence basifixed; stipules 3–7 mm long, the lower ones almost or quite connate-sheathing; leaves 2–8 cm long; leaflets 9–10, 3–11 mm long, 1.5–8 mm wide, obovate to oblanceolate, obtuse or emarginate, loosely pilose below, glabrous above; peduncles 1.5–5 cm long; racemes loosely 3– to 10-flowered, the flowers ascending, the axis not much elongating, 0.5–2 cm long in fruit; bracts 2.5–4.5 mm long; pedicels 1.5–3 mm long; bracteoles 2; calyx 5.8–10 mm long, the tube campanulate-cylindrical, 4.7–7 mm long, the teeth 1.1–3 mm long, subulate; flowers 14–19 mm long, reddish violet to pink purple; pods ascending to declined, curved, 2–4.5 cm long, 5–8 mm thick, with a stipe 1–2.5 mm long, triquetrous, sulcate dorsally, the valves stramineous, leathery, prominently reticulate, thinly villous, bilocular. Rabbitbrush, ricegrass, and galleta communities at 1525 to 1620 m in Iron and Beaver counties; eastern Nevada; a Great Basin endemic; 2 (0).

Astragalus chloodes Barneby Grass Milkvetch. Perennial, acaulescent or subacaulescent, 5–24 cm tall, from a branching caudex; pubescence malpighian; stems obscured by stipules; stipules 2–8 mm long, all usually connate-sheathing; leaves simple 1–13 (17) cm long, 1–3 mm wide, flat or involute, strigose on both sides; peduncles 2–9 cm long; racemes loosely 7– to 23-flowered, the flowers ascending at anthesis, the axis 4.5–24 cm long in fruit; bracts 2–4.5 mm long; pedicels 1–2.5 mm long; bracteoles 0; calyx 4.5–8.5 mm long, the tube 2–3 mm long, campanulate, strigose, the teeth 2.5–5.2 mm long, rigid-spreading; flowers 6.2–8.2 mm long, pink purple; pods erect or ascending, sessile, obliquely lanceolate or oblong in outline, curved, 8–12 mm long, 1.7–3 mm wide, glabrous or strigose, unilocular; ovules 4–8. Entrada, Navajo, Frontier, Dakota, and other sandstone hogbacks and cuervas in pinyon-juniper and mixed desert shrub communities at 1450 to 1700 m in Uintah (type from 6 mi SE of Jensen) County; endemic; 36 (ix). The grass milkvetch simulates a grass, not only in its narrow leaves, but also in the flowers in bud, which resemble grass spikelets.

Astragalus cibarius Sheldon Browse Milkvetch. [*A. webberi* var. *cibarius* (Sheldon) Jones; *Xylophacos cibarius* (Sheldon) Rydb.; *A. arietinus* Jones, type from Cedar City]. Perennial, caulescent, 6–30 cm tall, from a branching caudex; pubescence basifixed; stems decumbent to ascending; stipules 3–8 mm long, all distinct; leaves 3.5–10 cm long; leaflets 11–19, 4–17 mm long, 2–13 mm wide, obovate, oblong, or oblanceolate, obtuse or retuse, strigose beneath, glabrous above; peduncles 3–8 cm long; racemes 4– to 14-flowered, subcapitate at early anthesis, the flowers spreading-ascending, the axis 0.5–2.7 cm long in fruit; bracts 2–4 mm long; pedicels 1–2.5 mm long; bracteoles 0–2; calyx 6.4–9.2 mm long, the tube 5–7 mm long, cylindrical, strigose, the teeth 1.4–2.5 mm long; flowers 15–19 mm long, pink purple with white wing-tips or whitish to ochroleucous and variously tinged; pods ascending, subsessile, ellipsoid to oblong, 17–32 mm long, 7–10 mm thick, curved to almost straight, strigose, unilocular, woody or stiffly leathery; ovules 27–32; $2n = 22$. Mountain brush, sagebrush, juniper-pinyon, and mixed desert shrub communities at 1630 to 2430 m in Beaver, Box Elder, Cache, Davis, Garfield, Iron, Juab, Millard, Morgan, Rich, Salt Lake, Sanpete, Sevier, Summit, Tooele, Utah (type from Utah Valley), Wasatch, Washington, and Weber counties; Nevada,

Idaho, Montana, Wyoming, and Colorado; 151 (xix). This species is allied to *A. ensiformis* and *A. malacoides*, but is easily distinguished from both of them on geographical and morphological grounds.

Astragalus ciccer L. Chickpea Milkvetch. [*Cystium ciccer* (L.) Steven]. Perennial, caulescent. 20–70 cm, tall or more, from a branching caudex; pubescence basifixed; stems prostrate to ascending; stipules 2–8 mm long, at least the lowermost connate-sheathing; leaves 4–21 cm long; leaflets 17–27 (31), 5–40 mm long, 2–14 mm wide, lance-elliptic to oblong, acute to obtuse, strigose on both sides or glabrous above; peduncles 4–12 cm long; racemes densely 10– to 30-flowered, the flowers ascending at anthesis, the axis 2–7 cm long in fruit; bracts 2–6.5 mm long; pedicels 0.3–1.5 mm long; bracteoles 0; calyx 6–9 mm long, the tube 5–6 mm long, short-cylindric, strigulose, the teeth 1.6–3 mm long; flowers 12.5–16.5 mm long, ochroleucous; pods ascending, or by crowding, spreading, subsessile, the body ovoid or subglobose, strongly inflated, 6–14 mm long, 6–10 mm thick, pilose, bilocular; 2n = 64. Introduced forage plant, escaping and persisting in pinyon-juniper, sagebrush, mountain brush, and aspen communities at 1770 to 2930 m in Box Elder, Garfield, Iron, Sanpete, and Washington counties; indigenous to Europe; 10 (0).

Astragalus coltonii Jones Colton Milkvetch. Perennial, caulescent, 10–75 cm tall, from a branching caudex; pubescence basifixed; stems erect or ascending; stipules 1–7 mm long, all distinct; leaves 2–10 cm long; leaflets 3–19, or the uppermost leaves simple, 3–20 mm long, 0.3–3 mm wide, linear, narrowly oblong or ovate, strigose on both sides; peduncles 4–30 cm long; racemes loosely 5– to 30-flowered, the flowers spreading-declined at anthesis, the axis 3–20 cm long in fruit; bracts 0.5–3.2 mm long; pedicels 0.8–2.5 mm long; bracteoles 0; calyx 4.5–8 mm long, the tube 4–6.7 mm long, cylindrical, strigose, purplish, the teeth 0.6–2.3 mm long, broadly subulate; flowers 12–19 mm long, pink purple; pods pendulous, stipitate, the stipe 4–11 mm long, the body oblong to oblanceolate in outline, 19–35 mm long, 3–6 mm wide, strongly laterally flattened, glabrous, unilocular; ovules 14–20. Two allopatric and distinctive varieties occur in Utah.

1. Leaves all odd-pinnate, with 9–19 leaflets, the terminal one jointed on all leaves; plants of Grand and San Juan counties *A. coltonii* var. *moabensis*
- Leaves odd-pinnate, or the uppermost simple, with 3–9 leaflets, the terminal one continuous with the rachis; plants not from Grand or San Juan counties *A. coltonii* var. *coltonii*

Var. *coltonii* [*Homalobus coltonii* (Jones) Rydb.; *A. coltonii* var. *aphyllus* Jones, type from Richfield]. Bunchgrass, salt desert shrub, pinyon-juniper, and mountain brush communities at 1470 to 2300 m in Carbon (type from Castle Gate), Emery, Garfield, Kane, Millard, Sevier, and Wayne counties; endemic; 61 (xii).

Var. *moabensis* Jones (*A. coltonii* var. *foliosus* Jones ex Eastw.; *Homalobus canovirens* Rydb., type from La Sal Mts.; *A. canovirens* (Rydb.) Barneby]. Pinyon-juniper and mountain brush communities at 1400 to 2300 m in Grand and San Juan (type from Monticello) counties; Wyoming, Colorado, New Mexico, and Arizona; 31 (xii).

Astragalus consobrinus (Barneby) Welsh Bicknell Milkvetch. [*A. castaneiformis* var. *consobrinus* Barneby,

type from near Bicknell]. Perennial, sometimes flowering the first year, acaulescent, 1–5 cm tall, the caudex branches obscured by persistent leaf bases and stipules; pubescence malpighian; stems essentially lacking; stipules 3–7 mm long, all distinct; leaves 1–5 cm long; leaflets 3–11, 2–8 mm long, 1.5–4 mm wide, obovate to oblanceolate or orbicular, rounded to obtuse or acute, strigose on both surfaces; peduncles 0.4–3 cm long; racemes 2– to 10-flowered, the flowers ascending at anthesis, the axis to 1 cm long in fruit; bracts 1.5–3.5 mm long; pedicels 1–2 mm long; bracteoles 0; calyx 5.5–8.9 mm long, the tube 4.1–6.8 mm long, cylindrical, strigose, the teeth 1.4–1.7 mm long, subulate; flowers 10–15.5 mm long, ochroleucous suffused with purple; pods ascending, sessile, obliquely ovoid or lance-ovoid, 11–19 mm long, 3–8 mm thick, strigose, unilocular; ovules 18–33. Sagebrush-grassland and pinyon-juniper communities at 1830 to 2200 m in Emery, Garfield, Piute, Sevier, and Wayne counties; endemic; 11 (vi).

Astragalus convallarius Greene Lesser Rushy Milkvetch. Perennial, caulescent, 10–60 cm tall, from a subterranean caudex; pubescence basifixed; stems erect or ascending, stipules 2–7 mm long, at least the lowermost connate-sheathing; leaves 2–11 cm long; leaflets, when present, 3–13, the uppermost leaves reduced to the rachis, mostly 5–30 mm long, 0.5–4 mm wide, linear to oblong or oblanceolate; peduncles 1–14 cm long; racemes 3– to 25-flowered, the flowers ascending to declined at anthesis, the axis 2–20 cm long in fruit; bracts 0.5–2.3 mm long; pedicels 1–8 mm long; bracteoles 0–2; calyx 4–6.3 mm long, the tube 3.4–5.4 mm long, triangular-subulate; flowers 6.4–12 mm long, ochroleucous or variously tinged or veined with purple; pods pendulous to spreading, sessile, linear to narrowly oblong, straight, 13–50 mm long, 2.3–4 mm thick, laterally compressed, strigose, unilocular; ovules 11–26. This is possibly the most widespread of the milkvetch species within Utah. Two allopatric varieties are present.

1. Pods 25–50 mm long, 2.3–3.3 mm wide; plants widespread, but not in western Iron and Washington counties *A. convallarius* var. *convallarius*
- Pods 13–25 mm long, 3.4–4 mm wide; plants of western Iron and Washington counties *A. convallarius* var. *finitimus*

Var. *convallarius* [*Homalobus campestris* Nutt. ex T. & G.; *Tragacantha campestris* (Nutt.) Kuntze; *A. serotinus* var. *campestris* (Nutt.) Jones; *Phaca convallaria* (Nutt.) Greene; *Homalobus junceus* Nutt. ex T. & G.; *A. junceus* (Nutt.) Gray, not Ledeb. ex Sprengel; *T. juncea* (Nutt.) Kuntze; *A. diversifolius* var. *junceus* (Nutt.) Jones; *A. diversifolius* var. *roborum* Jones; *A. junceiformis* A. Nels.; *Homalobus junceiformis* (A. Nels.) Rydb.; *A. junceus* var. *attenuatus* Jones, type from Price]. Mixed desert shrub, sagebrush, pinyon-juniper, mountain brush, ponderosa pine, and aspen communities at 1400 to 2900 m in all except Grand, Iron, and Washington counties; Idaho and Montana, south to Nevada and Colorado; 206 (xvii).

Var. *finitimus* Barneby Pinyon-juniper and sagebrush communities at 1700 to 2270 m in western Iron and Washington (type from 3 mi S of Enterprise) counties; Lincoln County, Nevada; 14 (iii).

Astragalus cottamii Welsh Cottam Milkvetch. [*Astragalus monumentalis* var. *cottamii* (Welsh) Isely]. Perennial, sometimes flowering the first year, acaulescent or

subcaulescent, 1.2–8 cm tall, from a branching caudex; pubescence basifixed; stems lacking or 0.5–6 cm long, the internodes mostly obscured by stipules, these 2–6 mm long, all distinct; leaves 1.2–8 cm long; leaflets (5) 9–19 (21), 2–9 mm long, 1–4.2 mm wide, elliptic to oval or oblanceolate, acute to obtuse, strigose on both sides or glabrous above; peduncles 0.7–7 cm long; racemes 3– to 9-flowered, the flowers ascending at anthesis, the axis 0.5–2 cm long in fruit; bracteoles 0–2; calyx 6.2–8 mm long, the tube 4.8–6.7 mm long, cylindrical, strigulose, purplish, the teeth 1.2–2 mm long, subulate; flowers 11–17 mm long, pink purple or bicolored; pods spreading-descending, sessile, curved, oblong to oblong-lanceolate in outline, triquetrous, the dorsal suture sulcate, bilocular, strigose, usually purple-blotched. Rimrock and ledges of Cedar Mesa, Kayenta, and Entrada sandstone formations and in the sandy canyons cut from them, in pinyon-juniper and blackbrush communities on Entrada, Navajo, Cedar Mesa, and White Rim formations at 1310 to 1895 m in San Juan (type from east of Clay Hills Divide) County; Arizona and New Mexico; A Colorado Plateau endemic; 14 (ix).

Astragalus cronquistii Barneby Cronquist Milkvetch. Perennial, caulescent, 1.5–4 dm tall, from a subterranean caudex; pubescence basifixed; stems decumbent-ascending; stipules 2–6 mm long, all distinct; leaves 1.5–4.5 cm long; leaflets 7–15, 6–23 mm long, 1.5–4 mm wide, oblong to narrowly elliptic, retuse to truncate, strigose beneath, glabrate above; peduncles 2–6.5 cm long; racemes 6– to 20-flowered, the flowers declined at anthesis, the axis 0.5–8.5 cm long in fruit; bracts 0.6–1.2 mm long; pedicels 1.5–2.5 mm long; bracteoles 1; calyx 3.8–5.3 mm long, the tube 3.3–4 mm long, campanulate, strigose, the teeth 0.5–1.3 mm long, triangular; flowers 8–9 mm long, dull pink purple; pods declined-pendulous, sessile or subsessile, the body narrowly elliptic in outline, 13–30 mm long, 3–4.8 mm wide, trigonous, grooved dorsally, strigose, semibilocular. Blackbrush and salt desert shrub on Cutler and Morrison formations at 1430 to 1525 m in San Juan (type from W of Comb Reef) County; Montezuma County, Colorado; a Plateau endemic; 11 (iii).

Astragalus cymbooides Jones Canoe Milkvetch. [*Xylophacos cymbooides* (Jones) Rydb.; *A. amphioxys* var. *cymbellus* Jones, type from San Rafael Swell]. Perennial, acaulescent or subcaulescent, 2.5–8 cm tall, from a simple or branched caudex; pubescence malpighian; stems lacking or 0.5–3 cm long, the internodes mostly obscured by stipules; stipules 3–8 mm long, all distinct; leaves 2.5–8 cm long; leaflets (1–3) 5–18, 3–13 mm long, 2–9 mm wide, obovate, elliptic or oblanceolate, obtuse to acute, pubescent on both surfaces; peduncles 2–8 cm long; racemes 3– to 9-flowered, the flowers ascending at anthesis, the axis 0.5–2 cm long in fruit; bracts 1–4 mm long; pedicels 0.7–2.5 mm long; bracteoles 0; calyx 7.6–10.2 mm long, the tube 5.9–8 mm long, cylindrical, strigose, the teeth 1–2.3 mm long, subulate; flowers 15–18.5 mm long, ochroleucous or suffused purplish, or pink purple; pods ascending, sessile, oblong to oblong-elliptic in outline, straight, 17–30 mm long, 6–9.5 mm wide, laterally compressed, the valves papery or cellular-spongy, the exocarp in time exfoliating, strigose, unilocular; ovules 39–57; $2n = 24$ (?). Salt desert shrub and pinyon-juniper communities at 1600 to 2300 m in Carbon, Emery (type from Huntington), and Grand counties; en-

demic; 59 (x). The small-flowered phases of canoe milkvetch approach *A. consobrinus* and the large-flowered phases are difficult to distinguish, in anthesis, from *A. amphioxys*. Further work is indicated.

Astragalus desereticus Barneby Deseret Milkvetch. Perennial, acaulescent or subcaulescent, 4–15 cm tall, from a caudex; pubescence basifixed; stems to 6 cm long, the internodes more or less obscured by stipules, these 3.5–7 mm long, all distinct; leaves 4–12 cm long; leaflets 11–17, 2–14 mm long, 1.5–8 mm wide, elliptic to obovate, short-acuminate to acute, strigulose-villosulous on both sides; peduncles 2–5.5 cm long; racemes 5– to 10-flowered, the flowers ascending at anthesis, the axis 0.5–2 cm long in fruit; bracts 3–6 mm long; pedicels 2–3 mm long; bracteoles 0–2; calyx 8.4–12 mm long, the tube 6.2–7.5 mm long, cylindrical, villous, the teeth 2–4 mm long, subulate; flowers 18–22.5 mm long, whitish suffused with pale purple, the keel purple-tipped; pods ascending, sessile or substipitate, ovoid-ellipsoid, curved, 10–20 mm long, 5–10 mm thick, densely hirsute with lustrous hairs; ovules 14–16. Sagebrush-juniper community at 1830 m in Utah (type from near Birdseye) County; endemic; 7 (i). This species has long remained obscure, but occurs within a short distance from a road that has been traversed by botanists for almost a century since its initial discovery. It was rediscovered by Elizabeth Neese in May of 1981, after a hiatus of some six decades. The plants were initially thought to be closely allied to *A. argophyllus*, but the relationship is probably nearer to *A. purshii*.

Astragalus desperatus Jones Rimrock Milkvetch. [*Batidopaca desperata* (Jones) Rydb.; *Tium desperatum* (Jones) Rydb.]. Perennial, acaulescent or subcaulescent, 1–12 cm tall, from a branching caudex; pubescence basifixed; stems to 8 cm long, the internodes often obscured by stipules; stipules 1.5–7 mm long, at least some connate-sheathing; leaves 1–12 cm long; leaflets 7–17, 2–13 mm long, 1–5 mm wide, elliptic to oblanceolate or obovate, acute to obtuse, strigose on both sides or glabrate above; peduncles 0.5–13 cm long; racemes 3– to 18-flowered, the flowers ascending to declined at anthesis, the axis 0.4–13 cm long in fruit; bracts 1.5–5 mm long; pedicels 0.5–1.4 mm long; bracteoles 0–2; calyx 3.5–6 mm long, the tube 2.5–4 mm long, campanulate, strigose-pilose, the teeth 0.8–2.6 mm long, subulate; flowers 6–9 mm long, pink purple or bicolored; pods declined to deflexed, sessile or short-stipitate, the stipe (gynophore) to 1.2 mm long, the body obliquely ovoid to lance-ellipsoid, curved, 6–19 mm long, 3–6 mm thick, hirsute with lustrous hairs, unilocular; ovules 16–28; $2n = 24$. Two more or less distinctive but partially sympatric varieties are present.

1. Pods lunately curved, at maturity mainly 11–19 mm long; plants commonly shortly caulescent; racemes typically with 6–28 flowers; widespread *A. desperatus* var. *desperatus*
- Pods straight or nearly so, at maturity 6–11 mm long; plants commonly acaulescent; racemes typically with 3–6 flowers; northern and western San Rafael Swell *A. desperatus* var. *petrophilus*

Var. *desperatus* Mixed desert shrub and pinyon-juniper communities, often on rimrock, at 1130 to 1900 m in Emery, Garfield, Grand (type from near Cisco), Kane, San Juan, and Wayne counties; Colorado and Arizona; a Plateau endemic; 107 (xxxiv).

Var. *petrophilus* Jones [*Batidophaca petrophila* (Jones) Rydb.]. Pinyon-juniper and mixed desert shrub communities at 1430 to 2135 m in Emery (type from San Rafael Swell) County; endemic; 22 (v).

Astragalus detritalis Jones Debris Milkvetch. [*Homalobus detritalis* (Jones) Rydb.; *A. spectabilis* C. L. Porter, not Schischkin, the type from southwest of Vernal]. Perennial, acaulescent, 0.5–8 cm tall, from a branching caudex; pubescence malpighian; stems essentially lacking; stipules 3–10 mm long, at least some (usually all) connate-sheathing; leaves 0.5–8 cm long, simple or with 3–7 leaflets, 3–30 mm long, and 0.5–2.5 mm wide, narrowly oblanceolate to linear, spinulose-tipped, strigose on both sides; peduncles 1–9 cm long; racemes 2– to 8-flowered, the flowers ascending at anthesis, the axis 0.9–3.8 cm long, bracts 2.5–7 mm long; pedicels 0.5–2.5 mm long; bracteoles 0–2; calyx 5–9.6 mm long, the tube 3.1–5.4 mm long, campanulate, strigose, the teeth 1.6–4.7 mm long, subulate; flowers 13–30 mm long, pink purple; pods erect to straight or curved, 15–35 mm long, 2–3.5 mm wide, laterally compressed, mottled, strigose, unilocular; ovules 15–24. Pinyon-juniper and mixed desert shrub communities at 1650 to 1950 m in Duchesne (type from southwest of Duchesne) and Uintah counties; Rio Blanco County, Colorado; a Uinta Basin endemic; 38 (x).

Astragalus diversifolius Gray Mesic Milkvetch. [*Homalobus orthocarpus* Nutt. ex T. & G., not *A. orthocarpus* Boiss.; *A. campestris* var. *diversifolius* (Gray) Machr.; *A. junceus* var. *orthocarpus* (Nutt.) Jones; *A. junceus* var. *diversifolius* (Gray) Jones; *A. convallarius* var. *diversifolius* (Gray) Tidestr.; *A. ibapensis* Jones, type from Deep Creek Mts.; *Atelphragma ibapense* (Jones) Rydb.]. Perennial, caulescent, 20–50 cm tall, from a subterranean to superficial caudex and stout taproot; pubescence basifixed; stems prostrate to ascending; stipules 1–3 mm long, the lowest connate-sheathing; leaves 1.5–7 cm long; leaflets 1–7, 4–47 (67) mm long, narrowly elliptic, linear, oblanceolate, or lanceolate, the uppermost often simple, strigose on both sides; peduncles 2–15 cm long; racemes 3– to 8-flowered, the flowers ascending at anthesis, the axis 0.5–3 mm long in fruit; bracts 0.7–2.5 mm long; pedicels 1.8–4 mm long; bracteoles 0; calyx 4.4–6.7 mm long, the tube 3.2–4.7 mm long, campanulate, strigose, the teeth 1–2 mm long, subulate; flowers 8–23.5 mm long, greenish white, often tinged with purple; pods ascending to declined, sessile or substipitate, the body narrowly oblong, 10–17 mm long, 2.7–4 mm wide, strongly laterally compressed, strigose, unilocular; ovules 10–16. Moist, often saline meadows at 1340 to 1700 m in Juab and Tooele counties; Idaho; 6 (ii). The mesic milkvetch was rediscovered at Juab by Sherel Goodrich in 1980; the next previous collection was taken there in 1902.

Astragalus drummondii Dougl. ex Hook. Drummond Milkvetch. [*Tragacantha drummondii* (Dougl.) Kuntze; *Tium drummondii* (Dougl.) Rydb.]. Perennial, caulescent, 25–60 cm tall, from a branching, subterranean caudex; pubescence basifixed; stems erect or ascending; stipules 3–12 mm long, at least some connate-sheathing; leaves 4–13 mm long; leaflets 17–33, 4–33 mm long, 2–12 mm wide, oblong to oblanceolate or obovate, obtuse to truncate or emarginate, villous-pilose beneath, usually glabrous above; peduncles 4–12 cm long; racemes 14– to 30-flowered, the flowers spreading-declined at anthesis,

the axis 3–22 cm long in fruit; bracts 2–5 mm long; pedicels 1.5–5 mm long; bracteoles 0–2; calyx 7–12.5 mm long, the tube 4.7–8 mm long, short-cylindric, sparingly villous, the teeth 1.7–4.5 mm long, subulate; flowers 18–25 mm long, whitish to ochroleucous, the keel purple-tipped; pods pendulous, stipitate, the stipe 5–11 mm long, the body narrowly oblong to oblanceolate in outline, 17–32 mm long, 3.5–5.5 mm thick, trigonous, sulcate dorsally, glabrous, bilocular; ovules 14–30; 2n = 22. Pinyon-juniper, ponderosa pine, and mountain brush communities at 1530 to 2130 m in Beaver, San Juan, Sevier, and Utah counties; Alberta and Saskatchewan, south to New Mexico; 22 (vi). Recent collections from near Natural Bridges National Monument in San Juan County appear to be waifs.

Astragalus duchesnensis Jones Duchesne Milkvetch. [*Lonchophaca duchesnensis* (Jones) Rydb.]. Perennial, caulescent, 15–40 cm tall, from a branching caudex; pubescence basifixed; stems straggling to ascending or erect; stipules 3–8 mm long, all distinct; leaves 2–10 cm long; leaflets 5–15, 3–20 mm long, 0.5–3 mm wide, linear to oblong or narrowly oblanceolate, obtuse to retuse, strigose on both sides or glabrate above, the uppermost leaflet sometimes continuous with the rachis; peduncles 3–10.5 cm long, racemes 6– to 22-flowered, the flowers ascending at anthesis, the axis 2.5–12 cm long in fruit; bracts 0.7–2 mm long; pedicels 0.8–2.2 mm long; bracteoles 0; calyx 3.6–5.5 mm long, the tube 3.1–4.3 mm long, campanulate, usually dull purple, the teeth 0.4–1 mm long, triangular; flowers 8.5–12.5 mm long, pink purple with white wing-tips; pods declined, sessile, oblong to narrowly oblanceolate in outline, 20–35 mm long, 3.3–5 mm thick, dorsiventrally compressed in the lower half, becoming laterally compressed in the distal portion, strigose, unilocular; ovules 21–31. Sandy or gravelly to fine-textured clay soils in mixed desert shrub and pinyon-juniper communities at 1430 to 1830 m in Daggett, Duchesne (type from Theodore to Myton), and Uintah counties; Rio Blanco County, Colorado; a Uinta Basin endemic; 73 (xviii).

Astragalus eastwoodae Jones Eastwood Milkvetch. [*A. preussii* var. *sulcatus* Jones (type from SE of Kane Spring); *Phaca eastwoodae* (Jones) Rydb.; *A. preussii* var. *eastwoodae* (Jones) Jones]. Perennial, short caulescent, 8–20 cm tall, from a branching caudex; pubescence lacking except on the calyx; basifixed; stems 2–14 cm long, decumbent to ascending; stipules 2–6.5 mm long, all distinct; leaves 3–13 cm long; leaflets 13–25, 1–15 mm long, 1–5 mm broad, elliptic to lance-elliptic, oblanceolate or obovate, obtuse to truncate-emarginate, glabrous; peduncles 2–10.5 cm long; bracts 1.5–4.5 mm long; pedicels 1.5–3.5 mm long; bracteoles 2; calyx 10–12.2 mm long, the tube 8–9.5 mm long, cylindric, purple, sparsely black-strigose, the teeth 1.3–2.7 mm long, subulate; flowers 18–22 mm long, pink purple; pods spreading to declined, stipitate, the stipe 1.5–4.5 mm long, the inflated body oblong-ellipsoid, 14–26 mm long, 7–14.5 mm thick, the valves papery and straw colored, unilocular, glabrous; ovules 20–38; 2n = 24, 26. Mixed desert shrub and pinyon-juniper communities at 1330 to 1830 m in seliniferous, often fine-textured soils, in Emery, Garfield, Grand, and San Juan counties; Colorado; 10 (ii). The Eastwood milkvetch is closely allied to *A. preussii*. It differs mainly in the shorter stems, smaller leaflets, and spreading-descending, thin-textured pods.

Astragalus emoryanus (Rydb.) Cory Emory Milkvetch. [*Hamosa emoryana* Rydb.]. Annual or winter annual, caulescent, 4–45 cm tall, from a slender taproot; pubescence basifixed; stems prostrate; stipules 1.5–3.6 mm long, all distinct; leaves 1–4.5 cm long; leaflets 11–19, 2–10 mm long, 1–6 mm wide, oval-obovate to obcordate or oblanceolate, obtuse to retuse on all leaves, sparingly strigose on both sides or glabrate above; peduncles 2–6 cm long; racemes 2- to 10-flowered, the flowers spreading at anthesis, the axis 0.3–2.5 cm long in fruit; bracts 0.5–2 mm long; bracteoles 0; calyx 3.6–6 mm long, the tube 1.9–3.5 mm long, campanulate, strigose, the teeth 1.3–2.5 mm long; flowers 7.3–11 mm long, pink purple; pods declined to ascending, sessile, narrowly oblong, curved, 0.8–2.2 cm long, 2.2–4.3 mm wide, trigonous, glabrous, bilocular; ovules 10–16. Pinyon-juniper and sagebrush communities at 1700 m along the strike valley at the plunging east margin of the East Kaibab monocline, Kane County; Arizona, New Mexico, Texas, and Mexico; 2 (j). This is a poorly known entity in Utah. It is very similar in most salient features with *A. nuttallianus*, from which it can be distinguished by the deciduous, straw colored pods, merely strigose calyx teeth, retuse-obtuse leaflets on all leaves, and rounded keel-tip. This latter feature is shared with *A. nuttallianus* var. *micranthiformis*, but that taxon is known to occur in Kane County only east of the Cockscomb.

Astragalus ensiformis Jones Pagumpa Milkvetch. [*A. ursinus* Jones, not Gray; *Hamosa ensiformis* (Jones) Rydb; *A. ensiformis* var. *gracilior* Barneby (type from S of Veyo); *A. minthorniae* var. *gracilior* (Barneby) Barneby]. Perennial, caulescent, 8–45 cm tall, from a superficial to subterranean caudex; pubescence basifixed; stems decumbent to erect; stipules 4–10 mm long, all distinct; leaves 4–15.5 cm long; leaflets (5) 11–23, 6–24 mm long, 1.5–13.5 mm wide, ovate to oblong, obovate, or oblanceolate, obtuse to retuse, strigose (sometimes sparingly so) beneath, strigose to glabrous above; peduncles 2.5–13 cm long; racemes 12- to 30-flowered, the flowers ascending to declined at anthesis, the axis 3.5–13.5 cm long in fruit; bracts 2–6 mm long; pedicels 1–3.5 mm long; bracteoles 0–2; calyx 5.2–7.8 mm long, the tube 4.5–6.5 mm long, short-cylindric, pilosulose with black hairs, the teeth 1.2–2.5 mm long, subulate; flowers 13–17 mm long, purplish to pink purple, the wing-tips pale to white; pods ascending to descending, sessile or substipitate, the body narrowly oblong, curved, 15–30 mm long, 4–6 mm thick, subterete (compressed laterally when pressed), bilocular, strigose to strigulose; ovules 24–36. Pinyon-juniper, sagebrush, salt desert shrub, and blackbrush communities at 1230 to 2350 m in Washington County; Mohave County, Arizona; 21 (vi).

Astragalus episcopus Wats. Bishop Milkvetch. [*Tragacantha episcopa* (Wats.) Kuntze; *Homalobus episcopus* (Wats) Rydb.; *A. kaibensis* Jones; *Louchophaca kaibensis* (Jones) Rydb.]. Perennial, caulescent, rushlike, 20–45 cm tall, arising from a subterranean caudex; pubescence basifixed; stems erect or ascending; stipules 2–13 mm long, all distinct; leaves 2–10 cm long, most of them reduced to the rachis, some with leaflets 3–13 in number, these 1–15 mm long and 0.5–2 mm wide, linear to elliptic or oblong, acute to obtuse or emarginate, strigose on both sides; peduncles 6–23 cm long; racemes very loosely 6- to 30-flowered, the flowers ascending at anthesis, the axis 3–30 cm long in fruit; bracts 1.3–3 mm long; pedicels

1.5–3.5 mm long; bracteoles 0–2; calyx 4.1–7 mm long, the tube 3.4–5.2 (6) mm long, short cylindric, always much longer than broad, suffused with purple or very pale, white-strigose, the teeth 0.6–2.2 mm long, triangular to subulate; flowers 10–15.5 mm long, pale pink or whitish to pink purple; pods pendulous, sessile or subsessile, the body oblong to lance-elliptic in outline, slightly curved to straight, 14–32 mm long, 4–8 mm wide, laterally compressed, glabrous to strigose, straw colored, or suffused with purple or mottled; unilocular; ovules 16–26; $n = 11$. Mixed desert shrub and pinyon-juniper communities, often in clay or silty soils, at 1270 to 1700 m in Emery, Garfield, Kane (type locality?), San Juan, and Wayne counties; Arizona and New Mexico; 56 (xiv). This taxon is closely allied to *A. lancearius*, and a case can be made for its inclusion within that entity at infraspecific level.

Astragalus equisoleis Neese & Welsh Horseshoe Milkvetch. Perennial, caulescent or subcaulescent, 5–15 cm tall, from a branching caudex; pubescence basifixed; stipules 2–5 cm long; leaves 1.5–9 cm long; leaflets 5–17, 3–12 mm long, 1.5–5 mm wide, elliptic, oblanceolate, or obovate, acute to obtuse, strigose on both sides; peduncles erect, 2–9 cm long; racemes 4- to 13-flowered, the flowers ascending or spreading at anthesis, the axis 1.5–8 cm long in fruit; bracts 2–4.5 mm long; pedicels 0.5–2 mm long; bracteoles 0; calyx 6–8.5 mm long, the tube 4.5–6 mm long, cylindric, strigose, the teeth 1.2–2.5 mm long, subulate; flowers 12–16 mm long, purplish; pods declined to deflexed, sessile or stipitate, obliquely ovoid or lance-ellipsoid, lunately curved, dorsiventrally compressed, constricted distally at the beak, laterally compressed, incurved, 10–14 mm long, 3.5–6.5 mm wide, hirsute, unilocular, the valves thickly papery; ovules 20. Sagebrush, shadscale, horsebrush, and other mixed desert shrub communities on the Duchesne River Formation at 1460 to 1580 m in Uintah (type from E of Horseshoe Bend) County; endemic; 11 (ix).

Astragalus eremiticus Sheldon Hermit Milkvetch. [*A. arrectus* var. *eremiticus* (Sheldon) Jones]. Perennial, caulescent, 20–45 cm tall, from a branching commonly superficial caudex; pubescence basifixed; stems erect or ascending; stipules 3–11 mm long, 1.5–12 mm wide, ovate to oblong, elliptic or narrowly oblong, obtuse to retuse, strigose beneath, glabrate to glabrous above; peduncles 2.5–15 cm long; racemes 10- to 26-flowered, the flowers ascending to declined at anthesis, the axis 5–17 cm long in fruit; bracts 1.5–4 mm long; pedicels 0.7–3.5 mm long; bracteoles 0–2; calyx 4.5–8.7 mm long, the tube 4–6.8 mm long, short-cylindric, strigose the teeth 0.7–2 mm long, triangular to subulate; flowers 12–18 mm long, ochroleucous, pink purple, or merely tinged purplish; pods erect, stipitate, the stipe 6–15 mm long, the body oblong to ellipsoid or obliquely ellipsoid, 12–27 mm long, 3.5–8 mm thick, trigonous, glabrous, bilocular; ovules 17–32; $2n = 24$. Juniper-pinyon, live oak, and sagebrush communities at 1130 to 1830 m in Iron, Kane (west of Cockscomb), and Washington (type from Beaver Dam Mts.) counties; Arizona, Nevada, and Idaho; 18 (iii). Plants from west of the Gumlock intersection at Shem, with inflated and proportionately shorter pod bodies, decumbent stems, and subterranean caudices, simulate the rare *A. ampullarius*, which occupies similar clay soils also on the Chinle Formation. The Shem plants are designated as var. *ampullarioides* Welsh.

Astragalus eurekensis Jones Eureka Milkvetch. [*Xylophaca eurekensis* (Jones) Rydb.; *X. medius* Rydb., type from Lake Point, Tooele County]. Perennial, acaulescent, 2–15 cm tall, the caudex branches obscured by persistent leaf bases; pubescence basifixed; stipules 3–11 mm long, all distinct; leaves 2–15 cm long; leaflets (3) 5–19, 3–35 mm long, 2–8 mm wide, elliptic to oblong, acute, gray or silvery strigose on both surfaces; peduncles 1–13 cm long, pilose; racemes 3- to 7-flowered, the flowers ascending at anthesis, the axis 0.2–2 cm long in fruit; bracts 4–8 mm long; pedicels 1.2–3 mm long; calyx 10.5–15.5 mm long, the tube 8.5–10.5 mm long, cylindrical, pilose-villous, the teeth 2.5–5.7 mm long, subulate; flowers 22–27 mm long, ochroleucous, faintly to strongly suffused with purple or rarely pink purple; pods ascending, sessile, obliquely lance-ovoid, 15–40 mm long, 5–9 mm thick, villous-hirsute, unilocular; ovules 26–36. Sagebrush, pinyon-juniper, and mountain brush communities at 1370 to 2135 m in Beaver, Garfield, Iron, Juab (type from Eureka), Millard, Sanpete, Sevier, Tooele, Utah, and Wasatch counties; endemic; 83 (xv). When, as rarely, the flower color is bright pink purple this entity, lacking fruit is exceedingly difficult to distinguish from *A. newberryi* (q. v.).

Astragalus falcatus Lam. Russian Sickle Milkvetch. Perennial, caulescent, 40–90 cm tall, from a branching caudex; pubescence malpighian; stems ascending to erect, forming large clumps; stipules 2–12 mm long, at least some connate-sheathing; leaves 5–22 cm long; leaflets 19–37, 6–35 mm long, 1.5–10 mm wide, oblong to elliptic or oblanceolate, acute to apiculate, strigose below, glabrous above, green on both sides; peduncles 6–17 cm long; racemes 20- to 70-flowered, the flowers declined at anthesis, the axis 3–20 cm long in fruit; bracts 2–5 mm long; pedicels 32–65 mm long, recurved in fruit; bracteoles 2; calyx 3.6–4.7 mm long, the tube 3–3.5 mm long, campanulate, strigose, the teeth 0.5–1.2 mm long, triangular; flowers 9–11 mm long, greenish white, sometimes suffused with purple; pods decurved, subsessile, curved-oblong, 13–23 mm long, 2.5–4.5 mm wide, triangular, strigose, bilocular; ovules 12–14; $n = 8$. Introduced soil stabilization plant, established in Duchesne and Juab counties; southeastern Europe; 3 (iii). This is a robust perennial, capable of surviving in harsh, fine-textured soils in the mountain brush and pinyon-juniper communities. The plant is also suspected of being poisonous to livestock.

Astragalus filipes Torr. Perennial, caulescent, 2–9 dm tall; pubescence basifixed; stems erect or ascending, forming large clumps; stipules 2–5 mm long, at least the lowermost connate-sheathing; leaves 2.5–12 cm long; leaflets (5) 9–23, 3–25 (30) mm long, 0.5–5 mm wide, linear to narrowly elliptic or oblong, obtuse to truncate, retuse or subacute, green and glabrous or strigose on one or both sides; peduncles 4.5–22 cm long; racemes loosely (4) 6- to 30-flowered, the flowers spreading to declined, ochroleucous; bracts 1–3.5 mm long; pedicels 1.5–6 mm long; bracteoles typically lacking; calyx 4–7.7 mm long, the tube 3.3–6.4 mm long, subcylindric to campanulate, strigulose with black and white hairs, the teeth 0.5–1.5 mm long, triangular; flowers 10–14.3 mm long; pod pendulous, stipitate, the stipe 6–16 mm long, the body 17–30 mm long, 3.5–6.5 mm wide, oblong to elliptic in outline, the sutures commonly parallel, strongly laterally compressed, the valves papery, glabrous to strigulose; ovules

11–22; $n = 11, 12$. Juniper and sagebrush communities at 1645 to 1710 m in Box Elder County; Washington and Idaho south to California and Nevada; 3 (0).

Astragalus flavus Nutt. ex T. & G. Yellow Milkvetch. Perennial, caulescent, 5–30 cm tall, from a branching caudex; pubescence malpighian; stems decumbent to ascending or erect; stipules 2–10 mm long, all connate-sheathing; leaves 3–15 (18) cm long; leaflets (5) 9–21, 3–31 mm long, 0.5–6 mm wide, linear, narrowly oblong, or oblanceolate to ovate, obtuse to acute, silvery strigose (greenish) on both sides or glabrate to glabrous above; peduncles 3–23 cm long, racemes 6- to 30-flowered, the flowers ascending at anthesis, the axis 2–12 cm long in fruit; bracts 1.5–5 mm long; pedicels 0.7–1.2 mm long; bracteoles 0; calyx 5.5–9.5 mm long, the tube 3–5.2 mm long, campanulate, strigose to pilose, the teeth 2–6 mm long, yellow to ochroleucous, whitish, lilac, or pink purple; pods erect, sessile, oblong, 7–13 mm long, 3.5–5.5 mm thick, straight, dorsiventrally compressed, strigose, unilocular; ovules 6–17; $2n = 24, 26$. Three more or less distinctive but intergrading varieties, all primary senophytes, are present in Utah.

1. Calyx shaggy long-villous, the teeth 3–6 mm long, equaling or longer than the tube; flowers pink purple; plants of Emery, Grand, Wayne, and Garfield counties *A. flavus* var. *argillosus*
- Calyx strigose to short-villous, the teeth 2–3 (4) mm long, shorter than the tube; flowers yellow to white or tinged purplish, rarely pink purple; plants of various distribution 2
- 2(1). Flowers whitish or yellowish, sometimes tinged with purple, rarely pink-purple; keel 6–8 mm long; plants from central and southern counties *A. flavus* var. *candicans*
- Flowers cream to yellow; keel 8–10 mm long; plants from east-central to northeastern Utah *A. flavus* var. *flavus*

Var. argillosus (Jones) Barneby Clay Milkvetch. [*A. argillosus* Jones, type from Green River, Emery County; *Cnemidophacos argillosus* (Jones) Rydb.]. Mancos shale, Summerville, Cedar Mountain and Morrison formations, on saline clays and silts with salt desert shrubs at 1230 to 1600 m in Emery (type from Green river), Garfield, Grand, and Wayne counties; endemic; 39 (vii).

Var. candicans Gray St. George Milkvetch. [*A. confertiflorus* Gray, type from near St. George; *Cnemidophacos confertiflorus* (Gray) Rydb.]. Mancos and Tropic shales, Moenkopi, Chinle, Morrison, and Kaiparowits formations and other saline clays and silts at 900 to 2130 m in Garfield, Kane, San Juan, Sevier (type from near Richfield), and Washington counties; Arizona and Nevada; 51 (x). The var. *candicans* passes into var. *flavus* in central and eastern Utah.

Var. flavus Yellow Milkvetch. [*Cnemidophacos flavus* (Nutt.) Rydb.; *Tragacantha flaviflora* Kuntze; *A. confertiflorus* var. *flaviflorus* (Kuntze) Jones]. Mancos Shale, Chinle, Moenkopi, Duchesne River, Uinta, and other formations composed of saline silts and clays in salt desert shrub and pinyon-juniper communities at 1230 to 1730 m in Carbon, Daggett, Duchesne, Emery, Grand, San Juan, Sanpete, Sevier, and Uinta counties; Arizona, New Mexico, Colorado, and Wyoming; 75 (xxii). Sheep poisoning attributable to var. *flavus* is known from the lower elevation portions of the Uinta Basin.

Astragalus flexuosus (Hook.) G. Don Prairie Milkvetch. Perennial, caulescent, 1–6 dm tall, from a branching caudex; pubescence basifixed; stems decumbent or ascending; stipules 1–7 mm long, at least the lowermost connate-sheathing; leaves 1.5–9 cm long; leaflets (5) 9–25, 1–8 mm wide, linear or oblong to oblanceolate or obovate, obtuse to truncate or retuse, strigose to glabrate beneath, usually glabrous above; peduncles 1.5–14 cm long; racemes 7– to 26-flowered, the flowers spreading at anthesis 0.6–4.5 mm long; pedicels 0.7–3.5 mm long; bracteoles 0–2; calyx 3.3–5.8 mm long, the tube 2.4–4.3 mm long, campanulate, strigose, the teeth 0.5–1.7 mm long, subulate; flowers 7–11 mm long, pink purple to dull purplish; pods descending to spreading, sessile or short-stipitate, the stipe 0.5–1.3 mm long, the body oblong to oblanceolate or elliptic in outline, 8–24 mm long, 2.7–4.8 mm thick, subterete or variously somewhat flattened, strigose to glabrous, unilocular; ovules 12–25; $2n = 22$. Two rather distinctive varieties are present, both confined to eastern Utah.

1. Calyx tube 2.4–2.7 mm long; pods sessile or nearly so; plants spreading decumbent, in pinyon-juniper and mixed desert shrublands *A. flexuosus* var. *diehlii*
- Calyx tube 2.7–4.3 mm long; pods subsessile to shortly stipitate; plants of pinyon-juniper and mountain brush communities *A. flexuosus* var. *flexuosus*

Var. *diehlii* (Jones) Barneby [*A. diehlii* Jones, type from Farnham, Carbon County; *Pisophaca diehlii* (Jones) Rydb.]. Salt desert shrub and pinyon-juniper communities at 1370 to 1670 m in Carbon, Emery, Grand, and San Juan counties; Colorado; 13 (vii).

Var. *flexuosus* [*Phaca flexuosa* Hook.; *Homalobus flexuosus* (Hook.) Rydb.; *Pisophaca flexuosa* (Hook.) Rydb.]. Pinyon-juniper and mountain brush communities at 1685 to 2135 m in Grand and San Juan counties; British Columbia east to Ontario and south to New Mexico, Nebraska, and Minnesota; 2 (0).

***Astragalus fucatus* Barneby** Hopi Milkvetch. [*A. subcinereus* sensu Jones, not Gray, q.v.]. Perennial, caulescent, 7–45 cm tall, from a subterranean to superficial caudex; pubescence basifixed; stems ascending to erect or sprawling; stipules 1–5.5 mm long, the lowest connate-sheathing; leaves 2–12.5 cm long; leaflets 9–17, 3–20 (25) mm long, 0.5–4 mm wide, obtuse to retuse, strigose beneath, glabrous above; peduncles 1–6.5 cm long; racemes 9– to 22-flowered, the flowers ascending to declined at anthesis, the axis 2–11.5 cm long in fruit; bracts 0.8–2 mm long; pedicels 0.7–3.5 mm long; bracteoles 0; calyx 3.3–5.4 mm long, the tube 2.3–3.3 mm long, campanulate, strigose, the teeth 0.8–2.2 mm long; flowers 6.4–8.7 mm long, pink purple; pods spreading to declined, sessile, bladderly-inflated, ovoid, ellipsoid, or subglobose, 17–32 mm long, 12–20 mm wide (when pressed), mottled, strigose, unilocular; ovules 21–32. Mixed sandy desert shrub communities at 1330 to 1830 m in Emery, Garfield, San Juan, and Wayne counties; New Mexico and Arizona; 27 (ix).

***Astragalus geyeri* Gray** Geyer Milkvetch. [*Phaca annua* Geyer, not *A. annua* DC.]. Annual (or rarely biennial), caulescent, 6–27 cm long, from a slender taproot; pubescence basifixed; stems prostrate to ascending or erect; stipules 1.5–4 mm long, all distinct; leaves 2–10.5 cm long; leaflets 3–13, 3–17 mm long, 1–5.2 mm wide, linear to oblong or narrowly elliptic, obtuse to retuse,

strigose beneath and strigose to glabrous above; peduncles 0.6–1.5 cm long; racemes 2– to 8-flowered, the flowers ascending at anthesis, the axis 0.8–1.5 cm long in fruit; bracts 0.7–2 mm long; pedicels 0.6–1.5 mm long; bracteoles 0–1; calyx campanulate, strigose, the teeth 0.6–1.5 mm long; flowers 5–7.6 mm long, pale, suffused with purple, or pink purple; pods spreading to declined, bladderly-inflated, obliquely ovoid, 15–24 mm long, 6–12 mm wide (when pressed), strigose, unilocular; ovules 7–18. Sandy soil in mixed desert shrub communities at 1370 to 1830 m in Beaver, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Millard, Salt Lake, Tooele, Uintah, and Wayne counties; Oregon east to Wyoming, south to California, Nevada, and Colorado; 54 (xi). Plants grown from seed in a greenhouse produced mature fruit and seed in 58 days.

***Astragalus gilviflorus* Sheldon** Plains Orophaca. [*A. triphyllus* Pursh, not Pallas; *Tragacantha triphylla* (Pursh) Kuntze; *Orophaca triphylla* (Pursh) Britt.; *Phaca caespitosa* Nutt., not *A. argophyllus* Nutt. ex T. & G.]. Perennial, acaulescent, 1.5–13 cm tall, from a branching caudex; pubescence malpighian; stems entirely obscured by stipules; stipules 6–18 mm long, connate-sheathing; leaves 1–13 cm long, palmately trifoliolate, the leaflets 7–20 mm long, 2–7 mm wide, spatulate to elliptic, acute to obtuse, silvery strigose on both sides; peduncles obsolete; racemes capitate, 1– to 3-flowered, the flowers erect, the axis very short in fruit; bracts 4.5–7.6 mm long, tridentate; pedicels 0–1.6 mm long; bracteoles 0; calyx 9.3–18 mm long, the tube 10–14 mm long, cylindrical, loosely villous, the teeth 1.6–4 mm long; flowers 17–28 mm long, whitish to ochroleucous; pods erect, sessile, ovoid-ellipsoid, 6–10 mm long, 2.5–5 mm thick, densely hairy, unilocular; $2n = 24$. Sagebrush community at ca 2130 m in Rich and Summit counties; Alberta east to Ontario and south to Wyoming and Nebraska; 7 (ii).

***Astragalus hallii* Gray** Hall Milkvetch. Perennial, caulescent, 12–50 cm tall, from a subterranean caudex; pubescence basifixed; stems decumbent to ascending or erect; stipules 1–7 mm long, at least the lowermost connate-sheathing; leaves 2–9 cm long; leaflets 11–23, 2–11 mm long, 1–7 mm wide, obovate to oblanceolate or elliptic, retuse to truncate or obtuse, strigulose beneath, sparingly hairy or glabrous above; peduncles 3–9.5 cm long; racemes 9– to 25-flowered, the flowers spreading-declined at anthesis, the axis 1–7 cm long in fruit; bracts 1.5–5 mm long; pedicels 1.2–4 mm long; bracteoles 0–2; calyx 6–7 mm long, the tube 5.2–6.2 mm long, triangular; flowers 12.8–15 mm long, pink purple; pods spreading to declined, short-stipitate, the stipe 1.5–3.5 mm long, the inflated body cylindrical to obliquely ovoid-ellipsoid, 19–27 mm long, 8–12 mm thick, strigulose, unilocular; ovules 20–37. Pinyon-juniper and mountain brush communities at 1600 to 2130 m in Garfield (?) and Kane counties; Arizona and New Mexico; 7 (i). Our plants belong to **var. *fallax* (Wats.) Barneby** [*A. fallax* Wats.; *A. famelicus* Sheldon, not *A. fallax* Fisch.; *A. gracilentus* var. *fallax* (Wats.) Jones; *Pisophaca famelica* (Sheldon) Rydb.]. They seem not to differ from those of the Flagstaff Plateau in north-central Arizona.

***Astragalus hamiltonii* C. L. Porter** Hamilton Milkvetch. [*A. lonchocarpus* var. *hamiltonii* (C. L. Porter) Isely]. Perennial, caulescent, 25–60 cm long, from a shallowly subterranean caudex; pubescence basifixed; stems erect; stipules 1.5–9.5 mm long, all distinct or rarely

some shortly connate-sheathing; leaves 3–8 cm long, the uppermost (and sometimes the lowermost) simple, the others with leaflets 3–7, 10–47 mm long, 2–7 mm wide, elliptic to narrowly oblanceolate, obtuse to retuse, strigose on both sides, the terminal leaflet continuous with the rachis; peduncles 2.5–15.5 cm long; racemes 7– to 30-flowered, the flowers spreading-declined at anthesis, the axis 2–11 cm long in fruit; bracts 1–2.5 mm long; pedicels 1.2–3 mm long; bracteoles 0–2; calyx 8.2–11 mm long, light brown, the tube 6.5–9.2 mm long, cylindrical, gibbous, strigose, the teeth 1.7–2.6 mm long, subulate; flowers 20–24 mm long, ochroleucous, concolorous; pods pendulous, stipitate, the stipe 9–12 mm long, the body ellipsoid, 25–35 mm long, 4–7.5 mm thick, dorsiventrally compressed, strigose, unilocular; ovules 16–22. Duchesne River and Wasatch formations at 1600 to 1770 m in the juniper-pinyon community of western Uintah (type from 5 mi SW of Vernal) County; endemic; 25 (v). This is a mirrored-image congener of *A. lonchocarpus* (q. v.), which is known in the Uinta Basin only from eastern Uintah County, adjacent to Colorado.

Astragalus harrisonii Barneby Harrison Milkvetch. Perennial, caulescent, rushlike, 40–70 cm tall, from a subterranean caudex; pubescence basifixed; stems diffusely interbranched, in clumps to 1 m wide or more; stipules 1–5 mm long, all distinct; leaves 1.5–6.5 cm long, the uppermost simple, with the terminal leaflet expanded and confluent with the rachis, the others with leaflets 3–9, 2–11 mm long, 0.5–1.5 mm wide, linear-elliptic, acute, strigose on both sides; peduncles 6–19 cm long; racemes loosely 3– to 15-flowered, the flowers ascending at anthesis, the axis 5–40 cm long in fruit; bracts 0.5–1.1 mm long; pedicels 1.5–5.5 mm long; calyx 2.7–4.6 mm long, the tube 1.5–3.7 mm long, campanulate, strigose, the teeth 0.5–1.9 mm long, triangular; flowers 9–10.5 mm long, pink purple; pods pendulous, stipitate, the stipe 3–4 mm long, the body narrowly ellipsoid, straight or curved, 17–28 mm long, dorsiventrally compressed, strigose to glabrous, unilocular; ovules 10–12. Pinyon-juniper community at 1650 m in Capitol Reef (type locality) and Waterpocket Fold, Wayne County; endemic; 13 (vii). The Harrison milkvetch is a near congener of *A. nidularius* (q. v.).

Astragalus henrimontanensis Welsh Dana Milkvetch. [*Astragalus stocksii* Welsh, not Benth. ex Bunge]. Perennial, strictly acaulescent, 4–15 cm tall, from a branching caudex, the branches clothed with coarse, persistent leaf bases; pubescence basifixed; stipules 3–8 mm long, all distinct; leaves 2.7–12.5 cm long; leaflets 7–17, 3–13 mm long, 1.5–6 mm wide, elliptic to oblanceolate, mucronate, acute to obtuse or truncate, strigose on both sides; peduncles 1.1–8 cm long; racemes 2– to 11-flowered, the flowers ascending at anthesis, the axis 0.8–2.2 cm long in fruit; bracts 1.8–5.5 mm long; pedicels 1.3–2.5 mm long; bracteoles 0–2; calyx 10.2–15 mm long, the tube 8.2–11.5 mm long, cylindrical, strigose, the teeth 1.9–3.5 mm long, subulate; flowers 15–23 mm long, ochroleucous, the wings and keel purple-tipped; pods ascending, sessile, lance-ovoid, slightly incurved, 22–35 mm long, 5–11 mm thick, somewhat dorsiventrally compressed, strigose, unilocular. Ponderosa pine, pinyon-juniper, and sagebrush communities at ca 2430 m in the Henry Mts. (type locality) and Aquarius Plateau, Garfield County; endemic; 17 (v). The Dana milkvetch combines features of *A. argophyllus* var. *pan-*

guicensis, which sometimes has persistent leaf bases but a tendency to caulescence; however, the Dana milkvetch has the habit and flower color of *A. eurekensis*. Specimens identified previously by other workers as *A. henrimontanensis* from northern Arizona are *A. argophyllus* var. *panguicensis*.

Astragalus holmgreniorum Barneby Holmgren Milkvetch. Perennial, strictly acaulescent, 4–12 cm tall, arising from a thickened root crown and taproot; pubescence basifixed; stipules papery, 3–8 mm long, all distinct; leaves 4–21.5 cm long; leaflets 5–23, 6–16 mm long, 3.5–12 mm wide, broadly obovate to orbiculate, emarginate, pilose below, green and glabrous above; peduncles 2–9 cm long, procumbent; racemes 4– to 16-flowered, the flowers ascending to spreading at anthesis, the axis 0.4–6.5 cm long in fruit; bracts 4–8 mm long; pedicels 1–2 mm long; calyx 10.5–12.5 mm long, the tube 8–9.5 mm long, cylindrical, thinly white pilose, the teeth 2–3.5 mm long, subulate; flowers 18–23.5 mm long, pink purple; pods reclining, 2.5–5.5 cm long, 6–9 mm thick, curved-elliptic, trigonously compressed, keeled on the ventral suture, openly sulcate dorsally, the valves coriaceous, glabrous, more or less reticulate, bilocular; ovules 30–34. Warm desert shrub at ca 820 to 850 m in Washington County; Mohave County Arizona; a Virgin-Mohave endemic; 3 (0). This plant was first taken by Melvin Ogden southeast of St. George on 19 May 1941 (BRY).

Astragalus humistratus Gray Goundcover Milkvetch. Perennial, caulescent, 7–80 cm long, radiating from a caudex; pubescence malpighian; stems prostrate; stipules 2–9 mm long, 0.5–6 mm wide, elliptic to oblong or oblanceolate, acute, strigose on both sides or glabrate above; peduncles 2–9 cm long; racemes 3– to 20-flowered, the flowers ascending at anthesis, the axis 1–12 cm long in fruit; bracts 1.5–7 mm long; pedicels 0.4–2.2 mm long; bracteoles 0–2; calyx 4.5–8.8 mm long, the tube 2.4–4.1 mm long, campanulate, strigose, the teeth 1.4–5 mm long; flowers 7–11.5 mm long, greenish to ochroleucous, often suffused or veined purplish, or pink purple; pods ascending to spreading, obliquely ovoid or oblong-ellipsoid, 6–14 mm long, 3.5–5.7 mm wide, variously compressed, strigose, unilocular; $n = 12$. Mountain brush, cool desert shrub, pinyon, juniper, ponderosa pine, and aspen communities at 1600 to 2745 m in Beaver, Garfield, Iron, Kane, and Washington counties; Nevada, Arizona, and New Mexico; 49 (xvi). Our material belongs to var. *humivagans* (Rydb.) Barneby [*Batiophaca humivagans* Rydb.].

Astragalus iodanthus Wats. Humboldt River Milkvetch. [*Tragacantha iodantha* (Wats.) Kuntze; *Xylophacos iodantha* (Wats) Rydb.; *A. iodantha* var. *diphanoides* Barneby]. Perennial, caulescent, 8–35 cm long, from a branching caudex; pubescence basifixed; stems prostrate to decumbent; stipules 2–6 mm long, all distinct; leaves 2–8 cm long; leaflets 7–21, 3–18 mm long, 2–12 mm wide, obovate to oblong or oblanceolate to elliptic, truncate to retuse, obtuse, or mucronate, sparingly strigose to glabrous on both sides; peduncles 1–4.5 cm long, shorter than the leaf; racemes 7– to 17-flowered, the flowers ascending to spreading at anthesis, the axis 0.5–4.5 cm long in fruit; bracts 1–3 mm long; pedicels 0.3–2 mm long; bracteoles 2; calyx 5–8 mm long, the tube 3.4–5 mm long, short-cylindrical, strigose, the teeth 1.3–3 mm long; flowers 12–15.5 mm long, pink

purple to pale; pods ascending to declined, sessile, the body curved through a half-circle. 20–40 mm long, 5–8 mm thick, dorsiventrally or trigonously compressed, obliquely lanceolate, unilocular to semibilocular, strigose; ovules 14–30; $2n = 22$. Juniper-sagebrush community at ca 1649 m in Box Elder County; Oregon, California, and Nevada; 1 (0).

Astragalus iselyi Welsh Isely Milkvetch. Perennial, caulescent, 8–25 cm tall, from a branching caudex; pubescence basifixed; stems ascending to erect; stipules 3–9 mm long, all distinct; leaves 3.2–22 cm long; leaflets (1) 3–13, 7–23 (45) mm long, 3–19 (40) mm wide, elliptic to rhombic, acute to mucronate, sparsely strigose to glabrate on both sides; peduncles 1.4–10 cm long, racemes 7- to 20-flowered, the flowers spreading at anthesis, the axis 1–3 cm long in fruit; bracts 2–4.5 mm long; pedicels 0.8–2.5 mm long; bracteoles 0; calyx 6.7–10 mm long, the tube 5.5–6.3 mm long, cylindrical, strigulose, the teeth 1.8–3.1 mm long, subulate; flowers 17–18 mm long, ochroleucous, concolorous; pods spreading-declined, sessile or subsessile, inflated, subcylindric, 25–38 mm long, 10–15 mm thick, strigose, leathery, unilocular; ovules 38–44. Morrison and Paradox formations in pinyon-juniper and salt desert shrub communities at 1530 to 1830 m on the western foothills of the La Sal Mts., Grand and San Juan (type from Brumley Ridge) counties; endemic; 20 (vii). This early flowering (March–April) selenophyte is allied to *A. sabulosus* (q. v.).

Astragalus jejunus Wats. Starvling Milkvetch. [*Tragacantha jejuna* (Wats.) Kuntze; *Phaca jejuna* (Wats.) Rydb.]. Perennial, acaulescent, 1–5 cm tall, from a much-branched caudex; pubescence basifixed; stems obsolete, obscured by stipules and leaf bases; stipules 1.5–3 mm long, all connate-sheathing; leaves 1–4 cm long; leaflets 9–15, 1–5 mm long, 0.5–1 mm wide, linear to narrowly elliptic, obtuse to acute, involute, strigose on both sides; peduncles 0.5–3.5 cm long; racemes 3- to 7-flowered, the flowers spreading at anthesis, the axis 0.2–1 cm long in fruit; bracts 1–1.5 mm long; pedicels 1–2.5 mm long, very slender; bracteoles 0; calyx 2.3–3 mm long, the tube 1.5–2 mm long, campanulate, strigose, the teeth 0.5–1 mm long, subulate; flowers 5–6.5 mm long, pink purple; pods spreading, sessile, bladderly-inflated, subglobose, 10–17 mm long, 7–11 mm thick, mottled, strigose, unilocular; ovules 10–14. Sagebrush and sagebrush-juniper communities, often on windswept ridgetops at 1830 to 2300 m in Rich County; southwestern Wyoming and east-central Nevada; 10 (i). The type is from the Bear River Valley. This tiny plant has as its nearest congener *A. limnocharis* (q. v.), a plant of higher elevations in central southern Utah.

Astragalus kentrophyta Gray Kentrophyta. Perennial, caulescent, mat-forming to erect, 15–45 cm long, from a caudex and stolonlike, creeping stems; pubescence basifixed or malpighian; stems prostrate to erect, compact to elongate; stipules 1.5–5 mm long, at least some connate-sheathing; leaves 0.4–2.6 cm long; leaflets 3–9, 3–13 mm long, 0.5–1.5 mm wide, linear to narrowly elliptic or lanceolate, all continuous with the rachis and spinulose-tipped, strigose on both sides; peduncles to 1.5 cm long; racemes 1- to 3-flowered, the flowers declined at anthesis, the axis to 0.5 mm long in fruit; bracts 0.8–3.5 mm long; pedicels 0.5–2 mm long; bracteoles 0; calyx 2.4–8.3 mm long, campanulate, strigose, the teeth 1.5–5 mm long, subulate; flowers 4.5–10 mm long, pink-purple or

whitish, ochroleucous or purple tinged; pods declined or spreading, sessile, elliptic to oblong or lance-acuminate in outline, usually curved, 4–10 mm long, 1.3–4 mm wide, strigose, unilocular; ovules 2–8; $2n = 24$. Four rather distinctive varieties occur in Utah.

1. Pubescence entirely of basifixed hairs; plants prostrate, of barrens at high elevations *A. kentrophyta* var. *implexus*
- Pubescence mostly of malpighian hairs; plants prostrate to erect, of low to high elevations 2
- 2(1). Calyx 6–8.3 mm long, the teeth 3.4–5 mm long; pods 7–10 mm long; plants prostrate, of sandy sites in canyons of the Colorado *A. kentrophyta* var. *coloradoensis*
- Calyx 3.4–5.5 mm long, the teeth 1.5–2.4 mm long; pods 4–7 mm long; plants erect or prostrate, usually of clay or silty soils at low to higher elevations 3
- 3(2). Plants prostrate; pods 3–4.5 mm long, beakless or nearly so; known from Daggett County *A. kentrophyta* var. *jessiae*
- Plants erect or prostrate; pods 4–7 mm long, beaked; known from Duchesne County southward *A. kentrophyta* var. *elatus*

Var. *coloradoensis* Jones Canyon Kentrophyta. [*A. montanus* var. *coloradoensis* (Jones) Jones; *Kentrophyta coloradoensis* (Jones) Rydb.]. Wash bottoms and rimrock in mixed desert shrub communities at 970 to 1630 m in Emery, Garfield, Kane, and Wayne counties; Coconino County, Arizona; a Colorado Plateau endemic; 19 (viii).

Var. *elatus* Wats. Tall Kentrophyta. [*A. viridis* var. *impensus* Sheldon; *A. kentrophyta* var. *impensus* (Sheldon) Jones; *A. impensus* (Sheldon) Woot. & Standl; *A. montanus* var. *impensus* (Sheldon) Jones; *A. tegetarius* var. *elatus* (Wats.) Barneby]. Mixed desert and salt desert shrub, juniper-pinyon, ponderosa pine, and pine-spruce communities, often in flood plains, at 1530 to 2600 m in Beaver, Duchesne, Emery, Garfield, Grand, Iron, Juab, Kane, Millard, Piute, Sevier, Uintah, and Wayne counties; California, Nevada, Arizona, Colorado, and New Mexico; 79 (xxviii). Both erect and prostrate phases are known, and the presence of malpighian hairs is diagnostic.

Var. *implexus* (Canby) Barneby Mountain Kentrophyta. [*A. tegetarius* var. *implexus* Canby; *A. tegetarius* Wats.; *Tragacantha tegetaria* (Wats.) Kuntze; *Homalobus tegetarius* (Wats.) Rydb.; *A. montanus* var. *tegetarius* (Wats.) Jones; *A. tegetarius* var. *rotundus* Jones, type from Loa; *A. kentrophyta* var. *rotundus* (Jones) Jones]. Ridgetops and breaks, commonly in barrens, at 2130 to 3500 m in Box Elder, Cache, Garfield, Iron, Juab, Kane, Salt Lake, Sanpete, Sevier, Summit, Tooele, and Utah counties; Oregon to Montana, south to California, Nevada, and New Mexico; 58 (ix).

Var. *jessiae* (Peck) Barneby Jessie Kentrophyta. [*A. jessiae* Peck]. White volcanic ash "barrens" at 1770 m in Daggett County at 1740 to 1800 m in Daggett County; Oregon, Idaho, and Wyoming; 6 (ii).

Astragalus lancearius Gray Lancer Milkvetch. [*Homalobus lancearius* (Gray) Rydb.; *A. episcopus* var. *lancearius* (Gray) Isely]. Perennial, caulescent, rushlike, 15–55 cm tall, arising from a subterranean caudex; pubescence basifixed; stems erect or ascending; stipules 2–7 mm long, all distinct; leaves 1.5–10.5 cm long, some or most of them reduced to the rachis, some or most of them with

leaflets 3-7 in number, 2-14 mm long, 0.5-1.5 mm wide, linear to oblong, acute to obtuse, strigose on both sides; peduncles 4-23 cm long; racemes very loosely 6- to 25-flowered, the flowers ascending at anthesis, the axis 3-19 (26) cm long in fruit; bracts 1-1.5 mm long; pedicels 1-3 mm long; bracteoles 0-2; calyx 3.5-5.2 mm long, the tube 2.8-4.2 mm long, campanulate, about as broad as long, campanulate, black-strigose, the teeth 0.5-1.2 mm long, triangular; flowers 8.8-11.5 mm long, pink purple or merely tinged purplish; pods deflexed, sessile or subsessile, the body lance-oblong to oblong or lance-elliptic in outline, slightly curved or straight, 20-35 mm long, 5-9 mm wide, laterally compressed, glabrous to strigose, brown to straw colored, unilocular; ovules 8-14. Mixed desert shrub and pinyon-juniper communities at 1270 to 1730 m in Kane and Washington counties; Coconino and Mohave counties, Arizona; a Colorado Plateau endemic; 12 (iii). This is a near ally of *A. episcopus* (q.v.), differing diagnostically mainly in the proportionally shorter calyces.

Astragalus lentiginosus Dougl. ex Hook. Freckled Milkvetch. Perennial, caulescent, mostly 1.5-6 dm tall, from a caudex; pubescence basifixed; stipules 1.5-7 mm long or more, all distinct; leaves 2.4-15 cm long; leaflets 9-23, 2-23 mm long, 1-13 mm wide, elliptic to ovate or lanceolate, obtuse to rounded, emarginate, or acute, pubescent to glabrous on one or both sides; peduncles 1-14 cm long, sometimes more; racemes (5) 11- to 30-flowered, the flowers ascending to declined at anthesis, the axis 1-18 cm long in fruit; pedicels 1-4 mm long; bracts 1.5-6 mm long; bracteoles 0-2; calyx 3.5-11.6 mm long, the tube 3-9 mm long, cylindrical to short-cylindrical, strigose, the teeth 0.6-2.5 mm long, subulate or triangular; flowers 8.4-22 mm long, pink purple, ochroleucous, whitish, or variously suffused with pink or purple; pods ascending to declined, sessile or with a gynophore, variable in outline, either inflated and ovoid (12-26 mm long, 5-20 mm thick) or not inflated and oblong in outline (15-25 mm long, 3-7.5 mm thick), strigose or glabrous, mottled or not, leathery to membranous, bilocular; ovules 16-38; n = 11. Numerous varieties are known to occur in Utah.

- 1. Flowers small, the keel 5.5-8.5 mm long 2
- Flowers larger, the keel 9-16 mm long or more 4
- 2(1). Raceme axis much elongating in fruit, 4-16 cm long or more; plants of Washington County *A. lentiginosus* var. *fremontii*
- Raceme axis little elongating in fruit, not over 4 cm long; plants not of Washington County 3
- 3(2). Pods opaque, stiffly papery; plants rare in west-central Utah *A. lentiginosus* var. *scorpionis*
- Pods transparent to translucent, thinly papery; plants locally common and rather widespread in western to central and northern counties. . . . *A. lentiginosus* var. *salinus*
- 4(1). Pods stipitate, the stipes 0.5-1.5 mm long; flowers 20-23 mm long; plants of greasewood communities in western Utah *A. lentiginosus* var. *pohlii*
- Pods sessile or essentially so; flowers mainly less than 20 mm long 5
- 5(4). Raceme axis much elongating in fruit, usually more than 8 cm long 6
- Raceme axis not much elongating in fruit, seldom as much as 7 cm long in fruit 8

- 6(5). Flowers ochroleucous or faintly suffused with purple; pods diaphanous, glabrous; plants of Washington County *A. lentiginosus* var. *virgatus*
- Flowers ordinarily pink purple to pink; pods usually opaque or strigose or both; distriguation various 7
- 7(6). Pods bladdery-inflated; herbage cinereous, the stems caescent; plants known from the western slope of the Beaverdam Mts., Washington County *A. lentiginosus* var. *stramineus*
- Pods not or scarcely inflated; herbage greenish, the stems not or seldom caescent; plants of various distribution *A. lentiginosus* var. *palans*
- 8(5). Pods thinly papery, diaphanous; plants of eastern Kane County *A. lentiginosus* var. *wahweapensis*
- Pods stiffly papery to leathery, opaque or nearly so; plants variously distributed 9
- 9(8). Leaflets 9-17; peduncles 1-5 cm long, shorter than the subtending leaves; flowers pale pink to whitish, or less commonly pink purple; plants of Rich and Daggett counties *A. lentiginosus* var. *platyphyllidius*
- Leaflets 15-23; peduncles 2.5-8 cm long, mostly longer than the subtending leaves; plants variously distributed *A. lentiginosus* var. *araneosus*

Var. *araneosus* (Sheldon) Barneby Cobweb Milkvetch. [*Astragalus araneosus* Sheldon, type from Frisco; *A. palans* var. *araneosus* (Sheldon) Jones; *Cystium araneosum* (Sheldon) Rydb.; *A. lentiginosus* var. *chartaceosus* Jones, type from Ephraim]. Sagebrush, mixed desert shrub, pinyon-juniper, and less commonly in mountain brush communities at 1270 to 2430 m in Box Elder, Beaver, Garfield, Iron, Juab, Kane, Millard, Piute, Sanpete, Sevier, Tooele, and Wayne counties; Nevada; 216 (lix). This variety is the common phase of the freckled milkvetch in south-central to western Utah. It approaches var. *diphysus* (Gray) Jones in its technical features, but specimens from Utah assigned previously to that taxon belong to other varieties. The problems of inclusion of this variety within an expanded var. *diphysus* involve negation of the morphological trends within var. *araneosus* proper. Material from the Henry Mts., with a slightly lax inflorescence belongs to var. *wahweapensis* (q.v.).

Var. *fremontii* (Gray) Wats. Fremont Milkvetch. [*A. fremontii* Gray ex Torr.; *A. coulteri* var. *fremontii* (Gray) Jones; *Cystium fremontii* (Gray) Rydb.]. Braided stream gravels and slopes in creosote bush, Joshua tree, and pinyon-juniper communities in western Washington County; California and Nevada; 12 (ii).

Var. *palans* (Jones) Jones Straggling Milkvetch. [*A. palans* Jones, type from Montezuma Canyon; *Tium palans* (Jones) Rydb.; *A. ursinus* Gray, type from Bear Valley, Utah; *A. lentiginosus* var. *ursinus* (Gray) Barneby; *A. bryantii* Barneby]. Salt desert shrub, blackbrush, juniper, pinyon-juniper, and mixed desert shrub communities at 1130 to 1900 m in Carbon, Emery, Grand, Kane, San Juan, Washington, and Wayne counties; Colorado and Arizona; 117 (xxiii). The straggling milkvetch is the common phase of *A. lentiginosus* in the canyons of the Colorado River. It is distinctive in having oblong, usually curved pods, seldom more than 7 mm thick, pale pink purple flowers, and elongate inflorescences. The type locality of the long sought *A. ursinus* Gray remains in question. Specimens taken recently in the south end of the Beaverdam Mts., Washington

County, approach the type materials in general conformation and suggest that the specimens on which *A. ursinus* was based came from Washington (not Iron) County. The name *A. ursinus* is here taken as a synonym of *A. lentiginosus* var. *palans*. Specimens cited previously as *A. Bryantii* do not differ in any remarkable way from var. *palans*.

Var. *platyphyllidius* (Rydb.) Barneby Broad-leaved Milkvetch. [*Cystium platyphyllidium* Rydb.]. Sagebrush, pinyon-juniper, and mountain brush communities at 1700 to 2135 m in Daggett and Rich counties; Oregon and California, east to Wyoming and Colorado; 4 (i). The peduncles and commonly the fruiting racemes are surpassed by the subtending leaves. This feature, coupled with leaflets that average fewer per leaf seem to distinguish var. *platyphyllidius* from var. *araneosus*. Flower color varies from whitish, with keel tip purple, to pink purple throughout.

Var. *pohlü* Welsh & Barneby Pohl Milkvetch. Greasewood communities at 1330 to 1650 m in Rush and Skull valleys, Tooele (type from 4.5 mi N of Vernon) County; endemic; 7 (iii).

Var. *salinus* (Howell) Barneby Salt Milkvetch. [*A. salinus* Howell; *Cystium salinum* (Howell) Rydb.]. Pinyon-juniper, mountain brush, and sagebrush communities at 1770 to 2430 m in Beaver, Box Elder, Iron, Juab, Millard, Morgan, Sanpete, Summit, and Wasatch counties; California, Oregon, Nevada, Idaho, and Wyoming; 33 (viii). The tiny flowers and diaphanous pods are diagnostic.

Var. *scorpionis* Jones Scorpion Milkvetch. [*Cystium scorpionis* (Jones) Rydb.]. Sagebrush community upward to timberline at 2130 to 3350 m in western Juab County; Nevada; 1 (0). This rare small-flowered plant differs from var. *salinus* mainly in its opaque leathery pods.

Var. *stramineus* (Rydb.) Barneby Straw Milkvetch. [*Cystium stramineum* Rydb., type from southern Utah]. Mixed warm desert shrub community at 900 to 1000 m on the western slope of the Beaver Dam Mts., Washington County; Arizona and Nevada. This is the only member of the species having moderate sized flowers known to occur in Washington County; it is a Beaver Dam-Virgin endemic; 6 (0).

Var. *vitreus* Barneby Glass Milkvetch. Creosote bush and mixed warm desert shrub communities at 1830 to 1430 m in central and western Kane and eastern Washington (type from 5 mi W of Leeds) counties; Mohave and Coconino counties, Arizona; 21 (iii). In its typical phase, north of Washington, the flowers are very pale, but become bright pink purple eastward. The large, glassy pods are distinctive.

Var. *wahweapensis* Welsh Pinyon-juniper and mixed desert shrub communities at 1860 to 2135 m in Garfield (Henry Mts.) and Kane (Four Mile Bench, type locality) counties; endemic; 28 (viii). This plant is characterized by its diaphanous pods and moderately elongate racemes. It is more or less intermediate between varieties *araneosus* and *vitreus*.

***Astragalus limnocharis* Barneby** Navajo Lake Milkvetch. Perennial, subcaulescent, 1–5 cm tall, arising from a branching caudex; pubescence basifixed; stems prostrate to erect; stipules 2–4 mm long, all connate-sheathing; leaves 1.5–7 cm long; leaflets (5) 7–13, 2–9 mm long, 1–2 mm wide, lanceolate to elliptic or oblong, obtuse, strigose beneath, long-ciliate on the involute

margin, glabrous above; peduncles 2–5 cm long, reclining in fruit; racemes 2– to 10-flowered, the flowers spreading to declined at anthesis, the axis 0.2–0.5 cm long in fruit; bracts 1–3 mm long; pedicels 0.8–1.5 mm long; bracteoles 0; calyx 2.8–3.6 mm long, the tube 2–2.5 mm long, campanulate, strigose, the teeth 0.7–1.6 mm long, subulate; flowers 6.2–7.5 mm long, ochroleucous or pink purple; pods spreading, sessile, ovoid, bladderly-inflated, 9–18 mm long, 7–13 mm thick, mottled, strigose, unilocular; ovules 10–12. Lake shores and limestone breaks on Pink and White Limestone members of the Wasatch Formation, at 2670 to 3400 m in Garfield, Iron, and Kane (type from Navajo Lake), counties; endemic; 14 (v). This “lake beauty” has a principal locality on the beach at Navajo Lake, where it is evidently dispersed by wave action. Plants occur along the terraces below the high water line as the lake recedes. Evidently, the nearest allies of the Navajo Lake milkvetch are *A. jejunus* (q.v.), known in Utah only from Rich County, and *A. montii* of the Wasatch Plateau. A phase with pink purple flowers is present on the Table Cliff Plateau and vicinity in Garfield County. These latter plants are soboliferous, possibly an ecological response to the steep, unstable limestone slopes that serve as habitat; they are designated as var. *tabulaeus* Welsh. Specimens from Navajo Lake and vicinity have ochroleucous flowers and typically lack sobols. They are var. *limnocharis*.

***Astragalus loanus* Barneby** Loa Milkvetch. [*A. newberryi* var. *wardianus* Barneby, type from east of Glenwood]. Perennial, acaulescent, 3–6 cm tall, the caudex branches clothed with a thatch of persistent leaf bases; pubescence incipiently malpighian; stipules 5–10 mm long, all distinct; leaves 2–8 cm long; leaflets (1) 3–5, 6–25 mm long, 5–20 mm wide, obovate to rhombic, elliptic, or oval, obtuse, densely strigose on both sides; peduncles 1–3 cm long; racemes 2– to 7-flowered, the flowers erect-ascending at anthesis, the axis 0.2–0.8 cm long in fruit; bracts 2.5–6 mm long; pedicels 1.2–4 mm long; bracteoles 0–2; calyx 12–17 mm long, the tube 10–14 mm long, cylindrical, loosely strigulose, the teeth 1.8–5.5 mm long, linear-subulate; flowers 20–28 mm long, ochroleucous or greenish white, often tinged faintly purplish, the keel-tip purple; pods ascending, sessile, inflated, ovoid, 17–30 mm long, 13–23 mm wide (when pressed), the valves red purple to straw colored, hirsute with lustrous long hairs; unilocular; ovules 28–38. Sagebrush and pinyon-juniper communities, exclusively on igneous gravels at 1920 to 2075 m in central Sevier County; endemic; 8 (iv). Careful examination of the type of *A. loanus* has demonstrated that two taxa were involved within the initial concept of *A. loanus*. The discordant material has been segregated as a separate species, *A. welshii* Barneby (q.v.).

***Astragalus lonchocarpus* Torr.** Great Rushy Milkvetch. [*Phaca macrocarpa* Gray; *Tragacantha lonchocarpa* (Torr.) Kuntze; *Homalobus macrocarpus* (Gray) Rydb.; *Lonchophaca macrocarpa* (Gray) Rydb.; *A. macra* A. Nels.; *L. macra* (A. Nels.) Rydb.]. Perennial, caulescent, 30–84 cm tall, from a shallowly subterranean caudex; pubescence basifixed; stems erect, often in dense clumps; stipules 1–9 mm long, all distinct; leaves 2–13 cm long, the uppermost and sometimes all simple, the lower with leaflets 3–9, 2–36 mm long, 0.5–4 mm wide, linear to narrowly oblanceolate, obtuse to acute, strigose on both sides or glabrous above; peduncles 6–24 cm long;

racemes loosely 7- to 40-flowered, the flowers spreading-declined at anthesis, the axis 3.5-45 cm long in fruit; bracts 0.8-2.5 mm long, pedicels 1.3-4.5 mm long; bracteoles 0; calyx 5.8-10.3 mm long, usually brown, the tube 5-8 mm long, cylindrical, gibbous, strigose, the teeth 0.6-2 mm long, subulate; flowers 13-20 mm long, ochroleucous to almost white, concolorous; pods pendulous, stipitate, the stipe 3-15 mm long, the body elliptic to oblong in outline, 22-50 mm long, 3.3-6.2 mm wide, dorsiventrally compressed, the valves often brownish, strigose, unilocular; ovules 12-26; $2n = 22$. Salt desert shrub, blackbrush, and pinyon-juniper communities at 1170 to 2530 m in Beaver, Box Elder, Carbon, Emery, Garfield, Grand, Iron, Juab, Kane, Millard, Piute, San Juan, Sevier, Tooele, and Wayne counties; Colorado, New Mexico, Arizona, and Nevada; 135 (xxx). This species is allied with *A. hamiltonii* (q.v.).

Astragalus lutosus Jones Dragon Milkvetch. Perennial, short-caulescent, 2-10 tall, from a subterranean caudex; pubescence basifixed; stems prostrate to ascending, radiating; stipules 2-5 mm long, all distinct or some shortly connate-sheathing; leaves 1-5.5 cm long; leaflets 11-27, 1-12 mm long, 1-5 mm wide, obovate to elliptic or oblong, often folded, obtuse to retuse, gray-strigulose on both sides or glabrous above; peduncles 0.5-4 cm long; racemes 4- to 10-flowered, the flowers ascending-spreading at anthesis, the axis 0.3-1 cm long in fruit; bracts 1.5-2.5 mm long; pedicels 1.2-3 mm long; bracteoles 0; calyx 4.8-10.4 mm long, the tube 3.6-7.4 mm long, short-cylindric, strigulose, the teeth 1.2-3 mm long, subulate; flowers 9-17 mm long, white to ochroleucous, the keel-tip purplish; pods spreading to ascending, stipitate, the stipe (gynophore) 1-4.5 mm long, the body ovoid-ellipsoid, bladderly-inflated, 15-37 mm long, 8-23 mm thick, strigose, unilocular. Barrens, often with other mound-forming species in mixed desert shrub, pinyon-juniper, mountain brush, and limber pine-Douglas fir communities, on outcrops of Green River Shale at 1645 to 2870 m in Uintah (type from White River), Utah, and Wasatch counties; Rio Blanco County, Colorado; 33 (i). The Dragon milkvetch long remained obscure, but exploration during the past decade has demonstrated a rather broad distribution for this plant of peculiar shale strata.

Astragalus malacoides Barneby Kaiparowits Milkvetch. Perennial, short-caulescent, 7-26 cm tall, from a slightly subterranean caudex; pubescence basifixed; stems decumbent or prostrate to ascending; stipules 2-7 mm long, all distinct; leaves 4.5-14 cm long; leaflets 15-29, 3-25 mm long, 2-12 mm wide, obovate to oblong or elliptic, obtuse to emarginate, hirtellous beneath, glabrous above; peduncles 4-12 mm long; racemes 10- to 24-flowered, the flowers ascending-spreading at anthesis, the axis 1.2-10 cm long in fruit; bracts 3-5 mm long; pedicels 1-2.5 mm long; bracteoles 0-2; calyx 10-15 mm long, the tube 7-12 mm long, cylindrical, hirsutulous, the teeth 2-6.2 mm long, linear-subulate; flowers 16-22 mm long, pink purple; pods declined to ascending, short-stipitate, the stipe 2-3 mm long, the body oblong, curved, 25-40 mm long, 5-8 mm wide, laterally compressed, hirsutulous, bilocular; ovules 24-30. Straight Cliffs, Wahweap, Kaiparowits, Ferron, and Moenkopi formations (inter alia), usually in clay or silty soils, in juniper-pinyon and mixed desert shrub communities at 1600 to 2400 m in Garfield (Circle Cliffs, Tarantula Mesa, and Henry Mts.) and Kane (Kaiparowits vicinity, type locality) counties; endemic; 28 (vi).

Astragalus megacarpus (Nutt.) Gray Great Bladdery Milkvetch. [*Phaca megacarpa* Nutt. ex T. & G.; *Tragacantha megacarpa* (Nutt.) Kuntze; *A. megacarpus* var. *prodigus* Sheldon]. Perennial, short-caulescent or subcaulescent, 3-15 (17) cm tall, arising from a caudex; pubescence basifixed; stems 1-5 cm long, in dense, leafy clumps, the internodes mostly obscured by stipules, these 2-7 mm long and all distinct; leaves 2-15 (17) cm long; leaflets 7-19, 3-19 mm long, 2-12 mm wide, obovate, ovate, elliptic, or suborbicular, obtuse to retuse and mucronate, strigose to glabrous beneath, glabrous above; peduncles 0.5-6 cm long, much shorter than the leaves; racemes 1- to 7-flowered, the flowers ascending in anthesis, the axis 0.2-2.5 cm long in fruit; bracts 2-5 mm long; pedicels 3.5-8 mm long; bracteoles 0-2; calyx 7-10.2 mm long, the tube 5.2-8.5 mm long, cylindrical, strigose, the teeth 1.8-3.5 mm long; flowers 15-23 mm long, pink purple; pods ascending to descending, stipitate, the stipe (gynophore) 2-4 mm long, the body bladderly-inflated, ellipsoid, 35-70 (88) mm long, 15-45 mm wide (when pressed), commonly mottled, strigose, unilocular; ovules 38-54. Commonly on clay soils, these often saline or calciferous, in salt desert shrub, sagebrush, oakbrush, pinyon-juniper, and ponderosa pine communities at 1650 to 3050 m in Carbon, Duchesne, Emery, Garfield, Iron (type of var. *parryi* from Cedar Canyon), Juab, Kane, Millard, Sanpete, and Sevier counties; Nevada, Wyoming, and Colorado; 56 (xii). The great bladderly milkvetch is among our most distinctive species of *Astragalus*. A plant with its large pods declined on the ground around the base is a surprising sight. Our plants belong to var. *parryi* Gray ex Wats., sens. str., but this variety differs mainly in flower color (though our specimens seem to have smaller calyces also) from var. *megacarpus*, sens. str.

Astragalus miser Dougl. ex Hook. Weedy Milkvetch. Perennial, caulescent or short-caulescent, 3-35 cm tall, from a branching caudex; pubescence basifixed; stems decumbent to erect, 1-25 cm long or more; stipules 1.5-7 mm long, at least some connate-sheathing; leaves 1.5-20 cm long or more; leaflets 3-21, 3-35 mm long, 0.5-7 mm wide, linear to oblong, elliptic, or oval, acute to obtuse or emarginate, strigose beneath, glabrous or glabrate above; peduncles 2-14 cm long; racemes 3- to 20-flowered, the flowers spreading-declined at anthesis, the axis 1-10 cm long in fruit; calyx 2.1-5.2 mm long, the tube 1.9-2.9 mm long, campanulate, strigose, the teeth 0.5-2.5 mm long, subulate; flowers 5.9-10 mm long, pink purple, ochroleucous, or whitish, often suffused or veined with purple; keel with an upturned, usually purple beak; pods declined-pendulous, sessile or nearly so, narrowly oblong or oblanceolate in outline, 12-25 mm long, 2-4 mm wide, strigose, unilocular; ovules 8-19; $2n = 22$. The weedy milkvetch is a widespread, poisonous plant of middle and upper elevations in much of Utah. Both cattle and sheep are poisoned by this plant. Two rather tenuous varieties are known, one common the other evidently rare.

- 1. Leaflets 3-11; flowers 6-8 mm long; pods narrowly oblong in outline; plants rare, scattered in northern Utah *A. miser* var. *tenuifolius*
- Leaflets mostly 11-21; flowers 8-11 mm long; pods oblanceolate in outline; plants common in Utah *A. miser* var. *oblongifolius*

Var. *oblongifolius* (Rydb.) Cronq. Rydberg Weedy Milkvetch. [*Homalobus oblongifolius* Rydb.; *A. hylophilus* var. *oblongifolius* (Rydb.) Macbr.; *A. decumbens* var. *oblongifolius* (Rydb.) Cronq.; *Homalobus humilis* Rydb., type from the Tushar Mts.; *A. carltonii* Macbr., not *A. humilis* M. Bieb.]. In aspen, mixed aspen-conifer, and coniferous woodlands, and in sagebrush, mountain brush, and alpine meadow communities at 1830 to 3570 m in all Utah counties except Davis, Morgan, San Juan, and Washington; Nevada, Arizona, Wyoming, and Colorado; 211 (xxxiv).

Var. *tenuifolius* (Nutt.) Barneby Garrett's Weedy Milkvetch. [*Homalobus tenuifolius* Nutt.; *H. paucijugus* Rydb.; *A. garrettii* Macbr., not *A. paucijugus* Schrenk]. Sagebrush upward to mountain summits at 1970 to 3050 m in Rich and Salt Lake (type from Big Cottonwood Canyon) counties; Idaho, Nevada, and Wyoming; 4 (i).

Astragalus missouriensis Nutt. Missouri Milkvetch. Perennial, subcaulescent, 3–12 cm tall, from a caudex; pubescence malpighian; stems prostrate, to 8 cm long, the internodes often concealed by stipules; stipules 2–9 mm long, all distinct; leaves 1.5–12 cm long; leaflets 5–15, 3–15 mm long, 1–8 mm wide, elliptic to obovate, acute to mucronate or obtuse, strigose on both sides; peduncles 1.5–8 cm long; racemes 3- to 12-flowered, the flowers ascending at anthesis, the axis 0.4–3 cm long, in fruit; bracts 2.5–8 mm long; pedicels 1–3.5 mm long; bracteoles 0–1; calyx 8.5–13 mm long, the tube 7–10 mm long, cylindric, strigose, the teeth 1.5–3 mm long, subulate; flowers 15–22 mm long, pink purple, rarely white; pods ascending to descending, sessile, ellipsoid, 15–25 mm long, 7–9 mm thick, curved, dorsiventrally compressed, strigose, unilocular; ovules 35–55. Pinyon-juniper and sagebrush communities at 1600 to 2430 m in San Juan County; Alberta to Manitoba and Minnesota, south to New Mexico and Texas; 2 (0). Our material belongs to var. *amphibolus* Barneby.

Astragalus moencoppensis Jones Moenkopi Milkvetch. [*Cnemidophacis moencoppensis* (Jones) Rydb.]. Perennial, caulescent, 9–60 cm tall, from a branching caudex; pubescence basifixed; stems erect or ascending, commonly shorter than the longest peduncles; stipules 1.5–7 mm long, at least some connate-sheathing; leaves 4–16.5 cm long; leaflets 5–15, 2–23 mm long, 0.3–2 mm wide, filiform to linear or narrowly elliptic, acute to obtuse, the terminal often continuous with the rachis, strigose below, glabrous on the involute upper surface; peduncles 4–25 cm long; racemes 6- to 34-flowered, the flowers ascending at anthesis, the axis 3–25 cm long in fruit; bracts 1.5–3.5 mm long; pedicels 0.3–2 mm long; bracteoles 0–1; calyx 5–7.5 mm long, the tube 3–4 mm long, campanulate, white-pilose, the teeth 1.8–3.5 mm long, lance-subulate; flowers 8–11 mm long, pink purple; pods ascending-spreading, sessile, ovoid to ellipsoid, 6–7 mm long, 2.3–3.4 mm thick, strigulose, unilocular. Salt desert shrub, mixed desert shrub, and pinyon-juniper communities, usually in silty or clay soils, at 1330 to 2130 m in Emery, Garfield, Grand, Kane, San Juan, and Wayne counties; Arizona; a Colorado Plateau endemic; 63 (xviii). The Moenkopi milkvetch is a primary selenium indicator of distinctive mien and odor.

Astragalus mollissimus Torr. Woolly Locoweed. Perennial, acaulescent, 6–45 cm tall, from a caudex; pubescence basifixed; stems mostly obscured by stipules, these 4–13 mm long, all distinct; leaves 2–28 cm long;

leaflets 15–35, 2–18 mm long, 1–14 mm wide, obovate to suborbicular or elliptic, obtuse to retuse or acute, densely woolly-tomentose on both sides; peduncles 2.5–24 cm long; racemes 7- to 20-flowered, the flowers ascending at anthesis, the axis 1.5–18 cm long in fruit; bracts 2.5–8 mm long; pedicels 0.5–3 mm long; bracteoles 0–1; calyx 11–15.5 mm long, the tube 7.7–13 mm long, cylindric, villous, the teeth 2–4.2 mm long, subulate; flowers 18–25 mm long, pink purple; pods descending, sessile, ovoid, 11–23 mm long, 6–11 mm thick, curved, densely villous-tomentose, bilocular; ovules 28–38; 2n = 22. Salt desert shrub, mixed desert shrub, grassland, and pinyon-juniper communities at 1130 to 2330 m in Beaver, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Kane, Millard, Piute, San Juan, Sanpete, Sevier, Tooele, Uintah, Washington, and Wayne counties; Wyoming and Nebraska, south to Nevada, Texas, and Mexico; 193 (xlv). Our material belongs to var. *thompsonae* (Wats.) Barneby [*A. thompsonae* Wats. type from Kanab; *Tragacantha thompsonae* (Wats.) Kuntze; *A. bigelovii* var. *thompsonae* (Wats.) Jones; *A. syrticolus* Sheldon]. The woolly locoweed is one of the earliest of the *Astragalus* species to flower in Utah. It has been taken in flower as early as February in southern counties. The species as a whole is recognized as being poisonous. The plants are seldom abundant, except along roadsides, and this might account for the lack of reports of poisoning from this entity in Utah.

Astragalus montii Welsh Heliotrope Milkvetch. [*A. limnocharis* var. *montii* (Welsh) Isely]. Perennial, subcaulescent, 1–5 cm tall, arising from a branching caudex; pubescence basifixed; stems ascending to erect; stipules 2–4 mm long, all connate-sheathing; leaves 1.3–4.8 cm long; leaflets 5–13, 2–8 mm long, 1–2 mm wide, lanceolate to oblong or elliptic, strigose beneath, not ciliate on the involute margin, glabrous above; peduncles 0.8–4.5 cm long, reclining in fruit; racemes 2- to 8-flowered, the flowers ascending to spreading in anthesis, the axis 0.2–0.5 cm long in fruit; bracts 1–3 mm long; pedicels 0.8–1.5 mm long; bracteoles 0; calyx 3.3–4 mm long, the tube 2.2–2.5 mm long, campanulate, strigose, the teeth 0.6–1.5 mm long, triangular-subulate; flowers 7.2–8 mm long, pink purple, the wing-tips white; pods spreading, sessile, ovoid, bladderly-inflated, 11–18 mm long, 8–12 mm thick, mottled, strigose, unilocular; ovules 10. The Heliotrope milkvetch is known only from Flagstaff Limestone at ca 3350 m on the Wasatch Plateau, San Pete (type from Heliotrope Mt.) County; endemic; 6 (i). The species is a near congener of *A. limnocharis* from the Markagunt and Table Cliff plateaus and vicinities, differing inter alia in the pink purple flowers with contrasting white wing-tips, which are larger, and in the merely strigose (not long-ciliate) leaflet margins. The phase of *A. limnocharis* (var. *tabulaeus*) with pink purple flowers does not have the contrasting white wing tips and is strongly soboliferous.

Astragalus monumentalis Barneby Monument Milkvetch. Perennial, acaulescent or subcaulescent, 3–18 cm tall, from a branching caudex; pubescence basifixed or shortly malpighian; stems 1–6 cm long, ascending, the internodes commonly concealed by stipules, these 2–4 mm long, all distinct; leaves 1.5–8 (11) cm long; leaflets (5) 9–17 (21), 2–9 mm long, 1–4 mm broad, oval to obovate, elliptic, or oblanceolate, strigulose beneath, glabrous or glabrate above; peduncles 1–12 cm long;

racemes 3- to 9-flowered, the flowers ascending at anthesis, the axis 0.5-7 cm long in fruit; bracts 1.5-5 mm long; pedicels 0.8-2.2 mm long; bracteoles 0; calyx 3.6-4.5 mm long, the tube 3.1-3.5 mm long, campanulate, strigose, purplish, the teeth 0.5-1 mm long; flowers 8-9 mm long, pink purple; pods ascending, sessile or nearly so, narrowly oblong to lanceolate in outline, 12-21 mm long, 2.3-3 mm wide, straight or curved, triangular in cross-section, the dorsal suture sulcate, strigose, bilocular, often mottled. Rimrock and other slickrock sites in mixed desert shrub and pinyon-juniper communities at 1230 to 1870 m in Garfield and San Juan (type from White Canyon) counties; endemic; 27 (xviii). This is a mirrored-image congener of *A. cottamii* (q.v.), differing in its smaller floral parts and overall flower size and in the incipient malpighian pubescence.

Astragalus musiniensis Jones Ferron Milkvetch. [*Xylophacos musiniensis* (Jones) Rydb.; *A. musiniensis* var. *newberryoides* Jones, type from the San Rafael Swell]. Perennial, acaulescent, 3-13 cm tall, from a caudex, the branches often clothed with a thatch of persistent leaf bases; pubescence basifixed or incipiently malpighian; stipules 3.5-10 mm long, all distinct; leaves 1.5-13 cm long; leaflets (1) 3-5, 5-35 mm long, 2-11 mm wide, elliptic to lanceolate, acute to obtuse, strigose on both surfaces; peduncles 0.5-7 cm long; racemes 1- to 6-flowered, the flowers erect-ascending at anthesis, the axis 0.2-1.4 cm long in fruit; bracts 1.6-4 mm long; pedicels 1.2-4 mm long; bracteoles 0; calyx 12-15.5 mm long, the tube 9.5-12.7 mm long, cylindric, strigose-pilose, the teeth 1.5-4 mm long; flowers 20-28 mm long, pink purple; pods ascending, sessile, obliquely ovoid, 15-36 mm long, 8-17 mm thick, dorsiventrally compressed, hirsutulous to villous-hirsute, unilocular. Salt desert shrub, mixed desert shrub, and pinyon-juniper communities at 1430 to 2130 m in Carbon, Emery (type from 2 miles south of Ferron), Garfield, Grand, Kane, and Wayne counties; endemic; 55 (xvii). The species was named by Marcus E. Jones for a peak on the Wasatch Plateau many miles remote from the type locality.

Astragalus nelsonianus Barneby Nelson Milkvetch. [*A. pectinatus* var. *platyphyllus* Jones]. Perennial, caulescent, 10-30 cm tall, from a subterranean caudex; pubescence basifixed; stems decumbent to ascending or erect; stipules 4-13 mm long, at least some connate-sheathing; leaves 2.5-9 cm long; leaflets 3-13, 10-45 mm long, 2-5 mm wide, narrowly oblong, obtuse to apiculate, strigose on both surfaces, the terminal leaflet continuous with the rachis; peduncles 3-12 cm long; racemes 6- to 20-flowered, the flowers ascending at anthesis, the axis 2-12 cm long in fruit; bracts 2.5-7 mm long; pedicels 1.5-4 mm long; bracteoles 1; calyx 10-14.5 mm long, the tube 7-10.2 mm long, cylindric, strigose, the teeth 2-4.5 mm long; flowers 10-14 mm long, white, concolorous; pods deflexed, sessile, oblong-ellipsoid, 13-33 mm long, 6-12 mm wide, finally laterally compressed, glabrous or pubescent, unilocular; ovules 20-28. Saline soils in desert shrub communities at 2070 to 2100 m in Daggett County; Wyoming; 4 (i). The Nelson milkvetch differs from *A. pectinatus* Dougl. ex G. Don in much the same manner that *A. hamiltonii* differs from *A. lonchocarpus*. The leaves and leaflets of both *A. nelsonii* and *A. hamiltonii* are much broader than those of their counterparts.

Astragalus newberryi Gray Newberry Milkvetch. [*Xylophacos newberryi* (Gray) Rydb.; *A. newberryi* var. *cas-*

toreus Jones, type from Beaverdam Mts.]. Perennial, acaulescent, 2-12 cm tall, from a caudex, the branches commonly clothed with a thatch of persistent leaf bases; pubescence basifixed; stipules 3-11 mm long, all distinct; leaves 1.5-14 cm long; leaflets 3-15, 3-20 mm long, 2-14 mm wide, obovate to elliptic, oblanceolate, or orbicular, acute to obtuse or retuse, villous-tomentulose on both surfaces; peduncles 0.5-11 cm long; racemes 2- to 8-flowered, ascending in flower, the axis 0.2-2.7 cm long in fruit; bracts 3.5-10 mm long; pedicels 1.4-5 mm long; bracteoles 0-2; calyx 11.5-20 mm long, the tube 8-17 mm long, cylindric, villous, the teeth 1.9-6 mm long, subulate; flowers 20-32 mm long, pink purple; pods ovoid, curved, 18-23 mm long, 7-12 mm thick, densely villous-tomentulose, unilocular; ovules 20-40; n = 11. Salt desert shrub, mixed desert shrub, sagebrush, mountain brush, and pinyon-juniper communities at 830 to 2300 m in Beaver, Box Elder, Garfield, Iron, Juab, Kane, Millard, Piute, Sevier, Tooele, and Washington counties; Oregon, California, Nevada, Arizona, and New Mexico; 116 (xxxiv). Dwarf material from the vicinity of Escalante and Kanab east to Glen Canyon belongs to var. *newberryi*, the remainder of our specimens are assignable to var. *castoreus* Jones.

Astragalus nidularius Barneby Birds-nest Milkvetch. Perennial, caulescent, 15-51 cm tall, from a subterranean caudex; pubescence basifixed; stems ascending to erect, often branched; stipules 1-6 mm long, at least some connate-sheathing; leaves 1.5-7 cm long; leaflets 5-11, 2-20 mm long, 1.3-2 mm wide, linear to oblong, obtuse to emarginate or acute, the terminal leaflet of upper leaves sometimes continuous with the rachis, pubescent on both sides or glabrous above; peduncles 4-16 cm long; racemes (3) 8- to 33-flowered, the flowers ascending to declined at anthesis, the axis 1.5-28 cm long in fruit; bracts 1.2-2.2 mm long; pedicels 1.2-3 mm long; bracteoles 0-2; calyx 3.8-7 mm long, the tube 3.3-5.5 mm long, campanulate, strigose, the teeth 1.5-2.2 mm long, subulate; flowers 10-15 mm long, pink purple; pods pendulous, stipitate, the stipe 3.5-6 mm long, the body narrowly oblong, 20-32 mm long, 3.5-4.5 mm thick, dorsiventrally compressed, strigose, unilocular; ovules 20-24. Pinyon-juniper and mixed desert shrub communities at 1370 to 1900 m in Garfield, San Juan (type from White Canyon) and Wayne counties; endemic; 20 (xii). The birds-nest milkvetch is a close ally of *A. harrisonii* (q.v.), from which it is separated geographically and in technical morphological features.

Astragalus nuttallianus A. DC. Small-flowered Milkvetch. Annual or winter-annual, caulescent, 2-35 cm long, from a taproot; pubescence basifixed; stems prostrate to decumbent or erect; stipules 1-5 mm long, all distinct; leaves 1-8.5 cm long; leaflets 7-19, 2-14 mm long, 1-6 mm wide, obovate to elliptic or oblong, acute to rounded or retuse to emarginate, strigose to glabrous on both sides; peduncles 1-8 cm long; racemes 1- to 7-flowered, the flowers ascending to declined at anthesis, the axis 0.2-2 cm long in fruit; bracts 0.5-2.5 mm long, pedicels 0.4-1.6 mm long; bracteoles 0; calyx 3.2-5.4 mm long, the tube 1.9-2.8 mm long, campanulate, strigose, the teeth 1-2.2 mm long, subulate; flowers 4.1-7.6 mm long, pink purple to whitish or faintly tinged with purple; pods ascending to declined, sessile or subsessile, narrowly oblong, curved, 12-20 mm long, 1.9-3.3 mm wide, glabrous to strigose, bilocular or

nearly so; ovules 12–18; $n = 11, 12$. There are two allopatric varieties in Utah.

1. Leaflets 9–15; axis of raceme 0.5–2 cm long in fruit; keel-tip blunt; plants of eastern Kane County and eastward *A. nuttallianus* var. *micranthiformis*
- Leaflets 7–11; axis of raceme 0.1–1 cm long in fruit; keel-tip acute to subacute, usually beaked; plants from Washington and Tooele counties *A. nuttallianus* var. *imperfectus*

Var. imperfectus (Rydb.) Barneby [*Hamosa imperfecta* Rydb.]. Creosote bush, warm desert shrub, and cool desert shrub communities at 670 to 1470 m in Washington and disjunctly in Tooele (Stansbury Island) counties; Nevada, California, and Arizona; 38 (viii).

Var. micranthiformis Barneby Blackbrush, mixed desert shrub, and pinyon-juniper communities at 1130 to 1670 m in Emery, Garfield, Grand, Kane, and San Juan counties; Arizona, Colorado, and New Mexico; 26 (xvi).

Astragalus oophorus Wats. Egg Milkvetch. Perennial, caulescent, 15–30 cm tall, from a caudex; pubescence basifixed; stems decumbent to ascending, radiating from the caudex; stipules 1.5–7 mm long, all distinct; leaves 3–21 cm long; leaflets 9–25, 3–20 mm long, 2–11 mm wide, oval to obovate or orbicular, obtuse to retuse or mucronate, glabrous on both surfaces, often ciliate; peduncles 4–13 cm long; racemes 4– to 13-flowered, the flowers spreading at anthesis, the axis 1–8 cm long in fruit; bracts 1.5–5 mm long; pedicels 2–6 mm long; bracteoles 0–1; calyx 6–12 mm long, the tube 4–8.5 mm long, cylindrical or short-cylindrical, glabrous or sparingly strigose, the teeth 2–5 mm long, subulate; flowers 17–24 mm long; ochroleucous, concolorous, or pink purple and with white wing-tips; pods spreading to pendulous, stipitate, the stipe (gynophore) 3.5–12 mm long, the body bladderly-inflated, ellipsoid, 25–55 mm long, 10–30 mm wide (when pressed), glabrous, unilocular, often mottled; ovules 28–54; $2n = 24$. Two distinctive varieties are present in Utah.

1. Flowers pink purple; calyx tube 7.8–9 mm long; stipe 10–12 mm long; plants of western Iron and Beaver counties *A. oophorus* var. *lonchocalyx*
- Flowers ochroleucous; calyx tube 4–7 mm long; stipe 3.5–8.5 mm long; plants widespread *A. oophorus* var. *caulescens*

Var. caulescens (Jones) Jones Pallid Egg Milkvetch. [*A. megacarpus* var. *caulescens* Jones, type from Loa Pass; *A. artipes* Gray; *Phaca artipes* (Gray) Rydb.; *A. oophorus* var. *artipes* (Gray) Jones]. Sagebrush, pinyon-juniper, and mountain brush communities at 1370 to 2430 m in Beaver, Garfield, Grand, Iron, Juab, Kane, Millard, Piute, Sanpete, Sevier, Tooele, Utah, and Washington counties; Colorado, Arizona, and Nevada; 99 (xix).

Var. lonchocalyx Barneby Pink Egg Milkvetch. Pinyon-juniper, sagebrush, and mixed desert shrub communities at 1770 to 2300 m in western Iron and Beaver counties; Lincoln County, Nevada; a Great Basin endemic; 7 (iv).

Astragalus pardalinus (Rydb.) Barneby Panther Milkvetch. [*Phaca pardalina* Rydb., type from Cedar Mt., Emery County]. Perennial (short-lived) or functionally annual, caulescent, 8–30 (35) cm tall, often clump-forming and about as broad as tall; pubescence basifixed; stems decumbent to ascending, forming rounded clumps;

stipules 2–5 mm long, all distinct or some shortly connate-sheathing; leaves 3–7 cm long; leaflets 11–17, 3–20 mm long, 1–5 mm wide, oblong to oblanceolate or obovate, truncate to retuse, mucronate, or acute, strigulose on both sides; peduncles 1–4 cm long; racemes 3– to 8-flowered, the flowers ascending at anthesis, the axis 1–4 cm long in fruit; bracts 1–3.5 mm long; pedicels 0.8–3.6 mm long; bracteoles 0–2; calyx 4.8–6.6 mm long, the tube 2.3–2.8 mm long, campanulate, villous, the teeth 2.3–2.8 mm long, subulate; flowers 6.3–8.2 mm long, pink purple (soon fading yellowish); pods declined, sessile or nearly so, obliquely ovoid-ellipsoid, inflated, 13–21 mm long, 8–11 mm thick, straight or only slightly curved, villosulous with spreading-curved hairs, unilocular; ovules 20–28. Mixed desert shrub and pinyon-juniper communities, usually in sandy soils, at 1270 to 1600 m in Emery (type from Cedar Mt.), Garfield, and Wayne counties; endemic; 17 (vii). The panther milkvetch shares several salient features with the closely related but largely allopatric taxa *A. pubentissimus* and *A. sabulumum* (q.v.). From both of these, *A. pardalinus* differs in its straight or nearly straight pods, with 20–28 ovules (not 9–19). The main area of distribution of the panther milkvetch is on the sandy eastern foot of the San Rafael Swell, which breaks abruptly to the canyons of the Green and Colorado rivers.

Astragalus pattersonii Gray ex Brand. Patterson Milkvetch. [*Tragacantha pattersonii* (Gray) Kuntze; *Phacopsis pattersonii* (Gray) Rydb.; *Rydbergiella pattersonii* (Gray) Fedde; *Jonesiella pattersonii* (Gray) Rydb.]. Perennial, caulescent, 20–45 (50) cm tall, from a branching caudex; stems decumbent to ascending or erect; stipules 3–8 mm long, all usually distinct; leaves 5–13 cm long; leaflets 7–15 or more, 6–38 mm long, 3–16 mm wide, elliptic to lanceolate, oblanceolate, or obovate, obtuse to acute, retuse or mucronate, strigose to glabrous on both sides; peduncles 3–18 cm long; racemes 6– to 24-flowered, the flowers declined-nodding at anthesis, the axis 2–15 cm long in fruit; bracts 2–8 mm long; pedicels 1–4.5 mm long; bracteoles 2; calyx 8.8–14.2 mm long, the tube 6–8.8 mm long, cylindrical, gibbous, pale tan or whitish, colored like the petals, thinly strigulose, the teeth 2.3–6.5 mm long, subulate; flowers 14–22 mm long, white, concolorous or the keel tip faintly purplish; pods erect, sessile, cylindrical to ellipsoid or ovoid, 17–35 mm long, 6–10 mm thick, glabrous or puberulent, unilocular; ovules 22–38; $2n = 24$. Pinyon-juniper and mixed desert shrub communities at 1470 to 2300 m in Carbon, Emery, Garfield, Sevier, Uintah, and Wayne counties; Colorado; 30 (xii). This handsome milkvetch occurs in a crescent below the coal measures from east of Price to south of Emery, on foothills and along washes in the Blue Gate member of the Mancos Shale. The Arizona materials are known from the valley of Kanab Creek, and this plant might also occur on seleniferous muds and silts in adjacent Kane County. The plant is similar in many ways to *A. praelongus* (q.v.), from which it differs in the whitish concolorous calyces and petals, spreading calyx teeth, and erect pods.

Astragalus perianus Barneby Rydberg Milkvetch. Perennial, short-caulescent, 1–6 cm tall, from a shallowly subterranean, branching caudex; pubescence basifixed; stems prostrate, 3–12 cm long; stipules 1–2.5 mm long, at least some connate-sheathing; leaves 1–3 cm long; leaflets 7–19, 1–5 mm long, 1–3 mm wide, oval to obovate,

retuse, strigulose on both sides or glabrous above; peduncles 0.3–2.2 cm long, racemes 2- to 6-flowered, the flowers spreading at anthesis, the axis 0.2–0.8 cm long in fruit; bracts 0.8–1.2 mm long; pedicels 1.4–2.5 mm long; bracteoles 0; calyx 3.5–4.2 mm long, the tube 2.3–3 mm long, campanulate, pilosulous, purplish, the teeth 1–1.4 mm long, subulate; flowers 6.8–8.5 mm long, whitish, faintly suffused with pink or purple; pods ascending to declined, sessile, bladdery-inflated, ovoid, 10–23 mm long, 8–14 mm wide (when pressed), strigose, purple-mottled, unilocular; ovules 18–20. Tertiary igneous gravels, often on barrens in alpine or montane sites in Beaver, Iron, Garfield, Kane (?), and Piute (type from west of Marysvale) counties; endemic; 30 (vi). The Rydberg milkvetch most closely resembles *A. serpens* (q.v.).

Astragalus pinonis Jones Pinyon Milkvetch. [*Pisophaca pinonis* (Jones) Rydb.]. Perennial, caulescent, 10–55 cm tall, from a shallowly subterranean caudex; pubescence basifixed; stems erect or reclining, commonly growing through sagebrush canopy; stipules 1.5–5 mm long, all distinct; leaves 2–11 cm long; leaflets 9–19, 2–18 mm long, 1–4 mm wide, linear to oblong, obtuse to retuse, strigose on both surfaces; peduncles 1.5–8 cm long; racemes 5- to 19-flowered, the flowers ascending-spreading at anthesis, the axis 2–7 cm long in fruit; bracts 1–2 mm long; pedicels 1–3 mm long; bracteoles 0–1; calyx 4.3–5.6 mm long, the tube 2.3–3.8 mm long, campanulate, strigose, the teeth 1–2 mm long, subulate; flowers 8.2–10.3 mm long, greenish to ochroleucous, suffused with purple; pods spreading-declined, subsessile, oblong-ellipsoid, straight to slightly curved, 20–35 mm long, 5.5–8.5 mm thick, terete or nearly so, strigose, unilocular; ovules 32–42. With black sagebrush in juniper and pinyon-juniper woodlands at 1580 to 2275 m in Beaver and Juab counties; Nevada; a Great Basin endemic. The pinyon milkvetch is obscure and apparently rare in Utah; 5 (iii). The type was collected at Frisco, Beaver County, where M. E. Jones found the plant in 1880 (on June 22). It grows up through low plants of black sagebrush and is difficult to see. The plants resemble those of *A. convallarius*, but the thicker pods, jointed terminal leaflets, and superficial caudex of *A. pinonis* are diagnostic.

Astragalus piscator Barneby & Welsh Fisher Milkvetch. Acaulescent or subcaulescent herbs from a vertical taproot, perennial of short duration flowering the first year, the leaves and scapiform peduncles arising from the root-crown at soil level, this more or less clothed with a persistent thatch of leaf bases, strigose throughout with appressed dolabriform hairs, the leaflets yellow green above, gray beneath; stipules ovate-acuminate 3–9 mm, usually closely imbricated, strigose dorsally, persistent; leaves (3) 4–10 (16) cm long; leaflets of most leaves 5–11 (13), elliptic or lance-elliptic, acute or subobtusate, (5) 7–17 (32) long, 2–4 (6) mm wide, those of some early leaves only 1–3 and rhombic ovate; peduncles (1) 2–6 (9) cm, ascending at anthesis, procumbent in fruit, the pods humistrate; racemes shortly loosely 3- to 10-flowered, the axis becoming 4–15 (20) mm in fruit; calyx 11–14.5 mm, either black- or partly white-strigose, the cylindrical tube 8.5–11 mm long, 3–4 mm wide, the linear-subulate teeth 2–3.5 (4) mm long; corolla of *A. amphioxys*, the banner 18–24 mm long, the obtuse keel 16–18 mm long; ovary strigulose, the ovules ca 40; pod ascending, sessile, deciduous from the receptacle, in profile lance-elliptic, shallowly lunate-incurved, obtuse at the base, acuminate distally, 24–40 long, 8–15 mm wide, somewhat laterally

compressed but the valves dilated near the middle into an obtuse longitudinal ridge, both sutures becoming sharply prominulous at maturity, the moderately fleshy, densely strigose, purplish-mottled valves becoming stiffly chartaceous or subcoriaceous (but not pithy) and ca 0.5 mm thick when dry, dehiscent after falling through the gaping beak. Sandy soils of valley benches and in gullied foothills, on Moenkopi, Cutler, and White Rim formations, 1550 to 1750 m, known only from the lower Grand River Valley in southeastern Grand, northern San Juan (type from Salt Creek) and extreme eastern Wayne counties; Colorado; endemic; 11 (vi).

Astragalus piutensis Barneby & Mabblerley Sevier Milkvetch. [*Xylophacos marianus* Rydb., type from Marysvale; *A. marianus* (Rydb.) Barneby]. Perennial, acaulescent or subcaulescent, 3–10 cm tall, from a branching caudex; pubescence basifixed (or incipiently malpighian); stems 0–6 cm long, the internodes mostly concealed by stipules, these 2–7 mm long, all distinct; leaves 1.2–8.5 mm long; leaflets 7–17, 3–11 mm long, 1–4 mm broad, obovate to oblanceolate, obtuse to emarginate or acuminate to acute, strigose on both sides; peduncles 1–8 cm long; racemes 2- to 10-flowered, the flowers ascending at anthesis, the axis 0.2–3.5 cm long in fruit; bracts 2–4.5 mm long; pedicels 0.8–3 mm long; bracteoles 0–2; calyx 10–13.2 mm long, the tube 7.3–9.4 mm long, cylindrical, pilosulous, the teeth 2–3.5 mm long, subulate; flowers 17–24 mm long, pink purple, often pale; pods spreading-ascending, sessile or nearly so, 10–23 mm long, 7–12 mm thick, ovoid-acuminate, densely shaggy-hirsute, unilocular; ovules 27–36. Oak-sagebrush, mixed warm and cool desert shrub, pinyon-juniper, and aspen-white fir communities at 900 to 2430 m in Beaver, Garfield, Iron, Juab, Millard, Piute, Sevier, Tooele, Washington, and Wayne counties; Nevada; 71 (xxv). The Sevier milkvetch resembles *A. argophyllus* var. *martinii*, but the shaggy-hirsute pods and flowers that average smaller are diagnostic.

Astragalus platytropis Gray Broad-keeled Milkvetch. [*Tragacantha platytropis* (Gray) Kuntze; *Phaca platytropis* (Gray) Rydb.; *Cystium platytrope* (Gray) Rydb.]. Perennial, acaulescent or nearly so, 2–7 cm tall, from a branching caudex, the branches often with a thatch of persistent leaf bases; pubescence basifixed; stems 0–2 cm long, prostrate-ascending or erect; stipules 1.5–5 mm long, at least some connate-sheathing; leaves 1–7 cm long; leaflets 5–15, 2–11 mm long, 1.5–7 mm wide, elliptic to obovate, oblong, or oval, acute to obtuse or retuse, silvery strigose on both sides; peduncles 1.5–6.5 cm long; racemes 2- to 9-flowered, the flowers ascending at anthesis, the axis 2–6 mm long in fruit; bracts 0.6–2 mm long; pedicels 0.7–1.9 mm long; bracteoles 0–2; calyx 3–5.4 mm long, the tube 2–3.4 mm long, campanulate, strigose, the teeth 0.2–2.1 mm long, subulate; flowers 7–9.5 mm long, pink purple; pods ascending, sessile, bladdery-inflated, ovoid to subglobose, 15–33 mm long, 10–22 mm wide (when pressed), purple-mottled, strigulose, semibilocular; ovules 26–34. Ridge tops in shrub communities at 2400 to 3500 m in western Beaver, Kane, Millard, and Tooele counties; Nevada and California; 4 (i).

Astragalus praelongus Sheldon Stinking Milkvetch. Perennial, caulescent, 1–9 dm tall, from a branching caudex; pubescence basifixed; stems erect or ascending, forming clumps; stipules 2.5–9 mm long, all distinct; leaves 3–22 cm long; leaflets 7–33, 3–50 mm long, 2–24 mm wide, obovate, elliptic, oblong, lanceolate, or oblanceolate, obtuse or retuse to acute, sparingly strigose

long, all distinct; leaves 2–8 cm long; leaflets 5–15, 2–14 mm long, 1.5–5 mm wide, oblong to ovate, obovate, or elliptic, obtuse to retuse, mucronate, or acute, villosulous on both side; peduncles 1–3.5 cm long; racemes 3– to 12-flowered, the flowers spreading at anthesis, the axis 0.4–3.5 cm long in fruit; bracts 1–3 mm long; pedicels 0.5–2 mm long; bracteoles 0; calyx 4.8–6.3 mm long, the tube 2.8–4.2 mm long, campanulate, villosulous, the teeth 1.8–2.8 mm long, subulate; flowers 8.8–12.2 mm long, pink purple or ochroleucous and suffused with purple; pods spreading-declined, sessile, inflated, obliquely lance-ellipsoid, 12–20 mm long, 4–8 mm thick, shaggy-pilose, unilocular; ovules 9–18.

- Plants ascending to erect; flowers monochrome in populations *A. pubentissimus* var. *pubentissimus*
- Plants spreading-decumbent; flowers polychrome in populations *A. pubentissimus* var. *peabodianus*

Var. *peabodianus* (Jones) Welsh [*A. peabodianus* Jones, type from Thompson Springs, Grand County]. The Peabody phase of the Green River milkvetch occurs in entrenched channels cut into the escarpments draining the south and west flanks of the Tavaputs Plateaus, in pinyon-juniper and mixed desert shrub communities at 1300 to 1770 m in Emery and Grand (type from Thompson's Springs) counties; endemic; 10 (ix).

Var. *pubentissimus* The Green River milkvetch occurs in pinyon-juniper and mixed desert shrub communities at 1525 to 1925 m in Duchesne and Uintah counties; Wyoming and Colorado; 37 (iv). Reports of livestock poisoning, mainly of sheep, are attributable to this species. In years when it is abundant, the plants constitute the principle forb in much of the lower middle reaches of the Uinta Basin, reminiscent of seeded alfalfa fields among the open juniper-pinyon woodlands.

***Astragalus purshii* Dougl. ex Hook.** Pursh Milkvetch. Perennial, acaulescent or subacaulescent, 4.5–13 cm tall, from thatch-clothed caudex branches; pubescence basifixed; stems 0–2 cm long; leaflets 5–17, 2–14 mm long, 1–7 mm wide, elliptic to oblanceolate, acute, densely villous on both sides; peduncles 1.5–10.5 cm long; racemes 1– to 7-flowered, the flowers ascending at anthesis, the axis 0.3–2 cm long in fruit; bracts 2–7 mm long; pedicels 1–5 mm long; bracteoles 0; calyx 12–16 mm long, the tube 8.5–12.5 mm long, cylindrical, villous-pilose, the teeth 2.2–6 mm long, subulate; flowers 19–26 mm long, whitish to ochroleucous or pink purple; pods ascending, sessile, obliquely ovoid, usually curved, 13–26 mm long, 5–11 mm wide, shaggy villous, unilocular; ovules 20–34; $2n = 22$. Two varieties are present in Utah.

- Flowers whitish or ochroleucous, discolored, the keel purple-tipped; plants of broad distribution in northernmost counties *A. purshii* var. *purshii*
- Flowers pink purple, concolorous; plants rare in Box Elder and Rich counties *A. purshii* var. *glareosus*

Var. *glareosus* (Dougl.) Barneby [*A. glareosus* Dougl. ex Hook.; *Tragacantha glareosa* (Dougl.) Kuntze; *A. inflexus* var. *glareosus* (Dougl.) Jones; *Phaca glareosa* (Dougl.) Piper; *Xylophacos glareosus* (Dougl.) Rydb.]. Sagebrush community at 1530 to 1830 m in Box Elder and Rich counties; British Columbia, south to Nevada; 2 (0). This variety simulates *A. utahensis* (q.v.) both in having

pink purple flowers and in habit. Leaflet shape and flower structure are important diagnostic features.

Var. *purshii* [Tragacantha purshii (Dougl.) Kuntze; Phaca purshii (Dougl.) Piper; Xylophacos purshii (Dougl.) Rydb.; A. purshii var. interior Jones]. Sagebrush, desert shrub, and pinyon-juniper communities at 1530 to 2270 m in Box Elder, Daggett, Duchesne, Rich, Summit, and Uintah counties; Washington to Alberta and Saskatchewan, south to California, Nevada, Colorado, and South Dakota; 59 (vii).

***Astragalus racemosus* Pursh** Alkali Milkvetch. Perennial, caulescent, 20–53 cm tall, from a branching caudex; pubescence basifixed; stems erect or ascending, forming clumps; stipules 3–8 mm long, at least some connate-sheathing; leaves 4–15 cm long; leaflets 9–19, 3–35 mm long, 1.5–13 mm wide, lance-elliptic to linear-lanceolate, acute to acuminate, glabrous or glabrate on both surfaces, sometimes ciliate; peduncles 3–13 mm long; racemes 9– to 45-flowered, the flowers nodding at anthesis, the axis 5–20 cm long in fruit; bracts 1.5–7.5 mm long; pedicels 2–8 mm long; bracteoles 0–2; calyx 8.6–12 mm long, the tube 5–6 mm long, short-cylindric, gibbous, glabrous or sparingly strigose, the teeth 3.3–6 mm long, subulate; flowers 14–17 mm long, ochroleucous, concolorous, or with the keel purple-tipped; pods pendulous, stipitate, the stipe 4–6 mm long, the oblong-ellipsoid body 10–21 mm long, 4–8 mm wide, triquetrous, glabrous, unilocular; ovules 12–22; $2n = 24$. Uinta and Duchesne River formations, rarely otherwise on saline clay and silty soils, in salt desert shrub and pinyon-juniper communities at 1570 to 1970 m in Duchesne and Uintah counties; Wyoming; 48 (vi). Our plants belong to var. *treleasei* C. L. Porter. They are primary selenium indicators. Consumption by cattle of this and other selenophytes results in "alkali disease," or "blind staggers." Plants from along Hill Creek in Uintah County have concolorous flowers; those from elsewhere are discolored.

***Astragalus rafaensis* Jones** San Rafael Milkvetch. [*Cnemidophacos rafaensis* (Jones) Rydb.]. Perennial, caulescent, rushlike, 32–65 cm tall, from a branching caudex; pubescence basifixed; stems erect or ascending, arranged in clumps; stipules 1–5 mm long, at least some connate-sheathing; leaves 2.5–14.8 cm long, all simple or some with leaflets 3–5, the lateral ones 3–20 mm long, 0.5–1.5 mm wide, linear to oblong, acute, glabrate beneath, glabrous above, the terminal leaflet longer and confluent with the rachis; peduncles 11–27 cm long; racemes loosely 5-flowered, the flowers ascending to declined in anthesis, the axis 2–5 cm long in fruit; bracts 1.2–3.5 mm long; pedicels 2–5.5 mm long; bracteoles 2; calyx 6–9.6 mm long, the tube 5.2–7.5 mm long, short-cylindric, thinly strigose to glabrate, the teeth (0.8) 1.1–2.1 mm long, triangular; flowers 19–26 mm long, pale pinkpurple or bicolored; pods deflexed, sessile, oblong-elliptic in outline, 12–25 mm long, 5–7 mm wide, laterally compressed, glabrous, leathery-woody, unilocular; ovules 18–20; $2n = 22$. Seliniferous clays and silts of the Buckhorn Conglomerate, Morrison, Summerville, Chinle, and Moenkopi formations at 1370 to 1625 m in salt desert shrub community in Emery and Grand Counties; near Gateway, Colorado; a Navajo Basin endemic; 19 (vii). There are two main populations in Emery County; one at the east base of Cedar Mountain (type locality) and the other in the vicinity of Window-blind Butte in the San Rafael Swell proper. This is a handsome selenophyte,

with close affinities to *A. toanus* and *A. saurinus* in Utah and *A. linifolius* in Colorado, especially the latter. It has lesser affinities to *A. woodruffii* (q.v.).

***Astragalus robbinsii* (Oakes) Gray** Robbins Milkvetch. [*Phaca robbinsii* Oakes]. Perennial, caulescent, 10–40 (60) cm long, from a branching caudex; pubescence basifixed; stems erect to ascending; stipules 1.5–6 mm long, at least some of the lower ones usually connate-sheathing; leaves 2–12 cm long; leaflets (7) 9–15, 7–32 mm long, 4–8 mm broad, lanceolate to oblong, obtuse or emarginate, strigulose beneath, glabrous or glabrate above; peduncles 3.5–19 cm long; racemes 5– to 25-flowered, the flowers declined at anthesis, the axis 3–18 cm long in fruit; bracts 1–3.5 mm long; pedicels 0.5–3 mm long; bracteoles usually 0; calyx 4–6.8 mm long, the tube 3.2–4.5 mm long, campanulate, strigulose, the teeth 0.7–2.3 mm long, subulate; flowers 7.2–11.5 mm long, purple or whitish; pods pendulous, stipitate, the stipe 1.5–6.5 mm long, the body ellipsoid, 13–25 mm long, 3.5–5.5 mm thick, obtusely trigonous, flattened dorsally, the valves loosely strigulose with black and white hairs, the septum 0.2–1.5 mm wide; ovules 6–10. With willows at 2730 m on the north slope of Uinta Mountains, Summit County, Alaska east to Newfoundland, south to Oregon, Nevada, Colorado, and Vermont; 2 (0). A specimen taken in 1914 was previously identified tentatively as *A. eucosmus* B. Robins. A second collection, by Sherel Goodrich in 1984 (BRY) at the site of the earlier discovery removes doubt as to the determination.

***Astragalus sabulosus* Gray** Gravel Milkvetch. [*Phaca sabulosum* (Gray) Rydb.; *A. virgineus* Sheldon]. Annual, winter annual, or biennial, caulescent, 4–30 cm tall, radiating from a taproot; pubescence basifixed; stems decumbent to ascending, rarely erect; stipules 1–4 mm long, all distinct; leaves 1.5–7 cm long; leaflets 9–15, 2–13 mm long, 1–5 mm wide, oblanceolate to oblong or obovate, retuse to truncate or obtuse, loosely villous on both surfaces or glabrate above; peduncles 0.5–4 cm long; racemes 2– to 7-flowered, the flowers ascending-spreading at anthesis, the axis 0.3–2 cm long in fruit; bracts 1–2.5 mm long; pedicels 0.8–2 mm long; bracteoles 0; calyx 3.8–5.5 mm long, the tube 1.8–2.5 mm long, campanulate, hirsutulous, the teeth 1.8–3 mm long, subulate; flowers 6.2–8 mm long, pink purple or less commonly ochroleucous and tinged with purple; pods spreading-declined, sessile, obliquely ovoid, inflated, 9–17 mm long, 5–8 mm thick, curved, white-hirsutulous, unilocular; ovules 10–19; 2n = 22, 24. Mixed desert shrub, salt desert shrub, and lower pinyon-juniper communities at 1130 to 1700 m in Emery, Garfield, Grand, Kane, San Juan, and Wayne counties; California, Nevada, Arizona, and New Mexico; 36 (xv).

***Astragalus sabulosus* Jones** Cisco Milkvetch. [*Jonesiella sabulosa* (Jones) Rydb.]. Perennial, caulescent, 13–38 cm tall, from a woody caudex; pubescence basifixed; stems decumbent to ascending or erect, forming clumps; stipules 4–9 mm long, all distinct; leaves 3–10.5 cm long; leaflets 5–11, 6–35 (50) mm long, 3–17 mm wide, rhombic-oval to obovate or elliptic, mucronate, strigose to glabrous on both sides; peduncles 3.5–7 cm long; racemes 4– to 10-flowered, the flowers ascending-spreading at anthesis, the axis 0.5–2 cm long in fruit; bracts 2–6 mm long; pedicels 2–5 mm long; bracteoles 0–2; calyx 15–17.5 mm long, the tube 11.5–14 mm long, cylindrical, strigulose, the teeth 3–4 mm long, subulate;

flowers 27–34 mm long, whitish to ochroleucous, fading yellowish; pods spreading to declined, subsessile, inflated, cylindrical, 20–48 mm long, 10–15 mm thick, stiffly papery to leathery, strigose, unilocular; ovules 55–59; 2n = 26. Salt desert shrub at 1300 to 1600 m on Mancos Shale and Morrison formations in the Grand River Valley, Grand (type from Cisco) County; endemic; 16 (ix). The Cisco milkvetch is a primary selenium indicator, with close affinities to *A. iselyi* (q.v.), from which it can be distinguished by its larger yellowish flowers. The Cisco milkvetch is also allied with *A. praelongus*, which has much smaller flowers and pods. The flowers of *A. sabulosus* are the largest within *Astragalus* in Utah, and possibly elsewhere (though they are not the longest).

***Astragalus saurinus* Barneby** Dinosaur Milkvetch. Perennial, caulescent, rushlike, 25–45 cm tall, from a shallowly subterranean caudex; pubescence basifixed; stems erect or ascending, arranged in clumps; stipules 1.2–7 mm long, usually at least some shortly connate-sheathing; leaves 2.5–9 cm long, the uppermost usually simple, the others with leaflets 3–9, mostly 10–28 mm long, 0.5–2 mm wide, linear to linear-elliptic, obtuse to acute, strigose on both surfaces, the terminal leaflet confluent with the rachis; peduncles 7–21 cm long; racemes 3– to 15-flowered, the flowers ascending-spreading at anthesis, the axis 0.5–6 cm long in fruit; bracts 1.2–2 mm long; pedicels 1.5–3 mm long; bracteoles 1–2; calyx 6.4–9.6 mm long, the tube 5.6–6.7 mm long, cylindrical, the teeth 0.9–2.9 mm long, triangular-subulate; flowers 18–22 mm long, bicolorous, pink purple, with white wing-tips, rarely all white; pods deflexed, sessile or nearly so, narrowly oblong in outline, straight or curved, 15–35 mm long, 4.4–6 mm wide, laterally compressed, strigose to glabrate, unilocular; ovules 19–29; 2n = 22. Duchesne River, Morrison, Carmel, Chinle, and Moenkopi formations in salt desert shrub and pinyon-juniper communities at 1430 to 1700 m in Uintah (type from 6 mi N of Jensen) County; endemic; 42 (xiii). This is a remarkably beautiful plant on the seleniferous substrates in Dinosaur National Monument.

***Astragalus scopulorum* T. C. Porter** Rocky Mountain Milkvetch. [*Tragacantha scopulorum* (T. C. Porter) Kuntze; *Tium scopulorum* (T. C. Porter) Rydb.]. Perennial, caulescent, 15–48 cm tall, from a shallowly subterranean caudex; pubescence basifixed; stems decumbent to ascending, radiating from the caudex; stipules 3–9 mm long, at least some connate-sheathing; leaves 1.5–8.5 cm long; leaflets 15–29, 2–18 mm long, 1–8 mm wide, oblong to elliptic or oblanceolate, some narrowly so, acute to obtuse or mucronate, thinly strigose to glabrous beneath, glabrous above, thinly ciliate; peduncles 2–14 cm long; racemes 4– to 22-flowered, the flowers declined to nodding at anthesis, the axis 1–7 cm long in fruit; bracts 1.5–7 mm long; pedicels 1–4 mm long; bracteoles 0–2; calyx 9–11.5 mm long, the tube 6.8–8.5 mm long, subcylindrical, strigulose, the teeth 1.5–3.5 mm long; flowers 18–24 mm long, ochroleucous, concolorous or the keel faintly purplish; pods pendulous, stipitate, the stipe 4–9 mm long, the body oblong, straight or curved, 18–35 mm long, 3–6.5 mm wide, triquetrous, glabrous, bilocular; 2n = 22. Mountain brush, sagebrush, ponderosa pine, pinyon-juniper, and aspen-white fir communities at 1670 to 2430 m in Carbon, Grand, eastern Juab, Millard, San Juan, Sanpete, Sevier, Summit, Utah, and Wasatch counties; Colorado, Arizona, and New Mexico; 41 (xii). The previous report of *A. adanus* A. Nels. for Utah belongs here.

Astragalus serpens Jones Plateau Milkvetch. [*Phaca serpens* (Jones) Rydb.]. Perennial, caulescent, 3.5–23 cm long, radiating from a weak caudex; pubescence basifixed; stems ascending to erect; stipules 1.5–3.5 mm long, all distinct; leaves 1.5–4.5 cm long; leaflets 9–15, 2–9 mm long, 1–4 mm wide, obovate to oblanceolate or elliptic, obtuse to emarginate, strigose-pilosulous beneath and above, or glabrate above; peduncles 0.7–2.5 cm long; racemes shortly 2- to 9-flowered, the flowers spreading at anthesis, the axis 0.2–0.8 cm long in fruit; bracts 1–1.5 mm long; pedicels 1–1.8 mm long; bracteoles 0; calyx 4.2–5 mm long, the tube 2.7–3.5 mm long, campanulate, white strigulose (some black hairs sometimes present), the teeth 1.5–2 mm long, subulate; flowers 6.6–8.6 mm long, purplish to pink purple or whitish; pods ascending to declined, stipitate, the stipe (gynophore) 0.7–1.5 mm long, the body bladderly-inflated, ovoid or ellipsoid, 13–29 mm long, 7–17 mm wide (when pressed), red mottled, strigose, unilocular. Sagebrush, pinyon-juniper, aspen, and aspen-fir communities at 2070 to 2780 m in eastern Piute, southeastern Sevier, and western Wayne (type from Loa Pass) counties; endemic; 11 (v). The closely similar *A. perianus* (q.v.) is distinguished by its prostrate habit, sessile or stipitate pods, subterranean root crown, and connate stipules. In some years *A. serpens* is abundant in the Loa Pass vicinity, where it occupies interspaces in low sagebrush on igneous gravel.

Astragalus sesquiflorus Wats. Sandstone Milkvetch. [*Tragacantha sesquiflora* (Wats.) Kuntze; *Batidophaca sesquiflora* (Wats.) Rydb.; *A. sesquiflorus* var. *brevipes* Barneby]. Perennial, caulescent, prostrate, often mat-forming, 0.5–5 cm tall, radiating from a branching caudex; pubescence malpighian; stems 5–28 cm long or more; stipules 1.5–4.5 mm long, all connate-sheathing; leaves 1–4 cm long; leaflets 7–13, 1.5–10 mm long, 0.6–2 mm wide, elliptic to obovate, acute to obtuse, strigose on both sides (commonly involute); peduncles 0.8–4.5 cm long; racemes 1- to 4-flowered, the flowers ascending at anthesis, the axis very short in fruit; bracts 1.2–3 mm long; pedicels 0.7–4 mm long; bracteoles 0–2; calyx 3.7–5.5 mm long, the tube 1.5–2.8 mm long, campanulate, strigulose, the teeth 1.9–3 mm long, subulate; flowers 6–8 mm long, pinkpurple; pods spreading-ascending, sessile or subsessile, the body obliquely oblong in outline, 8–10 mm long, 3–4 mm wide, trigonously compressed, strigulose, unilocular; ovules 7–10. Sandy sites, often on sandstone in sagebrush, mixed desert shrub, pinyon-juniper, and ponderosa pine or aspen communities at 1470 to 2930 m in Garfield, Kane (type from near Kanab), San Juan, Wayne, and disjunctly (accidentally?) in Sanpete counties; Colorado and Arizona; a Mohave-San Juan endemic; 28 (vii). The sandstone milkvetch is more closely allied to *A. humistratus* than to other species of milkvetch in Utah.

Astragalus spatulatus Sheldon Draba Milkvetch. [*Homalobus caespitosus* Nutt.; *A. caespitosus* (Nutt.) Gray, not Pallas; *Tragacantha caespitosa* (Nutt.) Kuntze; *A. simplicifolius* var. *spatulatus* (Sheldon) Jones; *H. canescens* Nutt. ex T. & G.; *H. brachycarpus* Nutt. ex T. & G.; *A. simplex* Tidestr., not *A. brachycarpus* Bieb.; *A. spatulatus* var. *simplex* Tidestr.; *H. uniflorus* Rydb.; *A. spatulatus* var. *uniflorus* (Rydb.) Barneby]. Perennial, acaulescent, 1.5–9 (12) cm tall, from a branching caudex; pubescence malpighian; stems obscured by marcescent leaf bases and stipules, tufted, sometimes mat-forming; stipules 2–7 mm long, all connate-sheathing; leaves all or

mostly simple (reduced to phyllodia), 0.8–10 cm long, only rarely with leaflets 3–5 on some leaves and with the terminal one confluent with the rachis, oblanceolate to linear, acute, mucronate, or spinulose, strigose on both surfaces; peduncles 0.4–9 cm long; racemes 1- to 11-flowered, the flowers ascending at anthesis, the axis 0.2–3 cm long in fruit; bracts 0.6–3 mm long; calyx 2.6–5 mm long, the tube 1.9–3.4 mm long, campanulate, strigose, the teeth 0.5–2.5 mm long, subulate; flowers 5.7–9.5 mm long, pink purplish to ochroleucous or whitish (in populations); pods erect, sessile, lanceolate to lance-oblong in outline, 4–13 mm long, 1.5–3 mm wide, strict or slightly curved, strigose to rarely glabrous, unilocular; ovules 4–12; $2n = 24$. Pinyon-juniper, sagebrush, and mountain brush communities, often on exposed ridges, at 1530 to 2630 m in Cache, Carbon, Daggett, Duchesne, Emery, Grand, Rich, Summit, Uintah, and Wasatch counties; Alberta and Saskatchewan, south to Idaho, Colorado, and Nebraska; 106 (xix). The draba milkvetch is most nearly allied to *A. detritalis* and *A. chloodes*, among our species.

Astragalus straturensis Jones Silver Reef Milkvetch. [*Atelophragma straturense* (Jones) Rydb.; *Hamosa atratifor-mis* Rydb., type from Washington County; *Tium atratiforme* (Rydb.) Rydb.]. Perennial, caulescent, 13–36 cm tall, from a superficial to shallowly subterranean caudex; pubescence basifixed; stems decumbent to ascending or erect, forming clumps; stipules 1–2.5 mm long, all distinct; leaves 3.5–9.5 cm long; leaflets 9–19, 3–13 mm long, 1–5 mm wide, oblong to linear or oval, obtuse to retuse, strigose beneath, glabrous above; peduncles 1.5–7.5 cm long; racemes 9- to 25-flowered, the flowers ascending to declined at anthesis, the axis 1.5–14 cm long in fruit; bracts 0.8–1.5 mm long; pedicels 0.8–1.5 mm long; bracteoles 0; calyx 3.5–4.2 mm long, the tube 2.5–3.5 mm long, campanulate, strigose, the teeth 0.7–1 mm long, triangular; flowers 6.5–8.5 mm long, pink purple with white wing-tips; pods pendulous, stipitate, the stipe 1.4–2 mm long, the body oblong in outline, curved or straight, 10–15 mm long, 2.2–3 mm wide, strigose, bilocular; ovules 10–13; $n = 11$. Sagebrush, pinyon-juniper, and mountain brush communities at 1530 to 2130 m in Beaver, Iron, southeastern Millard, and Washington (type from Silver Reef) counties; Arizona and Nevada; 15 (iv). The Silver Reef milkvetch has no close relatives in the milkvetch flora of Utah. In flower size and general habit, it resembles *A. wingatanus* of southeastern Utah, but the resemblance is only superficial.

Astragalus striatiflorus Jones Escarpment Milkvetch. Perennial, subcaulescent to short-caulescent, 1.5–6 cm tall, radiating from a branching, usually subterranean caudex; pubescence basifixed; stems 0–5 cm long, only the tips produced above the sand; stipules 2–4 mm long, all connate-sheathing; leaves 1–4 cm long; leaflets 5–13, 1–7 mm long, 0.8–2.5 mm wide, ovate to obovate or oblanceolate, obtuse, mucronate, or emarginate, pilosulous; peduncles 1–3 cm long; racemes 2- to 5-flowered, the flowers ascending at anthesis, the axis 0.2–1 cm long; pedicels 1–1.5 mm long; bracteoles 0; calyx 5.5–7 mm long, the tube 3–4 mm long, campanulate, hirsutulous, the teeth 1.8–3 mm long, subulate; flowers 9–12 mm long, pinkpurple or whitish and commonly suffused with purple, the keel-tip purple, long-attenuated, with the capitate stigma protruding; pods spreading, sessile, the body bladderly-inflated, ellipsoid, 12–18 mm long, 8–15

mm wide (when pressed), mottled, spreading-hairy, bilocular. Interdune valleys, sandy depressions on ledges, and bars and terraces in stream channels at 1530 to 1900 m in Kane (from the Paria River westward) and eastern Washington (type from Springdale) counties; Coconino County, Arizona; a Plateau endemic; 14 (vi). The escarpment milkvetch is a singular plant, resembling *A. perianus* more closely than any other in Utah. The attenuated keel-tip, protruding stigma, and inflated, bilocular pods are both unusual and diagnostic features.

Astragalus subcinereus Gray Silver Milkvetch. [*Phaca subcinerea* (Gray) Rydb.; *A. sileranus* Jones, type from Sink Valley (near Alton); *Phaca silerana* (Jones) Rydb.; *A. sileranus* var. *caraiacus* Jones, type from Elk Head Ranch on the upper Virgin River]. Perennial, caulescent, 14–90 cm long, radiating from a subterranean, branching caudex; pubescence basifixed; stems prostrate to weakly ascending; stipules 1.5–6.5 mm long, at least some connate-sheathing; leaves 1.5–8.5 cm long; leaflets 9–23, 2–16 mm long, 1–8.5 (10) mm wide, oblong to oblanceolate or obovate, obtuse, emarginate, or retuse, villosulous on both surfaces or glabrate above; peduncles 1.5–10 cm long; racemes 5– to 37-flowered, the flowers ascending to declined at anthesis, the axis 1–7 cm long in fruit; bracts 1–3 mm long; pedicels 0.5–2.5 mm long; bracteoles 0–1; calyx 3.4–6.3 mm long, the tube 2.3–3.6 mm long, campanulate, villosulous, the teeth 0.9–2.9 mm long, subulate; flowers 6–11 mm long, ochroleucous and commonly suffused with purple; pods spreading to declined, subsessile, inflated, ovoid-ellipsoid to ellipsoid, 12–27 mm long, (3.5) 6–13 mm wide (when pressed), subterete to dorsiventrally compressed, thinly villosulous, mottled; ovules 10–20. Much of the material from Kane, Garfield, and Washington counties differs from the typical plants in Mohave County, Arizona in being more leafy (the leaflets 4–10 mm broad), in having longer stems (3–7 dm long), and in having more firmly walled pods 15–28 mm long, and 6–10 (13) mm thick. These Utah plants belong, sens. str., to var. *caraiacus* Jones, but the features are weak and overlapping at best. Two varieties are treated:

1. Mature pods elliptic-oblong to oblong, 3.5–5.5 mm wide; flowers 8.5–11 mm long; stems 40–90 cm long; plants of igneous gravels in eastern Sevier and western Emery counties *A. subcinereus* var. *basalticus*
- Mature pods ovoid-ellipsoid, 6–13 mm wide; flowers 6–9 mm long; stems mostly 14–70 cm long; plants commonly of sedimentary gravels, sometimes from igneous substrates, but not in Emery or Sevier counties
..... *A. subcinereus* var. *subcinereus*

Var. *basalticus* Welsh Pinyon-juniper and ponderosa pine communities at 1360 to 2430 m in western Emery and eastern Sevier (type from 10 mi S of Fremont Junction) counties; endemic; 7 (v). Specimens of var. *basalticus* grow sympatrically with *A. flexuosus* var. *diehlii*. When material of the latter variety is robust, it approaches var. *basalticus* in habit, but not in pod and flower size. Indicated, however, is a close alignment between the two taxa, and var. *basalticus* could as well be treated within an expanded *A. flexuosus* or var. *diehlii* within *A. subcinereus*.

Var. *subcinereus* Ponderosa pine, pinyon-juniper, and sagebrush communities at 1670 to 2270 m in Garfield, Iron, Kane, and Washington counties; Lincoln County,

Nevada; Mohave and Coconino counties, Arizona; 18 (ii). The type is from southern Utah or northern Arizona.

Astragalus tenellus Pursh Pulse Milkvetch. [*Ervum multiflorum* Pursh; *Homalobus multiflorus* (Pursh) Nutt. ex T. & G.; *A. multiflorus* (Pursh) Gray; *Tragacantha multiflora* (Pursh) Kuntze; *H. tenellus* (Pursh) Britt. in Britt. & Br.; *H. strigulosus* Rydb.; *A. tenellus* f. *strigulosus* (Rydb.) Macbr.; *A. tenellus* var. *strigulosus* (Rydb.) F. Hermann]. Perennial, caulescent, 10–52 cm tall, from a branching caudex; pubescence basifixed; stems erect or ascending, or less commonly decumbent; forming clumps; stipules 1.5–7 mm long, turning black in drying, at least some connate-sheathing; leaves 2–9 cm long; leaflets 11–21, 3–24 mm long, 0.4–6 mm wide, narrowly oblong to elliptic, linear, oblanceolate, or obovate, acute to obtuse, mucronate, or emarginate, thinly strigose beneath, glabrous above; peduncles 0.2–4 cm long, often paired; racemes (1) 3– to 23-flowered, the flowers ascending at anthesis, the axis 0.5–11 cm long in fruit; bracts 0.5–2.7 mm long; pedicels 0.7–3.2 mm long; bracteoles 0–2; calyx 2.6–5.2 mm long, the tube 2–2.7 mm long, campanulate, strigose, the teeth 0.7–2.5 mm long; flowers 6–9 mm long, white to ochroleucous; pods pendulous, stipitate, the stipe 0.6–5.5 mm long, the body elliptic to oblong in outline, straight or curved, 7–16 mm long, 2.5–4.5 mm wide, laterally flattened, glabrous or less commonly strigose, unilocular; ovules 3–9; 2n = 16, 24. Mountain brush, sagebrush, pinyon-juniper, ponderosa pine, aspen-fir, and spruce-fir communities at 1670 to 2900 m in Box Elder, Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Millard, Piute, Sanpete, Sevier, Summit, Uintah, Utah, Wasatch, and Wayne counties; Yukon east to northern Manitoba, south to Nevada, New Mexico, Nebraska, and Minnesota; 147 (xxx).

Astragalus tephrodes Gray Ashen Milkvetch. Perennial, acaulescent to short-caulescent, 5–15 cm tall, from a branching, typically spreading caudex; pubescence basifixed; stems 0–15 cm long, the internodes often obscured by stipules; stipules 2–11 mm long, all distinct or rarely some shortly connate-sheathing; leaves 4–16 cm long; leaflets 11–31, 3–17 mm long, 2–11 mm broad, obovate to oblanceolate, elliptic, or orbicular, obtuse, acute, or emarginate, strigulose to pilosulous on both sides or glabrous above; peduncles 4–15 cm long; racemes 10– to 25-flowered, the flowers ascending at anthesis, the axis 1.5–8 cm long in fruit; bracts 1.5–9 mm long; pedicels 0.6–3.4 mm long; bracteoles 0; calyx 8.8–12.7 mm long, the tube 7.1–10 mm long, cylindric, pilosulous, the teeth 1.7–2.8 mm long, subulate; flowers 15–24 mm long, pink purple; pods ascending, ellipsoid to lance-ellipsoid, 17–30 mm long, 6–10 mm thick, strigulose to pilosulous, unilocular; ovules 24–35; 2n = 22. Mountain brush community at 2000 to 2500 m in Washington County; California, Arizona, and New Mexico; 6 (j). Our material belongs to the highly variable var. *brachylobus* (Gray) Barney [*A. shortianus* var. *brachylobus* Gray; *Xylophacos brachylobus* (Gray) Rydb.; *A. curtislobus* Tidestr., not *A. brachylobus* DC.].

Astragalus tetrapterus Gray Four-wing Milkvetch. [*Pterophacos tetrapterus* (Gray) Rydb.]. Perennial, caulescent, 10–35 cm tall, from a subterranean caudex; pubescence basifixed; stems erect or ascending or finally decumbent; stipules 2–5.5 mm long, all distinct; leaves 1.5–8.5 cm long; leaflets 9–23, 1–33 mm long, 0.3–3.2

mm wide, linear, narrowly oblong, or elliptic, obtuse to acute, strigose to glabrous on both sides, at least some terminal leaflets confluent with the rachis in the uppermost leaves; peduncles 1–6.5 cm long; racemes 6– to 15-flowered, the flowers ascending at anthesis, the axis 1–4 cm long in fruit; bracts 1.5–3.5 mm long; pedicels 1.4–4.3 mm long; bracteoles 0–2; calyx 5.5–8.7 mm long, the tube 4.7–7 mm long, cylindrical, strigose, the teeth 0.8–2.8 mm long, subulate; flowers 15–19 mm long, white to yellowish and tinged faintly with pink, the keel faintly purple-tipped; pods pendulous, sessile, obliquely oblong in outline, curved or coiled, 20–40 mm long, 6–10 mm wide, succulent at first, ultimately (by collapse of fleshy walls), sharply 4-angled, glabrous or strigose, unilocular; ovules 28–38; $2n = 22$. Pinyon-juniper and sagebrush communities at 1030 to 2130 m in Beaver, Iron, Kane, and Washington (type from 25 miles north of St. George) counties; Oregon, Nevada, and Arizona; 20 (iv). The four-wing milkvetch has been reported to produce locoism in livestock, but it is seldom sufficiently abundant to produce serious, large-scale losses.

Astragalus toanus Jones Toano Milkvetch. [*Cnemidophacos toanus* (Jones) Rydb.]. Perennial, caulescent, rushlike, 15–50 cm tall, from shallowly subterranean to superficial caudex; pubescence basifixed; stems erect or ascending, in clumps; stipules 1.5–6.5 mm long, at least some connate-sheathing; leaves 2–10 cm long, the uppermost, rarely all, simple, or with the terminal leaflet confluent with the rachis, the lower ones with leaflets 3–9, 3–30 mm long, 1.4–2.5 mm wide, linear-filiform to oblong, obtuse to acute, strigose or glabrous on both sides; peduncles 6–25 cm long; racemes 7– to 35-flowered, the flowers ascending at anthesis, the axis 3–30 cm long in fruit; bracts 1–3 mm long; pedicels 0.8–3.5 mm long; bracteoles 0–2; calyx 4.6–8 mm long, the tube 4.1–6.4 mm long, short-cylindrical, strigose, the teeth 0.5–2 mm long, subulate; flowers 15–20 mm long, pink purple, with wing tips white; pods erect, sessile, oblong in outline, 13–25 mm long, 3.7–5.5 mm wide, slightly compressed laterally, glabrous to strigose, unilocular; ovules 14–26; $2n = 22$. Seleniferous clay soils in salt desert shrub communities at 1530 to 1770 m in Box Elder and Millard counties; Nevada, Oregon, and Idaho; 17 (i). This species has affinities with both *A. saurinus* of the Uinta Basin and *A. rafaensis* of the San Rafael Swell.

Astragalus uncialis Barneby Currant Milkvetch. Perennial, acaulescent, 1.5–7.5 cm tall, arising from a branching caudex, forming tufts; stems obscured by stipules, these 3–6.5 mm long, all distinct; pubescence basifixed; leaves 1.5–7.5 cm long; leaflets 3–5, 5–17 mm long, 2–6 mm wide, oblanceolate, elliptic, or narrowly obovate, acute to almost obtuse; peduncles 0.5–3.5 mm long, ascending at anthesis, prostrate in fruit; racemes 1– to 3-flowered, the flowers almost erect, the axis very short in fruit; bracts 1.5–3.5 mm long; pedicels 1.5–3 mm long; bracteoles 0–1; calyx 12–17 mm long, cylindrical, strigulose with white and sometimes with some black hairs, the tube 10.2–13 mm long, the teeth 1.8–3.5 mm long, subulate; flowers 24.5–32 mm long, pink purple or purple; pods ascending, obliquely lance-ellipsoid, 2–3 cm long, 8–12 mm thick, dorsiventrally compressed, the valves thinly fleshy, strigulose, becoming leathery, unilocular; ovules 38–54. Shadscale and budsage communities at 1400 to 1620 m in Millard County; Nye County, Nevada; a Great Basin endemic; 11 (ii). Long known only

from the vicinity of Currant, Nevada, the principal population of this distinctive species is apparently in Utah, north of Sevier (dry) Lake, Millard County, where it grows in an extensive shadscale-budsage community on ancient terraces of Lake Bonneville. The species is closely allied to *A. newberryi*.

Astragalus utahensis (Torr.) T. & G. Utah milkvetch. [*Phaca mollissima* var. *utahensis* Torr. in Stansbury, type from Stansbury Island; *Tragacantha utahensis* (Torr.) Kuntze; *Xylophacos utahensis* (Torr.) Rydb.]. Perennial, subcaulescent, mostly 2–12 cm tall, radiating from a branching caudex and more or less matforming; pubescence basifixed; stems 0–10 cm long, the internodes usually concealed by stipules; stipules 3–10 mm long, all distinct; leaves 1.5–12 cm long; leaflets 9–19, 2–15 mm long, 2–12 mm wide, obovate or suborbicular to ovate, obtuse to emarginate, rarely acute, densely villous-tomentose on both surfaces; peduncles 1–14 cm long; racemes 2– to 8-flowered, the flowers ascending at anthesis, the axis 0.4–2.6 cm long in fruit; bracts 4–9 mm long; pedicels 2–4.3 mm long; bracteoles 0–2; calyx 12–14 mm long, the tube 8.5–13 mm long, cylindrical, villous-tomentose, the teeth 2–4.5 mm long, lance-subulate; flowers 23–31 mm long, pink purple (rarely white); pods ascending, sessile or stipitate, the stipe (gynophore) 1–2.5 mm long, the body 17–30 mm long, 5.5–7.5 mm wide, obscured by long shaggy-villous hairs, unilocular; ovules 22–31; $2n = 22$. Sagebrush, pinyon-juniper, mountain brush, and grassland communities at 1250 to 2130 m in all Utah counties except Daggett, Emery, Grand, Iron, Kane, Rich, San Juan, and Uintah; Idaho and Nevada; 228 (xxi). The Utah milkvetch is known locally as “lady-slipper,” because of a fancied resemblance of the large flowers to softly cushiony house-slippers. The plants are abundant along the Wasatch front, where they flower in April and May, much to the delight of beginning students in taxonomy, each of whom feels compelled to collect at least one plant and deposit it in a herbarium.

Astragalus wardii Gray Ward Milkvetch. [*Phaca wardii* (Gray) Rydb.]. Perennial, caulescent, 9–50 cm tall, from a branching, superficial (rarely subterranean) caudex; pubescence basifixed; stems decumbent to erect; stipules 1–3 mm long, all distinct; leaves 3–10 cm long; leaflets 17–23, 3–11 mm long, 0.8–6 wide, oblanceolate to elliptic or narrowly oblong to linear, obtuse to retuse or emarginate, strigose only on the midrib beneath and on the margins; peduncles 1.5–5 cm long; racemes loosely 5– to 15-flowered, the flowers ascending to declined at anthesis, the axis 1–5 cm long in fruit; bracts 1–2.2 mm long; pedicels 1–3.4 mm long; bracteoles 0–2; calyx 2.9–4.6 mm long, the tube 1.7–2.3 mm long, campanulate, strigose with black, less commonly black mixed with white, hairs, the teeth 1–2.4 mm long, subulate; flowers 5–8 mm long, whitish or ochroleucous; pods pendulous to spreading, sessile or on a gynophore about as broad as long, bladderly-inflated, 15–28 mm long, 9–17 mm wide (when pressed), mottled or not, glabrous, unilocular; ovules 12–17. Sagebrush, cottonwood, pinyon-juniper, ponderosa pine, spruce-fir, and less commonly in grassland and salt desert shrub communities at 1530 to 2730 m in Beaver, Garfield, Kane, Piute, and Sevier counties; endemic; 32 (ix). The Ward milkvetch (type from the Aquarius Plateau) is similar in its inflated, unilocular pods, distinct stipules, and small flowers with the closely contiguous, if not sympatric, *A. serpens*, from which it

can be distinguished by the more numerous leaflets, predominately black strigose calyces, and glabrous pods. The presence of an incipient gynophore in *A. wardii* strengthens the similarity between these distinctive species.

Astragalus welshii Barneby Welsh Milkvetch. [*A. loanus* Barneby, in part, but not as to type]. Perennial, acaulescent, 4–20 cm tall, the caudex branches clothed with a thatch of persistent leaf bases; pubescence incipiently malpighian; stipules 5–12 mm long, all distinct; leaves 3–20 cm long; leaflets 5–11, 6–25 mm long, 2–8 mm wide, lanceolate to elliptic or obovate, typically acute, densely strigose on both sides; peduncles 1.5–11 cm long, typically recurved at maturity; racemes 5– to 7-flowered, the flowers erect-ascending at anthesis, the axis 0.2–0.8 cm long in fruit; bracts 2.5–6 mm long; pedicels 1.2–4 mm long; bracteoles 0–2; calyx 11–14 mm long, the tube 8.5–11 mm long, cylindrical, loosely strigose, the teeth 1–3.5 mm long, linear-subulate; flowers 20–23 mm long, ochroleucous or greenish white, often tinged faintly purplish, the keel-tip purple; pods ascending (humistrate), sessile, inflated, ovoid, 17–23 mm long, 10–15 mm wide (when pressed), conspicuously beaked, the valves reddish to straw colored, hirsute with lustrous long hairs; unilocular; ovules 24–38. Sagebrush, pinyon-juniper and sagebrush-aspen communities, exclusively on igneous gravels at 2135 to 2810 m in western Garfield, eastern Iron, Piute (type from west of Loa Pass), and Wayne counties; endemic; 14 (v). The Welsh milkvetch has long masqueraded within the concept of *A. loanus* (q.v.), from which it differs in the more numerous, acute leaflets, smaller flowers and pods, and more robust size.

Astragalus wetherillii Jones Wetherill Milkvetch. [*Phaca wetherillii* (Jones) Rydb.]. Perennial, caulescent, 4–26 cm tall, from a branching caudex; pubescence basifixed; stems decumbent to ascending, forming clumps; stipules 1.2–3.5 mm long, all distinct; leaves 2–10 cm long; leaflets 7–15, 3–14 mm long, 2–9 mm wide, obovate to oval, obtuse to emarginate or mucronate, thinly strigose beneath, glabrous above; peduncles 1.5–4.5 cm long; racemes 2– to 9-flowered, the flowers ascending to declined at anthesis, the axis 0.3–2.3 mm long in fruit; bracts 1–2.5 mm long; pedicels 1–2.5 mm long; bracteoles 0; calyx 4.6–6.2 mm long, the tube 2.8–3.8 mm long, campanulate, strigose, the teeth 1.8–2.4 mm long, subulate; flowers 7.5–11 mm long, whitish or tinged lavender; pods spreading to declined or shortly stipitate, the stipe (gynophore) 2–2.5 mm long, the body inflated, ovoid-ellipsoid, slightly curved, 14–22 mm long, strigose, unilocular; ovules 9–13. Mountain brush and pinyon-juniper communities at 1430 to 1770 m in Grand County (collected by Eastwood according to Jones 1923); central western Colorado; 0 (0). The only Utah collection was taken from the canyon of the Colorado River east of Moab. It has not been recollected in many years, but likely it persists along the canyon slopes on the shaded side. It is a peculiar species, not quite like any other in Utah. The pods of early produced flowers are often mature and brown while progressively younger pods and flowers continue to be produced as the plants elongate. The species is locally common in the sandstone canyons east of Grand Junction, Colorado.

Astragalus wingatanus Wats. Fort Wingate Milkvetch. [*Homalobus wingatanus* (Wats.) Rydb.; *A. dodgeanus* Jones, type from Thompson's Springs; *A. wingatanus* var.

dodgeanus (Jones) Jones]. Perennial, caulescent, 15–45 (60) cm tall, from a subterranean caudex; pubescence basifixed; stems spreading-ascending, forming diffuse clumps; stipules 1.5–5 mm long, at least some connate-sheathing; leaves 1.5–6.5 cm long; leaflets 7–15 (17), 3–18 mm long, 0.4–3.6 mm wide, linear to narrowly oblong, elliptic, or oblanceolate, acute, obtuse, or retuse, strigose to glabrous beneath, glabrous above, often ciliate; peduncles 2–14 cm long; racemes very loosely 7– to 35-flowered, the flowers ascending at anthesis, the axis 3–8 cm long in fruit; bracts 0.5–2 mm long; pedicels 0.8–3 mm long; bracteoles 0–2; calyx 2.5–3.7 mm long, the tube 1.5–2.6 mm long, campanulate, strigose, the teeth 0.4–1.4 mm long, triangular-subulate; flowers 5.5–8 mm long, pink purple, the wing-tips white or pale; pods deflexed, subsessile or short-stipitate, the stipe to 1.7 mm long, the body elliptic to oblong in outline, straight or slightly curved, 9–15 mm long, 3–4.5 mm wide, compressed, glabrous, unilocular; ovules 4–8; $n = 11$. Pinyon-juniper, mixed desert shrub, salt desert shrub, and less commonly in mountain brush communities at 1530 to 2130 m in Carbon, Duchesne, Emery, Garfield, Grand, and San Juan counties; Colorado, New Mexico, and Arizona; 43 (xv). This species simulates *A. tenellus* (q.v.) in its small flowers and laterally flattened pods. The buried caudex and elongating fruiting racemes are diagnostic for *A. wingatanus*, and indicate relationships elsewhere (i.e., with scytocarpous taxa such as *A. flexuosus* var. *diehlii*).

Astragalus woodruffii Jones Woodruff Milkvetch. [*Homalobus woodruffii* (Jones) Rydb.]. Perennial, caulescent, rushlike, 25–55 (65) cm tall, from a deeply subterranean caudex; pubescence basifixed or incipiently malpighian; stems erect or ascending in broomlike clumps; stipules 10–25 mm long, at least some usually connate-sheathing; leaves 1.5–6.5 (8) cm long, at least the upper ones simple, the others with decurrent leaflets 2–9, 2–17 mm long, 0.5–2 mm wide, acute to obtuse, silvery strigose on both surfaces, the terminal leaflet decurrent also; peduncles 3.5–16 cm long; racemes 8– to 45-flowered, the flowers ascending at anthesis, the axis 2–25 cm long in fruit; bracts 2.5–7 mm long; pedicels 1–5 mm long; bracteoles 0–2; calyx 7.2–10.9 mm long, the tube 4.2–6.6 mm long, short-cylindrical, pilosulous, the teeth 2.7–6 mm long, lance-subulate; flowers 12–19 mm long, pink to red purple with pale or white wing tips; pods erect, sessile, oblong in outline, straight to slightly curved, 14–20 mm long, 2.5–4.8 mm wide, laterally compressed, strigose, unilocular. Seleniferous, sandy or sandy-silts with sandloving desert shrubs, mainly on the Entrada Formation, at 1330 to 1670 m in southeastern Emery (type from the San Rafael Swell), eastern Garfield and Wayne counties; endemic; 32 (vii). This handsome milkvetch has affinities with *A. rafaelensis*, *A. saurinus*, and *A. toanus*, but has been placed in its own section by Barneby (1964: 436). The species was described by Jones (1923: 78) as being "the most beautiful species of the genus when the whole mass is ablaze with pink-purple bloom." The plant is a primary selenium indicator.

Astragalus zionis Jones Zion Milkvetch. [*Xylophacos zionis* (Jones) Rydb.]. Perennial, subcaulescent or short-caulescent, 3–23 cm tall, from a branching caudex, this sometimes clothed with a persistent thatch of leaf bases; pubescence basifixed; stems 0–11 cm long, prostrate to ascending, the internodes often concealed by stipules,

these 1.5–5.5 mm long, all distinct or some shortly connate-sheathing; leaves mostly 2–15 cm long; leaflets 13–25, 2–16 mm long, 1–6 mm wide, elliptic or ovate, acute or less commonly obtuse, silvery villous on both sides; peduncles 0.5–15 cm long; racemes 1– to 11-flowered, the flowers ascending at anthesis, the axis 0.3–6 cm long in fruit; bracts 2–5 mm long; pedicels 1–3 mm long; bracteoles 0–2; calyx 8.3–18 mm long, the tube 6.5–12.7 mm long, cylindric, villous, the teeth 1.5–5.7 mm long, subulate; flowers 18–26 mm long, pink purple or sometimes pale; pods ascending, sessile, obliquely ovoid-oblong in outline, 15–30 mm long, 5.5–9 mm wide, usually curved, dorsiventrally compressed, strigose or villosulous, brightly mottled, usually unilocular; ovules 24–30; 2n = 22. On sandstone and in sandy and gravelly soils in mixed desert shrub, mountain brush, and riparian communities at 1340 to 2430 m in Garfield, Kane, San Juan, and Washington (type from Springdale) counties; Arizona; a Mohave-San Juan endemic; 46 (xiv).

Caesalpinia L.

Unarmed shrubs or perennial herbs, glandular-punctate in part; leaves alternate, bipinnate, petiolate, the pinnae bearing several leaflets; stipules small, persistent; flowers several to many, borne in racemes, the axis of the raceme densely glandular; calyx 5-lobed; corolla irregular; petals 5, conspicuous, the uppermost not enclosing the others in bud; stamens 10, long-exserted, brightly colored and showy, distinct; pistils sessile; pods flattened, dehiscent; x = 12.

- 1. Plants herbaceous, arising from prostrate rhizomes; leaves odd-pinnate, the pinnae 3–9, pedicels 2–5 mm long; flowers 6–12 mm long; known from eastern Utah *C. repens*
- Plants woody, 1–2.5 m tall, leaves even-pinnate, the pinnae 12–20 or more; flowers ca 2 cm long, with stamens 6–9 cm long; known from cultivation and established in Washington County *C. gilliesii*

Caesalpinia gilliesii (Wallich) Dietr. Poinciana; Bird-of-paradise. [*Poinciana gilliesii* Wallich ex Hook.; *Erythrostemon gilliesii* (Wallich) Klotzsch]. Shrubs, commonly (1) 1.5–2.5 m tall; leaves 15–28 cm long, with 8–12 pairs of pinnae, each with 7–11 pairs of elliptic to oblong leaflets 3–8 mm long, glabrous; petioles 2–4 cm long; flowers very showy; sepals distinct, 15–20 mm long, stipitate glandular and puberulent; petals yellow with orange markings, 20–35 mm long; staminal filaments red, 6–9 cm long; pods ascending, sessile, oblong in outline, 5.5–12 cm long, 14–20 mm wide, glandular-dotted, dehiscent. Cultivated ornamental of startling beauty, escaping and established at low elevation portions of Washington County; Texas to California, 7 (iii).

Caesalpinia repens Eastw. Creeping Rush-pea. [*Hoffmannseggia repens* (Eastw.) Cockerell; *Moparia repens* (Eastw.) Britt. & Rose]. Subcaulescent or shortly caulescent, 5–12.5 cm tall (above ground), from a deeply subterranean caudex, the branches below ground 3–15 cm long, pale; pubescence basifixed; leaves 2.5–9.5 cm long; pinnae 3–7 (9); leaflets 4–14, 3–12 mm long, 1–6 mm wide, asymmetrically obovate-elliptic to oblong, crowded, entire, villosulous; peduncles 1.2–6 cm long; racemes 7– to 26-flowered, the flowers spreading at anthesis, the axis 3–8 cm long in fruit; bracts 3–7 mm long, caducous; bracteoles 0; pedicels 2–7 mm long; calyx

8–10.5 mm long, the tube 2–4.5 mm long, campanulate, retrorsely villosulous, the teeth 6–8.5 mm long, oblong-lanceolate, villosulous; flowers opening flat or nearly so, the petals yellow, 10–12 mm long, red-spotted near the base, the whole fading pink orange; pods pendulous, oblong, 20–50 mm long, 10–20 mm wide, membranous, pilosulous. Sandy deserts with ephedra, Indian ricegrass, and other arenophilus plants at 1430 to 1670 m in Emery, Garfield, Grand, San Juan, and Wayne counties; Colorado; a Colorado Plateau endemic; 41 (vi). This is a striking plant in the light of early morning along the sandy stretches near Hanksville.

Caragana Fabr.

Shrubs; leaves alternate, even-pinnate, the rachis extended as a bristle or spine; stipules small and deciduous or persistent as spines; flowers solitary, yellow, showy; calyx campanulate or turbinate, obscurely to conspicuously 5-toothed; corolla papilionaceous; stamens 10, didelphous; ovary sessile; pods subcylindric, linear-oblong, straight, glabrous, elastically dehiscent, the valves coiling upon dehiscence.

Caragana arborescens Lam. Pea-tree. [*Robinia caragana* L.; *C. sibirica* Medicus; *C. inermis* Moench; *C. caragana* (L.) Karsten; *Aspalathus caragana* (L.) Kuntze]. Shrubs to 4 m tall or more; leaves 4–10 cm long; leaflets 8–12, 12–25 mm long, 5–15 mm wide, lance-oblong to elliptic or oval, cuspidate, villous above and below, becoming glabrate in age; stipules slender, occasionally persisting as spines; bracts reduced to rudiments at juncture of peduncle and pedicel; flowers 17–23 mm long, borne singly on peduncles 12–35 mm long, few to several from each bud; pedicels 5–15 mm long; calyx turbinate, pubescent, the tube 4.5–7.5 mm long, the teeth small or obsolete, the margin villous; pods ascending to declined, sessile, linear-oblong, straight, 35–55 mm long, 4–7 mm thick, glabrous, the valves drying brown; 2n = 16. Cultivated ornamental and erosion control plant in Kane, Millard, Salt Lake, Sanpete, Sevier, Summit, Uintah, and Utah counties; introduced from Siberia; 15 (ii).

Cercis L.

Small trees or shrubs; leaves alternate, simple, palmately veined, cordate-ovate or orbicular; stipules deciduous; flowers clustered, appearing before the leaves from spurs on old branches or cauliflorous, pink, showy; calyx turbinate-campanulate, shallowly 5-lobed; corolla irregular, the keel larger than the banner; stamens 10, distinct; ovary subsessile; pods short-stipitate, laterally flattened, the ventral suture somewhat winged, indehiscent or tardily dehiscent; x = 7.

- 1. Leaves ovate- or cordate-acuminate; flowers 9–12 mm long, plants cultivated, introduced *C. canadensis*
- Leaves cordate-reniform or broader than long, rounded or emarginate, not acuminate apically; flowers 12–14 mm long or more *C. occidentalis*

Cercis canadensis L. American Redbud; Judas Tree. Shrub or small tree, mostly 1.5–3 m tall, rarely more; leaves commonly ovate-cordate, truncate to cordate basally, acuminate to acute apically, 3.5–10 cm long, longer than broad to somewhat broader than long, glabrate to puberulent beneath; flowers appearing before

the leaves, clustered on spurs, cauliflorous; pedicels 6–10 mm long; calyx asymmetric, 2.5–3.5 mm long, 4.3–6.3 mm wide; corolla pink (pink purple), 9–12 mm long; keel petals 3.8–5 mm wide; pods pendulous-spreading, laterally flattened, 40–80 mm long, 8–18 mm wide, winged, the wings 0.8–2.1 mm wide, glabrous; $n = 7$. Cultivated ornamental at 1370 to 1570 m in Salt Lake and Utah counties, and undoubtedly elsewhere; introduced from the eastern U. S., where indigenous from Nebraska south to Texas, east to the Atlantic; 17 (ii). Our materials seem to belong to *var. canadensis*.

Cercis occidentalis Torr. ex Gray Western Redbud. Small tree or less commonly a shrub, mostly 1.5–3.5 m tall, rarely more; leaves cordate-reniform, cordate basally, rounded to emarginate apically, 2–7 cm long, commonly broader than long, glabrous or puberulent along vein axils beneath; flowers appearing before the leaves, clustered on spurs, cauliflorous; pedicels 8–12 mm long; calyx asymmetric, 3–4.5 mm long, 5.5–8 mm wide; corolla pink to pink purple, 12–15 mm long; keel petals 5.5–8 mm wide; pods short-stipitate, 4–10 cm long, 13–20 mm wide, winged, the wings 1.5–2.5 mm wide, glabrous. Indigenous, or rarely cultivated, at 770 to 1230 m in sandstone canyons and alcoves, often in hanging gardens, in Garfield, Kane, Salt Lake (in cultivation), San Juan, and Washington counties; California, Nevada, and Arizona; 41 (xii). Variation in *Cercis* has been summarized by Isely (1975). Our material was recognized by him as being distinctive as a population when compared to typical California specimens. Plants from Utah, Arizona, and Nevada clearly belong to *var. orbiculata* (Greene) Tidestr. in Tidestr. & Kittell [*C. orbiculata* Greene, type from Diamond Valley, Washington County].

Cladrastis Raf.

Unarmed trees; leaves alternate, odd-pinnately compound, petiolate; stipules lacking; axillary buds covered by the leaf base; flowers in panicles, white, showy; calyx turbinate-campanulate, 5-toothed, stamens 10, distinct or nearly so, included; ovary stipitate; pods pendulous with the panicles, oblong in outline, laterally flattened, often irregularly constricted (by abortion of the seeds), dehiscent.

Cladrastis kentukea (Dum.-Cours.) Rudd Yellowwood. [*Sophora kentukea* Dum.-Cours.; *Virgilia lutea* Michx.; *C. lutea* (Michx.) K. Koch; *C. tinctoria* Raf.]. Tree to 10 m tall, rarely more; bark smooth; wood yellow; leaves 15–32 cm long; leaflets 7–9 (11), 4–11 cm long, 2.3–7 cm wide, elliptic to ovate or obovate, acute to obtuse basally, acuminate to acute or obtuse apically, borne on petiolules, glabrous; panicles 20–40 cm long; flowers numerous, white, 15–25 mm long; calyx 8.5–9.5 mm long, villous, the rounded lobes 1.2–1.8 mm long, densely villous; pods stipitate, the stipe 4–6 mm long, usually shorter than the calyx, the body 55–80 mm long, 8–10 mm wide, flattened, glabrous; $2n = 28$. Cultivated ornamental tree of lower elevations in Cache, Salt Lake, and Utah counties; introduced from the eastern U. S.; 8 (0). This is a beautiful tree, worthy of being cultivated widely.

Colutea L.

Unarmed shrubs; leaves alternate, odd-pinnately compound, petiolate; stipules more or less persistent, papery; flowers in racemes, yellow, showy; calyx turbinate-campanulate, 5-toothed; petals papilionaceous; stamens di-

adelphous, 9 and 1; ovary stipitate, the style hirsute along the ventral margin; pods pendulous, bladderly-inflated, strigulose, the incurved style persistent.

Colutea arborescens L. Bladder-senna. Shrubs, 1.2–3.5 m tall, sometimes dying to the ground; herbage strigose; leaves 6–12 cm long; leaflets 9–13, 14–23 (30) mm long, 7.5–12.5 mm wide, obovate to oblanceolate or elliptic, rounded to emarginate, mucronate, strigose beneath, glabrous above, the veins apparent; racemes 4– to 11-flowered; pedicels 3.5–9 mm long; bracts 1.2–4.2 mm long; bracteoles 2; calyx 4.5–7.5 mm long, the tube 4.2–5.2 mm long, the teeth 1.2–2.2 mm long; flowers 16–22 mm long, yellow, the banner abruptly reflexed, the wings strongly angled upward, surpassed by the keel; pods stipitate, the stipe 6–10 mm long, the body bladderly-inflated, ellipsoid, 45–60 mm long (or more), 16–24 mm wide (when pressed), usually mottled, indehiscent; $2n = 16$. Cultivated, mainly as an ornamental, in Salt Lake and Utah counties, but recently it has been used in erosion control plantings, especially on clay roadsides in Juab and Sanpete counties at elevations of 1670 to 2500 m; introduced from Europe and Africa; 8 (i).

Coronilla L.

Perennial herbs, caulescent, from a taproot and caudex; leaves alternate, pinnately compound; stipules herbaceous, becoming chartaceous; flowers papilionaceous, in axillary, pedunculate umbels; bracts minute, scarious; calyx 5-toothed; petals 5, pink or white, the keel long-attenuate; stamens 10, diadelphous; ovary enclosed in the staminal sheath, the style glabrous; fruit a loment, 4-angled.

Coronilla varia L. Crown-vetch. Perennial, 3–10.5 dm tall, with spreading stems, glabrous to scabrous; stipules small; leaflets 9–23, 5–21 mm long, 1.5–11 mm wide, oblong to obovate or oblanceolate, acute to retuse apically; peduncles 3–11 cm long; bracts minute; flowers 11–20, 9–12 mm long; calyx 1.5–2 mm long, the teeth much shorter than the tube; loment 35–50 mm long; $2n = 24, 48$. Cultivated erosion control plant, escaping and persisting in Salt Lake, Sanpete, Sevier, Utah, and Washington counties; introduced from Europe; 5 (ii).

Cytisus L.

Deciduous or evergreen shrubs; leaves alternate, trifoliolate or simple; stipules minute, thickened; flowers papilionaceous, axillary, solitary or sometimes 2 or 3; bracts minute; calyx bilabiate, the upper lip 2-lobed, the lower 3-lobed; petals 5, yellow, the keel not especially alternate; stamens 10, monadelphous, with 4 longer than the other, the style curved, broadened near the concave top; pods flattened, several-seeded.

Cytisus scoparius (L.) Link Scots Broom. [*Spartium scoparium* L.]. Shrubs to 2 m tall or more, the branchlets green, strongly angled; leaves trifoliolate, becoming simple upward; flowers solitary, rarely 2 or 3, 16–22 mm long, yellow or tinged purple; pods villous along the margin; $2n = 46, 48$. Escaped cultivated plants in Weber County; widespread in the Pacific coastal states; introduced from Europe; 9 (0).

Dalea Lucanus emend. Barneby

Perennial herbs, unarmed; leaves alternate, odd-pinnate with 3 or more leaflets, glandular-dotted; stipules

linear to subulate; peduncles opposite the leaves; flowers in dense spikes; calyx campanulate, 5- to 10-ribbed and 5-lobed; corolla papilionaceous, the banner petal attached near the rim of the floral cup, the outer four variously inserted or all near the rim of the staminal tube; stamens 5, monadelphous; petals white, yellowish, pink, or pink purple to indigo; pods 1- to 2-seeded, indehiscent, included in the calyx or slightly exceeding it; $x = 7$ or 8 . Note: Included herein are the herbaceous species traditionally placed in *Petalostemon*, and excluded are those shrubby species now regarded as *Psoralea* (q.v.).

Wemple, D. K. 1970. Revision of the genus *Petalostemon* (Leguminosae). Iowa State J. Sci. 45: 1-102.

1. Stems prostrate; spike slender, commonly less than 8 mm thick; leaflets 5-17; plants of Kane, San Juan, and Washington counties *D. lanata*
- Stems decumbent to ascending or erect; spikes thicker, commonly 10 mm or more; leaflets 7 (9) or fewer; distribution various 2
- 2(1). Herbage pilose, pilosulous, or hirsute with lustrous hairs *D. flavescens*
- Herbage glabrous 3
- 3(2). Petals pink to pink purple; calyx oblique, the teeth long-pilose *D. searlsiae*
- Petals white (fading cream); calyx symmetric, the teeth ciliate *D. oligophylla*

***Dalea flavescens* (Wats.) Welsh** Kanab Prairie-clover. [*Petalostemon flavescens* Wats., type from near Kanab; *Kunistera flavescens* (Wats.) Kuntze]. Stems 20-52 cm tall, from a superficial to subterranean caudex, glabrous to strigulose or pilose; stipules 1-4 mm long, lance-subulate to linear, persistent; leaves 1.5-4.7 cm long; leaflets 3-7, 5-20 mm long, 1-9 mm wide, folded or flat, oblong to oblanceolate or elliptic to linear, lustrous strigulose or pilose on both sides, glandular beneath; terminal leaflet petiolulate on a continuation of the rachis or subsessile; peduncles 1.5-20 cm long, glabrous to sparingly or densely pilose- or villous-hirsute; spikes 1.5-9 (14) cm long, 10-18 mm wide (when pressed), the rachis spreading-hairy; bracts 4-8 mm long, lance-aristate to lance-subulate or lanceolate, villous to pilose and sometimes glandular; calyx 4-7 mm long, the tube 10-ribbed, the tube not translucent, the teeth 1.5-4 mm long; flowers 6.2-11 mm long, the petals white, fading cream; pistils 7.5-13 mm long, the style 6-9.5 mm long; pods villous. Two rather distinctive varieties are recognized:

1. Spikes dense, the longest seldom more than 5 cm long; calyx teeth 1.5-2.5 mm long; pistils 7.5-10.3 mm long; styles 6-8 mm long; plants widespread *D. flavescens* var. *flavescens*
- Spikes rather lax, the longest 5-14 cm long; calyx teeth 2.7-4 mm long; pistils 11.5-13 mm long; styles 8.5-9.5 mm long; plants of central Glen Canyon *D. flavescens* var. *epica*

Var. *epica* (Welsh) Welsh & Chatterley Hole-in-the-Rock Prairie-clover. [*D. epica* Welsh, type from east of Halls Crossing]. Sandstone bedrock and sand in blackbrush and mixed desert shrub communities at 1430 to 1530 m in eastern Garfield and southwestern San Juan counties; endemic; 6 (v).

Var. *flavescens* Grasslands, mixed desert shrub, blackbrush, and pinyon-juniper communities, commonly in

sandy soils, at 970 to 1870 m in Emery, Garfield, Grand, Kane, San Juan, and Wayne counties; Arizona, a Navajo Basin endemic; 46 (xxiii). The Kanab prairie-clover is remarkably variable in several features, e.g., in number and position of glands, in vesture of the peduncle, and in width of the spike. In one specimen (Holmgren & Goddard 9990, frag. BRY) from the bottom of Glen Canyon near the mouth of Bridge (Forbidding) Canyon (now beneath Lake Powell), the calyx teeth are glandular. This seems to represent an extension of the glandular condition from bracts, where they do or don't exist, to the calyx teeth, where they tend not to exist. Spike width varies with maturity of flowers and fruit, but there is a tendency, especially along the canyons of the Colorado River, towards very broad flowering spikes (12-16 mm), and these might warrant taxonomic recognition when more material becomes available. Plants from East Clark Bench and eastward to Last Chance Canyon in Kane County, mainly occupy stabilized dunes dominated by *Vanclvea*, *Ephedra*, and *Oryzopsis* mixtures, and have moderately to densely hairy peduncles which vary from 3-10 cm in length at anthesis. Most of the remainder of the plants in Utah have glabrous to sparingly hairy peduncles, which are 9-20 cm long at anthesis. Later, it might become prudent to treat these variants at some taxonomic level.

***Dalea lanata* Sprengel** Woolly Dalea. [*Parosela lanata* (Sprengel) Britt.; *D. terminalis* (Jones) Heller]. Stems prostrate, 15-60 cm long or more, from a subterranean to superficial caudex, pilosulous to glabrous; stipules 1-2 mm long, subulate, more or less persistent; leaves 0.9-3 cm long; leaflets 5-17, 1.5-10 mm long, 1-5.5 mm wide, obovate to cuneate, truncate to emarginate, commonly folded, pilosulous or glabrous; peduncles 0.5-2.5 cm long; spikes 1.8-7.5 cm long, lax in mid- to late-anthesis and in fruit; bracts ovate-acuminate, pilosulous and with one or more large glands; calyx 3.2-4.6 mm long, the tube 2.1-2.7 mm long, glabrous, the teeth 0.9-1.9 mm long, pilosulous dorsally and ciliate; flowers 6-7 mm long, the petals indigo to rose pink; pistils 5-6 mm long, the style 3.5-4.5 mm long; pods villous to glabrous; $2n = 14$. Stabilized dunes and other sandy sites in salt desert shrub and blackbrush communities at 970 to 1525 m in Kane, San Juan, and Washington counties; Arizona, Colorado, and Kansas, south to Mexico; 10 (ii). Our material belongs to var. *terminalis* (Jones) Barneby. This variety differs from var. *lanata* inter alia in the glabrous, shining, membranous calyx tube. Some plants from San Juan County (Harrison 12194 et al. BRY) are glabrous throughout, but seem not to differ otherwise.

***Dalea oligophylla* (Torr.) Shinn.** Western Prairie-clover. [*Petalostemon gracilis* var. *oligophyllus* Torr. in Emory; *P. gracilis* Gray, not *D. gracilis* Kunth; *Kunistera occidentalis* Gray ex Heller; *P. occidentale* (Gray) Fern.; *K. candida* var. *occidentalis* (Gray) Rydb.; *K. oligophylla* (Torr.) Heller; *P. oligophyllus* (Torr.) Rydb.; *P. truncatus* Rydb.; *P. sonorae* Rydb.; *P. candidus* var. *oligophyllus* (Torr.) F. Hermann; *D. candida* var. *oligophylla* (Torr.) Shinn.]. Stems decumbent to erect, 4-9 dm tall, from a superficial caudex, glabrous; stipules 1-4.5 mm long, fragile, often coiled; leaves 1.5-5.2 cm long; leaflets 4-9, 5-27 mm long, 1-7 mm wide, oblanceolate to elliptic or oblong, truncate to emarginate, commonly folded, glabrous, glandular beneath; peduncles 1.5-15 cm long, glabrous; spikes 1-6.8 cm long, 8-12 mm thick, the rachis commonly glabrous; bracts lance-

acuminate, caducous; calyx strongly 10-ribbed, usually pubescent between the ribs, the tube 2.3-3 mm long, the lobes 1-1.3 mm long; pistils 9-11 mm long, the style 8-10 mm long; pods glabrous or sparingly hairy apically. Sandy drainages and crevices in rimrock in mixed desert shrub, blackbrush, pinyon-juniper, and hanging garden communities at 1070 to 1830 m in Emery, Garfield, Grand, Kane, San Juan, and Wayne counties; Alberta to Saskatchewan, south to Arizona, New Mexico, Texas, Mexico, and Iowa; 45 (ix).

Dalea searlsiae (Gray) Barneby Searls Prairie-clover. [*Petalostemon searlsiae* Gray; *Kuhnistera searlsiae* (Gray) Kuntze]. Stems decumbent to erect, 23-65 cm tall, from a superficial caudex, glabrous; stipules 1-3 mm long, deciduous; leaves 1.4-5.2 cm long; leaflets 5-11, 3-18 mm long, 0.8-6 mm wide, oblanceolate to elliptic or almost linear, truncate to emarginate or acute, commonly involute or folded, glabrous, glandular beneath; peduncles 3.5-22 cm long, glabrous; spikes 1.6-9 (13) cm long, 8-12 mm wide, the rachis glabrous to hairy; bracts obovate to lanceolate, acuminate-aristate, deciduous; calyx 10-ribbed, the tube glabrous to moderately pilose, 2.4-2.9 mm long, the lobes 1-1.4 mm long, usually long-pilose; pistils 5-7 mm long, the style 4-5 mm long; pods villous. Sagebrush, pinyon-juniper, warm-desert shrub, cool desert shrub, or less commonly in spruce-fir communities, at 1230 to 2800 m in Box Elder, Garfield, Iron, Juab, Kane, Tooele, and Washington counties; Arizona, Nevada, and California; 46 (ii). This species is allied to *D. ornata* (Dougl.) Barneby, whose range is contiguous to the northwest.

Desmanthus Willd.

Perennial herbs, unarmed; leaves bipinnate; flowers whitish, numerous, borne in axillary, long-pedunculate heads; calyx united, campanulate, 5-toothed; petals 5, distinct or connate only near the base; stamens 5, long-exserted; fruit obliquely oblong, glabrous, borne in compact subglobose clusters; seeds few.

Desmanthus illinoensis (Michx.) Macmillan Illinois Mimosa. [*Mimosa illinoensis* Michx.]. Plants erect, mainly 8-12 dm tall or more, strongly angled; stipules slender, 6-10 mm long; leaves bipinnate, 3-10 cm long, with 6-12 pairs of pinnae, 2-4 cm long, these each with 20-30 pairs of leaflets 2-5 mm long; peduncles 2-6 cm long, ascending or curved-ascending; petals ca 2 mm long; pods strongly curved or twisted together in a dense capitate cluster, 10-25 mm long, 4-7 mm wide; seeds ca 2.5-5 mm long. Cultivated botanical curiosity, escaping and established, especially along irrigation canals in Washington County; indigenous from the northeastern U. S., south to Colorado, New Mexico, and Florida; 5 (i).

Calega L.

Perennial, caulescent, from a caudex and stout taproot; leaves alternate, odd-pinnate; stipules sagittate, distinct; flowers papilionaceous, borne in axillary racemes, each subtended by a bract; bracteoles 0; calyx 5-toothed; petals 5, purplish blue, the keel subequal to the wings, attenuate apically; stamens monadelphous; ovary enclosed in the staminal sheath, the style glabrous; pods sessile, narrowly oblong in outline, more or less constricted between the seeds, unilocular.

Calega officinalis L. Coatsrue; Professor-weed. Perennial, caulescent, 5-10 dm tall, from a branching caudex;

pubescence basifixed; stems erect or ascending; stipules 7-16 mm long, sagittate, the basal lobes again once or twice lobed; leaves 3-22 cm long; leaflets 9-15, 7-52 mm long, 3-17 mm wide, lanceolate to elliptic, cuspidate-aristate apically, glabrous above, thinly pilose along veins beneath; peduncles 3-9 cm long; racemes 20- to 36-flowered, the flowers declined at anthesis, the axis 2.5-7 cm long in fruit; bracts 3.5-6 mm long, some commonly semisagittate; calyx 4-5.5 mm long, the tube 2-2.5 mm long, campanulate, glabrous, the teeth 2-3.2 mm long, subulate; flowers 9.5-12.5 mm long, blue purple (fading cream); pods ascending, subcylindric, 18-38 mm long, 2-3 mm thick, longitudinally nerved, glabrous, unilocular; 2n = 16. Introduced, established weedy plant, known in Utah only from Cache County, where it has grown continuously since at least 1909; adventive from Europe; 10 (0).

Gleditsia L.

Trees, often armed with simple or branched thorns; leaves alternate, deciduous, pinnately once to twice compound (with both kinds of leaves often on the same branch, or some intermediate); stipules minute, caducous; leaflets 14-36 on once-pinnate leaves and on the 3-5 pinnae; flowers in spikelike, axillary racemes, polygamous, almost regular; sepals equal or nearly so; petals 3-5, very narrow, yellowish, the uppermost internal in bud; stamens 3-10, distinct, the anthers in pistillate flowers abortive; pods flattened, straplike, indehiscent.

Gleditsia triacanthos L. Honey Locust. Trees to 20 m tall or more; bark smooth; leaflets 12-35 cm long, the pinnae 3-5 (8) when bipinnate, the leaflets 14-36 on once pinnately compound leaves and on pinnae, 10-42 mm long, 3-14 mm wide, lanceolate to oblong, crenate, obtuse to cuspidate, glabrous above, puberulent along veins beneath; racemes many-flowered, 3-7 cm long, short-pedunculate or subsessile; sepals separate; petals 4-5 mm long, greenish; pods sessile, oblong in outline, laterally flattened, 7-35 cm long, 15-30 mm wide, curved, indehiscent, the seeds imbedded in tissue; 2n = 28. Cultivated shade tree, rarely escaping, in Beaver, Cache, Davis, Grand, Millard, Salt Lake, Utah, Wayne, Washington, and Weber counties; 29 (v).

Glycyrrhiza L.

Perennial, caulescent, from stout, sweet roots; leaves alternate, odd-pinnate, glandular-punctate; stipules subulate, distinct; flowers papilionaceous, in axillary racemes, each subtended by a lanceolate, deciduous bract; bracteoles 0; calyx 5-toothed; petals 5, white to cream, the keel shorter than the wings; stamens 10, diadelphous; ovary enclosed in the staminal sheath, the style glabrous; pods sessile, elliptic to oblong in outline, burlike, armed with uncinat appendages, or smooth, indehiscent, few-seeded; x = 8.

Glycyrrhiza lepidota Pursh Licorice. Plants 4-12 dm tall, from a deep-seated root; stipules 2-7 mm long, subulate; leaves 8-19 cm long; leaflets 13-19, 8-53 mm long, 3-15 mm wide, lanceolate to oblong, mucronate, glabrous above, glandular-dotted and puberulent beneath; peduncles often paired, 3-8 cm long; racemes 20- to 50-flowered, the flowers ascending at anthesis, the rachis 2.5-9 cm long in fruit; bracts 5-8 mm long, caducous; calyx 4.8-6.9 mm long, the tube 2.5-4.9 mm long, campanulate to short-cylindric, stipitate-glandular, the

teeth 1.5–3.6 mm long; flowers 9.1–13 mm long, white to cream; pods spreading, laterally compressed, oblong, 13–20 mm long, the body 5–7 mm wide, beset with hooked prickles, simulating cockleburrs. Terraces, stream-sides, seeps, and other semimoist sites in stream-side, creosote bush, greasewood, mixed desert shrub, pinyon-juniper, and cottonwood-willow communities at 670 to 2470 m in all Utah counties, except Carbon, Davis, Duchesne, Morgan, and Tooele; widespread in the U. S., except for the southeast; 78 (xviii). The licorice of commerce, *G. glabra* L., is reported from ditches and meadows in Cache County. It differs from *G. lepidota* mainly in the smooth pods, lacking uncinat appendages.

Gymnocladus L.

Unarmed trees; leaves alternate, deciduous, bipinately compound; stipules small, deciduous; leaflets 9–15 on each of the 3–7 pinnae, or the lowermost pinnae represented by leaflets; flowers in terminal panicles, dioecious or polygamous, regular or nearly so; calyx 5-lobed; petals 5, distinct; pods broad-oblong, hard, thick, flattened, pulpy.

Gymnocladus dioica (L.) K. Koch Kentucky Coffeetree. [*Gulandina dioica* L.]. Tree to 20 m or more; leaves 20–60 (90) cm long; pinnae 3–7 pair, each with 9–15 leaflets, these 17–70 mm long, 7–30 mm wide, ovate to lanceolate, entire, acuminate, pilose (especially along the veins) beneath, glabrous to glabrate above; panicles many-flowered; pistillate panicles to 25 cm long, the staminate much smaller and more dense; flowers 10–13 mm long, greenish to bluish white; fruit 10–20 cm long, 3–5 cm broad, persistent, tardily dehiscent, the large seeds imbedded in greenish, initially gelatinous tissue. Cultivated ornamental and botanical curiosity in Salt Lake, Utah, and Weber counties; introduced from the eastern U. S.; 8 (i).

Hedysarum L.

Perennial herbs, caulescent, from a caudex and taproot; leaves alternate, odd-pinnate; stipules adnate to the petiole base, at least the lowermost connate-sheathing; flowers papilionaceous, in axillary racemes, each subtended by a bract; bracteoles 2; calyx 5-toothed; petals 5, red purple to pink or pink purple, the keel much longer than the wings, abruptly bow-shaped; stamens 10, diadelphous; ovary enclosed in the staminal sheath, the style glabrous; loments with 2–8 segments, prominently reticulate.

Northstrom, T. E. 1974. The genus *Hedysarum* in North America. Ph. D. Dissertation. Brigham Young University. 187 pp.

Northstrom, T. E. and S. L. Welsh. 1970. Revision of the *Hedysarum boreale* complex. Great Basin Naturalist 30: 109–130.

Rollins, R. C. 1940. Studies in the genus *Hedysarum* in North America. Rhodora 42: 217–238.

1. Leaflets thin, the veins readily apparent; fruit segments winged; calyx lobes unequal, shorter than the tube; plants of eastern and northern Utah *H. occidentale*
- Leaflets thick, the veins not apparent; fruit segments not winged; calyx lobes subequal, longer than the tube; plants widespread *H. boreale*

Hedysarum boreale Nutt. Northern Sweetvetch. Perennial, caulescent, 17–70 cm tall, from branching, subterranean to superficial caudex; pubescence basifixed; stems decumbent to erect; stipules 2–10 mm long, at

least some connate-sheathing; leaves 3–12 cm long; leaflets 5–15, 7–35 mm long, 2–19 mm wide, oblong to elliptic, lance-oblong, or ovate (rarely linear), strigose on both sides or glabrate to glabrous above; peduncles 2.8–15 cm long; racemes 5– to 45-flowered, the flowers ascending at anthesis, the axis 5–28.5 cm long in fruit; bracts 2–4 mm long; pedicels 0.8–4.5 mm long; bracteoles 2; calyx 4.5–8 mm long, the tube 2.5–3.5 mm long, campanulate, strigose, the teeth 2–6 mm long, subulate; flowers 10–19 mm long, red purple to pink or pink purple, less commonly white; loments stipitate, pendulous to spreading, with 2–8 segments, not winged, prominently reticulate. Our material belongs to ssp. *boreale* and is separable into two varieties.

1. Segments of loment bearing spines on lateral surfaces; plants of Uintah County, transitional to the next *H. boreale* var. *gremiale*
- Segments of the loment lacking spines; plants widespread *H. boreale* var. *boreale*

Var. *boreale* [*H. carnulosum* Greene; *H. pabulare* A. Nels.; *H. pabulare* var. *rivulare* L. O. Williams; *H. mackenziei* var. *pabulare* (A. Nels.) Kearney & Peebles; *H. utahense* Rydb., type from Salt Lake City; *H. boreale* var. *utahense* (Rydb.) Rollins; *H. caulescens* Nutt. ex T. & G.; *H. cinerascens* (Rydb.) Rollins; *H. boreale* var. *obovatum* Rollins]. Mixed desert shrub, pinyon-juniper, mountain brush, ponderosa pine, and aspen communities at 1175 to 2500 m in all Utah counties, except Beaver, Iron, Morgan, Piute, and Summit; Alberta east to Manitoba, south to Nevada, Arizona, New Mexico, and Texas; 217 (xxxi). The use of leaf pubescence, or lack thereof, to segregate the var. *boreale* into further taxa is a function in frustration, leading to two essentially sympatric phases that might reflect ecology more than genetics.

Var. *gremiale* (Rollins) Northstrom & Welsh [*H. gremiale* Rollins, type from north of Vernal]. Pinyon-juniper and mountain brush communities at 1470 to 1670 m in Uintah County; endemic; 13 (0). The spines on loment segments vary from few (or none) to numerous, indicating a complete transition with var. *boreale*. Incipient spines are present in specimens of var. *boreale* from outside of Utah, but nowhere are the spines so well or so consistently developed as in Uintah County.

Hedysarum occidentale Greene Western Sweetvetch. [*H. lancifolium* Rydb.; *H. marginatum* Greene; *H. uintahense* A. Nels.]. Perennial, caulescent, 30–90 cm tall, from a branching, superficial caudex; pubescence basifixed; stems ascending to erect; stipules 10–17 mm long; leaves 8–20 cm long; leaflets 11–19, 9–37 mm long, 4–16 mm wide, ovate to lance-ovate or elliptic, apiculate to emarginate, strigose on both sides or glabrous above; peduncles 3.7–15 cm long; racemes 10– to 50-flowered, the flowers spreading to declined at anthesis, the axis 6–14 cm long in fruit; bracts 2–8 mm long; bracteoles 2; calyx 3.5–11 mm long, the tube 2.3–6 mm long, campanulate, glabrous to strigose, the teeth 0.5–2 mm long, triangular; flowers 16–23 mm long, pink to red-purple; loments stipitate, pendulous, with 1–5 segments, winged. Mountain brush, sagebrush, and lower spruce-fir-aspen communities at 1770 to 2430 m in Carbon, Duchesne, Emery, Rich, and Summit counties; British Columbia south to Washington, Montana, Idaho, Wyoming, and Colorado; 17 (vii). Utah plants have been collected in flower and fruit in mid- to late summer. Materi-

als from western Duchesne, Carbon, and Emery counties differ from the body of the species in leaflet features and are separable as var. *canone* Welsh (type from Soldier Creek, Carbon County); 17 (vii). Specimens from Rich, Summit, and northern Duchesne counties belong to var. *occidentale*.

Laburnum Medicus

Trees, unarmed; leaves alternate, palmately trifoliate; stipules lacking; flowers in terminal, pendulous racemes, perfect; calyx 2-lipped, the upper lip 2-toothed, the lower lip with 3 coalescent teeth; petals all distinct; stamens 10, monadelphous; ovary stipitate; pods pendulous with the raceme, narrowly oblong, laterally compressed, more or less constricted between the few to several seeds.

Laburnum anagyroides Medicus Golden-chain; Beantree. [*L. vulgare* Bercht. & Presl; *Cytissus laburnum* L.]. Slender trees to 6 m tall; leaves (including petioles 1–7 cm long) 2.5–15 cm long; leaflets 3, palmate, 1.4–7.5 cm long, 0.7–3.5 cm wide, lanceolate to elliptic or oblanceolate, acute to obtuse or rounded, strigulose to glabrate beneath, glabrous above, often ciliate; peduncles 1.2–3.8 cm long; racemes (7) 15– to 50-flowered, the flowers inverted and spreading at anthesis, the axis 15–30 cm long in fruit; bracts lacking; bracteoles 0; pedicels 8–14 mm long; calyx oblique, 4.5–5.5 mm long, the tube 3–4 mm long, glabrous, the lobes ca 1.5 mm long, tufted hairy; flowers 14–17 mm long, yellow; pods stipitate, the stipe 2–5 mm long, the body oblong in outline, 30–50 mm long, 5–8 mm wide, strigose, tardily dehiscent; $2n = 50$. Cultivated ornamental tree of great beauty, in cities and towns in much of lower elevation Utah; introduced from southern Europe; 7 (0).

Lathyrus L.

Annual or perennial herbs, clambering, trailing, or climbing; leaves alternate, even-pinnately compound, the rachis terminating in a bristle or prehensile tendril; stipules herbaceous, semihastate or semisagittate; leaflets 2–12, very variable; flowers in axillary racemes, papilionaceous; calyx 5-toothed, obliquely campanulate; petals 5, white or cream to pink, purplish, or otherwise (in cultivated types), the wings not adnate to the keel, but fitted together in a groove; stamens 10, diadelphous; style laterally compressed, bearded along the ventral (upper) edge; pods oblong, several-seeded, the valves coiling upon dehiscence.

Hitchcock, C. L. 1952. A revision of the North American species of *Lathyrus*. Univ. Washington Publ. Biol. 15: 1–104.
 Welsh, S. L. 1965. Legumes of Utah III. *Lathyrus* L. Proc. Utah Acad. Sci. 42: 214–221

1. Leaflets 2; stem winged; plants introduced, annual or perennial 2
- Leaflets 4 or more; stems angled but not winged; plants indigenous, perennial 4
- 2(1). Plants annual, pubescent; flowers 25–30 mm long *L. odoratus*
- Plants perennial, glabrous; flowers 12–25 mm long 3
- 3(2). Leaflets narrowly lanceolate to elliptic; flowers 15–18 mm long *L. sylvestris*
- Leaflets lance-elliptic to oblong or ovate; flowers 20–25 mm long *L. latifolius*

- 4(1). Keel conspicuously shorter than the wings; calyx glabrous or the teeth merely ciliate, the lower tooth usually longer than the tube; stipules large, foliaceous; petals pink-purple, rarely white *L. pauciflorus*
- Keel commonly subequal to the wings; calyx often hairy, the lower tooth shorter than the tube, stipules not foliaceous; flowers pink purple, pale lavender, pinkish violet, cream, or white 5
- 5(4). Flowers 12–22 mm long; petals pale lavender tinged to pinkish violet, cream, or white, often polychrome in populations; plants common at middle elevations, especially in aspen, flowering in summer *L. lanszwertii*
- Flowers 15–30 mm long; petals bright pink to blue purple; plants widespread at lower elevations, flowering mainly in springtime 6
- 6(5). Plants villous; calyx 5–8 mm long, the tube 3.5–5.5 mm long; pods not stipitate; plants common *L. brachycalyx*
- Plants glabrous or sparingly villous; calyx 8–12 mm long, the tube 5–7 mm long; pods stipitate, the stipe 4–6 mm long; plants uncommon in southeastern Utah *L. eucosmus*

Lathyrus brachycalyx Rydb. Rydberg Sweetpea. Perennial, clambering herbs, decumbent to erect, 10–50 cm long, the herbage villous or sometimes glabrous above (exceptionally throughout); stipules 6–15 mm long, semisagittate; leaves 2–9 cm long (excluding tendrils); leaflets 6–12, 5–50 (70) mm long, 2–10 mm wide, linear to elliptic, oblong, lanceolate, or oblanceolate; tendrils simple or branched; peduncles 4–10 cm long; racemes 2– to 5-flowered, the flowers spreading at anthesis; calyx tube 3.5–7 mm long, campanulate, the teeth 1.5–4 mm long, triangular to triangular-lanceolate; flowers 15–25 mm long, pink to pink purple (white); pods 30–45 mm long, 5–8 mm wide; $2n = 14$. There are two more or less distinctive and allopatric varieties in Utah.

1. Plants typically villous; leaflets commonly 10–25 (30) mm long; banner not deeply cordate apically, the blade longer than broad; Great Basin *L. brachycalyx* var. *brachycalyx*
- Plants typically glabrous or sparingly villous; leaflets commonly 25–70 mm long; banner often deeply cordate apically, the blade as broad as long or broader; plants mainly of the southern tier of counties *L. brachycalyx* var. *zionis*

Var. *brachycalyx* Mixed desert shrub, pinyon-juniper, and mountain brush communities at 1575 to 2600 m in Beaver, Box Elder, Juab, Millard, Salt Lake (type from City Creek Canyon), Sanpete, Tooele, and Utah counties; Nevada; a Great Basin endemic; 65 (x).

Var. *zionis* (C. L. Hitchc.) Welsh Zion Sweetpea. [*L. zionis* C. L. Hitchc., type from 10 mi E of Zion National Park]. Sandy soils in pinyon-juniper, mixed desert shrub, and riparian communities at 1200 to 2500 m in Garfield, Grand, Kane, San Juan, and Washington counties; Arizona, Colorado, and New Mexico; 53 (xi).

Lathyrus eucosmus Butters & St. John Scemly Sweetpea. [*L. brachycalyx* ssp. *eucosmus* (Butters & St. John) Welsh; *L. brachycalyx* var. *eucosmus* (Butters & St. John) Welsh]. Plants 1.5–4 (6) dm tall; stipules 8–20 mm long, semisagittate; leaves 3–10 (13) cm long; leaflets 6–10, mainly 3–6.5 cm long, 4–12 (16) mm wide, narrowly elliptic to lance-elliptic, coriaceous; peduncles 3–12 cm long; racemes 2– to 5-flowered; calyx 8–12 mm long, the tube 5–7 mm long, prominently veined, the teeth 2–5

mm long; flowers 20–30 mm long; pods stipitate, the stipe 4–6 mm long, the body 3–4.5 cm long, 7–10 mm wide; $2n = 14$. Clay soils in washes in salt desert shrub communities at 1450 to 1700 m in Emery, Grand, and San Juan counties; Colorado, New Mexico, and Arizona; Mexico; 5 (0). It is with some hesitance that I reverse a stand of more than a decade of reduction of this entity within *L. brachycalyx*, but the floral features seem overwhelming, and the potential exists for nearer relationships elsewhere.

***Lathyrus lanszwertii* Kellogg** Lanszwert Sweetpea. Plants clambering, decumbent to erect, 20–60 cm tall, the herbage glabrous to villous; stipules 7–20 mm long, semisagittate; leaves 2–14 cm long (excluding tendrils); leaflets 4–12, 7–75 mm long, 3–18 (26) mm wide, elliptic to lanceolate, oblanceolate, or oval; tendrils short and simple to more commonly branched and prehensile; peduncles 2–8.5 cm long; racemes 2- to 5-flowered, the flowers spreading at anthesis; calyx tube 3.5–6 mm long, campanulate, the lower lateral teeth 1.8–4.2 mm long, triangular to lanceolate; flowers 12–22 mm long, pink purple to white or cream and commonly suffused or veined with pink or purple; pods 30–60 mm long, 3–7 mm wide; $2n = 14, 28$. Three rather poorly defined and apparently intergrading varieties are present in Utah.

1. Tendrils reduced to a simple filiform stalk, rarely coiled; leaflets commonly 6 only; plants of southeastern Utah *L. lanszwertii* var. *arizonica*
- Tendrils commonly branched and/or coiled; leaflets often more than 6; plants widespread 2
- 2(1). Flowers white, less commonly suffused or veined with pink or purple, mostly 15–22 mm long; plants more abundant southward in Utah *L. lanszwertii* var. *laetivirens*
- Flowers pink purple or suffused with purple or almost white, commonly 12–17 mm long; plants more abundant northward in Utah ... *L. lanszwertii* var. *lanszwertii*

Var. *arizonicus* (Britt.) Welsh [*L. arizonicus* Britt.; *L. leucanthus* Rydb.]. Mountain brush, ponderosa pine, aspen, and alpine communities at 2440 to 3355 m in Grand and San Juan counties; Colorado, Arizona, and New Mexico; 10 (0).

Var. *laetivirens* (Greene) Welsh [*L. laetivirens* Greene ex Rydb.; *L. leucanthus* var. *laetivirens* (Greene) C. L. Hitchc.]. Riparian, mountain brush, aspen, coniferous forest and other montane communities at 1830 to 3130 m in Beaver, Carbon, Emery, Garfield, Grand, Millard, Salt Lake, San Juan, Sanpete, Sevier, Utah, and Washington counties; Colorado and Arizona; 53 (xiii). Mostly the members of this variety are distinctive by their broader leaflets and larger flowers, but they are transitional in every way with the following.

Var. *lanszwertii* [L. *coriaceus* White, type from the Wasatch Mts.]. Aspen, Douglas fir, spruce-fir, and less commonly in mountain brush communities at 1650 to 2440 m in Davis, Duchesne, Garfield, Rich, Tooele, Salt Lake, Sanpete, Sevier, Summit, Utah, and Wasatch counties; Washington, Oregon, California, Idaho, and Nevada; 101 (xxv). Plants with truly purple or pink purple flowers are the exception in Utah. Flower color changes subtly from population to population and even within populations. Recognition of more than one entity from among the variation would be arbitrary at best, and would serve no useful purpose.

***Lathyrus latifolius* L.** Perennial Sweetpea. Perennial, climbing or clambering vines, 8–20 dm tall, the stems

broadly winged, glabrous; stipules 9–40 mm long, semihastate to semisagittate; leaves 6–12 cm long (excluding tendrils); leaflets 2, 35–80 (150) mm long, 5–23 (50) mm wide, lance-elliptic to oblong or ovate; tendrils branched, coiled; peduncles 7–15 cm long; racemes 5- to 15-flowered, the flowers spreading at anthesis; calyx tube 5.8–6.2 mm long, campanulate, the lower lateral teeth 3–6 mm long, lanceolate; flowers 20–25 mm long, pink purple, pink or white; pods 6–8 cm long, 7–10 mm wide, glabrous; $2n = 14$. Cultivated, escaping and now established, mainly along canal banks in Carbon, Grand, Millard, Uintah, and Utah counties; introduced from Europe; 10 (ii).

***Lathyrus odoratus* L.** Sweetpea. Annual, climbing vines, 8–30 dm tall, the stems broadly winged, pubescent; stipules 10–30 mm long, semihastate; leaves 6–15 cm long (excluding tendrils); leaflets 2, 25–85 mm long, 8–40 mm wide, elliptic to ovate or oblanceolate; tendrils well developed, prehensile; peduncles 3–28 cm long; racemes 2- to 5-flowered, the flowers spreading at anthesis; calyx tubes 5.5–7.5 mm long, campanulate, spreading-hairy, the lower lateral teeth 5–8 mm long, lanceolate; flowers 25–37 mm long, varicolored; pods 3–6 cm long, 5–8 mm wide, pubescent; $2n = 14$. Cultivated ornamental of greenhouse and outside plantings, growing best in cool middle elevations; introduced from Europe; 4 (ii).

***Lathyrus pauciflorus* Fern.** Utah Sweetpea. Perennial, 2–10 dm tall or more, climbing vines, glabrous; stems merely angled; stipules 8–32 mm long, the larger ones, at least, foliose and toothed; leaves 2–12.5 cm long (excluding tendrils); leaflets 8–12, 14–50 mm long, 8–32 mm wide, ovate to elliptic; tendrils well developed, prehensile; peduncles 3.5–24 cm long; racemes 3- to 10-flowered, the flowers spreading at anthesis; calyx tube 5–7.3 mm long, obliquely campanulate, more or less gibbous, the lower lateral teeth 2.5–7 mm long, often curved and spreading; flowers 13–27 mm long, pink to pink purple, with keel usually pale or white; pods 4–7.5 cm long, 7–11 mm wide; $2n = 14$. Sagebrush, mountain brush, aspen, lodgepole pine, mixed conifer, and meadow communities at 1370 to 2900 m in Box Elder, Cache, Davis, Millard, Morgan, Salt Lake, Sanpete, Sevier, Summit, Tooele, Utah, Wasatch, and Weber counties; Oregon, Idaho, Colorado, and California; 92 (xiii). Our material belongs to var. *utahensis* (Jones) Peck [*L. utahensis* Jones, type from Sevier County; *L. bradfieldianus* A. Nels.]. Apparent hybrids are known between this and both varieties *laetivirens* and *lanszwertii* of *L. lanszwertii*.

***Lathyrus sylvestris* L.** Scots Sweetpea. Perennial, 6–20 dm tall, clambering, the stems broadly winged, glabrous; stipules 20–34 mm long, semisagittate; leaves 3–12 (15) cm long (excluding tendrils); leaflets 2, 3–12 cm long, 5–40 mm wide, linear-lanceolate to lanceolate or elliptic; peduncles 8–22 cm long; racemes 4- to 9-flowered, the flowers ascending-spreading at anthesis; calyx tube 4–5 mm long, campanulate, the lower lateral teeth 1.7–4 mm long, lanceolate; flowers 15–18 mm long, red or red purple; pods 4–6 cm long, 5–8 mm wide, glabrous; $2n = 14$. Cultivated ornamental, persisting, escaping, and established in Utah and Sevier counties; introduced from Europe; 2 (0).

Lepedeza Michx.

Perennial herbs (or woody at the base) from a caudex; leaves alternate, pinnately trifoliate; stipules inconspicuous; flowers papilionaceous, in axillary racemes or subpaniculate, each subtended by a bract; bracteoles 2, attached at base of calyx; calyx 5-toothed; petals 5, pink

purple; stamens 10, diadelphous; ovary 1-ovuled, the style incurved and beardless, the stigma small and terminal; pod short, partially included in the calyx.

Lespedeza thunbergii (DC.) Nakai. Thunberg Bush-clover. [*Desmodium thunbergii* DC.]. Perennial, 8-10 dm tall or more and 15-20 dm wide, clumpforming; pubescence basifixed; stems striate; petioles 3-8 mm long; leaflets 3, lacking stipules, commonly 2-5 cm long, elliptic to oblong or ovate, glabrous above, strigose beneath; peduncles 0.5-1.2 cm long; racemes many-flowered; flowers 10-12 mm long (or more?), pink purple; bracteoles lanceolate; pods obovate to oblong, to 10 mm long; $n = 11$. Cultivated ornamental plant in Utah County; introduced from China; 1 (i).

Lotus L.

Plants annual or perennial herbs or suffrutescent, caulescent, from a taproot and caudex; leaves alternate, pinnately (or appearing palmately) compound; stipules foliaceous, scarious, or glandlike; flowers papilionaceous, in axillary pedunculate umbels or solitary; bracts leaf-like; calyx 5-toothed; petals 5, yellow or white, sometimes suffused with red, the keel long-attenuate; stamens 10, diadelphous; ovary enclosed in the staminal sheath, the style glabrous; pods flattened or subterete, straight, 1- to several-seeded, dehiscent; $x = 6, 7, 10$.

Ottley, A. M. 1944. The American Loti with special consideration of a proposed new section, *Simpetaria*. *Brittonia* 5: 81-123.

1. Plants annual, prostrate to ascending; flowers sessile in leaf axils; known from Washington County 2
- Plants perennial, sometimes flowering the first year, prostrate to erect 3
- 2(1). Plants subglabrous or merely strigose; calyx teeth subequal to the tube; pods 10-15 mm long . . . *L. denticulatus*
- Plants villous; calyx teeth much longer than the tube; pods 5-10 mm long *L. humistratus*
- 3(1). Flowers sessile, solitary in leaf axils, or on peduncles to 2.6 cm long; plants indigenous in San Juan County *L. wrightii*
- Flowers pedunculate, solitary, or 2 to several; plants variously distributed, seldom or not of San Juan County 4
- 4(3). Plants suffruticose, rigid, commonly erect, internodes greatly exceeding leaf length; bracts of inflorescence 1 or 0; plants of Washington County *L. rigidus*
- Plants herbaceous, prostrate to ascending or erect; internode and leaf length various; bracts of inflorescence 1 or more; distribution various 5
- 5(4). Stipules leaflet-like; plants introduced, cultivated and escaping 6
- Stipules reduced to glands; plants indigenous 7
- 6(5). Flowers 3 or 4, each 7-9 mm long; leaflets of main leaves lance-linear to narrowly elliptic, acute . . . *L. tenuis*
- Flowers 5-12, each 8-12 mm long; leaflets of main leaves obovate, rounded *L. corniculatus*
- 7(5). Leaves sessile, the leaflets strictly palmate, usually drying a lead-green color; plants widely distributed in central to southwestern Utah *L. utahensis*
- Leaves short-petiolate, the rachis elongate and at least 1 leaflet pinnately disposed; plants of western Kane, Iron, and Washington counties *L. plebeius*

Lotus corniculatus L. Birds-foot Trefoil. Perennial, 1-5 dm long, with ascending or procumbent stems,

glabrous or strigose; stipules foliar, almost or quite as large as the leaflets; leaflets 3, 5-15 mm long, 2-8 mm wide, obovate, rounded apically; peduncles 0.5-7.5 cm long; bracts 1- to 3-foliolate; flowers (1 or 2) mostly 5-12, 8-12 mm long, yellow; calyx 3-4 mm long, the teeth subequal to the tube; pods linear, 20-35 mm long, 2-3.5 mm thick, subterete, straight, glabrous; $2n = 12, 24, 32$. Cultivated forage plant of moist pastures, persisting in Cache, Millard, Utah, and Washington counties; introduced from Europe; 5 (i).

Lotus denticulatus (Drew) Greene Mohave Trefoil. [*Hosackia denticulata* Drew; *Anisolotus denticulatus* (Drew) Heller; *L. subpinnatus* authors, not Lag.?). Annual, 3-30 cm long, with prostrate to ascending stems, glabrous to strigose; stipules reduced to glands; leaves pinnate, the rachis flattened; leaflets 3-5, 1.5-15 mm long, 0.8-7 (10) mm wide, obovate, obtuse to truncate apically; peduncles lacking, the flowers solitary, axillary, 4.5-7 mm long, white or suffused with yellow; calyx 2.8-5 mm long, the teeth subequal to the tube; pods 10-15 mm long, 2.8-3.1 mm wide, compressed, sparingly strigose; $2n = 12$. Salt and warm desert shrub communities at 870 to 1100 m in Washington County; Nevada and California; 9 (i).

Lotus humistratus Greene Low Trefoil. Annual, 6-30 cm long, with prostrate to ascending stems; stipules reduced to glands; leaves pinnate, the rachis flattened; leaflets 3-5, 3-15 mm long, 1-8 mm wide, obovate to oblanceolate, obtuse apically; peduncles lacking, the flowers solitary, axillary, 4-6 mm long, yellow or tinged red; calyx 3-4 mm long, the teeth much longer than the tube; pods 5-10 mm long, 2.5-3.5 mm wide, laterally compressed, strigulose-villous. Sandy or gravelly sites in creosote bush and other warm desert shrub communities at 670 to 950 m in Iron and Washington counties; Arizona, New Mexico, and California; Mexico; 9 (i).

Lotus plebeius (Brandege) Barneby Long-bracted Trefoil. [*Hosackia plebeia* Brandege; *L. neomexicanus* Greene; *H. rigida* var. *mammularia* Jones, type from Rockville; *Anisolotus numularius* (Jones) Woot. & Standl.; *L. numularius* (Jones) Tidestr., not Reichenb. ex Steudel; *L. nummulus* Dayton; *L. longibracteatus* Rydb., type from near St. George; *A. longibracteatus* (Rydb.) Rydb.; *L. oroboides* var. *nanus* Isely]. Perennial, 7-38 cm long, with prostrate to decumbent stems radiating from a herbaceous, superficial caudex; stipules reduced to glands; leaves petiolate, pinnate, with at least 1 leaf commonly placed along the short rachis; leaflets 3 or 4, 2-22 mm long, 1-8 mm wide, oblanceolate to elliptic or oval (on lowermost leaves), obtuse to acute; peduncles 0.5-6.5 cm long; bracts 1- to 3-foliolate; flowers 1 or 2, 12-17 mm long, yellow, suffused with red; calyx 5-8 mm long, the tube 2.8-5.1 mm long, strigose, the teeth 2.2-8.9 mm long, shorter than the tube; pods narrowly oblong, 15-28 mm long, 3-4 mm wide, straight, strigose. Sandy and gravelly sites in desert shrub, riparian, and pinyon-juniper communities at 670 to 1600 m in Iron, Kane (west of the Paria River), and Washington counties; Nevada and Arizona; 50 (viii). The long-bracted trefoil, as it occurs in Utah, was considered by Ottley (1944: 109-113) to consist of hybrids between *L. rigidus* and *L. utahensis*. The plants differ markedly from either of the putative parents, and have features not shared by them. The stems of *L. plebeius* are prostrate-decumbent or procumbent from a herbaceous caudex, differing in this regard from both of the presumed parental species.

Lotus rigidus (Benth.) Greene Bush Trefoil. [*Hosackia rigida* Benth.; *Anisolotus rigidus* Rydb.]. Perennial, 25–70 cm tall, with erect or ascending stems commonly woody at the base, from a ligneous or subligneous, superficial caudex; stipules reduced to glands; leaves petiolate, the rachis flattened, pinnate, with at least 1 leaflet along the rachis; leaflets 3–5, 2–20 mm long, 0.8–4 mm wide, oblanceolate to oblong, obtuse to emarginate; peduncles 2.3–14 cm long; bracts 1– to 3-foliolate; flowers 1–3, 12–23 mm long, yellow suffused with red; calyx 6.2–10 mm long, the tube 4.2–6.5 mm long, cylindro-campanulate, strigose, the teeth 2–4 mm long, shorter than the tube; pods narrowly oblong, 32–45 mm long, 3.7–4.2 mm wide, straight, glabrous. Sandstone outcrops and sandy or gravelly to clay banks and terraces at 750 to 1070 m in Washington County; Nevada, Arizona, California, and Mexico; 15 (iv). The plants form rounded clumps with very brittle stems, making difficult the task of representing it well on herbarium mounts.

Lotus tenuis Kit. in Willd. Slender Trefoil. [*L. corniculatus* var. *tenuifolius* L.; *L. tenuifolius* (L.) Reichenb.]. Perennial, 2–6 dm tall, with weak, ascending stems, glabrous; stipules foliar, almost or quite as large as the leaflets; leaflets 3, 5–15 mm long, 2–4 mm wide, lanceolate to narrowly oblanceolate or lance-linear, acute apically; peduncles 2–7.5 cm long; bracts 1– to 3-foliolate; flowers 2–4, 7–9 mm long, yellow (often drying blue); calyx 4–5 mm long, the teeth subequal to the tube; pods linear, 25–30 mm long, 2–3 mm thick, subterete, glabrous; 2n = 12. Cultivated forage plant of moist meadows, persisting in Utah and Washington counties; introduced from Europe; 2 (0).

Lotus utahensis Ottery Utah Trefoil. Perennial, 15–43 cm tall, with erect-ascending stems from a shallowly subterranean, subligneous caudex; stipules reduced to glands; leaves sessile, palmate; leaflets 3–5, 2–23 mm long, 1.5–7 mm wide, spatulate to oblanceolate or oblong, obtuse to acute; peduncles 1.4–7.5 cm long; bracts 1– to 3-foliolate; flowers 1–4, 12–16 mm long, yellow, suffused with red; calyx 4.5–8.7 mm long, the tube 3.3–4.5 mm long, cylindro-campanulate, strigose, the teeth 2.1–4.2 mm long, shorter than the tube; pods narrowly oblong, 22–35 mm long, 2.5–3.5 mm wide, minutely strigulose to glabrate, shining straight. Sagebrush, pinyon-juniper, mountain brush, aspen, and spruce-fir communities at 1470 to 2730 m in Beaver, Garfield, Iron, Kane (type from W of Carmel), Millard, Piute, Sevier, Utah, Washington, and Wayne counties; Nevada and Arizona; 110 (xxvi).

Lotus wrightii (Gray) Greene Wright Trefoil. [*Hosackia wrightii* Gray; *Anisolotus wrightii* (Gray) Rydb.]. Perennial, 12–60 cm tall, with erect-ascending stems from a commonly superficial caudex; stipules reduced to glands; leaves petiolate (sometimes shortly so), palmate; leaflets 3–5, 2–22 mm long, 1–5 mm wide, spatulate to oblanceolate, oblong, linear, obtuse to acute; peduncles 0–2.6 cm long; bracts 1– to 5-foliolate; flowers commonly solitary, rarely 2, 14–18 mm long, yellow suffused with red; calyx 7.5–9.2 mm long, longer than or subequal to the tube; pods narrowly oblong, 25–34 mm long, 2–2.6 mm wide, strigulose to villosulous, straight. Ponderosa pine woods at 1830 to 2130 m in San Juan County; Colorado, Arizona, and New Mexico; 4 (0).

Lupinus L.

Plants annual or perennial herbs; leaves alternate, palmately compound; stipules slender, persistent; flowers

borne in terminal racemes, perfect; calyx bilabiate, the lips entire or toothed, commonly with bracteoles; petals usually blue or blue purple, less commonly whitish, yellow, or reddish, the banner variously reflexed, glabrous or variously hairy dorsally, the wings mostly glabrous, the keel glabrous or ciliate on upper (less commonly lower) edges; stamens 10, monadelphous, with 5 long filaments alternating with 5 short ones; pods laterally compressed, 2- to several-seeded. Note: The genus is notoriously difficult because of lack of clear diagnostic features. Taxa tend to grade morphologically into each other, probably due to hybridization. The basic chromosome number is x = 12, but most of ours are polyploids, and numerous aneuploids are known. Wide ranging perennial taxa tend to intergrade with all others they contact. Because of these problems and the likelihood of cleistogamy in some taxa it is not possible to assign all specimens to described entities. The following summary treatment is tentative.

- 1. Plants annual, the cotyledons commonly persistent Key 1
- Plants perennial, the cotyledons not present at flowering Key 2

Key 1.

Plants annual.

- 1. Leaflets long-pilose on both surfaces; cotyledons petiolate; ovules 4–6; plants of Washington County *L. concinnus*
- Leaflets variously hairy beneath, glabrous or glabrate above; cotyledons sessile; ovules 2–6; plants of various distribution 2
- 2(1). Flowers borne in subcapitate racemes, the rachis commonly 2 cm long or shorter 3
- Flowers borne in elongate racemes, the rachis commonly 2 cm long or longer 4
- 3(2). Plants subcaulescent or acaulescent, the internodes seldom to 1 cm long, upper calyx lip 2 mm long or less, entire *L. brevicaulis*
- Plants caulescent, with several developed internodes, at least some more than 2 cm long; upper calyx lip 3–6 mm long, bilobed *L. kingii*
- 4(2). Plants caulescent; cotyledons petiolate; keel petals ciliate, at least on lower margin near the base; ovules 4–6; plants of Washington County *L. sparsiflorus*
- Plants acaulescent, subcaulescent or short caulescent; cotyledons sessile; keel petals ciliate on upper edges toward the apex; ovules 2; plants of various distribution 5
- 5(4). Peduncles 1.5–7.5 cm long; pods not constricted between the seeds; plants subcaulescent to short caulescent, known from Washington County *L. flavoculatus*
- Peduncles 0–3.5 cm long; pods constricted between the seeds; plants mostly short caulescent, widespread in Utah *L. pusillus*

Key 2.

Plants perennial.

- 1. Leaflets glabrous above 2
- Leaflets pubescent above 4
- 2(1). Banner reflexed at or below the midpoint, glabrous or pubescent distally along the crest; plants of Washington County *L. latifolius*
- Banner reflexed above (beyond) the midpoint, hairy if at all beneath the upper calyx lip or, if as above, plants not of Washington County 3
- 3(2). Leaves mainly basal, the petioles 8–13 cm long or more, coarsely hirsute; stems from a rhizome; plants of Grand and San Juan counties *L. polyphyllus*
- Leaves mainly well distributed along the stem, the petioles commonly less than 8 cm long, strigose or silvery hairy; stems from a caudex; plants of various distribution *L. argenteus*
- 4(1). Banner glabrous dorsally 5
- Banner pubescent on the back, at least beneath upper lip of calyx 7
- 5(4). Flowers 10–13.5 mm long; calyx saccate-gibbous or shortly spurred; leaves mainly basal; plants of Duchesne, Garfield, Kane, and Uintah counties *L. polyphyllus*
- Flowers 7–13 mm long; calyx not especially gibbous; leaves distributed along the stem, or all leaves basal; plants variously distributed 6
- 6(5). Plants acaulescent or short-caulescent; leaves essentially all basal *L. lepidus*
- Plants caulescent; leaves distributed along the stem *L. argenteus*
- 7(4). Calyx with a gibbous-saccate spur at base of upper lip; wings pubescent, or keel ciliate below the claws (rarely glabrous) 8
- Calyx at most gibbous at base of upper lip; wings and lower edge of keel glabrous 9
- 8(7). Wings not ciliate; flowers yellow or varicolored in populations; plants of far western Utah *L. arbustus*
- Wings or keel (or both) ciliate below the claws (rarely glabrous); flowers commonly blue purple; plants widespread *L. caudatus*
- 9(7). Leaves mainly basal; plants commonly less than 5 dm tall, known from Juab, Millard, Tooele, and Utah counties *L. polyphyllus*
- Leaves mainly well distributed along the stems; plants often over 5 dm tall or of different distribution or both 10
- 10(9). Banner reflexed at or below the midpoint, strigose to thinly strigose near the tip or rarely hairy along the crest *L. sericeus*
- Banner reflexed beyond the midpoint, strigose on the back beneath the calyx lobe or over much of the back 11
- 11(10). Stems velvety or woolly hairy; plants commonly of meadows and stream terraces in Duchesne, Salt Lake, Summit, Uintah, Utah and Wasatch counties *L. leucophyllus*
- Stems with appressed, ascending, spreading, or retrorse hairs, but not velvety or woolly; distribution and habitat various *L. argenteus*

cence of stems minutely strigulose; leaves scattered along the stem, but with much shorter petioles upward; petioles 2.5–16 cm long; leaflets 7–13, 24–50 mm long, 3–10 mm wide, oblanceolate, pilose on both surfaces; peduncles 2–5 cm long; racemes 12– to 46-flowered, the axis 2.5–18 cm long in anthesis, 4–23 cm long in fruit; flowers 10–14 mm long, yellow or white or blue purple or all of these in populations or in the same raceme; pedicels 1.5–6 mm long; calyx with a gibbous-saccate spur at base of upper lip, the spur 1.5–2.5 mm long; banner with a central white, yellowish, or brownish spot, pubescent dorsally, reflexed near the midpoint; wings ciliate along the upper edge near the apex; keel ciliate along the upper margin; ovules 5 or 6. Sagebrush and pinyon-juniper communities at 2135 to 2440 m in the Deep Creek Mountains, Juab and Tooele counties; Washington to Montana, south to California and Nevada; 11 (ii). Our material is assigned to var. *calcaratus* (Kellogg) Welsh, a taxon of questionable significance among the range of variation in *L. arbustus* [*L. calcaratus* Kellogg; *L. laxiflorus* var. *calcaratus* (Kellogg) Dunn]. This is perhaps our most beautiful lupine species.

Lupinus argenteus Pursh Silvery Lupine. Plants perennial, 18–90 cm tall, from a superficial caudex, puberulent to strigose on stems and petioles; leaves mainly cauline; petioles 1.5–8 cm long; leaflets 6–9, 7–95 mm long, 2–22 mm wide, oblanceolate to spatulate or almost linear, flat or folded, strigulose to strigose on both surfaces or almost or quite glabrous above; peduncles 1.5–14.5 cm long; racemes 15– to 92-flowered, 5–24 cm long in anthesis, the axis 6–29 cm long in fruit; flowers (5–7) 8.5–16 mm long, blue purple, blue, white, or rarely other hues; pedicels 1.5–6 mm long; calyx gibbous or rounded at base of upper lip; banner with a central yellow or white spot, pubescent or glabrous dorsally, reflexed above the midpoint, the wings and keel glabrous or variously sparingly ciliate; ovules 3–6. The silvery lupine is represented in Utah by several more or less distinctive but intergrading varieties. Furthermore, at least some of the phases grade into other taxa, especially into *L. caudatus*, but also into *L. sericeus*. Silvery lupine, along with those species, constitutes the most common and most widespread of the perennial lupines in the state. Possibly all of them are poisonous to livestock due to the presence of alkaloids. The large proportion of the specimens encountered can be segregated by use of the following, admittedly arbitrary key.

- 1. Leaflets more or less evenly pubescent above, generally folded, the upper surface thus obscured; plants generally of middle and lower elevations 2
- Leaflets glabrous above, or with hairs scattered or merely with a few near the margin, commonly flat and green, but sometimes folded, plants generally of middle and upper elevations 4
- 2(1). Stems with spreading or retrorse hairs; flowers mainly 7–10 mm long; plants of Washington County *L. argenteus* var. *palmeri*
- Stems with appressed or ascending hairs; flower size various; plants of various distribution 3
- 3(2). Flowers 12–14 mm long; plants of sandy washes in Emery, Garfield, Grand, and San Juan counties *L. argenteus* var. *moabensis*
- Flowers 8–12 mm long; plants widespread in the western U. S. *L. argenteus* var. *argenteus*

Lupinus arbustus Dougl. ex Lindl. Spur Lupine. Perennial, 26–60 cm tall, from a woody caudex; pubes-

- 4(1). Flowers 5–7 (7.5) mm long; pedicels typically more than 2.5 mm long; plants uncommon in the northern Wasatch *L. argenteus* var. *parviflorus*
- Flowers typically larger or, if almost as small, the pedicels less than 2.5 mm long and plants of different distribution 5
- 5(4). Flowers mainly 6–8 mm long, with pedicels less than 3.5 mm long; plants of Grand and San Juan counties ..
..... *L. argenteus* var. *fulvomaculatus*
- Flowers mainly 8–11 mm long and with pedicels more than 3.5 mm long; plants of broader distribution
..... *L. argenteus* var. *rubricaulis*

Var. *argenteus* [*L. tenellus* Dougl. ex G. Don; *L. argenteus* ssp. *argenteus* var. *tenellus* (Dougl.) Dunn; *L. alpestris* as to concept, but not as to type; *L. lucidulus* Rydb.; *L. laxus* Rydb.; *L. decumbens* var. *argenteus* Rydb.; *L. macounii* Rydb.; *L. stenophyllus* Rydb.; *L. hillii* authors, not Greene; *L. pulcher* Eastw., type from south of Cedar City; *L. garrettianus* C. P. Sm., type from 1 mi west of Duchesne; *L. spathulatus* var. *boreus* C. P. Sm.]. Creosote bush, shadscale, ephedra, grass, sagebrush, pinyon-juniper, mountain brush, ponderosa pine, aspen, Douglas fir, and less commonly spruce-fir communities at 1065 to 3450 m in all Utah counties (except San Juan); Alberta and Saskatchewan, south to Oregon, California, Nevada, New Mexico, and the Dakotas; 185 (ii).

Var. *fulvomaculatus* (Payson) Barneby [*L. fulvomaculatus* Payson; *L. parviflorus* var. *fulvomaculatus* (Payson) Harmon]. Mountain brush, aspen, and spruce-fir communities at 2590 to 3050 m in Grand and San Juan counties; Colorado; 5 (0).

Var. *moabensis* Welsh Blackbrush and mixed desert shrub communities at 1280 to 1895 m in Emery, Grand, San Juan, and Wayne counties; Mesa County, Colorado; a Navajo Basin endemic; 23 (v).

Var. *palmeri* (Wats.) Barneby [*L. palmeri* Wats.]. Sagebrush and pinyon-juniper communities at ca 1525 to 2135 m in Iron and Washington counties; New Mexico, Arizona, Nevada, and California; 3 (i).

Var. *parviflorus* (Nutt.) C. L. Hitchc. [*L. parviflorus* Nutt. ex H. & A.; *L. argenteus* ssp. *parviflorus* (Nutt.) Phillips]. Aspen, lodgepole pine, and spruce-fir communities at 2270 to 2730 m in Box Elder, Cache, Duchesne, Salt Lake, and Summit counties; Montana and Idaho to Wyoming and South Dakota; 7 (0).

Var. *rubricaulis* (Greene) Welsh [*L. rubricaulis* Greene; *L. caudatus* var. *rubricaulis* (Greene) C. P. Sm.; *L. argenteus* ssp. *rubricaulis* (Greene) Hess & Dunn; *L. argenteus* var. *boreus* (C. P. Sm.) Welsh, at least as to concept; *L. spathulatus* Rydb., type from Wasatch Mts.; *L. argenteus* ssp. *spathulatus* (Rydb.) Hess & Dunn; *L. alpestris* A. Nels., as to type, but not as to concept; *L. maculatus* Rydb., type from P. V. (Pleasant Valley) Junction]. Aspen, meadow, mixed conifer, riparian, and spruce-fir communities at 2470 to 3370 m in Beaver, Carbon, Daggett, Davis, Duchesne, Emery, Garfield, Iron, Juab, Piute, Salt Lake, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, Wayne, and Weber counties; Idaho, Montana, and South Dakota, south to Nevada and New Mexico; 129 (xxix). Two potential varieties are separable only arbitrarily, one with single inflorescences per stem (var. *rubricaulis*), and the other with more than the terminal inflorescence developing (*argenteus* phase). The specimens are wholly confluent geographically and seem unworthy of taxonomic segregation.

No combinations are intended or implied however. It is with some reluctance that I synonymize *L. maculatus*. The materials previously assigned there, especially that from the east side of Mt. Timpanogos, are indeed singular, some even with an incipient spur and shaggy pubescence, but they fit within the whole as herein interpreted.

Lupinus brevicaulis Wats. Shortstem lupine. Annual, 4–11 cm tall from a taproot; cotyledons sessile; stems 0–2 cm long, when developed at all usually obscured by the leaf bases; leaves in a basal tuft; petioles 0.8–6.5 cm long; leaflets 3–9, 5–18 mm long, 1.5–9 mm wide, oblanceolate, flat or folded, pilose beneath, glabrous above (except marginally in some); peduncles 0.6–6.5 cm long; racemes 4– to 12-flowered, 1–2.5 cm long in anthesis, the axis 1.5–3 cm long in fruit; flowers 5.2–7 mm long, blue purple or white; pedicels 0.3–0.8 mm long; calyx tapering to the pedicel, the upper lip very short; banner with a central yellow spot, glabrous dorsally, reflexed near the midpoint; ovules 2 or 3. Creosote bush, blackbrush, salt desert shrub, pinyon-juniper, and sagebrush communities at 830 to 1970 m in Beaver, Carbon, Daggett, Emery, Garfield, Grand, Iron, Millard, Salt Lake, San Juan, Uintah, Utah, and Washington counties; Oregon to Colorado, south to Arizona and New Mexico; the short-stemmed lupine apparently forms hybrids with *L. flavoculatus*; 30 (iv).

Lupinus caudatus Kellogg Spurred Lupine. Perennial, 21–80 cm tall, from a woody caudex; leaves mainly cauline; petioles 1–12 cm long, commonly 2–8 cm long; leaflets 5–9, 10–45 (60) mm long, 2–14 cm wide, oblanceolate to elliptic or narrowly oblanceolate, pilose on both surfaces or glabrate above; peduncles 1–6.5 cm long; racemes 10– to 57-flowered, 3–16 cm long in anthesis, the axis 4.5–17 cm long in fruit; flowers 8–12.5 (13.5) mm long, blue purple or less commonly white; pedicels 1–3 (5) mm long; calyx with a gibbous-saccate spur 0.2–1.5 (2) mm long at the base of the upper lip; banner pubescent dorsally, reflexed at or beyond the midpoint; wings commonly ciliate above and near the claws, the keel commonly ciliate above and near the claws; ovules 3–5. Three rather weak varieties are known from Utah. They are separable only arbitrarily, but seem to represent at least trends within the variation.

- 1. Banner reflexed at the midpoint; leaflets rather broadly oblanceolate; plants rare in Kane County
..... *L. caudatus* var. *cutleri*
- Banner reflexed beyond the midpoint; leaflets only rarely broadly oblanceolate; plants of various distribution 2
- 2(1). Leaflets bicolored, green to yellow green above, dull green to grayish beneath; plants uncommon in southern Utah
..... *L. caudatus* var. *argophyllus*
- Leaflets more uniformly colored, either green or gray on both surfaces or only somewhat bicolored; plants common in much of Utah *L. caudatus* var. *utahensis*

Var. *argophyllus* (Gray) Welsh [*L. decumbens* var. *argophyllus* Gray; *L. caudatus* ssp. *argophyllus* (Gray) Phillips; *L. argophyllus* (Gray) Cockerell; *L. laxiflorus* var. *argophyllus* (Gray) Jones; *L. argenteus* var. *argophyllus* (Gray) Wats.; *L. helleri* Greene; *L. aduncus* Greene]. Pinyon-juniper, mountain brush, ponderosa pine, and grassland communities at 1570 to 2430 m in Beaver, Garfield, Kane, and San Juan counties; Wyoming to New Mexico; 9 (iii).

Var. *cutleri* (Eastw.) Welsh [*L. cutleri* Eastw.; *L. caudatus* ssp. *cutleri* (Eastw.) Hess]. Pinyon-juniper woodland at 1570 m along the Cockscomb in Kane County; Arizona, Colorado, and New Mexico; 1 (i).

Var. *utahensis* (Wats.) Welsh [*L. holosericeus* var. *utahensis* Wats., type from Wasatch Mts.; *L. argentinus* Rydb.; *L. leucophyllus* var. *lupinus* Rydb., type from Bears Ears, Elk Mt.; *L. utahensis* Mold.]. Sagebrush, pinyon-juniper, mountain brush, ponderosa pine, aspen, mixed conifer and grassland communities at 1470 to 2730 m in Beaver, Box Elder, Cache, Davis, Duchesne, Garfield, Iron, Juab, Kane, Millard, Morgan, Piute, Rich, Salt Lake, San Juan, Tooele, Uintah, Utah, Wasatch, Wayne, and Weber counties; Oregon, Idaho, and Wyoming, south to California, Nevada, Arizona, and Colorado; 104 (xiv).

***Lupinus concinnus* Agardh** Elegant Lupine. Annual, caulescent, 6.5–20 cm tall, from a taproot; cotyledons petiolate; stems with apparent internodes; leaves mainly cauline, the lowermost the smallest; petioles 0.6–8 cm long; leaflets 5–8, 4–24 mm long, 1.5–7.5 mm wide, obovate to oblanceolate, pilose on both sides; peduncles 0.4–2 cm long; racemes 6– to 17-flowered, 2–4 cm long in anthesis, the axis 4–7 cm long in fruit; flowers 7–8.8 mm long, blue purple (rarely white); pedicels 0.5–1.2 mm long; calyx tapering to the pedicel; upper lip well developed; banner with a central yellow spot, glabrous dorsally, reflexed at or below the midpoint; ovules 2–4. Warm desert shrublands at 770 to 1070 m in Washington County; New Mexico, Arizona, and Nevada; 16 (iv). Our material belongs to var. *orcuttii* C. P. Sm. [*L. micensis* Jones; *L. orcuttii* Wats.; *L. concinnus* ssp. *orcuttii* (Wats.) Dunn].

***Lupinus flavoculatus* Heller** Yellow-eye Lupine. [*L. rubens* var. *flavoculatus* (Heller) C. P. Sm.; *L. odoratus* var. *flavoculatus* (Heller) Jepson]. Annual, 3–11 cm tall from a taproot; cotyledons sessile; stems 0–2 cm long, often with at least 1 apparent internode; leaves mainly basal; petioles 0.5–8.5 cm long; leaflets 6–10, 5–20 mm long, 2–9 mm wide, obovate to oblanceolate, flat or folded, pilose to glabrate beneath, glabrous above, long ciliate; peduncles 1.5–7.5 cm long; racemes 9– to 16-flowered, 1.2–3 cm long in anthesis, the axis 2–4 cm long in fruit; flowers 5.1–7.2 mm long, bluepurple or less commonly white; pedicels 0.5–2 mm long; calyx tapering to the pedicel, the upper lip short; banner with a central yellow spot, glabrous dorsally, reflexed near the midpoint; ovules 2–4. Warm desert shrub and pinyon-juniper communities at 770 to 2330 m in Washington County; Nevada and California; 12 (0).

***Lupinus kingii* Wats.** King Lupine. [*L. sileri* Wats., type from southern Utah; *L. capitatus* Greene]. Annual, 6–24 cm tall, from a taproot; cotyledons sessile; stems with 2 or more apparent internodes; leaves mainly cauline; petioles 0.8–3.5 cm long; leaflets 5–7, 7–23 mm long, 2–6.5 mm wide, oblanceolate, flat or folded, long-pilose on both surfaces or glabrous medially above or overall; peduncles 0–9.5 cm long; racemes 5– to 12-flowered, 1–2.3 cm long at anthesis, the axis 1.8–3.7 cm long in fruit; flowers 7.8–9.2 mm long, blue purple or less commonly pallid; calyx somewhat gibbous at base of upper lip; banner with a central yellow spot, glabrous dorsally, reflexed below the midpoint; ovules usually 2. Two varieties are present.

1. Racemes sessile, the peduncles obsolete, contained within the foliage *L. kingii* var. *argillaceus*
- Racemes pedunculate, the peduncles 1–9.5 cm long, commonly produced beyond the foliage *L. kingii* var. *kingii*

Var. *argillaceus* (Woot. & Standl.) C. P. Sm. [*L. argillaceus* Woot. & Standl.]. Pinyon-juniper community at 2400 m in the Henry Mts., Garfield County; New Mexico; 1 (0).

Var. *kingii* Sagebrush, pinyon-juniper, mountain brush, and ponderosa pine communities at 1830 to 2440 m in Garfield, Iron, Kane, Piute, San Juan, Sevier, Wasatch (type from Heber Valley), and Washington counties; Nevada, Arizona, New Mexico, and Colorado; 45 (vii).

***Lupinus latifolius* Agardh** Broad-leaved Lupine. Perennial, 3–12 dm tall, from a branching caudex; pubescence appressed strigose or almost lacking; leaves mainly cauline; petioles 4–20 cm long; leaflets 5–11, 25–90 mm long, 4–20 mm wide, oblong to elliptic or oblanceolate, flat, glabrous above, thinly appressed-strigose beneath; racemes 10– to 35-flowered, 8–25 cm long at anthesis, 10–40 cm long in fruit; flowers 10–14 mm long, blue to pinkish, fading brown; pedicels 6–12 mm long; calyx not gibbous at the base; banner with a central yellow spot; glabrous dorsally, reflexed below the midpoint; ovules 7–10. Oakbrush and streamside communities at 1230 m in Washington (Zion National Park) County; California, Oregon, Washington. Our materials appear to belong to var. *columbianus* (Heller) C. P. Sm. [*L. columbianus* Heller; *L. leucanthus* Rydb., type from Springdale; *L. latifolius* ssp. *leucanthus* (Rydb.) Kenney & Dunn]; 2 (0).

***Lupinus lepidus* Dougl.** Stemless Lupine. Perennial, 2.5–40 cm tall, caespitose from a branching caudex, acaulescent or subacaulescent to short-caulescent; leaves mainly basal; petioles 1–10 cm long; leaflets 5–9, 3–40 mm long, 1.5–9 mm wide, oblanceolate to elliptic, flat or folded, mucronate, pilose on both surfaces, or less so above; peduncles 0–3 cm long; racemes 12– to 85-flowered, 1–23 cm long at anthesis, the axis 2–30 cm long in fruit; flowers 7–14 mm long, blue purple or white; pedicels 1–4 mm long; calyx tapering to the petiole or only somewhat gibbous at base of upper lip; banner with a central yellow spot, glabrous dorsally, reflexed at or below the midpoint; ovules 2–4. Two markedly distinctive varieties are present in Utah.

1. Plants low, 3–12 cm tall; racemes sessile, surpassed by the foliage; distribution montane *L. lepidus* var. *utahensis*
- Plants 15–40 cm tall, racemes typically short-pedunculate, much surpassing the foliage; plants of lower elevations in western Iron and Washington counties *L. lepidus* var. *aridus*

Var. *aridus* (Dougl.) Jepson Rolled Lupine. [*L. aridus* Dougl. ex Lindl.; *L. volutans* Greene]. Sagebrush and pinyon-juniper communities at 1670 to 1850 m in southwestern Iron and northwestern Washington counties; Washington, Oregon, and Nevada; 8 (i).

Var. *utahensis* (Wats.) C. L. Hitchc. [*L. aridus* var. *utahensis* Wats., type from Parleys Park, Summit County; *L. watsonii* Heller, type from Parleys Park; *L. caespitosus* var. *utahensis* (Wats.) B. Cox; *L. caespitosus* Nutt. in T. & G.; *L. lepidus* ssp. *caespitosus* (Nutt.)

Detl.], Meadows, open deciduous woodland, mixed conifer, and sagebrush communities at 2130 to 3350 m in Beaver, Cache, Carbon, Daggett, Emery, Garfield, Grand, Iron, Kane, Millard, Piute, Rich, Salt Lake, Sanpete, Sevier, Uintah, Utah, Wasatch, Washington and Wayne counties; Idaho and Montana, south to California, Nevada, and Colorado; 68 (xxii). It is with some reluctance that I accept the conservative treatment presented herein instead of the more liberal earlier presentation (Welsh 1978). Consideration is here given to the broader problems of interpretation of *Lupinus* as it exists in the western states. The concepts included herein support ideology elsewhere within the Leguminosae. Historical accidents of previous approaches have been largely overcome by David Dunn and his students. Hopefully, the present treatment represents a further step in reducing the problems of this amazing group of plants.

Lupinus leucophyllus Dougl. ex Lindl. White-leaved Lupine. [*L. catananus* C. P. Sm., type from Hailstone, Wasatch County]. Perennial, 40–90 cm tall or more, from a woody caudex; pubescence of stems dense, appressed to spreading; leaves mainly cauline; petioles 1.2–16 cm long; leaflets 7–10, 9–70 mm long, 3–13 mm wide, oblanceolate, flat or folded, villous-pilose on both surfaces; peduncles 2.5–5.5 cm long; racemes 22– to 70-flowered, 7–18 cm long in anthesis, the axis 8–19 cm long in fruit; pedicels 2.5–5 mm long; flowers 10–15 mm long, blue purple or less commonly pallid; calyx gibbous to saccate-gibbous at base of upper lip; banner with a central yellow spot, densely hairy dorsally, reflexed above the midpoint; ovules 4–6. Sagebrush, grass, and riparian communities at 1450 to 2300 m in Duchesne, Morgan, Summit, Uintah, and Wasatch counties; Washington south to Nevada and east to Wyoming; 13 (iv). This lupine forms apparent hybrids with *L. caudatus* and *L. sericeus*.

Lupinus polyphyllus Lindl. Showy Lupine. Plants perennial, 13–70 cm tall, from a subterranean to superficial caudex; pubescence of stems spreading-hirsute to hirsute-pilose or appressed-ascending; leaves mainly basal or basal and cauline; petioles of lowermost leaves 3.5–30 cm long; leaflets 8–13, 12–75 mm long, 1.2–7 mm wide, oblanceolate to obovate, plane or folded, pilose beneath, glabrous above or pilose on both sides; peduncles 3.5–13 cm long; racemes 13– to 68-flowered, 6–25 cm long in anthesis, 8–36 cm long in fruit; flowers 10–16 mm long, blue purple or rarely white; pedicels 3–9 mm long; calyx gibbous or saccate-spurred at base of upper lip; banner with a central yellow or white spot, glabrous dorsally, reflexed near or above the midpoint; wings glabrous; keel sparingly ciliate near the apex; ovules 3–7. Three distinctive varieties are present in Utah.

1. Stems from a subterranean caudex; plants of San Juan and Grand counties *L. polyphyllus* var. *ammophilus*
- Stems from a superficial caudex; plants of Uintah and Kane counties or from western Utah 2
- 2(1). Leaflets silky-strigose on both surfaces; petioles of basal leaves only somewhat (if at all) longer than the cauline ones; plants of Duchesne, Uintah, Garfield, and Kane counties *L. polyphyllus* var. *humicola*
- Leaflets glabrous above or essentially so; petioles of basal leaves markedly longer than the cauline ones; plants of Juab, Millard, Tooele, and Utah counties *L. polyphyllus* var. *prunophilus*

Var. *ammophilus* (Greene) Barneby Sand Lupine. [*L. ammophilus* Greene]. Sagebrush, pinyon-juniper, mountain brush, ponderosa pine, and aspen-Douglas fir woods, commonly in sandy soils, at 1830 to 2730 m in Grand and San Juan counties; Colorado and New Mexico; 12 (iv).

Var. *humicola* (A. Nels.) Barneby [*L. humicola* A. Nels.; *L. wyethii* Wats.]. Wash bottoms and terraces or rimrock in pinyon-juniper and riparian communities at 1470 to 1900 m in Duchesne, Garfield, Kane, and Uintah Counties; British Columbia and Alberta south to California, Nevada, and Colorado; 10 (iii).

Var. *prunophilus* (Jones) Phillips Robinson Lupine. [*L. prunophilus* Jones, type from Robinson, Juab County; *L. wyethii* var. *prunophilus* (Jones) C. P. Sm.; *L. arcticus* var. *prunophilus* (Jones) C. P. Sm.; *L. tooeleensis* C. P. Sm., type from Johnson Canyon, Deep Creek Mts.]. Sagebrush, pinyon-juniper, and mountain brush communities at 1530 to 2130 m in Juab, Millard, Tooele, and Utah counties; Washington to Nevada, east to Montana, Wyoming, and Colorado; 21 (iv).

Lupinus pusillus Pursh Dwarf Lupine. Annual, 3–24 cm tall, from a taproot; cotyledons sessile; pubescence of stems and petioles spreading long-hairy; leaves mainly cauline; petioles 1–9 cm long; leaflets 3–9 (14), 11–48 mm long, 2–10 mm wide, oblanceolate, flat or folded, long-pilose beneath, glabrous above; peduncles 0.5–3.5 cm long; racemes 4– to 38-flowered, 1–17 cm long in anthesis, the axis 4–21 cm long in fruit; flowers 8.5–12 mm long, blue or variously pink or white; pedicels 1–3.5 mm long; calyx tapering to the pedicel; banner with a central yellow spot, glabrous dorsally, reflexed near the midpoint; ovules 2; pods constricted between the seeds. Blackbrush, mixed desert shrub, pinyon-juniper, and mountain brush communities, commonly in sand, at 800 to 1970 m in Beaver, Daggett, Duchesne, Emery, Garfield, Grand, Kane, Juab, Millard, San Juan, Tooele, Uintah, and Wayne counties; Washington to Alberta and Saskatchewan south to Oregon, Nevada, Arizona, New Mexico, and Kansas; 177 (xxix). Three more or less completely intergrading varieties have been recognized from among our specimens. Plants with short peduncles, seldom more than 1 cm long have been designated as var. *intermontanus* (Heller) C. P. Sm. Those with elongate peduncles and glabrous calyx tube and pedicels are var. *rubens* (Rydb.) Welsh [*L. rubens* Rydb., type from St. George], and those with pilose calyx tube and pedicels are var. *pusillus*. They do seem to represent trends within the variation, and there is some geographical basis for them. However, there is poor geographic correlation and sufficient intergradation as to make segregation of the materials moot.

Lupinus sericeus Pursh Silky Lupine. Perennial, 3–12 dm tall, from a branching caudex; pubescence of stems short-villous to pilose or strigose, sometimes spreading; petioles 1.2–9 cm long; leaflets 5–9, 7–78 mm long, 2–15 mm wide, oblanceolate, commonly flat (at least some), pilose to puberulent on both surfaces or glabrous to glabrate above; peduncles 1.3–9 (12) cm long; racemes 14– to 70-flowered, 6–28 cm long in anthesis, the axis 8–37 cm long in fruit; flowers 10–16 mm long, blue, blue purple, pale, or white; pedicels 2–7 mm long; calyx more or less gibbous at the base of the upper lip; banner with yellow or brown eyespot, strigose along the dorsal crest or more widely; ovules 5–7; 2n = 48. Widely distributed in Utah, and constituting with *L. argenteus* and *L. caudatus*

one of three important species complexes in Utah. They occupy most of the range of perennial lupines in the state. Four more or less completely confluent varieties are recognized.

1. Stems with spreading to retrorse hairs; flowers pale or blue; plants of Washington County *L. sericeus* var. *jonesii*
- Stems with appressed or ascending hairs, the hairs seldom if ever spreading to retrorse 2
- 2(1). Flowers white in populations, the eyespot and veins commonly dark brown or fading dark brown; plants mostly from Sevier County southward *L. sericeus* var. *barbiger*
- Flowers commonly blue or blue purple in populations, intergrading with the preceding when in contact, the eyespot yellow or brown 3
- 3(2). Leaflets sparingly pubescent to glabrous above; plants mostly of central southern Utah; intergrading with the following *L. sericeus* var. *marianus*
- Leaflets uniformly puberulent to pilose above; plants of broad distribution *L. sericeus* var. *sericeus*

Var. *barbiger* (Wats.) Welsh Sink Lupine. [*L. barbiger* Wats., type from Kane County]. Sagebrush and mountain brush communities at 1930 to 2730 m in Garfield, Kane, Piute, Sevier, Washington and Wayne counties; endemic; 40 (xvii).

Var. *jonesii* (Rydb.) Welsh Jones Lupine. [*L. jonesii* Rydb., type from Silver Reef, Washington County]. Pinyon-juniper and oak-ponderosa pine communities at ca 2000 m in southwestern Kane and Washington Counties; endemic; 8(i).

Var. *marianus* (Rydb.) Welsh Marysvale Lupine. [*L. marianus* Rydb., type from Bullion Creek, Piute County; *L. sericeus* ssp. *marianus* (Rydb.) Fleak & Dunn]. Sagebrush, pinyon-juniper, mountain brush, ponderosa pine, aspen, and spruce-fir communities at 1770 to 2870 m in eastern Beaver, Garfield, Piute (type from Bullion Creek), and Sevier counties; endemic; 15 (vi).

Var. *sericeus* [*L. aegra-ovium* C. P. Sm., type from Salina Canyon; *L. huffmanii* C. P. Sm., type from Salina Canyon; *L. sericeus* ssp. *huffmanii* (C. P. Sm.) Fleak & Dunn; *L. larsonianus* C. P. Sm., type from Salina Canyon; *L. purpoviridis* C. P. Sm., type from Salina Canyon vicinity; *L. rickeri* C. P. Sm., type from Salina Canyon; *L. egglestonianus* C. P. Sm.; *L. salinensis* C. P. Sm., type from Salina Canyon; *L. flexuosus* Lindl.; *L. sericeus* var. *flexuosus* (Lindl.) C. P. Sm.]. Sagebrush, mountain brush, pinyon-juniper, ponderosa pine, aspen, spruce-fir, and alpine meadow communities at 1770 to 3130 m in Beaver, Cache, Carbon, Davis, Duchesne, Emery, Garfield, Grand, Juab, Kane, Millard, Piute, Salt Lake, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, Wayne, and Weber counties; British Columbia east to Alberta, south to California, Arizona, and New Mexico; 109 (xxxvii).

Lupinus sparsiflorus Benth. Mohave Lupine. Annual, 9–45 cm tall, from a taproot; cotyledons sessile; pubescence of stems appressed or ascending, of two lengths; leaves mainly cauline; petioles 1.4–8 cm long; leaflets 5–9, 5–35 mm long, 1–4 mm wide, elliptic-oblong to oblanceolate, flat or folded, long-pilose on both surfaces, less densely hairy above; peduncles 1.3–5 cm long; racemes 8– to 46–flowered, 4–23 cm long in anthe-

sis, the axis 6–29 cm long in fruit; flowers 8.5–11 mm long, blue purple or rarely white; pedicels 2–5 mm long; calyx gibbous at base of upper lip; banner with a central yellow spot, glabrous dorsally, reflexed beyond the mid-point; ovules 4–6. Joshua tree, creosote bush, and mixed warm desert shrub communities, often on riparian gravels, at 670 to 1100 m in Washington County; Arizona, Nevada, California, and Mexico; 23 (vii).

Medicago L.

Annual or perennial herbs, caulescent from a taproot or caudex; leaves alternate, pinnately trifoliate, the leaflets serrate in the distal half or less; stipules herbaceous, often toothed; flowers papilionaceous, borne in axillary, pedunculate racemes or heads; bracts subulate; calyx 5-toothed; petals 5, yellow, white, blue, pink, lavender, or purple; stamens 10, diadelphous; ovary enfolded by the staminal sheath, the style subulate, irritable; pods curved to spirally coiled, 1– to several-seeded, indehiscent, reticulate or spiny.

1. Flowers 2–3 mm long; inflorescence less than 10 mm long in anthesis; pods coiled through a single spiral, 1-seeded, unarmed; plants annual, prostrate to decumbent or rarely erect *M. lupulina*
- Flowers 4–10 mm long; inflorescence longer than 10 mm (including flower length), or pods differing from above; plants various 2
- 2(1). Flowers 4–5 mm long, yellow, 2–5 per raceme; racemes less than 10 mm long; pods armed with prickles, several-seeded; plants annual *M. polymorpha*
- Flowers 6–10 mm long, yellow or blue, lavender, pink, purple, or white, 6 to many on at least some racemes; racemes longer than 10 mm; pods unarmed, several-seeded; plants typically perennial 3
- 3(2). Flowers yellow (sometimes tinged violet); pods merely curved; plants uncommon *M. falcata*
- Flowers blue, pink, lavender, purple, or white; pods spirally coiled; plants common *M. sativa*

Medicago falcata L. Yellow Alfalfa. Perennial (rarely functionally annual), 4–10 dm tall or more, the stems erect or ascending, strigulose; stipules 4–12 mm long, persistent, conspicuously veined; leaves short-petiolate, the leaflets linear, oblong, oblanceolate, or elliptic, 6–20 mm long, 1–6 (10) mm wide, few-toothed, tridentate, or merely apiculate apically, strigulose beneath; peduncles subequal to the subtending leaves or longer; racemes 6– to 20–flowered, mostly 10–20 mm long; flowers 6–9 mm long, yellow, sometimes suffused with violet; calyx campanulate, the tube 1–2 mm long, the teeth 1.5–3 mm long, lance-subulate; pods 6–10 mm long, merely curved, unarmed, several-seeded; $2n = 16, 32$. Sparingly cultivated forage plant, escaping and persisting; introduced from the Old World; 3 (ii). This plant forms hybrids with *M. sativa*, and is sometimes considered a phase of that species.

Medicago lupulina L. Black Medick; Hop Clover. Annual, the stems prostrate to decumbent or sometimes erect, 10–40 cm long; stipules entire or nearly so, 3–6 mm long, persistent; leaves short-petiolate, the leaflets cuneate to orbiculate, 4–15 mm long, 2–12 mm wide, toothed in the apical 1/3 (rarely more), pubescent to glabrous; peduncles mostly equaling or surpassing the subtending leaves; racemes 6– to 25–flowered, less than 25 mm long in fruit; flowers 2–3 mm long, yellow; calyx

campanulate, about 1 mm long; pods spiral through ca 1 coil, unarmed, 1-seeded; 2n = 16, 28, 32. Introduced weedy species of lawns, fields, and other open sites in practically all of Utah; introduced from Europe; 49 (v).

Medicago polymorpha L. Bur Clover. [*M. hispida* Gaertn.]. Annual, the stems prostrate to erect, 1-4 dm long; stipules deeply divided into long teeth, mostly 3-7 mm long; leaves short-petiolate, the leaflets cuneate to obovate or obovate, 10-25 mm long, 6-18 mm wide, toothed into the apical 1/3 or more, pubescent to glabrous; peduncles mostly shorter than the subtending leaves; racemes 2- to 5-flowered, less than 10 mm long; flowers 4-5 mm long, yellow; calyx campanulate, the tube 1-1.5 mm long, the lance-subulate teeth 1-2 mm long; pods spirally coiled, armed with spines, several-seeded; 2n = 14, 16. Rare weedy species of cultivated land in Utah, but to be expected almost anywhere; introduced from Europe; 1 (0).

Medicago sativa L. Alfalfa; Lucern. Perennial, or functionally annual, the stems 4-12 dm long or more, ascending to erect, finally sprawling, strigulose; stipules entire or toothed, 4-12 mm long, persistent; leaves short-petiolate, the leaflets elliptic to oblanceolate, 8-40 mm long, 2-15 mm wide, apically few-toothed, pubescent; peduncles often surpassing the subtending leaves; racemes 6- to 25-flowered, 10-35 mm long or more; flowers 6-10 mm long, blue, lavender, pink, purple, or white; calyx campanulate to short-cylindric, the tube 1.5-2.5 mm long, the lance-subulate teeth 2-4 mm long; pods spirally coiled, unarmed, several-seeded; 2n = 16, 32, 64. Introduced forage plant, escaping and persisting, now almost or quite cosmopolitan at moderate and lower elevations in Utah; introduced from Europe. This is possibly the most important single forage species in Utah. It has been grown since antiquity in the Old World.

Melilotus L.

Plants annual or biennial herbs, caulescent, from a stout taproot; leaves alternate, pinnately trifoliolate, the leaflets dentate-serrate in the distal half or more; stipules herbaceous, distinct, subulate, entire or hastately lobed; flowers papilionaceous, borne in axillary, pedunculate racemes; bracts subulate; calyx 5-toothed; petals 5, white or yellow, the keel obtuse; stamens 10, diadelphous; ovary enclosed by the staminal sheath, the style subulate, not irritable; pods straight, ovoid, reticulately veined or cross-ribbed, unarmed, glabrous, 1- to 2-seeded, indehiscent; x = 8.

- 1. Flowers 2-3 mm long, yellow; pedicels less than 1 mm long; plants of Washington County *M. indicus*
- Flowers 3-7 mm long, white or yellow; pedicels 1-2 mm long; plants widespread 2
- 2(1). Flowers white; pods reticulately veined *M. albus*
- Flowers yellow; pods cross-ribbed *M. officinalis*

Melilotus albus Desr. ex Lam. White Sweet-clover. Annual or biennial, the stems commonly 5-15 dm tall or more, erect, strigulose; stipules entire or hastately lobed, mostly 5-10 mm long, persistent; leaves short-petiolate, the leaflets obovate to elliptic or oblanceolate, 8-35 mm long, 1-15 mm wide, pubescent or glabrous; peduncles commonly surpassing the subtending leaves; racemes 38- to 115-flowered, 2.8-12.5 cm long or more; flowers 4-5.5 mm long, white; calyx campanulate, the tube

1.2-1.8 mm long, the teeth 1-1.5 mm long, acuminate; pods 2.5-6 mm long, reticulately veined, 1- to 2-seeded; 2n = 16. Introduced forage plant, now widely established at 1065 to 2135 m in Beaver, Box Elder, Cache, Daggett, Emery, Garfield, Grand, Juab, Kane, Millard, Salt Lake, San Juan, Sanpete, Sevier, Tooele, Uintah, Utah, Washington, and Wayne counties; introduced from Europe; 66 (xii). This plant is an excellent source of honey for domestic bees. The plants contain coumarin, and are responsible for bloat and subsequent death in livestock.

Melilotus indicus (L.) All. India Sweet-clover. [*Trifolium melilotus-indica* L.]. Annual or winter annual, the stems 2-8 dm tall, erect, glabrous or strigose; stipules lance-subulate, 4-6 mm long, persistent; leaves short-petiolate, the leaflets obovate to oblanceolate or elliptic, 7-30 mm long, 3-14 mm wide, glabrous; peduncles shorter to longer than the subtending leaves; racemes 21- to 43-flowered, 8-30 mm long; flowers 2-3 mm long, yellow (fading white); calyx campanulate, the tube 0.6-0.8 mm long, the teeth 0.5-0.7 mm long, triangular; pods 1.5-2 mm long, reticulately veined, 1-seeded; 2n = 16. Adventive weedy species at 820 to 915 m in Washington County; introduced from Eurasia; 4 (0).

Melilotus officinalis (L.) Pallas Yellow Sweet-clover. [*Trifolium melilotus-officinalis* L.]. Annual, winter annual, or biennial, the stems 5-15 dm tall or more, erect, strigulose; stipules entire or with 1-3 basal teeth, 3-10 mm long, persistent; leaves shortly petiolate, the leaflets cuneate to elliptic or oblanceolate, 8-38 mm long, 3-16 mm wide, pubescent or glabrous; peduncles shorter to longer than the subtending leaves; racemes 20- to 65-flowered, 1.8-11 (14) cm long; flowers 4.5-6 (7) mm long, yellow, fading cream; calyx campanulate, the tube 1-1.8 mm long, the teeth 1-1.5 mm long, acuminate; pods 3-5 mm long, cross-ribbed, 1- or 2-seeded; 2n = 16. Common ruderal weed of almost cosmopolitan distribution at 1220 to 2440 m in probably all Utah counties; introduced from Europe; 83 (xiii).

Onobrychis Adanson

Perennial herbs, caulescent, from a caudex and taproot; leaves alternate, odd-pinnate; stipules adnate to the petiole base, the lowermost amplexicaul but not connate; flowers papilionaceous, in axillary racemes, each subtended by a bract; bracteoles 2; calyx 5-toothed; petals 5, red purple to lavender or pink, the keel much longer than the wings, abruptly bow shaped; stamens 10, essentially diadelphous; ovary enclosed in the staminal sheath, the style glabrous; loment reduced to 1 segment, this armed with prickles.

Onobrychis viciifolia Scop. Sainfoin; Holy Clover. [*Hedysarum onobrychis* L.; *O. onobrychis* (L.) Rydb.; *O. sativa* Lam.]. Perennial, caulescent, 20-45 cm tall, from a branching, superficial caudex; stems ascending to erect; stipules 3-12 mm long, all more or less amplexicaul; leaves 3-12 mm long; leaflets 11-21 (27), 8-25 mm long, 2-7 mm wide, oblong to elliptic or oblanceolate, pilose mainly along veins beneath, glabrous above; peduncles 8-19 cm long; racemes 14- to 39 (50) -flowered, the flowers ascending-spreading at anthesis, the axis 4-14 cm long in fruit; bracts 2.5-4.5 mm long; pedicels 0.2-1.5 mm long; bracteoles 1; calyx 5.5-6.5 mm long, the tube 2.3-3 mm long, campanulate, the teeth 2.2-4 mm long, subulate; flowers 10-13 mm long, red purple,

lavender, or pink; loment sessile, ascending, armed with prickles; $2n = 28$. Introduced forage plant, escaping and persisting in Juab, Millard, Rich, Salt Lake, Sanpete, Summit, and Utah counties; native to Europe; 10 (i). The genus is closely allied to *Hedysarum* (q. v.).

Oxytropis DC.

Perennial, caulescent, or acaulescent herbs, from a taproot and caudex; leaves alternate or basal, odd-pinnate; stipules adnate to the petiole base, often connate-sheathing; flowers papilionaceous, scapose or borne in axillary racemes, each subtended by a single bract; bracteoles 0 (rarely 2); calyx 5-toothed; petals 5, pink, pink purple, or white, the keel shorter than the wings, the keel-tip produced into a porrect beak; stamens 10, diadelphous; ovary enfolded in the staminal sheath, the style glabrous; pods sessile or stipitate, straight, erect, ascending, or spreading-declined, 1- or 2-loculed, or partially 2-loculed by intrusion of the ventral (upper) suture, dehiscent apically or throughout; $x = 8$.

Barneby, R. C. 1952. A revision of the North American species of *Oxytropis* DC. Proc. California Acad. Sci. IV. 27: 177-312.

- 1. Plants shortly caulescent; stipules only somewhat adnate to the petioles; flowers 5-9 mm long; pods spreading-declined *O. deflexa*
- Plants acaulescent, scapose; stipules adnate to the petioles through half their length or more; flowers commonly more than 9 mm long; pods erect or ascending 2
- 2(1). Bracts, calyx teeth, pods, and sometimes other plant parts glandular-viscid; flowers either pink-purple or cream *O. viscida*
- Bracts, calyx teeth, pods, and other plant parts pilose to villousulose, but not at all glandular-viscid 3
- 3(2). Racemes 1- to 5-flowered, subcapitate 4
- Racemes 6- to many-flowered, the axis elongate, only rarely subcapitate 7
- 4(3). Calyx swollen at full anthesis, becoming inflated and finally enclosing the pod; pods rarely longer than 10 mm; plants of Daggett and Duchesne counties *O. multiceps*
- Calyx campanulate, not turgid, not becoming inflated or enclosing the fruit, at length rupturing along one side; pods often over 10 mm long 5
- 5(4). Pods oblong-ellipsoid, not inflated, leathery in texture; flowers 1-4; plants of mountain summits in north central to southern Utah *O. parryi*
- Pods ovoid, inflated, papery in texture; flower number various; plants distributed variously 6
- 6(5). Flowers 6-12 mm long; leaflets 7-17; plants of limestone, gravel, and basalt in southern Utah *O. oreophila*
- Flowers (11) 14-17 mm long; leaflets 3-7; plants of shale and limestone in eastern, central, and southern Utah *O. jonesii*
- 7(3). Plants dwarf, seldom over 10 cm tall; flowers 6-12 mm long; growing in limestone, gravel, and basalt in southern Utah *O. oreophila*
- Plants mainly over 10 cm tall, flowers 14-27 mm long; growing on various substrates and with distribution various but seldom as above 8
- 8(7). Petals bright pink purple 9
- Petals white or ochroleucous to yellowish 10

- 9(8). Pubescence of basifixed hairs; calyx somewhat swollen and accrescent; plants of Daggett County ... *O. besseyi*
- Pubescence of malpighian hairs; calyx not swollen or enlarged; plants of wide distribution *O. lambertii*
- 10(8). Wing petals dilated apically, at least 5 mm wide; plants broadly distributed *O. sericea*
- Wing petals not especially dilated, less than 5 mm wide; plants known from the north slope of the Uinta Mts. *O. campestris*

***Oxytropis besseyi* (Rydb.) Blank.** Bessey Locoweed. [*Aragallus besseyi* Rydb.]. Caespitose, acaulescent, 8-28 cm tall; pubescence basifixed, silky pilose to subtomentose; stipules pilose-tomentose; leaves 6-20 cm long; leaflets 11-13 (25), 6-25 mm long, 2-6 mm wide, lanceolate to lance-oblong or elliptic, silky-pilose; scapes 6-19 cm long, subtomentose; racemes 8- to 22-flowered, the flowers spreading-ascending at maturity, the axis 2.5-8 cm long in fruit; bracts silky-pilose; flowers 18-25 mm long, brilliant pink purple; calyx 10-13 mm long, the tube swollen at anthesis, 7.5-9.5 mm long, the teeth 2.5-4 mm long, lance-subulate; pods sessile or nearly so, strongly inflated, the body ovoid, 5-8 mm thick, semi-bilocular, densely villous. Two varieties occur in Utah.

- 1. Scapes much surpassing even the longer leaves; leaflets mainly 5-9; pods 4-6 mm thick *O. besseyi* var. *ventosa*
- Scapes only somewhat surpassing the leaves; leaflets mainly 9-15 or more; pods 5-8 mm thick *O. besseyi* var. *obnapiformis*

Var. *obnapiformis* (C. L. Porter) Welsh [*O. obnapiformis* C. L. Porter; *O. nana* var. *obnapiformis* (C. L. Porter) Isely]. Pinyon-juniper community at 1765 to 2105 m in Daggett County; Wyoming and Colorado; 10 (i).

Var. *ventosa* (Greene) Barneby [*Aragallus ventosus* Greene; *O. nana* var. *ventosa* (Greene) Isely]. Sagebrush-grass and pinyon-juniper communities at 1750 to 1922 m in Daggett County; Wyoming; 4 (i).

***Oxytropis campestris* (L.) DC.** Yellow Locoweed. [*Astragalus campestris* L.]. Caespitose, acaulescent, 4-18 cm tall; pubescence basifixed, mainly pilose; stipules glabrous or sparingly pilose; leaves 1.5-12 cm long; leaflets 7-17, 3-23 mm long, 1-6 mm wide, oblong to lanceolate or obovate; scapes 2.5-15 cm long, pilose to glabrate; flowers 14-20 mm long, ochroleucous; calyx 7-10 mm long, the tube cylindrical, the teeth 1.5-3 mm long, triangular-subulate; pods 8-18 mm long, erect, sessile or subsessile, pilose, partially bilocular by intrusion of the ventral suture. Meadows and open woods at 2270 to 2600 m in Summit County (Goodmans Ranch, Bear River, E. & L. Payson 4868 POM); Oregon, Washington, Idaho, Montana, and Colorado. The range as given is for var. *cusickii* (Greenman) Barneby [*O. cusickii* Greenman]. The species proper is circumboreal.

***Oxytropis deflexa* (Pallas) DC.** Stemmed Oxytrope. [*Astragalus deflexus* Pallas]. Shortly caulescent to subacaulescent, (5) 7-48 cm tall; pubescence basifixed, villous-pilose; leaves 2-20 cm long; leaflets 23-41, 3-24 mm long, 1-7 mm wide, lance-oblong to lanceolate, pilose on both surfaces, quite sessile; peduncles 3.5-32 cm long, villous-pilose; racemes 3- to 25-flowered, the flowers ascending to declined at anthesis, the axis 3.5-10 cm long in fruit; bracts pilose; flowers 5-10.5 mm long, whitish, lilac, or blue purple; calyx 4-8 mm long, the tube 2-3.5 (4.2) mm long, campanulate, the teeth 1.5-5 mm

long, lance-subulate; pods spreading-declined, subsessile to shortly stipitate, the body oblong to ellipsoid, 8–18 mm long, 3–4.5 mm wide, subunilocular, pilosulous. Two rather distinctive varieties occur in Utah.

- 1. Plants subcaulescent; flowers 9–10.5 mm long, blue-purple; racemes 15–22 mm broad at anthesis; high elevations in the Uinta Mts. *O. deflexa* var. *deflexa*
- Plants commonly short caulescent; flowers 5–9 mm long, whitish, lilac, or blue purple; racemes commonly less than 17 mm wide at anthesis; moderate elevations, wide-spread *O. deflexa* var. *sericea*

Var. *deflexa* Alpine meadows at 2750 to 3350 m in Daggett, Duchesne, and Summit counties; Colorado and north to the Yukon; Asia; 11 (0). The North American material here assigned to var. *deflexa* might well represent a distinct taxon.

Var. *sericea* T. & G. Moist meadows, streambanks, and gravel bars in aspen, mixed conifer, and sagebrush communities at 2430 to 3050 m in Emery, Garfield, Grand, Iron, Sanpete, Sevier, Summit, Uintah, and Wayne counties; Alaska and Yukon south to California, New Mexico, and North Dakota; 21 (vi).

Oxytropis jonesii Barneby Jones Oxytrope. Acaulescent, densely pulvinate-caespitose; pubescence basifixed, villous-pilose; leaves 0.7–3 cm long; leaflets 1–7, 2–11 mm long, 1–3.5 mm wide, lanceolate to lance-oblong, pilose to strigose on both surfaces, quite sessile; scapes 0–3.5 cm long, villous-pilose; racemes 1– to 5-flowered, the flowers ascending at fruit; bracts pilose; flowers (11) 14–16.5 mm long, pink purple; calyx 7.5–9.5 mm long, the tube shortly cylindrical, 4.5–7 mm long, the teeth 1.5–3 mm long, triangular to subulate; pods sessile or subsessile, erect, bladderly-inflated, 14–25 mm long, 8–13 mm wide (when pressed), semibilocular, villous-pilose. Ponderosa pine, western bristlecone pine, and mixed desert shrub communities on Flagstaff Limestone, Pink Limestone member of Wasatch Formation, and on Green River Shale, at 1930 to 2430 m in Emery, Garfield (type from Red Canyon), Grand, Iron, Sanpete, and Uintah counties; endemic; 27 (vi). The Jones oxytrope is probably better treated as a variety of *O. oreophila*, but no such combination is intended or implied herein.

Oxytropis lambertii Pursh Lambert Locoweed. [*O. lambertii* var. *bigelovii* Gray; *Aragallus bigelovii* (Gray) Greene; *Astragalus lambertii* var. *bigelovii* (Gray) Tidestr.; *Aragallus metcalfei* Greene; *A. knoultonii* Greene; *A. patens* Rydb.; *O. patens* (Rydb.) A. Nels.; *O. bilocularis* A. Nels.]. Caespitose, acaulescent, (10) 14–50 cm tall; pubescence malpighian, strigose; stipules pilose; leaves 3–24 cm long; leaflets 7–13, 7–45 mm long, 2–8 mm wide, lanceolate to oblong or linear; scapes 4–28 cm long, strigose; racemes 8– to 40-flowered, the flowers ascending at anthesis, the axis 3–23 cm long in fruit; bracts strigose; flowers 17–25 mm long, pink purple; calyx 6.5–10 mm long, the cylindrical tube 4.5–7.5 mm long, the teeth 1.5–4.5 mm long, subulate; pods sessile or shortly stipitate, erect or ascending at maturity, cylindrical to lance-acuminate in outline, the body 15–27 mm long, 2.5–6 mm thick, bilocular, strigose to strigulose. Mixed desert shrub, pinyon-juniper, sagebrush, and grass communities at 1230 to 2730 m in Carbon, Duchesne, Emery, Garfield, Kane, San Juan, Sanpete, Sevier, Wasatch, and Wayne counties; Saskatchewan and Manitoba to Arizona and New Mexico; 75 (xv). Our material

belongs to var. *bigelovii* Gray. In places where *O. lambertii* contacts *O. sericea*, hybrid swarms of great variability and beauty occur. No such extensive hybrid populations are known for Utah, possibly because the points of contact between the species are few or non-existent.

Oxytropis multiceps T. & G. Rocky Mountain Oxytrope. [*Spiesia multiceps* (T. & G) Kuntze; *Aragallus multiceps* (T. & G.) Heller; *Astragalus bisontum* Tidestr.; *O. multiceps* var. *minor* Gray; *Aragallus multiceps* var. *minor* (Gray) A. Nels.; *A. minor* (Gray) Cockerell ex Daniels; *O. minor* (Gray) Cockerell; *Astragalus bisontum* var. *minor* (Gray) Tidestr.]. Caespitosae, acaulescent, pulvinate; pubescence basifixed, silky pilose; stipules amplexicaul but distinct, silky-pilose; leaves 1–5 cm long; leaflets 5–9, 3–13 mm long, 1–4 mm wide, lanceolate to elliptic, oblong, or oblanceolate, silky-pilose; scapes 1–4 cm long, long-villous; racemes 1– to 4-flowered, the flowers ascending-spreading at anthesis, the axis to 0.5–1 cm long in fruit; bracts thinly pilose; flowers 17–24 mm long, bright pink purple; calyx 7–13 (20) mm long, the tube swollen at anthesis, becoming bladderly-inflated and investing the fruit at maturity, 5.5–10 mm long (8–18 mm in fruit), the teeth 2–3 mm long, triangular-subulate; pods included within the swollen calyx, stipitate, the stipe 0.5–1.5 mm long, the ovoid-ellipsoid body 6–10 mm long, 3–5 mm wide, subunilocular, short-villous. Pinyon-juniper and ponderosa pine communities at 1830 to 2270 m in Daggett and Duchesne counties; Wyoming, Colorado, and Nebraska; 5 (0).

Oxytropis oreophila Gray Mountain Oxytrope. Caespitose, acaulescent, often densely pulvinate, 1–14 (23) cm tall; pubescence basifixed, silky-pilose; stipules silky-pilose; leaves 0.5–8.5 cm long; leaflets (5) 7–17, 1–15 mm long, 0.5–4 mm wide, lanceolate, elliptic, oval, or ovate, pilose; scapes 0–12 (21) cm long, pilose to hirsute; racemes (1) 2– to 12-flowered, the flowers ascending-spreading at anthesis, the axis to 1 cm long in fruit; bracts pilose; flowers 6–12.5 mm long, pink to pink purple or white; calyx 4.5–8 mm long, the tube 3.2–5.5 mm long, campanulate to short-cylindric, the teeth 1.3–2.5 mm long, subulate; pods sessile, bladderly-inflated (7) 9–17 mm long, 5–14 mm wide (when pressed), subunilocular, hirsutulous to villous. Two varieties are present.

- 1. Plants pulvinate caespitose; leaves 0.5–2 cm long, the leaflets 7–11; pods 10–12 mm long, usually less than 6 mm wide; flowers mostly less than 10 mm long *O. oreophila* var. *juniperina*
- Plants densely to loosely caespitose; leaves often more than 2 cm long, the leaflets 9–15 (17); pods 9–17 mm long, more than 6 mm wide; flowers commonly 10–12.5 mm long *O. oreophila* var. *oreophila*

Var. *juniperina* Welsh Pinyon-juniper, mountain brush, fringed sagebrush, ponderosa pine, and bristlecone pine communities at 1891 to 2565 m in Beaver, Garfield, Iron, Piute, Sevier, and Wayne (type from 1 mi E of Bicknell) counties; Nevada; 25 (vii). This is the compact, xeric phase of the species, that often shares similar habitats with *O. jonesii* (q.v.).

Var. *oreophila* [*Spiesia oreophila* (Gray) Kuntze; *Aragallus oreophilus* (Gray) A. Nels.; *Astragalus oreophilus* (Gray) Tidestr.; *A. munzii* Wheeler]. Alpine tundra, ridge tops, meadows, and spruce-fir communities at 2255 to 3785 m in Beaver, Garfield, Iron, Kane, Piute, Washington, and Wayne counties; California, Nevada, Arizona; 68 (xiv).

Oxytropis parryi Gray Parry Oxytrope. [*Spiesia parryi* (Gray) Kuntze; *Aragallus parryi* (Gray) Greene; *As-tragalus parryanus* Tidestr., not *A. parryi* Gray]. Caespitose, acaulescent, 2–11 cm tall; pubescence basifixed, silky-pilose; leaves 1.5–7 cm long, leaflets 7–17, 2–9 (12) mm long, 0.8–3 mm wide, oblong to elliptic or lanceolate, pilose; scapes 1.2–8 (10) cm long, pilose; racemes 1– to 3 (4)-flowered, the flowers erect or ascending, the axis 0.5–1 cm long in fruit; bracts pilose; flowers 7.5–12 mm long, pink purple; calyx 5–8 mm long, the tube 3–5.5 mm long, campanulate to short-cylindric, the teeth 1.5–2.5 mm long, triangular-subulate; pods erect, sessile, oblong to lance-ovoid or ovoid, 13–22 mm long, 4–8 mm thick, bilocular or nearly so, pilosulous. Alpine tundra, ridge tops, and meadows, at 2700 to 3785 m in Beaver, Carbon, Duchesne, Emery, Garfield, Grand, Juab, Piute, San Juan, Summit, Tooele, Wasatch and Wayne counties; Idaho, Wyoming, California, Colorado, and New Mexico; 38 (viii).

Oxytropis sericea Nutt. in T. & G. Silky or White Locoweed. [*O. lambertii* var. *sericea* (Nutt.) Gray; *Spiesia lambertii* var. *sericea* (Nutt.) Rydb.; *Aragallus lambertii* var. *sericeus* (Nutt.) A. Nels.; *Aragallus majusculus* Greene, type from Mt. Ellen, Henry Mts.]. Caespitose, acaulescent, 13–32 cm tall, pubescence basifixed, silky-pilose; stipules pilose to subtomentose; leaves 3.5–21 cm long; leaflets 9–23, 4–32 (40) mm long, 1.5–10 mm wide, lanceolate to oblong, elliptic, or ovate, pilose; scapes 7–26 cm long, pilose; racemes 6– to 27-flowered, the flowers ascending to spreading, the axis 1.5–12 cm long in fruit; bracts pilose; flowers 15–26 mm long, white or tinged with purple; calyx 8–12 mm long, the tube cylindric, the teeth triangular to subulate; pods erect, sessile, the body subcylindric to ovoid-oblong, 10–25 mm long, 4–7.5 mm thick, bilocular or nearly so, strigose or pilosulous. Sagebrush, pinyon-juniper, and grassland (rarely mixed desert shrub) communities at 1670 to 3350 m in Box Elder, Carbon, Daggett, Duchesne, Emery, Garfield, Kane, Piute, Summit, and Wayne counties; Yukon south to Nevada, New Mexico, and Oklahoma. Our material belongs to var. *sericea*; 58 (x).

Oxytropis viscida Nutt. Viscid Locoweed. [*O. campestris* var. *viscida* (Nutt.) Wats.; *Spiesia viscida* (Nutt.) Tidestr.]. Caespitose, acaulescent, 4–18 cm tall; pubescence basifixed, spreading-hairy; stipules glabrous dorsally, commonly prominently glandular; leaves 2–17 cm long; leaflets 19–39 or more, 1.5–20 mm long, 1–5 mm wide, oblong to lanceolate or elliptic, glabrate to glabrous on both sides, sometimes glandular; scapes 2–12.5 cm long, spreading-hairy; racemes 3– to 20-flowered, the flowers spreading-ascending, the axis 2–7 cm long in fruit; bracts glandular; flowers 11–19 mm long, whitish, lilac, or pink purple; calyx 5–11 mm long, the shortly cylindric tube 4–7 mm long, the teeth 1.5–3.5 mm long, triangular-subulate, commonly glandular; pods erect, sessile, ovoid to subcylindric, 8–20 mm long, 4–5 mm thick, bilocular, glandular. Pinyon-juniper, grassland, and spruce-fir communities at 2430 to 3355 m in Emery, Salt Lake, Sanpete, Sevier, Utah, and Wayne counties; Alaska east to Gaspe and south to California, Nevada, Colorado, and Minnesota; 16 (iv). Our material belongs to var. *viscida*. This is a portion of a circumboral complex with great variation. Utah materials demonstrate two of the extreme phases of that variety. Naming of the phases within the species would lead to an endless en-

taglement. Thus, the whitish flowered plants from Emery, Sanpete, and Sevier counties are considered as a minor element in this evidently polygenetic and polymorphic series.

Parkinsonia L.

Trees, armed; leaves alternate, pinnately twice-compound, subsessile; leaflets numerous; flowers in short racemes or some solitary in leaf axils, only slightly irregular; sepals 5, distinct; petals 5, subequal, the uppermost enclosed by the others in bud; stamens 10, distinct, hairy at the base; ovary several-ovuled, shortly stipitate.

Parkinsonia aculeata L. Retama. Small, open trees, mainly 5–8 m tall; branchlets green, armed with needle-sharp, somewhat recurved spines representing modified leaf rachises; leaves with 1 or 2 pair of pinnae, these mainly 1–4 (5) dm long, each with a flattened rachis; leaflets very numerous, 2–4 mm long and 0.5–1 mm wide; flowers ca 1 cm wide, yellow; legumes constricted between the seeds, 3–10 cm long. Cultivated ornamental of great beauty, escaping and persisting in Washington County; widespread in the southern U. S.; 1 (0).

Parryella T. & G.

Unarmed shrubs; leaves alternate, pinnate, with numerous leaflets, glandular-dotted; stipules subulate, caducous; peduncles opposite the leaves; flowers in loose spicate racemes or panicles; calyx turbinate-campanulate, 10–ribbed near the base, 5-lobed; petals lacking; stamens 10, the filaments distinct, inserted on the hypanthium; pods 1-seeded (2-ovuled), indehiscent, obliquely ovoid, glandular-dotted, exserted from the calyx.

Rydberg, P. A. 1919. *Parryella*. N. Amer. Fl. 24: 25–26.

Parryella filifolia T. & G. ex Gray Narrow-leaf Dunebroom. Shrubs to 15 dm tall or more, often partially buried in sand, the branchlets strigose and with mammiform, glandular protuberances; stipules 1–2 mm long, chestnut brown, fragile; leaves 3.5–13 cm long; leaflets 8–40, 10–21 mm long, linear, all involute, strigose to glabrate and glandular on the visible surface; peduncles 0–1 cm long; racemes 4–10 cm long, the main ones often branched near the base, forming panicles, 35– to 90-flowered, the axis not much elongating in fruit; bracts reduced to gland-tipped vestiges; calyx 2.5–3.1 mm long, 10–ribbed near the base, the tube opaque, the teeth 0.2–0.5 mm long, ciliate; flowers 5–6.5 mm long in anthesis, the stamens long-exserted; pods short-stipitate, the body 5–6.5 mm long, 2.5–3 mm wide, the pilose style base persistent, glabrous, glandular-punctate; $n = 10$. Stabilized dune sands at 1470 to 1570 m in Grand and San Juan counties; New Mexico and Arizona; 10 (vi). This plant shows promise in reclamation of sandy sites.

Pediomelum Rydb.

Perennial herbs, unarmed, from deep-seated, tuberous roots; leaves alternate, palmately 3– to 7-foliolate, glandular-dotted; stipules triangular to subulate; flowers borne in axillary racemes or spikelike racemes; calyx subcylindric, gibbous at the base on the upper side, 5-lobed, the lowest lobe the longest; stamens 10, diadelphous (rarely all connate); petals blue to purple, lavender, or white; pods 1-seeded, irregularly dehiscent, usually included within the calyx. Note: The name is from the

Greek words for prairie and apple, a literal translation of the French "Pomme de Prairie," a reference to the edible, tuberous roots of most species. The species have been traditionally assigned within an expanded *Psoralea* L., a genus now restricted to South African plants (see also *Psoralidium*).

Rydberg, P. A. 1919. *Pediomelum*. N. Amer. Fl. 24(1): 17-24.

Ockendon, D. J. 1965. A taxonomic study of *Psoralea* subgenus *Pediomelum* (Leguminosae). Southwestern Nat. 10: 81-124.

1. Leaflets conspicuously bicolor, cinereous beneath, bright green and glabrous to glabrate above (except along some veins); plants known only from southern Kane County and adjacent Arizona *P. epipsilum*
- Leaflets not bicolor, or if green above, the surface strigose to pilose also 2
- 2(1). Plants definitely caulescent; leaflets green on both sides; flowers mainly less than 12 mm long; plants of Grand and San Juan County *P. aromaticum*
- Plants acaulescent or short-caulescent; leaflets bicolor; flowers mostly more than 12 mm long; plants variously distributed 3
- 3(1). Leaflets commonly 3, strongly white strigose along the veins above; plants of the Paunsaugunt and Paria regions *P. parriense*
- Leaflets commonly 5, uniformly strigose or pilose above, or thinly strigose along the veins; plants variously distributed 4
- 4(3). Calyx lobes very unequal, the lower one much enlarged; seeds reticulate; plant known from near the Utah-Arizona boundary in Arizona *P. castoreum* (Wats.) Rydb.
- Calyx lobes subequal; seeds smooth; plants variously distributed 5
- 5(4). Petioles and peduncles pubescent with appressed or ascending hairs; plants widespread in eastern Utah ... *P. megalanthum*
- Petioles and peduncles retrorsely hairy; plants of Washington County *P. mephiticum*

Pediomelum aromaticum (Payson) Welsh Paradox Breadroot. [*Psoralea aromatica* Payson; *P. rafaensis* Jones, type from the La Sal Mts.; *P. rafaensis* var. *magna* Jones, type from the San Rafael Swell (?)]. Caulescent, 8-15 (20) cm tall, from slender, subterranean caudex branches arising from deep-seated tuberous roots; stems with 2-4 (5) elongated internodes, strigose to strigulose; leaves mainly 5-foliolate; petioles 1.2-8 cm long, pubescent like the stems; leaflets 6-26 mm long, 3-16 mm wide, cuneate-obovate, gray green, strigulose, and punctate beneath, yellow green, punctate, and strigose overall or only along the veins above; stipules scarious, 2-9 mm long; peduncles 0.2-0.5 cm long; racemes 3- to 7-flowered, 1-2 cm long; pedicels 1-2.5 mm long; bracts lanceolate, 4-7 mm long; flowers 10-13 mm long, the banner, wings, and keel more or less suffused with purple; calyx 10-11 mm long, the tube 3-4 mm long, strongly gibbous, the lower tooth 5-7 mm long, about twice as broad as the lower lateral ones; pods to 15 mm long. Pinyon-juniper and mixed desert shrub communities at ca 1530 m in Emery (?), Grand, and San Juan counties; Paradox Basin, Colorado; a Navajo Basin endemic; 10(vi). Material from San Juan County has smaller flowers than noted for the species generally and is designated as var. *tuhji* Welsh.

Pediomelum epipsilum (Barneby) Welsh Kane Breadroot. [*Psoralea epipsila* Barneby, type from 17 mi E of Kanab]. Subacaulescent or short-caulescent, 3.5-10.5 cm tall, from slender, subterranean caudex branches arising from deep-seated tuberous roots; stems with 2 or 3 elongated internodes, or none, strigose to ascending hairy; leaves mainly 5-foliolate; petioles 0.8-5 cm long, pubescent like the stems; leaflets 5, 8-25 mm long, 3-15 mm wide, obovate, grayish, strigulose, and punctate beneath, bright yellow green, punctate and glabrous to thinly strigose above (especially along the veins); peduncles to 5 cm long; racemes 2-4 cm long; pedicels ca 3 mm long; bracts broadly lanceolate, 10-13 mm long; flowers 11-14 mm long, the banner, wings, and keel pale violet; calyx 11-14 mm long, the tube 5-6 mm long, strongly gibbous, the lower tooth ca 8 mm long, the upper ones shorter and narrower; pods 1-seeded. Pinyon-juniper woodland at ca 1670 m on Chinle and Moenkopi formations in Kane County, and in adjacent Arizona; 4(0).

Pediomelum megalanthum (Woot. & Standl.) Rydb. Large-flowered Breadroot. [*Psoralea megalantha* Woot. & Standl.]. Subacaulescent to caulescent, 4-25 cm tall, from slender, subterranean caudex branches arising from deep-seated tuberous roots; stems with 0-5 elongated internodes, incurved-strigose or with a few (rarely most) hairs spreading-ascending; leaves mainly 5 (8)-foliolate; petioles 1.2-9.5 cm long, pubescent like the stems or more commonly spreading hairy; leaflets 9-34 mm long, 4-23 mm wide, cuneate-obovate to subrhombic, gray green, strigulose, and punctate beneath, yellow green, punctate, and strigose overall above; stipules scarious 2-15 mm long; peduncles 1.4-5 cm long; racemes mainly 6- to 24-flowered, 2-5 cm long; pedicels 1.5-5 mm long; bracts commonly bidentate, lance-ovate, 3-12 mm long; flowers 12.5-21 mm long, the banner, wings, and keel commonly purple or suffused with purple; calyx 12.5-18.5 mm long, the tube 5.5-8 (9) mm long, only somewhat broader than the lateral ones; pods included in the calyx. Mixed desert shrub, juniper-pinyon woodland, and blackbrush communities at 1430 to 1830 m in Duchesne, Grand, San Juan, Uintah, and Wayne counties; Colorado and New Mexico; 54(xvii).

Pediomelum mephiticum (Wats.) Rydb. Skunk Breadroot. [*Psoralea mephitica* Wats., type from near St. George; *Pediomelum retrorsum* Rydb; *Psoralea retrorsa* (Rydb.) Tidestr. in Tidestr. & Kittell; *P. mephitica* var. *retrorsa* (Rydb.) Kearney & Peebles]. Acaulescent to subacaulescent, 4.5-15 cm tall, from slender, subterranean caudex branches arising from deep-seated tuberous roots; stems lacking or with very short internodes above ground, retrorsely hairy; leaves mainly 5-foliolate; petioles 3.2-12 cm long, retrorsely hairy; leaflets 11-35 mm long, 4-28 mm wide, obovate to broadly so, gray green, punctate beneath, green to yellow green, strigose overall (more densely along veins), and punctate above; stipules scarious, 4-12 mm long; peduncles 2-6 cm long; racemes mainly 12- to 35-flowered, 1.5-4.5 cm long; pedicels 1.5-3.5 mm long; bracts mainly not bidentate, elliptic-obovate, 5-12 mm long; flowers 10.5-12.8 mm long, the banner whitish or yellowish, the wings and keel purple or suffused with purple; calyx 9-12.5 mm long, the tube 3.5-4.5 mm long, strongly gibbous at the base, the lower tooth 4.5-9 mm long, ca twice as broad as the others; pods included in the calyx. Blackbrush and pinyon-juniper communities at 1470 to 1700 m in Wash-

ington County; Arizona, Nevada, and California; 17 (iii). This species was described by Sereno Watson simultaneously with *Psoralea castorea* (Proc. Amer. Acad. 14: 291. 1879). The type locality of both of these taxa is cited in the original descriptions as "near Beaver City, S. Utah." The types were both taken by Dr. E. Palmer (No. 96 for *P. castorea*, and No. 97 for *P. mephitica*). Palmer (Amer. Nat. 12: 601. 1878) in describing the use of these plants by Indians (as food) noted that *P. castorea* Wats. "grows in exposed sandy localities between Beaver Dams, Arizona, and St. Thomas, Nevada" [sic]. Of *P. mephitica*, Palmer (l.c.) notes "it is abundant on the lower places between the hills southeast of St. George, Southern Utah, and the Pah-Utes resort there to collect its roots" [sic]. Thus, the type localities can be inferred as being in northwestern Arizona or southeastern Nevada for *P. castorea*, and in the hills to the southeast of St. George for *P. mephitica*. There is no evidence to indicate that *P. castorea* was ever collected in Utah, but it is known from a site ca 1.5 km south of the boundary along Beaverdam Wash.

Pediomelum parianse (Welsh & Atwood) Welsh Paria Breadroot. [*Psoralea parianensis* Welsh & Atwood, type from Bryce Canyon]. Acaulescent or subcaulescent, 2–9 cm tall, from slender, subterranean caudex branches arising from deep-seated tuberous roots; stems lacking or with very short internodes above ground, strigose; leaves mainly 3–foliolate; petioles 1.3–7 cm long, strigose; leaflets 9–25 mm long, 7–22 mm wide, obovate or orbicular, cuneate, rounded to truncate or emarginate apically, gray green, glandular, and strigose beneath, yellow green, glandular, and strongly strigose along veins above; stipules scarious, 4–10 mm long; peduncles 0.5–2.8 cm long, the hairs appressed to ascending; racemes mainly 6– to 15-flowered, 1–2.5 cm long; pedicels 1–3.8 mm long; bracts abruptly acuminate, 4–8 mm long; flowers 8.8–12.5 cm long, the banner cream to ochroleucous, the wings and keel purple or suffused with purple; calyx 8.6–11.4 mm long, the tube 3.3–4.6 mm long, more or less gibbous at the base, the lower calyx teeth 5.3–6.8 mm long, almost twice broader than the others; pods included in the calyx, ca 9 mm long. Ponderosa pine and juniper pinyon woods at 1700 to 2430 m in Garfield (type from Bryce Canyon) and Kane counties; endemic; 8 (ii).

Peteria Gray

Perennial, caulescent, from a subterranean caudex, arising from deep-seated tuberous roots; leaves alternate, odd-pinnate; stipules only slightly adnate to the petiole base, spinescent; flowers papilionaceous, borne in terminal racemes, each subtended by a bract, or the lowermost flower sometimes axillary; bracteoles 0; calyx 5-toothed; petals 5, whitish to ochroleucous, rarely pinkish; stamens 10, diadelphous; style hairy at apex; pods narrowly oblong, straight, few- to several-seeded, laterally compressed, dehiscent, the valves coiling upon dehiscence.

Peteria thompsonae Wats. Thompson *Peteria*. [*P. nevadensis* Tidestr.]. Perennial, 11–48 cm tall; pubescence of basifixed, flattened, appressed hairs; stems erect to sprawling; stipular spines 1.8–6.5 mm long; leaves 4–18 cm long; leaflets 9–27, 6–17 mm long, 3–11 mm wide, elliptic to ovate, oblong, or oval, strigose on both sides or glabrate above; peduncles 0–4 cm long, racemes 5– to 44-flowered, the flowers ascending at anthesis, the axis 6–18 cm long in fruit; bracts 5–9 mm

long, stipitate-glandular; pedicels 1–5 mm long, strigulose and stipitate-glandular, the teeth 3.8–9 mm long, lance-subulate; flowers 18–22 mm long, whitish to ochroleucous, rarely pinkish; pods descending, stipitate, the stipe to 11 mm long, the body 48–55 (70) mm long, 5–7 mm wide, glabrous, more or less constricted between the seeds. Pinyon-juniper and mixed desert shrub communities at 1230 to 1870 m in Emery, Grand, Juab, Kane, San Juan, and Washington counties; Arizona, Nevada, and Idaho; 27 (x). The type specimen was collected by Mrs. Ellen Thompson, sister of John Wesley Powell, at Kanab, where she lived in 1872. This is a singular and striking plant.

Phaseolus L.

Annual herbs, from a taproot; leaves alternate, pinnately trifoliolate; stipules herbaecous, distinct; flowers papilionaceous, axillary or in axillary racemes, each subtended by a bract; bracteoles 2, attached at base of calyx; calyx 5-toothed; petals 5, pink to purplish or white; stamens 10, diadelphous; ovary few- to several-ovuled, the style twisted or coiled in the keel, bearded toward the apex, the stigma oblique; pods linear to oblong, laterally flattened to subterete, the valves coiling upon dehiscence.

Phaseolus vulgaris L. Kidney Bean. Annual, 3–20 dm tall or more, elump-forming or twining and vinelike; pubescence basifixed, villosulous or finally glabrate; petioles 4–20 cm long; leaflets 3, stipellate, commonly 4–10 cm long and 2–8 cm wide, ovate to lanceolate, pilosulous to villosulous on both sides, mainly along the veins; peduncles 0–2 cm long; racemes few-flowered; flowers 12–16 mm long; bracteoles ovate-lanceolate, prominently veined; pods slender, subterete to flattened, most 6–15 cm long. This is the table bean of commerce. It is cultivated widely, escaping commonly, but hardly persisting; native of the New World (?); 2 (i). Additional species are present in the cultivated flora of Utah, but the extent is unknown, and they are here excluded. Among them are the scarlet runner bean (*P. coccineus* L.) and the lima bean (*P. linensis* Macfady.).

Pisum L.

Plants herbaecous, annual, from a taproot; stipules prominent, larger than the leaflets, semisagittate to ovate or reniform; stems clambering, not winged; leaves alternate, even-pinnate, the terminal extension of the rachis forming prehensile tendrils; racemes axillary, pedunculate, 1– to few-flowered; stamens 10, diadelphous; style laterally compressed, bearded along the ventral edge; pods 1-loculed, oblong in outline, several-seeded, the valves coiling upon dehiscence.

Pisum sativum L. Garden Pea. Plants 2–20 dm long or more, sprawling or clambering, the stems merely angled, glabrous; stipules foliaceous, larger than the leaflets; leaflets 4–6, elliptic to ovate or oblong-lanceolate, 9–60 mm long, 6–40 mm wide, glabrous; tendrils with 1–3 pairs of lateral branches, prehensile; flowers 1–3 per raceme, white, red, or bicolored, 18–30 mm long; calyx 12–18 mm long, the teeth longer than the tube; pods commonly 4–10 cm long, glabrous; $2n = 14, 15, 28, 56, 84, 98, 112, 224$. Cultivated pea of commerce, widely grown, escaping but not persisting; introduced from Eurasia; 4 (i). Several horticultural forms are grown, most of them with white flowers.

Prosopis L.

Armed shrubs or small trees; leaves alternate, bipinnate, with an obscure gland between the lower pair of pinnae; leaflets several to numerous; stipules small or modified as spines; flowers perfect, borne in spike-like racemes, yellowish to ocreolucous; calyx 5-toothed; corolla regular, the 5 petals distinct or nearly so; stamens 10, distinct, exerted, the anthers terminally glandular; ovary pubescent, sessile or stipitate, the stigma concave; pods indehiscent, narrowly oblong and more or less constricted between the seeds or spirally coiled.

Johnston, M. C. 1962. The North American Mesquites, *Prosopis* Sect. *Algarobia* (Leguminosae). *Brittonia* 4: 72-90.
 Isely, D. 1973. *Prosopis*. Mem. New York Bot. Gard. 25(1): 116-122.

- 1. Leaflets 5-8 pairs, mostly less than 10 mm long; spines stipular, paired, pods coiled spirally into a woody cylinder *P. pubescens*
- Leaflets 10-18 pairs or more, often exceeding 10 mm in length; spines axillary, solitary or paired, pods narrowly oblong, laterally compressed, straight or nearly so *P. glandulosa*

Prosopis glandulosa Torr. Honey Mesquite. [*Algarobia glandulosa* (Torr.) T. & G.; *P. juliflora* var. *glandulosa* (Torr.) Cockerell; *Neltuma glandulosa* (Torr.) Britt. & Rose; *P. odorata* Torr. & Frem. as to flowering portions]. Armed shrubs or broad-crowned trees, commonly 3-5 m tall and as broad or more; leaves petiolate, the rachis produced as a spine; pinnae 2; leaflets 7-17 pairs, oblong to narrowly oblong, 7-38 mm long, 1-4 mm wide, glabrous on both sides, sometimes ciliate; spines nodal but not stipular, single or paired, 3-35 mm long or more; stipules inconspicuous, subulate; flowers in yellowish to greenish spikes, clustered from spur branches, ascending to declined; ovary pilose; pods stipitate, the stipe 5-8 mm long, the body narrowly oblong to linear, often curved, subterete to somewhat flattened, mostly 10 to 20 cm long, a bony endocarp around each seed; $2n = 26, 52, 56, 112$. Terraces and bars, or in creosote bush communities at 670 to 1170 m in Washington County; California, Nevada, Arizona, New Mexico, Kansas, Oklahoma, Texas, and southward; 19 (i). Our material belongs to var. *torreyana* (L. Benson) M. C. Johnston [*P. juliflora* var. *torreyana* L. Benson].

Prosopis pubescens Benth. Screwbean. [*P. odorata* Torr. & Frem. in Frem., as to fruit; *Strombocarpa pubescens* (Benth.) Gray; *S. odorata* (Torr. & Frem.) Gray]. Armed shrubs or small trees with slender branches, commonly 2.5-3.5 m tall; leaves shortly petiolate, the rachis produced as a spine; pinnae 2 (rarely 4); leaflets 5-8 pairs, elliptic to oblong, puberulent to glabrate; spines paired at nodes, apparently stipular, mostly 5-25 mm long; flowers in clusters or solitary, yellowish spikes; ovary villous; pods tightly coiled into a woody cylinder, 30-50 mm long, 4-6 mm thick; $2n = 56$. Benchlands, slopes, and terraces along drainages at 730 to 900 m in Washington County; California, Nevada, Arizona, New Mexico, Texas, and Mexico; 10 (i).

Psoralidium Rydb.

Perennial herbs, unarmed, from rhizomes; leaves alternate, pedately 3-foliolate, glandular-dotted; stipules triangular to subulate; flowers in axillary, pedunculate, interrupted spike-like racemes or racemes; calyx campan-

ulate, the tube short, 5-lobed, the lowermost lobe typically longer than the others; corolla papilionaceous; stamens 10, diadelphous; petals bluish or purplish to lavender, or less commonly white; pods 1-seeded, indehiscent, usually not included in the calyx.

Rydberg, P. A. 1919 *Psoralidium*. N. Amer. Fl. 24: 12-17.

- 1. Peduncles typically 15-40 cm long or more; leaves few, mostly deciduous by anthesis, the leaflets sharply acuminate; plants of southeastern Utah *P. junceum*
- Peduncles mainly shorter than 15 cm; leaves numerous, persisting through the season, the leaflets obtuse to rounded or cuspidate; distribution various 2
- 2(1). Plants commonly 4-10 dm tall, at least some leaves 4- to 5-foliolate; flowers mainly indigo, plants of Garfield, Iron, Kane, and Washington counties *P. tenuiflorum*
- Plants often less than 4 dm tall, all leaves commonly 3-foliolate; flowers white to purple; plants widespread in Utah *P. lanceolatum*

Psoralidium junceum (Eastw.) Rydb. Rush Scurfpea. [*Psoralea juncea* Eastw., type from Epsom Creek, San Juan County]. Caulescent, 4.8-9 dm tall, from a rhizome; stems with 5 or more elongated internodes, strigose; leaves commonly 3-foliolate, often deciduous by anthesis; petioles 1.4-7 cm long, pubescent like the stems; leaflets 3, 19-44 mm long, 3-7 mm wide, oblanceolate to elliptic, acuminate apically, strigose and glandular on both surfaces, greenish; stipules acuminate, strigose; peduncles (8) 11-48 cm long; racemes 7- to 20-flowered, 5-11 cm long; bracts lance-acuminate, glabrous dorsally, 1.5-2.5 mm long, deciduous; flowers 4.2-5.8 mm long, the petals indigo; calyx 2.7-3.4 mm long, the tube 1.3-2.5 mm long, campanulate, not especially gibbous, the lower tooth 0.7-1.4 mm long, longer than the others; pods 1-seeded, densely silky-villous. Stabilized dunes and other sandy sites in Garfield, Kane and San Juan counties; Coconino County, Arizona; a Glen Canyon-San Juan endemic; 23 (vi).

Psoralidium lanceolatum (Pursh) Rydb. Dune Scurfpea. Caulescent, 1.5-6.8 dm tall, from a rhizome, clump-forming, the stems with 5 or more elongated internodes, glabrous or strigose; leaves persistent at flowering; petioles 0.8-3 cm long, strigose to glabrate; leaflets 3, 14-50 mm long, 0.5-9 mm wide, oblanceolate below, becoming linear upward, obtuse to acute or cuspidate, sparingly strigose on both sides or glabrous above, yellow green; stipules lance-attenuate, 3-16 mm long; peduncles 3.3-24 cm long; racemes 5- to 41-flowered, 1.2-17 cm long; bracts ovate to elliptic or lanceolate, glabrous dorsally, 1.3-2.8 mm long, persistent; flowers 4.8-6.3 mm long, blue, white, or bicolored; calyx 1.6-2.8 mm long, the tube 1.3-2 mm long, campanulate, not especially gibbous, the lower tooth 0.2-0.8 mm long, not much larger than the others; pods 1-seeded, conspicuously glandular. Three varieties are recognized.

- 1. Racemes lax, 2.5-17 cm long at anthesis, the flower nodes widely separated, often with 2 or 3 flowers per node; blue flower color predominating; plants of southeastern Utah *P. lanceolatum* var. *stenophyllum*
- Racemes compact to moderately lax, 1.2-5.5 cm long at anthesis, the flower nodes seldom widely spaced or mainly with more than 3 flowers per node; blue and white flowers variably abundant; plants of various distribution 2

- 2(1). Racemes (1.2) 2.7–5.5 cm long, with (17) 27–41 flowers; plants of the Great Basin *P. lanceolatum* var. *stenostachys*
- Racemes 1–2.5 (2.8) cm long, with 5–24 flowers; plants of the Colorado Basin *P. lanceolatum* var. *lanceolatum*

Var. lanceolatum Plains Scurfpea. [*Psoralea lanceolata* Pursh; *P. elliptica* Pursh; *Lotodes ellipticum* (Pursh) Kuntze; *P. laxiflora* Nutt. ex T. & G.; *P. micrantha* Gray ex Torr.; *P. micranthum* (Gray) Rydb.]. Sand dunes and other sandy sites at 1230 to 1770 m in Daggett, Garfield, Grand, Kane, Uintah, Washington, and Wayne counties; Washington and Saskatchewan, south to California, Arizona, New Mexico, and Oklahoma; 48 (ix).

Var. stenophyllum (Rydb.) Welsh [*Psoralea stenophylla* Rydb., type from Wilson Mesa, Grand County; *Psoralidium stenophyllum* (Rydb.) Rydb.; *Psoralea lanceolata* var. *stenophyllum* (Rydb.) Toft & Welsh]. Sandy sites at 1270 to 1830 m in Emery, Garfield,, Grand, Kane, San Juan, and Wayne counties; endemic; 38 (xii).

Var. stenostachys (Rydb.) Welsh [*Psoralea stenostachys* Rydb., type from Government Well, Tooele County; *Psoralidium stenostachys* (Rydb.) Rydb.; *Psoralea lanceolata* var. *stenostachys* (Rydb.) Toft & Welsh]. Dunes and other sandy sites at 1340 to 1590 m in Juab, Millard, Salt Lake, Tooele (type from Government Well) and Weber counties; endemic; 33 (ii). Specimens from Salt Lake and Weber counties are placed here tentatively because of the nature of the existing materials. The plants have not been collected in those counties in recent times, and they might well be extinct. The question of their varietal status might therefore be moot.

Psoralidium tenuiflorum (Pursh) Rydb. Prairie Scurfpea. [*Psoralea tenuiflora* Pursh; *P. obtusiloba* T. & G.; *Psoralidium bigelovii* Rydb.; *Psoralea bigelovii* (Rydb.) Tidestr.; *P. tenuiflora* var. *bigelovii* (Rydb.) Macbr.; *P. floribunda* T. & G.; *Psoralidium floribundum* (Nutt.) Rydb.]. Caulescent, 4–10 dm tall or more, forming large clumps; stems with 8 or more elongated internodes, strigose; leaves 3– to 5-foliolate, persistent at flowering; petioles 0.1–2.2 cm long, strigose to strigulose; leaflets 3–5, 6–40 mm long, 2–16 mm wide, oblanceolate throughout, mainly rounded to a cuspidate apex, gray green and strigose beneath, yellow green and glabrous or pubescent only along the veins above; stipules scarious, 2–13 mm long, strigose; peduncles 0.5–7 cm long or lacking, sometimes bracteate or some flowers axillary; racemes mainly 7– to 21-flowered, 1–5.9 cm long; bracts ovate-acuminate, glabrous dorsally, 1.5–2.5 mm long, persistent; flowers 4.5–6 cm long, the petals indigo; calyx 2.5–3.2 mm long, the tube 1.5–2 mm long, campanulate, not gibbous, the lower tooth 0.8–1.7 mm long, noticeably larger than the others; pods 1-seeded, glabrous, conspicuously glandular. Pinyon-juniper, sagebrush, and mountain brush communities at 1700 to 2200 m in Garfield, Iron, Kane, and Washington counties; North Dakota and Montana, south to Arizona, Texas, and Mexico; 17 (iv). The segregation of varieties from among our materials seems unwarranted.

Psorothamnus Rydb.

Shrubs, typically armed; leaves alternate, odd-pinnate, with 5 or more leaflets, glandular-dotted; stipules subulate or vestigial; peduncles opposite the leaves; flowers in lax racemes; calyx campanulate, 10-ribbed, 5-lobed;

corolla papilionaceous, the petals all inserted on the hypanthium; stamens 9 or 10, monadelphous; petals mainly indigo; pods 1– to 2-seeded, indehiscent, exerted from the calyx; x = 10. Note: Traditional treatments have placed the species of *Psorothamnus* within an expanded *Dalea* (q.v.).

Rydberg, P. A. 1919. *Psorodendron* Rydb., and *Psorothamnus* Rydb. N. Amer. Fl. 24: 41–48.

- 1. Branchlets densely reflexed-puberulent, bearing conspicuous yellow to red orange resinous glands 2
- Branchlets merely appressed-strigose, lacking glands or only obscurely glandular 3
- 2(1). Calyx lobes ovate to oval, obtuse to rounded, or the lowermost ovate-acute *P. thompsonae*
- Calyx lobes all lance-attenuate *P. polydenius*
- 3(1). Calyx villous with contorted, spreading hairs, the lateral teeth linear-lanceolate, quite as long as the tube; plants rare in Kane County *P. arborescens*
- Calyx strigose with appressed hairs or glabrate, the lateral teeth lance-attenuate, mostly shorter than the tube; plants locally common in Garfield, Kane, San Juan, and Washington counties *P. fremontii*

Psorothamnus arborescens (Torr.) Barneby Beauty Indigo-bush. [*Dalea arborescens* Torr. in Gray; *Parosela arborescens* (Torr.) Heller; *Psorodendron arborescens* (Torr.) Rydb.; *Dalea amoena* Wats.; *Parosela amoena* (Wats.) Vail; *Psorodendron amoenum* (Wats.) Rydb.]. Armed shrubs, 4–10 dm tall or more; branchlets strigose to strigulose, sparingly glandular; stipules 1–2 mm long, subulate; leaves 1.4–3.8 cm long; leaflets 7–15, 1–10 (12) mm long, 0.7–1.5 mm wide, glandular beneath, strigose on both sides, linear to narrowly oblong, obtuse to rounded, the uppermost lateral leaflet often confluent with the terminal; peduncles 0.2–0.6 cm long or the lowermost flower axillary; racemes 11– to 21-flowered, 1.8–4.5 cm long, the rachis pilosulous; bracts 1.5–3.5 mm long, lance-aristate, villous; calyx 8–10 mm long, the tube 3.8–4.8 mm long, definitely 10-ribbed, villous, the teeth 3.6–5.2 mm long, villous, not markedly differing in width; flowers 8.1–10.6 mm long, indigo; pods conspicuously glandular-dotted, pilosulous. Mixed desert shrub at 1230 to 1530 m in Kane County; Arizona and Nevada; 2 (i). Our material belongs to var. *pubescens* (Parish) Barneby [*Parosela johnsonii* var. *pubescens* Parish; *Psorodendron pubescens* (Parish) Rydb.; *D. fremontii* var. *pubescens* (Parish) L. Benson; *D. amoena* var. *pubescens* (Parish) Peebles].

Psorothamnus fremontii (Torr.) Barneby Fremont Indigo-bush. [*Dalea fremontii* Torr. ex Gray; *Parosela fremontii* (Torr.) Vail; *Psorodendron fremontii* (Torr.) Rydb.; *Dalea johnsonii* Wats., type from near St. George; *Parosela johnsonii* (Wats.) Vail; *Psorodendron johnsonii* (Wats.) Rydb.; *Parosela johnsonii* var. *minutiflora* Parish; *D. fremontii* var. *minutifolia* (Parish) L. Benson]. Armed shrubs, 5–15 dm tall or more; branchlets strigose, sparingly if at all glandular; stipules 0.3–1.5 mm long, fragile; leaves 1.8–6.5 cm long; leaflets (1) 3–9, 3–14 mm long, 0.8–6 mm wide, glandular beneath, strigose on both sides, linear to oblong or elliptic, obtuse to rounded, the uppermost often confluent with the rachis; peduncles 0–2.2 cm long, or some flowers axillary; racemes 7– to 41-flowered, 3.5–14.3 cm long, the rachis strigose to strigulose; bracts 0.8–1.8 mm long, lanceolate, glabrous

or else foliose and with 1-4 leaflets; calyx 4.5-6.5 mm long, the tube 2.5-3.3 mm long, obscurely if at all 10-ribbed, appressed strigose to glabrate, the teeth 1.8-3.2 mm long, strigose, the upper markedly wider than the others; flowers 8.5-12 mm long, indigo; pods glandular-dotted; 2n = 20. Blackbrush, creosote bush, mixed desert shrub, and (less commonly) pinyon-juniper communities at 730 to 2270 m in Garfield, Kane, San Juan, and Washington counties; Nevada, Arizona, and California; 69 (xi). The plants are strikingly beautiful, contrasting indigo flowers against grayish foliage.

Psorothamnus polydenius (Torr.) Rydb. Glandular Indigo-bush. Armed shrubs, 1.5-8 dm tall or more; branchlets velvety with retrorse short hairs, conspicuously glandular with yellow or red orange resinous glands; stipules vestigial or to 0.5 mm long; leaves 0.4-2.8 cm long; leaflets 5-13, 1.2-6.5 mm long, 1-5 mm wide, oval to obovate, or obovate, glandular beneath, strigose on both sides, obtuse, rounded, or emarginate, the uppermost often confluent to each other and to the rachis; peduncles 0.8-2.7 cm long; racemes mainly 6- to 18-flowered, 2-5 cm long, the rachis retrorsely hairy; bracts 1-2.5 mm long, lanceolate, pilose; calyx 10-ribbed, the teeth 3.5-4.5 mm long, villous, lance-subulate, all about alike; flowers 7.5-9 mm long, indigo; pods glandular-dotted; n = 10. Two distinctive, geographically correlated varieties are present.

- 1. Branches strongly divaricate; leaflets flat, commonly less than 4 mm long; plants of Washington County *D. polydenius* var. *polydenius*
- Branches merely ascending, or rarely some divaricate; leaflets curved, at least some over 4 mm long; plants of eastern Emery County *D. polydenius* var. *jonesii*

Var. *jonesii* Barneby [*Dalea nummularia* Jones, type from Green River]. Salt desert shrub community on Mancos Shale Formation (Blue Gate and Tununk members) and less commonly elsewhere at ca 1470 m in eastern Emery County; endemic; 9 (i). The shrubs are typically less than 5 dm tall.

Var. *polydenius* [*Dalea polydenia* Torr. ex Wats.; *Parosela polydenia* (Torr.) Heller]. Creosote bush and Joshua tree communities on pedimental gravels and limestone at ca 1220 to 1345 m in Beaver Dam Mts., Washington County; Nevada and California; 6 (iii). The single colony known to me in Utah consists of shrubs ca 10-12 dm tall in the Limestone Knolls section of the Beaver Dam Mts., west of Castle Cliff.

Psorothamnus thompsonae (Vail) Welsh & Atwood Thompson Indigo-bush. [*Parosela thompsonae* Vail]. Armed shrubs, 2.5-8 dm tall or more; branchlets velvety with retrorse short hairs, conspicuously glandular with yellow to orange red mammiform resinous glands; stipules vestigial or to 0.8- mm long; leaves 0.7-5 cm long; leaflets 7-17, 1-10 mm long, 0.6-4 mmm wide, linear to oblong, oval, or obovate, glandular and strigose to glabrate beneath, strigose above, the uppermost jointed to the rachis; peduncles 0.4-1.8 cm long, rarely obsolete and some flowers axillary; racemes mainly 8- to 25-flowered, 2-9 cm long, the rachis retrorsely hairy; bracts 0.5-1.5 mm long, lanceolate, glabrous or hairy, soon deciduous; calyx 3.7-5 mm long, the tube 2.1-3.2 mm long, conspicuously 10-ribbed, glabrous or villous, ovate to oval, obtuse or only the lowermost acute; flowers 7.8-10.8 mm long, indigo or purple pink; pods glandular-dotted. Two distinctive varieties are known.

- 1. Calyx tube villous; leaflets linear; plants of San Juan County *P. thompsonae* var. *whitingii*
- Calyx tube glabrous; leaflets oblong to oval or obovate; plants of San Juan County and elsewhere *P. thompsonae* var. *thompsonae*

Var. *thompsonae* [*Parosela thompsonae* Vail; *Dalea thompsonae* (Vail) L. O. Williams]. Mixed and salt desert shrub communities at 1170 to 2270 m in Emery, Garfield, Kane (?), the type supposedly from near Kanab but more likely from along the Canyons of the Colorado east of there), San Juan, and Wayne counties; endemic; 25 (v). There are no modern collections of this taxon from Kane County.

Var. *whitingii* (Kearney & Peebles) Barneby [*Dalea whitingii* Kearney & Peebles]. Mixed desert shrub community at 1230 to 1530 m in Monument Valley and west to Navajo Mt., San Juan County; Arizona; a Navajo Basin endemic; 4 (0).

Robinia L.

Shrubs or trees, often armed; leaves alternate, odd-pinnate, the leaflets petiolulate and stipulate; stipules setaceous and caducous or persistent as spines; flowers in axillary racemes, white, pinkish, or pink, very showy, often aromatic; calyx campanulate to turbinate, the 5 teeth triangular to triangular-acuminate; corolla papilionaceous; stamens 10, diadelphous; ovary subsessile or sessile; pods oblong, straight, laterally flattened, tardily dehiscent; x = 10, 11.

- 1. Uppermost pair of calyx teeth connate almost to the apex, forming an emarginate lip; branchlets and peduncles lacking hispid processes *R. pseudoacacia*
- Uppermost pair of calyx teeth free for ca two-thirds of their length; branchlets or peduncles hispid 2
- 2(1). Branchlets and peduncles both glandular-hispid; shrubs, cultivated *R. hispida*
- Branchlets lacking processes; peduncles glandular-hispid; trees, cultivated or indigenous in Washington County *R. neomexicana*

Robinia hispida L. Rose-acacia. Shrubs, arising from root sprouts, spreading, commonly 1-2 m tall, except when grafted; branchlets both hispid and glandular-hispid; leaves 9.5-27 cm long; leaflets 7-13, 11-60 mm long, 7-40 mm wide, ovate or lance-ovate, elliptic, or oblong, obtuse, cuspidate, sparingly villous beneath, glabrous above; petioles hispid near the base; stipules obsolete; peduncles 1-4 cm long, hispid; racemes 3- to 10-flowered, 3-8 cm long; flowers 18-30 mm long, rose pink; calyx turbinate-campanulate, the tube 4.5-6 mm long, the teeth 3.5-7 mm long, triangular-acuminate; pods hispid, seldom produced. Cultivated ornamental in Utah County; indigenous from Virginia and Kentucky to Georgia and Alabama; 10 (i). Evidence indicates that rose-acacia is a sterile triploid, at least in part. Lack of fruit in plants from Utah seems to support this contention.

Robinia neomexicana Gray New Mexico Locust. [*R. neomexicana* var. *luxurians* Dieck; *R. luxurians* (Dieck) Schneider ex Silva Tarouca & Schneider; *R. breviloba* Rydb.; *R. subvelutina* Rydb.]. Small trees or shrubs, mainly 1-8 m tall; branchlets villosulous, rarely glandular; leaves 8-20 (28) cm long; leaflets 9-19, 12-40 mm long, 7-20 mm wide, lance-oblong to oblong, obtuse,

cuspidate, sparingly pubescent above and below, finally glabrate on one or both sides; petioles villosulous near the base; stipules 3–10 mm long or more, often spiny; peduncles 1–4 cm long, glandular-pubescent to hispid throughout; racemes 3– to 14–flowered, 3–8 cm long; flowers 16–24 mm long, pink; calyx campanulate, the tube 5 mm long, the teeth 3–5 mm long, triangular-acuminate; pods 40–80 mm long, glandular-pubescent to hispid or glabrous. Talus slopes and terraces in Zion Canyon, Beaverdam Wash, and near Enterprise Reservoir in Washington County; Colorado, Nevada, Arizona, New Mexico, Texas, and Mexico; 5 (i). The plant is also known from cultivation in Cache, Salt Lake, and Utah counties; 4 (i). The pink-flowered tree locusts of our region are all more or less involved through hybridization with the New Mexico locust and the black locust.

***Robinia pseudoacacia* L.** Black Locust. Trees to 25 m tall or more; branchlets puberulent to villosulous, lacking glands; leaves (6) 8.5–26 cm long; leaflets (5) 11–25, 11–60 mm long, 6–30 (38) mm wide, lance-oblong to oblong, obtuse to retuse or cuspidate, puberulent to glabrate on both sides; petioles villosulous to pilose near the base; stipules minute or represented by spines; peduncles 1.4–4.3 cm long, puberulent to villosulous; racemes 11– to 27–flowered, 4–13 cm long; flowers 12–20 (23) mm long, white (fading cream), or pale pink; calyx broadly campanulate to turbinate, the tube 3.5–5.5 mm long, the teeth 1.5–2 mm long, the upper pair connate, the sinus shallow; pods 4–12 cm long, glabrous; $2n = 22$. Cultivated ornamental, street, and shade trees, long persisting, escaping, and established in Cache, Carbon, Grand, Kane, Millard, Salt Lake, Sanpete, Utah, Washington, and Wayne counties; indigenous in the eastern U. S.; 34 (x). This is a handsome shade tree with very hard wood. The flowers yield nectar and the wood has been used for fence posts.

Sophora L.

Trees or herbs, unarmed; leaves alternate, odd-pinnately compound; stipules obsolete or herbaceous; flowers in terminal racemes or panicles, perfect, papilionaceous; calyx 5-toothed; petals all distinct; stamens 10, distinct or essentially so; ovary stipitate; pods spreading to pendulous, subterete, constricted between the seeds, indehiscent or tardily so; $x = 9$.

1. Plants trees, cultivated; flowers borne in panicles in midsummer *S. japonica*
- Plants herbaceous, indigenous; flowers in racemes, opening in springtime 2
- 2(1). Flowers blue purple to blue; leaflets more than 5 times longer than broad, silvery hairy *S. stenophylla*
- Flowers white to cream; leaflets less than 5 times longer than broad, gray green *S. nuttalliana*

***Sophora japonica* L.** Japanese Pagoda-tree. Trees to 12 m tall, the bark green and smooth for some years; branchlets sparingly villosulous to glabrate; leaf bases expanded, obscuring the axillary buds; leaves 12–23 cm long; leaflets 7–17, 14–60 mm long, 8–29 mm wide, lance-oblong to lanceolate, acute and apiculate, strigose beneath, glabrate to glabrous above; stipules obsolete; panicles many-flowered, 15–40 cm long; flowers 11–14 mm long, white to cream; calyx broadly campanulate 5.5–6.5 mm long, the tube 4.5–5.1 mm long, the teeth 0.8–1.2 mm

long, broadly triangular; pods mainly 5–10 cm long, fleshy, constricted between the seeds; $2n = 26, 28$. Cultivated ornamental, widely planted in lower elevation communities in Utah; introduced from China; 10 (i).

***Sophora nuttalliana* Turner** Silky Sophora. [*S. sericea* Nutt.]. Perennial, caulescent, 12–27 (30) cm tall, from a rhizome; pubescence essentially basifixed; stems ascending to erect; stipules 1.5–4 mm long, distinct, caducous; leaves 2.5–6 (7) cm long; leaflets 13–23, 2–11 mm long, 0.8–6 mm wide, oblong-obovate to obovate, rounded to retuse, often folded, strigose beneath, glabrous above; peduncles 0.8–3 cm long; racemes mainly 8– to 52–flowered, 3–9 cm long at anthesis, the axis 3–13 cm long in fruit; bracts 3–7 mm long; pedicels 2–4 mm long; bracteoles 1; calyx 8–10.5 mm long, gibbous, the tube 6.4–8.5 mm long, obliquely short-cylindric, the teeth 2–2.5 mm long, triangular; flowers 14–19 mm long, white to cream (fading cream); pods erect-ascending, stipitate, the stipe 6–12 mm long, the body 12–40 mm long, 3–4.5 mm thick, constricted tightly between the usually 1–3 seeds, strigose. River bottoms and roadsides at 1070 to 1670 m in San Juan and Washington counties; Wyoming and South Dakota, south to Arizona, New Mexico, and Texas; 6 (0).

***Sophora stenophylla* Gray** Silvery Sophora. Perennial, caulescent, 13–41 cm tall (above ground), from deeply seated rhizomes; pubescence basifixed; stems ascending to erect; stipules 3–12 mm long, distinct, caducous, or obsolete; leaves 1.7–5.6 mm wide, linear to narrowly oblong, acute to attenuate, silvery pilosulous, the pubescence fading yellowish in time; peduncles 1.7–5 cm long; racemes mainly 12– to 39–flowered, 5–17 cm long in anthesis, 6–23.5 cm long in fruit; bracts 3–7 mm long; pedicels 1–8 mm long; bracteoles 0; calyx 6.5–10.8 mm long, gibbous, the tube 4.8–7.2 mm long, obliquely short-cylindric, the teeth 1.7–3.6 mm long, ovate-triangular; flowers 15–27 mm long, blue purple to blue; pods spreading declined, stipitate, the stipe 8–16 mm long, the body 15–60 mm long, 6–8 mm wide, strongly constricted between the usually 1–5 seeds, strigose. Sand dunes and other sandy sites, mainly in mixed desert shrub communities, at 900 to 2270 m in Emery, Garfield (at Red Canyon, with ponderosa pine), Grand, Kane, San Juan, Uintah, Washington, and Wayne counties; New Mexico and Arizona; 48 (viii).

Spartium L.

Shrubs, unarmed; leaves alternate to subopposite, simple; stipules obsolete; flowers in terminal, erect racemes, papilionaceous, perfect; calyx 1-lipped, the 5 teeth marginal, all on the lower side of the calyx, the three central ones approximate, the lateral ones somewhat removed; petals yellow, the keel pubescent along the lower edge and with a porrect beak; stamens 10, monadelphous; ovary sessile; pods spreading-ascending, laterally compressed, many-seeded.

***Spartium junceum* L.** Spanish Broom. [*Genista juncea* (L.) Lam.]. Shrubs, 15–25 dm tall; leaves simple, 8–27 mm long, 0.5–4 mm wide, linear to narrowly oblanceolate, acute to obtuse, strigose on both sides; peduncles 3–22 cm long (from last leaf to first flower); racemes 3– to 16–flowered, 3–16 cm long; bracts minute, caducous; bracteoles 0; pedicels 1–4 mm long; calyx oblique, 7–8 mm long, glabrous, the teeth minute; flowers 21–26 mm long, yellow; pods sessile, 5–8 cm long, 5–7 mm wide,

strigose, dehiscent; $2n = 52, 54$. Cultivated ornamental in Washington County; introduced from southern Europe; 4 (ii).

Sphaerophysa DC.

Perennial, caulescent, from rhizomes; leaves alternate, odd-pinnate; stipules adnate to the petiole base, all distinct; flowers papilionaceous, borne in axillary racemes, each subtended by a single bract; bracteoles 1; calyx 5-toothed; petals 5, dull red, drying lavender to brown; stamens 10, diadelphous; ovary enveloped by the staminal sheath; style glabrous except for a tuft of hair below the stigma; pods stipitate, bladderly-inflated, subunilocular.

Sphaerophysa salsula (Pallas) DC. [*Phaca salsula* Pallas; *Swainsona salsula* (Pallas) Taub. in Engler & Prantl]. Perennial, caulescent. 4–7 dm tall, from a deeply placed rhizome; pubescence basifixed; stipules 1–4 mm long, all distinct; leaves 3–10 cm long; leaflets 15–25, 3–18 mm long, 1–7 mm wide, oblong-obovate to elliptic, retuse to obtuse and apiculate, strigose beneath, glabrous above; peduncles 2.5–9 cm long; racemes 5- to 17-flowered, the flowers ascending in anthesis, finally nodding, the axis 2.5–9 cm long in fruit; bracts 1–2 mm long; pedicels 2.5–8 mm long; bracteoles 2; calyx 5–6 mm long, the tube 3.8–4.6 mm long, campanulate, the teeth 1.2–2 mm long, triangular; flowers 12–14 mm long, dull red, fading lavender to brown; pods ascending to declined, stipitate, the stipe 4–7 mm long, the body bladderly-inflated, ovoid, 13–24 mm long, 9–20 mm wide (when pressed), unilocular, strigulose. Introduced weedy species known from the Uinta Basin; widespread in the western U. S.; adventive from Asia; 1 (0). This plant resembles an *Astragalus* species, and has been mistaken twice as belonging to previously undescribed and unnamed indigenous species (*A. violaceus* St. John; *A. iochrous* Barneby). Generic concepts revolving around this genus are unresolved, and it seems likely that the plants will ultimately be placed in some earlier named genus.

Thermopsis R. Br.

Perennial herbs, caulescent, from rhizomes; leaves alternate, palmately trifoliolate; stipules foliaceous; flowers papilionaceous, borne in terminal racemes; bracts herbaceous, persistent; calyx 5-toothed; petals 5, yellow or suffused with purple, the keel rounded; stamens 10, distinct; ovary stipitate, the style glabrous; pods narrowly oblong, flattened, many-seeded; $x = 9$.

1. Pods straight, not especially lomentlike, erect or ascending; plants mostly 20–70 cm tall or more, common through most of Utah *T. montana*
- Pods curved, lomentlike, spreading to recurved; plants mostly 14–40 cm tall, known from Daggett and Uintah counties *T. rhombifolia*

Thermopsis montana Nutt. in T. & G. Golden Pea; Yellow Pea. Caulescent, 2–7.5 (10) dm tall, the stems erect, pilosulous to glabrate; stipules foliar, lanceolate to ovate, 13–60 mm long, 3–30 mm wide; petioles 0.8–3.7 cm long; leaflets 3, 21–92 mm long, 5–36 mm wide, elliptic to lanceolate or oblanceolate, acute to rounded, pilosulous beneath, glabrous to glabrate above; peduncles 2.2–13 cm long; bracts 5–11 mm long; racemes mainly 2- to 23-flowered, 6–25 cm long in anthesis, the axis 9–28 cm long in fruit; flowers 20–26 mm long, yellow;

calyx 10.2–12.3 mm long, the tube 7–8.3 mm long, obliquely campanulate, the teeth 3.1–4 mm long, ovate-triangular; pods erect or ascending, stipitate, the stipe 2.5–6 mm long, the body 40–54 mm long, 5–7 mm wide, pilose, stramineous or turning black; $2n = 18$. Moist sites along streams, in meadows, around seeps and springs at 1250 to 3420 m in Box Elder, Daggett, Duchesne, Garfield, Juab, Kane, Millard, Morgan, Piute, San Juan, Sanpete, Sevier, Summit, Uintah, Utah, Wasatch, Washington, Wayne, and Weber counties; British Columbia to Montana, south to California, Arizona, and New Mexico; 126 (xvii). The abundant materials present in Utah herbaria demonstrate a wide range of variation in leaflet and stipule size and shape. There appears to be no basis for segregation of subordinate taxa, even those from the southern tier of counties known previously as *T. pinetorum* Greene or *T. ovata* (Robins.) Rydb. [*T. montana* ssp. *ovata* Robins ex Piper; *T. montana* var. *ovata* (Robins.) St. John; *T. rhombifolia* var. *ovata* (Robins.) Isely]. The leaves of plants from Washington County average larger, but that is hardly a basis for segregation. When included within an expanded *T. rhombifolia* our material is regarded as *T. rhombifolia* var. *montana* (Nutt.) Isely.

Thermopsis rhombifolia Nutt. ex Richards. Caulescent, 15–40 cm tall, the stems erect, glabrate; stipules foliose, ovate to lanceolate, 6–30 mm long, 2–22 mm wide; petioles 0.3–2.5 cm long; leaflets 3, 15–47 mm long, 7–25 mm wide, obovate to oblanceolate, obtuse to rounded, glabrous on both sides; peduncles 0.5–5.8 cm long; bracts simple to foliose; racemes mainly 4- to 30-flowered, 2–10 cm long in anthesis, the axis 2–12 cm long in fruit; flowers 18–22 mm long; calyx 7.5–10 mm long the tube 4.5–6 mm long, the teeth 3–4 mm long, triangular-ovate; pods divaricate, finally recurved, lomentlike, stipitate, the stipe 1.5–4 mm long, the body 25–70 mm long, 5–7 mm wide, pilose to glabrate; $2n = 18$. Sandy and clay soils, mainly where moist, in mixed desert shrub and pinyon-juniper communities at 1500 to 1800 m in Daggett and Uintah counties; Alberta and Saskatchewan south to Colorado and Nebraska; 21 (ii).

Trifolium L.

Perennial or short-lived perennial or annual, caulescent or acaulescent, from taproot and caudex, rhizome, or stolon; leaves alternate, palmately to pinnately 3-foliolate, or rarely 4- to 7-foliolate, commonly serrate throughout, rarely entire; stipules membranaceous to foliaceous, often connate; flowers papilionaceous, borne in terminal or axillary, pedunculate to sessile, subcapitate heads or racemes; calyx 5-toothed; petals 5, pink, white, or red purple, withering and persistent, finally investing the pod; stamens 10, diadelphous; pods usually shorter than the calyx, indehiscent, 1- to several-seeded.

- Martin, J. S. 1946. Notes on *Trifolium eriocephalum* Nutt. *Madrono* 8: 152–157.

1. Plants acaulescent or subcaulescent, mainly 1.5–10 cm tall 2
- Plants caulescent, with 1 or more elongated internodes (see also *T. parryi*), mainly 10–60 cm tall ... 7
- 2(1). Heads 1- to 4-flowered, essentially sessile, the flowers 15–23 mm long; plants of high elevations in the Uinta and La Sal mts. *T. nanum*
- Heads several-flowered, sessile or pedunculate, the flowers either shorter or the heads pedunculate; plants of various distribution 3
- 3(2). Plants densely pulvinate-caespitose, matted 4
- Plants loosely caespitose, not especially mat-forming . 5
- 4(3). Calyces densely woolly-villose; herbage silvery-hairy; plants of central Beaver and western Millard counties *T. andersonii*
- Calyces strigose to strigulose; herbage green, merely strigose; plants of Daggett, Millard, Rich, San Juan, and Summit counties *T. andinum*
- 5(3). Leaflets toothed; calyces villosulous to pilosulous; flowers less than 9 mm long; plants of moderate elevations, broadly distributed *T. gymnocarpon*
- Leaflets entire or, if toothed, the calyces glabrous; flowers more than 9 mm long; plants of high elevations 6
- 6(5). Leaflets entire; calyces strigose; plants of Uinta, La Sal, Abajo, and Henry mts. *T. dasphyllum*
- Leaflets toothed; calyces glabrous; plants of Uinta, La Sal, and Abajo mts. *T. parryi*
- 7(1). Plants stoloniferous, prostrate and rooting at the nodes; flowers white; calyx not bladderly-inflated; introduced, widespread *T. repens*
- Plants not stoloniferous (except in some *T. fragiferum*), usually erect or ascending, not or seldom rooting at the nodes; flowers mainly pink to red purple, though sometimes white 8
- 8(7). Calyx soon bladderly-inflated and enclosing the corolla; plants introduced *T. fragiferum*
- Calyx not accrescent or only slightly so, never enclosing the corolla; plants various 9
- 9(8). Heads sessile or nearly so, commonly immediately subtended by a trifoliate bract; plants cultivated, escaping, and persisting *T. pratense*
- Heads with well-developed peduncles, not immediately subtended by foliose bracts; plants indigenous or cultivated 10
- 10(9). Peduncles bent at the apex, the heads reflexed or appearing turned to one side 11
- Peduncles straight, the heads erect 13
- 11(10). Calyx tube and teeth villose; ovary with hairs near the apex along the ventral side; plants of lower middle elevations in Juab, Piute, Sevier, and Beaver (?) counties *T. eriocephalum*
- Calyx tube and teeth sparingly villosulous to glabrous; ovary glabrous or scaly, but not hairy as above; plants of various distribution 12
- 12(11). Heads definitely longer than broad; calyx teeth shorter than the tube; basal leaves prominent, long-petioled, plants of lower to middle elevations in Beaver, Iron, and Washington counties . *T. macilentum*
- Heads about as broad as long; calyx teeth subequal to the tube; basal leaves more shortly petioled than the subbasal ones; plants of higher elevations, of broad distribution but not as above *T. kingii*
- 13(10). Heads subtended by a spinose-toothed involucre ... 14
- Heads lacking an involucre; plants from a caudex, variously distributed, common or uncommon 16
- 14(13). Plants perennial from a caudex or from rhizomes, known from Juab, Kane, and Tooele counties *T. wormskjoldii*
- Plants annual from a taproot, though often more or less rhizomatous also; distribution various 15
- 15(14). Lower calyx teeth usually bi- or trifid; involucre shallowly rotund-lobate, the lobes erose-dentate, the teeth less than 2 mm long; plant report apparently due to mislabeled specimen from Nevada *T. cyathiferum* Lindl.
- Lower calyx teeth entire; involucre irregularly lobed and lacerate about half its length, the teeth often more than 2 mm long; plants of northern Utah *T. variegatum*
- 16(13). Flowers mainly 7–9 mm long, heads axillary, from the uppermost nodes; plants cultivated, escaping and persisting *T. hybridum*
- Flowers 10–16 mm long; heads terminal, solitary; plants indigenous 17
- 17(16). Calyx glabrous; flowers mainly 14–16 mm long; plants rare in Sevier and Piute (?) counties *T. beckwethii*
- Calyx villosulous to pilosulous; flowers mainly 10–12 mm long; plants widespread in Utah *T. longipes*
- Trifolium andersonii* Gray Frisco Clover.** Acaulescent, densely pulvinate-caespitose, mat-forming, 0.8–3 cm tall, from woody caudex branches and a thick taproot, the stems obscured by imbricated stipules and persistent leaf bases; petioles 0.3–1.1 cm long; leaflets 3, 3–8 mm long, 1.5–3.4 mm wide, oblanceolate to obovate, entire or toothed near the apex and the teeth more less obscured by pubescence, villosulous on both sides with hairs 0.3–0.7 mm long, commonly folded, mucronate; stipules scarious, pilose, 5–9 mm long; heads lacking an involucre, borne subsessile or on peduncles 0.2–0.6 cm long, these densely pilose; flowers 4–9, the banner reddish purple, the keel and wings pale, 8–9 mm long, on pedicels ca 0.5 mm long (obscured by pilose hairs); calyx 8.5–9.5 mm long, the tube 3–4 mm long, campanulate, obscured by villous hairs to 1.5 mm long, the teeth 5–7 mm long, subulate, villose; pods enclosed within the marcescent petals and calyx; $2n = 16$. Volcanic gravels and limestone in pinyon-juniper woods at ca 2100 to 2230 m in Beaver (San Francisco Mts.) and western Millard (Tunnel Springs Range) counties; California and Nevada. Our material, as described above, belongs to var. ***friscanum* Welsh** (type from Frisco, Beaver County); 8 (ii).
- Trifolium andinum* Nutt. in T. & G. Andean Clover.** Acaulescent, densely pulvinate-caespitose, mat-forming, 0.3–5 cm tall, from woody caudex branches and a thick taproot, the stems obscured by imbricated stipules and persistent leaf bases; petioles 0–2.3 cm long; leaflets 3, 2–12.5 mm long, 1.2–5 mm wide, oblanceolate to obovate, toothed in the apical third, strigose to strigulose on both sides, commonly folded, abruptly acuminate; stipules scarious, yellowish, glabrous except toward the tip, 3–9 mm long; heads closely subtended by reduced leaf-like bracts, these with or without a trifoliate bract, sessile or appearing pedunculate by elongation of internodes on floriferous branches, the internodes glabrous; flowers 7–15, in 2 closely associated heads, the banner violet purple, the keel and wings ochroleucous,

9–12 mm long, on pedicels 0.5–1 mm long, these glabrous to strigose; calyx 5–7 (8.5) mm long, the tube 2.2–3.6 (4) mm long, sparingly pilose to glabrous, the teeth 2–3.8 (4.5) mm long, lance-subulate, pilose; pods 4–5 mm long, 2.3–2.7 mm wide. Ponderosa pine, sagebrush, or mixed shrub communities at 1970 to 2730 m in Daggett, Millard (Canyon Range), Rich, San Juan (Navajo Mt.), and Summit counties; Wyoming, Nevada, and Arizona; 17 (i). The tripartite distribution of this clover is without precedence among the legumes of Utah. The plants from Navajo Mountain differ in features of flower, mainly in calyx teeth much shorter than the tube; possibly they are of taxonomic significance.

Trifolium beckwithii Brewer ex Wats. Beckwith Clover. Caulescent, 12–40 cm tall, from rhizomes and thick roots; petioles of lower leaves 4–15 cm long, becoming shorter upward; leaflets 3, 12–45 (50) mm long, 7–20 mm wide, elliptic to lance-elliptic or oblong, toothed from near the base, glabrous, flat, emarginate to apiculate; stipules prominent, herbaceous to scarious, 12–28 mm long; heads not subtended by an involucre, ca as broad as long, 25–35 mm wide, terminal or axillary, on peduncles 5–26 cm long, these glabrous; flowers numerous, the petals pink, fading brown, 12–16.5 mm long; calyx 6.5–8 mm long, the tube 2.5–3.1 mm long, gibbous, glabrous, 5-veined, the teeth 3.5–4.9 mm long, lance-subulate, glabrous; pods 4.8–5.2 mm long, 1.9–2.1 mm wide; $2n = 48$. Meadows at 2070 to 2200 m in Piute (?) and Sevier counties; California, Oregon, Nevada, Idaho, Montana, and South Dakota; 3 (ii). Utah materials have flowers and parts larger than for the species as a whole. At the known locality in Utah, the plants grow with *T. eriocephalum*.

Trifolium dasyphyllum T. & G. Uinta Clover. Acaulescent, loosely mat-forming, 2–14 cm tall, from a caudex and thick taproot, the stems obscured by imbricated stipules and leaf bases; petioles 0.3–4 cm long; leaflets 3, 3–28 mm long, 1–5 mm wide, oblanceolate, entire, strigose beneath, strigose to glabrate above, flat or folded, sharply apiculate; stipules scarious, glabrous or strigose, 5–17 mm long; heads closely subtended by a long-lobed involucre, 11–18 mm wide, terminal, sessile or on peduncles 0.5–10 cm long, these strigose; flowers 6–16, erect, the banner violet to ochroleucous, the keel and wings purple, or all purple, 11–13 mm long; pedicels 0.5–1.5 mm long; calyx 5.7–9.1 mm long, the tube 2.5–2.9 mm long, strigose to glabrate, the teeth 1.9–6.4 mm long, subulate, strigose to glabrate; pods 4–6 mm long. Alpine meadows at 2730 to 3800 m in Daggett, Garfield, Grand, San Juan, Summit, and Uintah counties; Montana, Wyoming, Colorado, and New Mexico; 28 (0). Our materials belong to var. *uintense* (Rydb.) Welsh [*T. uintense* Rydb., type from Uinta Mts., Summit County; *T. dasyphyllum* f. *uintense* (Rydb.) McDermott; *T. dasyphyllum* ssp. *uintense* (Rydb.) J. M. Gillett].

Trifolium eriocephalum Nutt. in T. & G. Woolly Clover. Caulescent, 12–36 (42) cm tall, from a caudex and tuberous to slender taproot; petioles 0.8–10 cm long; leaflets 3, 5–53 mm long, 5–12 mm wide, oblong to oblong-lanceolate or elliptic, toothed from near the base, thinly pilose to pilosulous on both sides, flat, obtuse to acute, apiculate; stipules foliaceous, glabrous or pilosulous, 15–55 mm long; heads lacking an involucre, 20–30 mm long, 20–27 mm wide, terminal, on peduncles 4–11 cm long, bent apically, thinly villosulous; flowers numer-

ous, curved at base and reflexed, the petals purple to red purple, rarely white, fading brown, 12–13.5 mm long; pedicels essentially obsolete; calyx 6.5–8 mm long, the tube 2.5–3.3 mm long, villosulous, the teeth 3.5–5.1 mm long, villosulous to glabrate, subulate; pods 2.5–7 mm long; $2n = 16$. Meadows at 1530 to 2270 m in Beaver (?), Juab, Piute, and Sevier counties; Washington, Idaho, Montana, California, and Nevada; 6 (ii). Our few specimens are assignable to var. *villiferum* (House) Martin [*T. villiferum* House, type from southern Utah. *T. eriocephalum* f. *villiferum* (House) McDermott; *T. eriocephalum* ssp. *villiferum* (House) J. M. Gillett]. The type (US) of *T. villiferum* is labeled as "S. Utah. Dr. E. Palmer 91, 1877." Gillett (1971) cites the type locality as Beaver City, Beaver Co., Utah." The problem of the type locality was discussed by Welsh (1978 p. 356).

Trifolium fragiferum L. Strawberry Clover. Caulescent, 5–30 cm long, rhizomatous and sometimes stoloniferous, decumbent to ascending; petioles 0.5–13 cm long, obovate, toothed from near the base, truncate to retuse and apiculate, flat, glabrous to glabrate on both sides; stipules scarious 8–20 mm long; heads involucre, many-flowered, subglobose, 10–22 mm wide, on peduncles 2–17 cm long, these glabrous; flowers 4–6 mm long, purplish, finally included within the accrescent calyx; calyx finally bladderly-inflated, pilose, reticulately veined around translucent lacunae; $2n = 16$. Meadows, roadsides, and other disturbed sites practically throughout Utah; introduced from Europe; 21 (iii).

Trifolium gymnocarpon Nutt. in T. & G. Nuttall Clover; Dwarf Clover. [*T. subcaulescens* Gray in Ives; *T. gymnocarpon* var. *subcaulescens* (Gray) A. Nels.; *T. nemorale* Greene; *T. plummerae* Wats.; *T. gymnocarpon* f. *plummerae* (Wats.) McDermott; *T. gymnocarpon* var. *plummerae* (Wats.) Martin; *T. gymnocarpon* ssp. *plummerae* (Wats.) J. M. Gillett]. Acaulescent to short caulescent, 4–16 cm tall, from a caudex and taproot, the stems mainly obscured by imbricated stipules and leaf bases; petioles 1–9 cm long; leaflets 3–5, 6–23 mm long, 2–10 mm wide, elliptic to oblong, ovate or obovate, toothed from near the base, pilosulous beneath, glabrous to pilosulous above, flat or folded, rounded to acute and apiculate; stipules scarious to herbaceous, 6–23 mm long; heads without an involucre, hemispheric, commonly 12–18 mm wide, terminal and axillary, on peduncles 1–6.5 cm long, these strigulose, erect to bent apically; flowers 6–15, the lower ones reflexed in age, the petals pink to lavender or purple, 8.5–11 mm long; pedicels 0.5–1 mm long; calyx 4.4–7 mm long, the tube 2.2–3.3 mm long, strigose, the teeth 1.8–3.7 mm long, subulate, strigose; pods 4–8 mm long, 3–4.5 mm wide. Mixed desert shrub, sagebrush, pinyon-juniper, mountain brush, ponderosa pine, Douglas fir, and spruce-fir communities at 1530 to 2900 m in Beaver, Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Iron, Kane, Millard, Piute, Rich, San Juan, Sanpete, Sevier, Summit, Uintah, Utah, and Wayne counties; Oregon, California, Nevada, Colorado, Arizona, Idaho, and Wyoming; 55 (xv). Attempts at recognition of infraspecific taxa appear to be futile.

Trifolium hybridum L. Alsike Clover. Caulescent, 15–70 cm tall, erect or ascending (rarely decumbent), from a caudex and taproot; petioles 0–16 cm long; leaflets 3, 5–35 mm long, 3–25 mm wide, oval to lance-elliptic, ovate or obovate, flat, toothed from near the base,

glabrous on both sides, obtuse to retuse and apiculate; stipules herbaceous, 5–25 mm long; heads without an involucre, 12–25 mm wide, terminal and axillary on peduncles 1.5–13 cm long, these glabrous or glabrate, erect; flowers many, the lower reflexed in age, the petals white to pink or reddish, fading red brown, 5–9 mm long; calyx 2.7–4 mm long, the tube 1.2–1.6 mm long, glabrous, scarious, the teeth 1–2.5 mm long, subulate, glabrous; pods 1– to 3–seeded; $2n = 16, 32$. Cultivated, short-lived, forage plant, escaping and persisting (?) in much of Utah; introduced from Europe; 27 (iii).

Trifolium kingii Wats. King Clover. Caulescent, (2) 7–40 cm tall, erect or ascending, from a caudex and taproot; petioles 0.8–15 cm long, the longest near the base but not basal; leaflets 3, 5–80 mm long, 4–26 mm wide, elliptic to lance-elliptic or lanceolate, flat, toothed from near the base, glabrous on both sides, obtuse to acute or attenuate and apiculate; stipules foliaceous, 8–30 mm long; heads nodding to suberect, without an involucre, 15–32 mm long, 15–30 mm wide (when pressed), terminal, on peduncles 3–13 cm long, these glabrous; flowers many, reflexed, the petals violet to purplish (rarely white), 12–16 mm long; calyx 5.3–9 mm long, glabrous, the tube 2.1–3.5 mm long, the teeth 1.8–6 mm long, subulate; pods 1– to 3–seeded; $2n = 16$. Meadows and open woods at 2270 to 3700 m in Beaver, Emery, Garfield, Grand, Piute, San Juan, Sanpete, Sevier, Summit (type from Parleys Park), and Utah counties; endemic; 37 (v). With its nodding heads and reflexed flowers, the King clover simulates *T. eriocephalum* in all salient aspects. The main differential feature involves the pubescence of herbage and calyces.

Trifolium longipes Nutt. in T. & G. Rydberg Clover. Caulescent (rarely acaulescent), 5–31 (37) cm tall, erect or ascending from a branching caudex and stout to slender taproot; petioles 1.2–10 cm long; leaflets 3, 5–47 (57) mm long, 3–18 mm wide, narrowly oblong to elliptic, oblanceolate, or obovate, flat, toothed from near the base, pilosulous beneath, glabrous above, acute to obtuse and apiculate; stipules foliaceous, 8–40 mm long; heads erect, without an involucre, 17–31 mm long, 15–33 mm wide (when pressed), terminal on peduncles 0.5–17 cm long, these strigulose; flowers many, finally reflexed, the petals whitish to pink or purple; 11–13 mm long; calyx 4.5–7.8 mm long, the tube 1.6–2.5 mm long, scarious, pilose distally, the teeth 2.9–5.8 mm long, pilose, subulate; pods 1– to 4–seeded; $2n = 16, 32, 48$. This is the common clover in the mountains of Utah. There are two rather distinctive and largely allopatric varieties.

1. Leaflets of main leaves commonly more than 5 times longer than broad; roots slender, not much enlarged; plants of Uinta, Deep Creek, La Sal, and Abajo mts. *T. longipes* var. *reflexum*
- Leaflets of main leaves commonly less than 4 times longer than broad; roots tuberous-thickened; plants mainly of southwestern Utah *T. longipes* var. *brachypus*

Var. *brachypus* Wats. [*T. longipes* var. *pygmaeum* sensu Gray in Ives, the name used descriptively; *T. longipes* ssp. *pygmaeum* J. M. Gillett; *T. brachypus* (Wats.) Blank.; *T. rusbyi* Greene; *T. confusum* Rydb., type from southern Utah, i.e., Sheep Range, Cedar City; *T. oreganum* f. *rusbyi* (Greene) McDermott; *T. oreganum* f. *brachypus* (Wats.) McDermott; *T. longipes* var. *rusbyi* (Greene) Harrington]. Alpine meadows, open

woods, stream banks, and grasslands at 1830 to 3500 m in Beaver, Emery, Garfield, Iron (type from near Cedar City), Kane, Piute, San Juan, Sevier, and Washington counties; Colorado, New Mexico, and Arizona; 57 (xiii).

Var. *reflexum* A. Nels. [*T. longipes* ssp. *reflexum* (A. Nels.) J. M. Gillett; *T. rydbergii* Greene; *T. oreganum* var. *rydbergii* (Greene) McDermott]. Meadows, stream banks, woods, and willow communities at 1870 to 3050 m in Cache, Daggett, Duchesne, Grand, Juab (Deep Creek Mts.), Salt Lake, San Juan, Summit, Uintah, Utah, and Wasatch counties; Wyoming, Colorado, and New Mexico; 35 (iv).

Trifolium macilentum Greene Lean Clover. [*T. kingii* ssp. *macilentum* (Greene) J. M. Gillett]. Caulescent, 12–35 cm tall, ascending to decumbent, from a caudex and taproot; petioles 2–16 cm long, the longest definitely basal; leaflets 3, 14–45 mm long, 4–25 mm wide, those of basal leaves broadly ovate to lance-ovate, those of cauline leaves narrowly lanceolate, flat, toothed from near the base, glabrous on both sides, retuse to obtuse, acute to attenuate and apiculate; stipules dimorphic, the lower ones scarious and very long, the cauline ones herbaceous and small; heads nodding to suberect, without an involucre, 21–40 mm long, 14–35 mm wide (when pressed), terminal on peduncles 4.5–15 cm long, these glabrous; flowers many, reflexed, violet to purplish, 13.5–17 mm long; calyx 4–5.7 mm long, pilose, the tube 2.2–3 mm long, the teeth 1.5–3.3 mm long, subulate; pods 1– to 3–seeded. Mountain brush, pinyon-juniper, and ponderosa pine communities at 1370 to 2270 m in western Beaver, Iron, and Washington (type from southern Utah) counties; Nevada and California; 20 (v). The lean clover was subordinated by Gillett (1972) within *T. kingii*, on the basis of specimens from Nevada that were mistaken for typical *T. kingii*. The lean clover is a plant of dryish hillsides at lower elevations, differing further in its strongly dimorphic leaves, flowers that average larger, and pilose (though sparingly) calyces that average shorter. Thus, it differs from *T. kingii* in about the same order of magnitude as does *T. eriocephalum*. Our material belongs to var. *macilentum*.

Trifolium nanum Torr. Dwarf Clover; Tundra Clover. Acaulescent, pulvinate-caespitose, 2–4 cm tall, from a caudex and taproot, the stems obscured by imbricated stipules and leaf bases; petioles 0.3–2 mm long; leaflets 3, 3–11 mm long, 1–5 mm wide, oblanceolate to obovate, toothed to entire, glabrous or with some hairs on the lower surface, folded or flat, acute to mucronate; stipules scarious to herbaceous; heads 1– to 4–flowered, with an involucre of distinct to connate bracts, terminal, sessile or on peduncles 0.3–4 cm long, these glabrate to glabrous; flowers 15–23 mm long, pale purplish (fading dark violet), erect; pedicels 1–2 mm long; calyx 5–7 mm long, the tube 3.5–4 mm long, scarious, glabrous, the teeth 2.2–2.8 mm long, triangular-subulate, glabrous; pods 1– to 4–seeded; $2n = 16$. Alpine meadows at 2900 to 3730 m in Daggett, Duchesne (?), Grand, San Juan, Summit, and Uintah counties; Montana, Wyoming, Colorado, and New Mexico; 11 (0). The dwarf clover is one of our most distinctive, yet poorly collected clovers.

Trifolium parryi Gray Parry Clover. Acaulescent or short caulescent and with 1 elongate internode, 4–25 cm tall, from a caudex and taproot; petioles 0.6–13 cm long; leaflets 3, 5–43 mm long, 1.5–13 (16) mm wide, oblanceolate or obovate to elliptic or oblong, flat, toothed from

near the base, glabrous on both sides, acute to obtuse and apiculate; stipules scarious to herbaceous, 6–18 mm long; heads 5– to 20-flowered, subtended by involucre bracts, terminal, on peduncles 1.8–22 cm long, these glabrous or sparingly hairy near the apex; flowers 12–17 mm long, the petals pale to dark pink purple (fading dark violet), erect; pedicels 0–1 mm long; calyx 4–7.1 mm long, the tube 2–3.9 mm long, scarious, glabrous, the teeth 2–3.2 mm long, lance-subulate; pods 1– to 4-seeded; $2n = 16, 32$. Alpine meadows, openings in spruce and other coniferous woods, and on talus slopes at 2730 to 3800 m in Daggett, Duchesne, San Juan, Summit, Uintah, and Wasatch counties; Montana, Wyoming, and Colorado; 41 (v). Our materials are segregated as var. *montanense* (Rydb.) Welsh [*T. montanense* Rydb.; *T. parryi* ssp. *montanense* (Rydb.) J. M. Gillett; *T. inequale* Rydb., type from Bear River Canyon, Uinta Mts.], but it is doubtfully distinct from var. *parryi*.

Trifolium pratense L. Red Clover. Caulescent, short-lived perennial, 18–60 cm tall or more, from a taproot, erect or ascending; petioles 0.8–19 cm long; leaflets 3, 11–54 mm long, 8–28 mm wide, elliptic to lanceolate, ovate, or obovate, flat, toothed from near the base (the teeth inconspicuous), long-pilose beneath, glabrous above, obtuse to retuse; stipules scarious to subherbaceous, 11–24 mm long; heads closely subtended by one or more foliose bracts, these often 3-foliolate, sessile, or spreading hairy peduncles to 3 cm long, many-flowered, 22–36 mm long, 20–34 mm wide, axillary, erect; flowers 13–20 mm long, deep red; calyx 7.5–9.7 mm long, the tube 3.2–4.1 mm long, strigose, scarious, the teeth 4.3–5.6 mm long, subulate, pilose; pods 2-seeded; $2n = 14, 28, 48$. Cultivated forage plant, escaping but seldom persisting in probably all Utah counties; introduced from Europe; 33 (iv).

Trifolium repens L. White Clover. Caulescent, 8–35 cm tall, the stems stoloniferous, creeping and rooting at the nodes, the petioles and peduncles often arising at right-angles to the stem axis, radiating from a root crown; petioles 1.8–24 cm long; leaflets 3, 5–22 mm long, 4–18 mm wide, obcordate or obovate to oval or elliptic, flat, toothed from near the base, glabrous on both sides, truncate to emarginate; stipules scarious, 3–10 mm long; heads without an involucre, many-flowered, 10–32 mm long, 15–30 mm wide, axillary, on peduncles 6–33 cm long, these glabrous or sparingly pilose, erect; flowers 5–9 (10) mm long, white or pinkish, fading brown, the lower reflexed in age; calyx 3.2–5.4 mm long, the tube 2.2–2.7 mm long, scarious, glabrous, the teeth 1–2.7 mm long, subulate, glabrous; pedicels 1–6.4 mm long; pods 1– to 3-seeded; $2n = 16, 22, 30, 32$. Cultivated forage and pasture plant now established through most of Utah; introduced from Europe; 53 (vi).

Trifolium variegatum Nutt. in T. & G. Variegated Clover. Annual, caulescent, with prostrate to erect stems 1–4 (6) dm long; petioles 0.5–4.5 cm long; leaflets 3, 3–27 mm long, 1.5–10 mm wide, obcordate to obovate or oblanceolate, flat, sharply toothed from near the base, glabrous on both sides; stipules herbaceous, ovate, laciniately toothed; heads involucre, the involucre flaring, saucer-shaped, lobed and lacerate, 3– to 40-flowered, 6–20 mm broad, axillary on peduncles 0.8–6.5 cm long, these glabrous; flowers 5–20 mm long, purplish, often white-tipped, fading brown, ascending to erect; calyx 5– to 20-nerved, the teeth subulate-setaceous, glabrous;

pedicels very short; pods 1– to 20-seeded; $2n = 16$. Stream banks and roadsides, at 1300 to 1800 m in Box Elder, Cache, Salt Lake, and Weber counties; British Columbia and Montana, south to California and Nevada; 4 (0).

Trifolium wormskjoldii Lehm. Wormskjold Clover. [*T. involucreatum* Ortega, not Lam.; *T. willdenovii* Sprengel; *T. fimbriatum* Lindl.; *T. involucreatum* var. *fimbriatum* (Lindl.) McDermott; *T. willdenovii* var. *fimbriatum* (Lindl.) Ewan; *T. spinulosum* Dougl. ex Hook.; *T. heterodon* T. & G.]. Caulescent, 12–35 cm tall or more, from a taproot, or sometimes rooting at decumbent stem bases, erect or ascending; petioles 1.2–4 cm long; leaflets 3, 6–30 mm long, 3–14 mm wide, oblanceolate to elliptic or obovate, flat, toothed from near the base, glabrous throughout; stipules herbaceous, 8–15 mm long, many-toothed, heads subtended by an involucre, 20–30 mm wide, many-flowered, axillary, erect; flowers 10–18 mm long, reddish to purple; calyx 7–9 mm long, the tube 2.9–3.7 mm long, glabrous, the teeth 4.1–5.3 mm long, subulate, glabrous; pods 1– to 4-seeded; $2n = 16, 32$. Meadows at lower middle elevations in Juab, Kane, and Tooele counties; British Columbia and Idaho south to California, New Mexico, and Mexico; 3 (0).

Trigonella L.

Annual or short-lived perennial, caulescent from a taproot; leaves alternate, pinnately 3-foliolate, serrate in the apical 1/3–1/2; stipules herbaceous, distinct, toothed or entire; flowers papilionaceous, borne in axillary racemes or subumbellately disposed; calyx 5-toothed; petals 5, yellow; stamens 10, diadelphous; pods laterally compressed, much surpassing the calyx, several-seeded.

Trigonella corniculata (L.) L. [*Trifolium* (*Melilotus*) *corniculata* L.]. Annual, caulescent, 12–26 cm tall; stipules 3–6 mm long, laciniately toothed; petioles 0.5–4.5 cm long; leaflets 3, the terminal on a short continuation of the rachis, 7–20 mm long, 2.5–16 mm wide, obovate to obcordate, toothed in the apical half, sparingly pilose (mainly along veins beneath), glabrous above, apiculate; peduncles 0.8–2.8 cm long, sparingly pilose; racemes 5– to 16-flowered, 0.8–1.4 cm long; pedicels 1–2 mm long; flowers 5.5–6.5 mm long, yellow; calyx 2.8–3.2 mm long, the tube 1.4–1.8 mm long, sparingly pilose, the teeth 1.2–1.4 mm long, subulate; pods sessile, 12–15 mm long, 2–2.5 mm wide, curved, reticulately veined, the veins leaving the margins at about right-angles, glabrous; $2n = 16$. Introduced revegetation plant, not known to persist, but to be expected; known from Sanpete County; introduced from Europe; 2 (0).

Vicia L.

Annual or perennial herbs, clambering, trailing, or climbing; leaves alternate, even-pinnately compound, the rachis terminating in a usually prehensile tendril, stipules herbaceous, entire to semisagittate; leaflets 4–12 or more, very variable; flowers solitary, axillary, or in axillary racemes, papilionaceous; calyx 5-toothed, obliquely campanulate to short-cylindric; petals 5, pink to white, the wings adnate to the keel; stamens 10, diadelphous; style filiform, bearded around the circumference below the stigma; pods oblong, 2– to several-seeded, the valves coiling upon dehiscence.

1. Flowers 15 or more in dense, secund racemes; introduced plants of cultivated lands and other sites . . . *V. villosa*
- Flowers 10 or fewer, in secund racemes or otherwise; introduced or indigenous plants 2
- 2(1). Flowers 5–8 mm long; plants very slender, indigenous in southern Utah *V. ludoviciana*
- Flowers 12–25 mm long or more; plants not very slender, indigenous and widespread or cultivated 3
- 3(2). Flowers 3–10 in pedunculate racemes; plants indigenous, widespread *V. americana*
- Flowers 1–3, sessile or very shortly pedunculate in leaf axils; plants uncommon, cultivated *V. faba*

Vicia americana Muhl. ex Willd. American Vetch. Perennial, 1.2–12.7 dm tall, the stems glabrous or pubescent; stipules 3–10 mm long, semisagittate, deeply toothed in the lower portion; leaves (excluding tendrils) 2–3 cm long; leaflets 8–16, 3–44 mm long, 1–19 mm wide, linear, elliptic, oblong, ovate, lanceolate, oblanceolate, or obovate, glabrous to pubescent, acute to truncate, rounded, or retuse and apiculate, less commonly toothed apically; tendrils branched or simple; peduncles 1.8–6.7 cm long; racemes 3– to 7 (10)-flowered, the flowers spreading at anthesis; calyx 6.2–8.4 mm long, the tube 4.8–6.5 mm long, the lowermost tooth 0.7–1.9 (2.5) mm long, triangular; flowers 13–22 (25) mm long, pink to pink purple; pods stipitate, the stipe 2.5–4.5 mm long, the body 23–35 mm long, 6–8 mm wide, glabrous; $2n = 14$. This widespread, indigenous vetch is extremely variable with regard to leaflet length-width ratios and shape. Thickness of leaflets and pubescence also varies considerably. Several subordinate taxa have been based on these variations, but continued recognition seems possible only when diagnostic criteria are arbitrarily applied, and even then with great difficulty, especially in plants with dimorphic leaves. More importantly, much of the variation seems to be ecologically influenced, and further recognition of most of the types seems unwarranted. Therefore, it seems best to treat only two infraspecific taxa, the one widespread and common, the other restricted and rare.

1. Leaflets 20–40 mm long, 2–5 mm wide, coriaceous, pubescent with short curved hairs; lateral veins prominent, leaving the midrib at a narrow angle; plants of Daggett and Uintah counties *V. americana* var. *minor*
- Leaflets 3–44 mm long, 1–19 mm wide, thin or glabrous, or both; lateral veins prominent or not, leaving the midrib at a wide angle; plants not of Daggett or Uintah counties *V. americana* var. *americana*

Var. *americana* [V. *oregana* Nutt. in T. & G.; V. *americana* var. *oregana* (Nutt.) A. Nels. in Coult. & Nels.; V. *americana* ssp. *oregana* (Nutt.) Abrams; V. *truncata* Nutt. in T. & G.; V. *americana* var. *truncata* (Nutt.) Brewer in Brewer & Wats.]. Sagebrush, pinyon-juniper, mountain brush, ponderosa pine, aspen, and spruce-fir communities at 1270 to 3570 m in all Utah counties, except Box Elder, Daggett, Grand, and Uintah; British Columbia east to Ontario and south to Mexico, Arizona, New Mexico, Kansas, Missouri, and Virginia; 221 (xlii).

Var. *minor* Hook. [V. *sylvatica* Nutt.; V. *sparsifolia* Nutt. ex T. & G.; *Lathyrus linearis* Nutt. ex T. & G.; V. *linearis* (Nutt.) Greene; L. *dissitifolius* Nutt. ex T. & G.; V. *dissitifolius* (Nutt.) Rydb.; V. *americana* var. *angustifolia* Nees in Neuwied.; V. *caespitosa* A. Nels.; V. *trifida*

Dietr.]. Pinyon-juniper and mixed desert shrub communities at 1670 to 1830 m in Daggett and Uintah counties; Alberta to North Dakota, south to Colorado and Texas; 9 (i).

Vicia faba L. Broadbean. Annual, 4–10 dm tall or more, the stems glabrous; stipules 4–15 mm long, semisagittate, not or only somewhat toothed; leaves (excluding tendrils) 6–14 cm long; leaflets 2–6, 3–7.5 (10) cm long, 1.3–4 cm wide, ovate-lanceolate to elliptic or obovate, glabrous or with short, curved hairs on veins and margin, obtuse to acute and apiculate; tendrils unbranched; peduncles very short or obsolete; racemes 1– to 4-flowered, the flowers erect-ascending; calyx 12–16 mm long, the shortly cylindrical tube 7.5–9.5 mm long, the lowermost tooth 3.5–6.5 mm long, lance-subulate; flowers 25–31 mm long, white, spotted with maroon or blackish violet; pods sessile to substipitate, the body 7–13 cm long or more 1–3 cm wide, glabrous; $2n = 12, 14, 16$. Sparingly cultivated vegetable plant, mainly for the large, edible seeds, known from Wasatch County; introduced from Asia; 1 (i).

Vicia ludoviciana Nutt. Louisiana Vetch. [V. *exigua* Nutt. ex T. & G.; V. *thurberi* Wats.; V. *producta* Rydb.]. Annual or winter annual, 3–8.5 dm tall, the stems glabrous or puberulent; stipules semihastate to linear-oblong, 1–4 mm long; leaves (excluding tendrils) 1.8–5.5 cm long; leaflets 6–10, 7–28 mm long, 0.6–4 mm wide, linear to oblong or oblanceolate, pilosulous to glabrous, obtuse to acute and mucronate; tendrils branched and prehensile; peduncles 0.4–4.8 cm long; racemes 1 (2)-flowered, the flowers ascending to spreading at anthesis; calyx 2.2–3.3 mm long, the campanulate tube 1.4–1.9 mm long, the lowermost tooth 0.8–1.4 mm long, lance-subulate; flowers 6.3–7.4 mm long, lavender; pods stipitate, the stipe 0.8–1.4 mm long, the body 16–28 mm long, 5–6.2 mm wide, glabrous. Blackbrush, creosote bush, mixed desert shrub, and pinyon-juniper communities at 900 to 1730 m in San Juan, Washington, and eastern Wayne counties; Oregon, California, Nevada, Arizona, New Mexico, Colorado, and Texas; 8 (i).

Vicia villosa Roth Hairy Vetch. Annual or biennial, 5–20 dm tall, the stems spreading-hairy; stipules toothed or entire, 5–15 mm long; leaves (excluding tendrils) 2.3–8 cm long; leaflets 10–18, 8–30 mm long, 1–6 mm wide, linear to oblong or narrowly lanceolate, long-pilose or hirsute on both sides, acute to obtuse and apiculate; peduncles 1.8–7.5 cm long; racemes mainly 15– to 25-flowered, the flowers declined at anthesis; calyx 7–7.8 mm long, the gibbous tube 3.8–4.7 mm long, the teeth 3.1–4.3 mm long, subulate, pilose; flowers 15–17 mm long, pink purple or reddish violet; pods 20–30 mm long, 7–10 mm wide, glabrous; $2n = 14$. Weedy introduction in cultivated lands and other disturbed sites, often along fence-rows in Salt Lake, Sanpete, Utah, Washington, and Weber counties; adventive from Europe; 9 (0).

Wisteria Nutt.

Twining woody vines, unarmed; leaves alternate, odd-pinnate with 7 or more leaflets; stipules ovate to lance-linear, caducous; peduncles opposite the leaves; flowers in elongate, pendulous racemes; calyx turbinate-campanulate, 2-lipped, the upper lip shortly 2-toothed, the lower 3-toothed; corolla papilionaceous, the banner strongly reflexed; stamens 10, diadelphous; petals white, pink, lavender, purple, or blue; pods stipitate, laterally flattened, constricted between the seeds.

- 1. Longest pedicels 12–28 mm long or more; calyx lobes very short; pods silky to velvety hairy *W. floribunda*
- Longest pedicels 6–11 mm long; calyx lobes almost as long as the tube; pods glabrous *W. macrostachya*

- 2(1). Bladders borne on separate branches; flowers 8–12 mm long *U. intermedia*
- Bladders borne on the leaves, flowers 5–8 mm long *U. minor*

Wisteria floribunda (Willd.) DC. Japanese Wisteria. [*Glycine floribunda* Willd.; *Kraunia floribunda* (Willd.) Taub.; *W. macrobotrys* Sieb. & Zucc.]. Twining vines to several meters long; leaves petiolate, 9–35 cm long; leaflets 9–15, 1.3–9 cm long, 9–30 mm wide, ovate to lance-oblong, long-attenuate, pilose to glabrate or glabrous on both sides; peduncles 0.5–5 cm long; racemes pendulous, many-flowered, 25–50 cm long; flowers 15–20 mm long, white, pink, purple, or lavender; calyx tube strigulose, 3.5–4.3 mm long, the upper teeth almost completely connate, the lowermost tooth 1.3–2.1 mm long, triangular; pods 10–18 cm long, 1.5–1.8 cm wide, tapering to the base, velvety hairy in lines. Cultivated ornamental of great beauty in both grafted and free growing forms in Utah and Washington counties; introduced from Japan; 4 (iii).

Wisteria macrostachya Nutt. Nuttall Wisteria. Freely twining vines to several meters long; leaves 15–40 cm long; leaflets 9–13, 2.8–9 cm long, 9–33 mm wide, ovate to lance-oblong, lance-acuminate, pilose along the veins beneath at maturity, pilose to glabrate or glabrous otherwise; peduncles 1–5 cm long; racemes pendulous, many-flowered, 22–55 cm long; flowers 18–22 mm long, lilac purple; calyx tube pilosulous, 4.5–5.5 mm long, the upper teeth cleft, the lowermost tooth 5.5–6.5 mm long, ovate-acuminate; pods 7–12 cm long, 1.1–1.5 cm wide, oblong, glabrous. Ornamental of charm and beauty in Utah, Washington, and Wayne counties; introduced from the southeastern U. S.; 5 (iii).

LENTIBULARIACEAE

Rich. in Poileau & Turpin

Bladderwort Family

Herbaceous, aquatic perennials; leaves alternate or basal, typically submersed and finely divided, bearing insectivorous bladders; flowers perfect, irregular, few to several in scapose racemes; calyx 2-lobed; corolla of 5 united petals, bilabiate, the lower lip saccate or spurred at the base; stamens 2, sometimes with 2 staminodia also; pistil 1, the ovary superior, unilocular, bicarpellate; style 1 or lacking, the stigma 2-lobed; fruit a capsule; x = 6, 8, 9, 11, 21.

Utricularia L.

Perennial herbs without roots or apparently so; leaves all submersed and finely dissected, or sometimes emergent and with leaves somewhat reduced, alternate, bearing bladderlike floats that trap small animals; flowers showy; calyx with 2 entire lobes; corolla with the upper lip entire or obscurely 2-lobed, the lower entire or 3-lobed, produced into a basal spur.

- 1. Leaf segments terete; bladders not on separate branches; leaves commonly 1–4 cm long or more; flowers 12–18 mm long *U. vulgaris*
- Leaf segments flat; bladders borne on separate branches or the flowers less than 10 mm long; leaves 0.5–1.5 cm long 2

Utricularia intermedia Hayne ex Schrader Flatleaf Bladderwort. Plants of shallow water, the stems growing on the bottom; leaves alternate, mostly 0.5–1.5 cm long, dissected into flat, linear segments; bladders 2–4 mm long, borne on separate, leafless branches; winter buds 5–7 mm long; scapes 5–20 cm long, emergent; flowers 2–5, yellow, 8–12 mm long, the spur about as long as the lower lip; fruiting pedicels erect. Ponds and lakes in Cache County; widely distributed in North America; Eurasia; 1 (0).

Utricularia minor L. Lesser Bladderwort. Plants of shallow water, growing along the bottom or floating; leaves alternate, mostly 4–10 mm long, divided into flat, linear segments; bladders 1–2 mm long, borne on the leaves; winter buds 2–5 mm long; scapes 5–12 (15) cm long, emergent; flowers 2–9, yellow, 5–8 mm long, the spur short and saccate or lacking; fruiting pedicels recurved. Ponds and lakes in Cache, Uintah, and Utah counties; widely distributed in North America; circumboreal; 4 (0).

Utricularia vulgaris L. Common bladderwort. Plants of shallow to deep water, rarely terrestrial, the stems coarse, usually floating; leaves alternate, 1–4 cm long, divided into numerous terete, filiform segments; bladders 1–3 mm wide, borne on the leaves; winter buds 8–15 mm long; scapes mostly 8–25 cm long, emergent; flowers 5–15 (rarely more), yellow, 12–18 mm long, the spur well developed, curved, shorter than the lower lip; fruiting pedicels recurved; n = 21, 22. Ponds, lakes, sluggish streams, or merely wet mud at 1340 to 3050 m in Cache, Duchesne, Garfield, and Millard counties; widespread in North America; circumboreal, 12 (i). This and the other bladderwort species in Utah are poorly represented in collections, usually present only as vegetative fragments taken with other aquatic vegetation. In 1983 Scipio Lake in eastern Millard County turned golden yellow with the flowers of common bladderwort. The entire lake surface was clogged with *Utricularia* and other floating aquatics.

LIMNANTHACEAE R. Br.

Meadowfoam Family

Low, weak, glabrous, annual herbs; leaves alternate, pinnately dissected, estipulate; flowers perfect, regular, solitary, axillary, mostly 3-merous; sepals distinct or essentially so, valvate; persistent; petals convolute, distinct; stamens 6–10, distinct, glandular at the base; pistil 1, the ovary 3-lobed, the carpels almost separate, connected by a common gynobasic style; ovules 1 per locule; fruit separating into 1-seeded segments (nutlets); x = 5.

Floerkea Willd.

This genus has the characters as noted for the family.

Floerkea proserpinacoides Willd. False Mermaid. Plants weak, decumbent-ascending or erect; stems 3–30 cm long, simple or branched; leaves pinnately dissected (compound), with mostly 3–15 segments, these typically 3–15 mm long and 1–4 mm wide, elliptic to oblanceolate; pedicels axillary, solitary, 1–4 cm long; sepals green,

foliaceous, ovate to lance-ovate, acute to acuminate, 2–6 mm long; petals white, 1–2 mm long, with small pyramidal tubercles; $n = 5$. Mountain brush, sagebrush, aspen, and spruce-fir communities, often in spring, pond, and stream margins and in other moist situations, at 1690 to 2625 m in Box Elder, Cache, Duchesne, Emery, Morgan, Salt Lake, Summit, Utah (?), and Wasatch counties; British Columbia to Nova Scotia, south to California, New Mexico, and Georgia; 14 (0).

LINACEAE S. F. Gray

Flax Family

Annual or perennial herbs; leaves alternate simple; flowers perfect, regular; sepals 5, persistent; petals 5, distinct, blue, yellow, or orange, soon falling; stamens 5, the filaments united at the base, (sometimes with 5 staminodia as well); pistil 1, the ovary superior, of 5 united carpels; styles distinct or united below; capsule 10-loculed and 10-seeded; $x = 6-11+$.

Linum L.

A single genus with characters of the family.

Rogers, C. M. 1968. Yellow-flowered species of *Linum* in Central America and western North America. *Brittonia* 209: 107–135.

———. 1979. A new combination in *Linum*. *Phytologia* 41: 447–448.

Mosquin, T. 1971. Biosystematic studies in the North American species of *Linum*, section *Adenolinum* (Linaceae). *Canad. J., Bot.* 49: 1379–1388.

1. Petals blue, or rarely white; stigma elongate, or at least longer than wide; staminodes alternating with stamens *L. perenne*
- Petals yellow or orange; stigmas capitate; staminodes lacking 2
- 2(1). Styles distinct; sepals not or scarcely aristate, the outer ones entire or with a few glandular teeth; fruit separating into ten 1-seeded segments *L. kingii*
- Styles united nearly to the apex; sepals spinose-aristate, the outer with numerous glandular teeth; fruit separating into five 2-seeded segments 3
- 3(2). Plants short-lived perennials (rarely annual); sepals persistent in fruit; secondary partitions of carpels incomplete, lacerate-fringed *L. subteres*
- Plants annual; sepals deciduous; secondary partitions complete 4
- 4(3). Stems densely hirtellous with spreading hairs; petals mostly orange to salmon, the bases reddish *L. puberulum*
- Stems glabrous or scaberulous; petals yellow to yellow orange 5
- 5(4). Styles 2–4 mm long, stems scaberulous below, usually simple below the middle *L. australe*
- Styles 4.5–7 mm long; stems glabrous, usually branched from near the base *L. aristatum*

Linum aristatum Engelm. Broom-flax. Annual, glabrous herbs from taproots; stems 8–45 cm tall, usually branched from near the base; leaves mainly 3–15 mm long, appressed-ascending, 0.5–1 mm wide; stipular glands present; flowers terminal, the peduncles mostly 5–35 mm long; sepals 5–9 mm long, lanceolate, acuminate to a slender awn-tip, glandular ciliate, hardly deciduous; petals yellow to yellow orange, caducous, mostly 7–12 mm long; anthers 0.8–1 mm long; staminodes lacking; style 4–7 mm long, cleft at the apex; fruit ellipsoid,

3.5–4.5 mm high, opening at maturity into five 2-seeded segments, the secondary partitions hyaline, almost complete; $n = 15$. Blackbrush, ephedra, sand sagebrush, Vanclevea, sagebrush, pinyon-juniper, and ponderosa pine communities, in sand dunes and other sandy sites, at 1125 to 1985 m in Emery, Garfield, Grand, Kane, San Juan, and Wayne counties; Colorado, Arizona, New Mexico, Texas, and Mexico; 30 (iii).

Linum australe Heller Small Yellow-flax. Annual, scabrous herbs from taproots; stems 10–40 cm tall, usually branched from above the base; leaves mainly 6–20 mm long, 0.5–1.5 mm wide, appressed-ascending or ascending; stipular glands absent or present; flowers terminal, the peduncles mainly 3–15 mm long; sepals 4.5–7 mm long, lanceolate, alternate to a short awn-tip, glandular ciliate, deciduous; petals yellow or yellow orange, not reddish at the base, mostly 5–9 mm long; anthers 0.4–0.8 mm long; style 2.5–4 mm long, subequal to the stamens, cleft at the tip, the stigmas capitate; fruit 3.5–4.5 mm long, ovoid, splitting at maturity into five 2-seeded segments, the secondary partitions hyaline, almost complete; $n = 15$. Ponderosa pine, sagebrush, or pinyon-juniper communities at ca 2350 to 2745 m in Garfield, Kane, San Juan, and Sevier counties; Alberta south to Nevada, Arizona, and northern Mexico; 6 (0).

Linum kingii Wats. [*L. kingii* var. *sedoides* T. C. Porter in Hayden, type from the Uinta Mts.; *L. kingii* var. *pinetorum* Jones, type from above Tropic]. Perennial, glabrous, glaucous herb from a caudex and stout taproot; stems 5–35 cm long, usually branching from the base; leaves 2–20 (25) mm long, 1–3 mm wide, ascending to spreading-ascending, linear to oblong; flowers in cymose clusters; sepals 2.5–3.5 mm long, ovate to oblong, acute or acutish, all or only the inner glandular-ciliate; petals yellow, 5–12 mm long, tardily deciduous; anthers 1.5–2.5 mm long; staminodia lacking; styles distinct, 4–7 mm long; fruit ovoid, 2.5–4 mm long, incompletely 10-loculed, opening from the top, with both primary and secondary partition long-ciliate. Salt desert shrub (rarely), juniper, ponderosa pine, Douglas fir, sagebrush, lodgepole pine, aspen, and spruce-fir communities, mainly in calcareous substrates, at 1400 to 3400 m in Box Elder, Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Iron, Juab, Kane, Millard, Salt Lake, Sanpete, Sevier, Summit (type from Uinta Mts.), Uintah, Utah, Wasatch, Washington, and Weber counties; Nevada, Idaho, Colorado, and Wyoming; 45 (viii).

Linum perenne L. Blue flax. Perennial, glabrous, glaucous herbs from a caudex and stout taproot; stems mostly 15–80 cm tall, usually simple; leaves 4–30 mm long, 0.5–4 mm wide, ascending to spreading-ascending, linear to oblong, the tips subulate; flowers in cymose clusters; sepals 3.5–6 mm long, elliptic to broadly so, entire; petals blue with a whitish or yellowish base, or white, 12–23 mm long; staminodia subulate, small, ca 1 mm long; styles distinct; fruit ovoid to globose, 6–8 mm long, opening from the top, with both primary and secondary sutures fringed-ciliate; $2n = 18$. Sagebrush, pinyon-juniper, mountain brush, mixed desert shrub, Salina wildrye, aspen, and spruce-fir communities at 1220 to 3355 m in all Utah counties; Alaska to Mackenzie, south to Mexico; Asia; 123 (xi). The North American phase of the *perenne* complex differs from the Eurasian counterpart primarily in homostylic flowers. Possibly our material is best treated as ssp. *lewisii* (Pursh) Hulten [*L. lewisii*

Pursh; *L. perenne* var. *lewisii* (Pursh) Eaton & Wright]. The cultivated flax *L. usitatissimum* L. occurs rarely as an escape. It is distinguished from *L. perenne*, by being annual and by having linear ciliate sepals and styles connected below the middle.

Linum puberulum (Engelm.) Heller [*L. rigidum* var. *puberulum* Engelm.]. Annual, hirtellous herbs from a taproot; stems 4–20 cm tall, usually branched from the base; leaves 3–15 mm long, 0.5–1 mm wide, appressed-ascending to ascending, linear subulate; stipular glands often present; flowers terminal on bracteate peduncles mostly 0.5–2.5 cm long; sepals 4–7 mm long, lanceolate, glandular ciliate; petals orange to salmon, with a dark base, 8–15 mm long; staminodia lacking; styles 3.5–6 mm long, cleft apically; fruit ovoid, 3–4 mm long, opening at maturity into five 2-seeded segments, the secondary partitions hyaline, almost complete; n = 15. Salt desert shrub and pinyon-juniper communities at 1125 to 2625 m in Duchesne, Emery, Garfield, San Juan, Sevier, Wasatch, and Wayne counties; Wyoming and Nebraska, south to California, Arizona, Texas, and Mexico; 16 (iii).

Linum subteres (Trel.) Winkler Utah Yellow-flax. [*L. aristatum* var. *subteres* Trel., type from Willow Creek, San Juan County]. Perennial (or annual), glabrous, glaucous herbs from taproots; stems mainly 10–45 cm tall, usually branched above; leaves 4–20 mm long, 0.5–2 mm wide, oblong to linear-subulate; stipular glands lacking; flowers terminal on slender sparingly bracteate peduncles mainly 0.5–6 cm long; sepals 4–7 mm long, lanceolate, acuminate to alternate, long; anthers 1–2 mm long; staminodes lacking; style 4.5–9 mm long, cleft apically; fruit ovoid, 3.5–4.5 mm high, opening at maturity into five 2-seeded segments, the secondary partitions prominently lacerate-fringed, incomplete; n = 15. Mixed desert shrub and pinyon-juniper communities, often in sand, at 1280 to 2075 m in Duchesne, Emery, Garfield, Kane, Millard, San Juan, Uintah, Washington, and Wayne counties; Nevada and Arizona; 42 (xiv).

LOASACEAE Dumort.

Stickleaf Family

Contributed by

L. C. Higgins (*Eucnide*; *Petalonyx*)

K. H. Thorne (*Mentzelia*)

Annual, perennial, or shrubby plants with barbed or sometimes stinging hairs; leaves opposite or alternate, entire or lobed, estipulate; flowers regular, bisexual, solitary or cymose; floral tube adnate to the ovary; sepals 4–5, persistent; petals 4–5, distinct or united, sometimes with petaloid staminodia alternate with the petals; stamens 5 to many; filaments narrow to petaloid, free or fused in fascicles; ovary inferior, 1- to 3-loculed; style 1, usually persistent; ovules 1 to many; fruit capsular, with 1 to many seeds; x = 7–15+.

- 1. Stamens 5, style entire; seed solitary; plants shrubby *Petalonyx*
- Stamens many; style often cleft; seeds few to many; plants herbs or subshrubs 2
- 2(1). Stamens inserted on the petals; placentae 5; petals cream; plants suffruticose, of Washington County. *Eucnide*
- Stamens not inserted on the petals; placentae 3; petals yellow to cream, plants typically herbaceous, widely distributed *Mentzelia*

Eucnide Zucc.

Suffruticose; herbage armed with short, barbed and stinging hairs; leaves alternate, petiolate, toothed or lobed; flowers mostly in terminal, bracteate cymes; sepals 5, persistent; petals 5, deciduous, united at the base, yellow or yellowish; stamens numerous, the filaments connate in a broad band below and adnate to the petals; style 5-cleft, the lobes often twisted; ovary 1-loculed and with 5 prominent placentae; ovules numerous; capsule obovoid, opening by 5 valves; seeds numerous, minute, longitudinally striate.

Eucnide urens (Gray) Parry Rocknettle. [*Mentzelia urens* Gray]. Clump-forming, 3–8 dm tall, the branches spreading or decumbent, straw colored, villous, also hispid; leaves ovate, coarsely toothed, 2–6 cm long and about as broad; petioles short or lacking; flowers corymbose; pedicels stout, 6–12 mm long; sepals lance-oblong, 20–25 mm long; petals pale yellow or cream, obovate, 2.5–4 cm long, the mucronate tip hispid; stamens 10–15 mm long, numerous; capsule obovoid, 10–12 mm long. Creosote bush and Joshua tree communities at ca 700 to 915 m in Washington County (type from near St. George); Arizona, Nevada, California, and Mexico; 7 (iv).

Mentzelia L.

Annual, biennial, or perennial, herbaceous or suffruticose from a taproot and with a caudex in some; stems simple or branched, glabrous or hairy, the outer bark white, shining, exfoliating; leaves alternate, simple, entire, crenate, dentate, sinuate, lobed, or pinnatifid; hairs glochidiate, hispid, or pustulate; inflorescence terminal, of solitary or few- to many-flowered cymes, usually subtended by bracts; calyx lobes distinct; petals 5 or 10, distinct; stamens numerous, filamentous or some petaloid, some cuspidate apically; ovary unilocular; placentae parietal; ovules horizontal or pendulous; fruit a capsule; seeds flat, winged or not, or irregularly angled or prismatic.

- 1. Plants annual; seeds pendulous in the capsule, irregularly angled or prismatic 2
- Plants perennial, biennial, or rarely annual; seeds flat, winged or not, horizontal in the capsule 7
- 2(1). Seeds prismatic, grooved on the angles ... *M. dispersa*
- Seeds irregularly angled 3
- 3(2). Leaves entire, rarely slightly dentate; seeds 1.8 mm long, plants of Uintah and Grand counties *M. thompsonii*
- Leaves pinnatifid, lobed, or occasionally entire; seeds less than 1.2 mm long 4
- 4(3). Capsules erect, straight or rarely some mature ones curved about 90 degrees 5
- Capsules, at least the mature ones, sigmoid or C-shaped 6
- 5(4). Bracts lanceolate, linear, pinnatifid, lobed, or entire, without a whitish spot at the base dorsally; petals yellow, to 5 mm long; plants common and widespread *M. albicaulis*
- Bracts oblanceolate, trilobed, angled, or entire, with a whitish spot at the base dorsally; petals yellow, to 6 (8) mm long; plants uncommon and restricted *M. montana*
- 6(4). Bracts lanceolate, entire or remotely lobed, petals to 10 mm long, plants of Washington County *M. californica*

— Bracts ovate, entire or remotely lobed or toothed; petals to 5 mm long; seed less than 1 mm long; plants of Kane, Tooele, and Washington counties . . . *M. obscura*

7(1). Filaments petaloid, distinctly cuspidate apically; plants of Washington County *M. tricuspis*

— Filaments petaloid or filamentous but, if the former, not cuspidate apically; plants of various distribution . . . 8

8(7). Petals 5 9

— Petals 10, the inner 5 somewhat narrower and shorter 14

9(8). Petals 5–8 cm long; outer series of stamens filamentous; plants mainly 3–10 dm tall *M. laevicaulis*

— Petals less than 5 cm long; outer series of stamens petaloid 10

10(9). Petals longer than 2 cm; stems branching above; leaves broadly lanceolate, linear, or oblong, entire or coarsely dentate, mainly 10–25 cm long; plants of moist habitats *M. rusbyi*

— Petals less than 2 cm long; stems, leaves, and habitats various 11

11(10). Outer petals pubescent dorsally; leaves ovate, oblanceolate, or broadly lanceolate, crenulate or dentate; plants of Grand County *M. marginata*

— Outer petals glabrous; leaves and distribution various 12

12(11). Leaves entire or crenulate; plants of Sanpete and Sevier counties *M. argillosa*

— Leaves dentate, pinnately lobed, or pinnatifid; plants not of Sanpete or Sevier counties 13

13(12). Leaves ovate, broadly elliptic or lanceolate, dentate; outer petaloid stamens spatulate; plants of Grand County *M. schultziorum*

— Leaves pinnatifid or trilobed; outer petaloid stamens broadly spatulate; plants of Carbon, Duchesne, Emery, Piute, and Uintah counties *M. multicaulis*

14(8). Outer petals pubescent dorsally; stems usually reddish beneath exfoliating bark; plants of southeastern Utah *M. cronquistii*

— Outer petals glabrous or rarely sparsely ciliate apically; stem stramineous beneath exfoliating bark 15

15(14). Leaves narrowly oblong, coarsely dentate to shortly lobed; petals sometimes ciliate apically; seeds narrowly winged; plants biennial *M. pumila*

— Leaves oblong, lanceolate, or ovate, dentate; petals and seeds various; plants annual, biennial, or perennial 16

16(15). Plants annual or apparently so, divaricately branching above; leaves ovate, dentate; seeds to 4 mm long, broadly winged *M. pterosperma*

— Plants biennial or perennial, variously branched or simple; leaves various; seeds usually less than 3.5 mm long, winged or not 17

17(16). Leaves lanceolate, oblong, dentate, broadly lobed to coarsely pinnatifid, the sinuses broad; outer stamens petaloid, seeds ca 3.5 mm long, winged . . . *M. multiflora*

— Leaves various in outline, pinnatifid almost to the midrib, the lobes narrow; outer stamens rarely petaloid; seeds brownish gray, 2.5–3.5 mm long, winged or almost wingless 18

18(17). Plants branched above; seed almost wingless; plants to be sought in eastern Utah *M. laciniata* (Rydb.) Darlington

— Plants branched from the base; seeds winged *M. pumila*

Mentzelia albicaulis Dougl. ex Hook. [*M. albicaulis* var. *gracilis* (Rydb.) Darlington]. Annual; stems 1–4 dm tall, simple or branched, white or greenish white, decumbent to erect, usually glabrous; leaves sessile, the lower ones oblanceolate, lanceolate, or linear, 3–10 (15) cm long, entire, lobed, or pinnatifid, the upper ones lanceolate or linear, the base sometimes clasping, lobed or pinnatifid; bracts linear or lanceolate, entire, angled, lobed, or pinnatifid, without a whitish spot at the base dorsally; inflorescence terminal; flowers 1–3, the 2 lateral ones pedunculate, subtended by bracts; calyx lobes erect, 2–4 mm long; petals 5, obovate, 2–8 (9) mm long; capsule cylindrical, tapering to the narrow base, 10–17 (23) mm long, 2–3 (4) mm wide, erect at maturity, straight or curved; seeds irregularly angled, white or tan, tuberculate; n = 36. Warm, mixed, and salt desert shrub, sagebrush, grassland, pinyon-juniper, and ponderosa pine communities, typically on sandy or gravelly soils, at 1065 to 2420 m in all Utah counties, except Morgan, Rich, Summit, and Wasatch; British Columbia south to California, Texas, and Mexico; 153 (iii).

Mentzelia argillosa Darlington Arapien Stickleaf. Perennial, 2–3 dm tall; stems glabrous, white, branched from the base; leaves oblanceolate to elliptic, entire or crenulate, 1–4.1 cm long, 0.6–1 cm wide; bracts linear, entire; inflorescence 1- or 2-flowered; calyx lobes 5–7.5 mm long; petals 5, obovate, 5–20 mm long; outer stamens somewhat dilated; calyx turbinate to campanulate, 8–10 mm long, ca 6 mm wide; seeds ca 1.8 mm long, scarcely winged; n = 11. Salt desert shrub and pinyon-juniper communities on the Arapien Shale Formation, at 1705 to 1895 m in Sanpete and Sevier (type from Vermillion) counties; Garfield County, Colorado; 12 (i).

Mentzelia californica Thompson & Roberts Annual, 1–4 dm tall; stems branched or simple, white, glabrous, decumbent to erect; lower leaves lanceolate to narrowly oblong, entire or pinnatifid, 3–7 cm long, 5–15 mm wide; middle leaves lanceolate, pinnatifid or lobed to entire; upper leaves and bracts lanceolate, remotely lobed or entire; inflorescence 1- to 3-flowered, the 2 lateral flowers peduncled, subtended by bracts; calyx lobes 2–6 mm long, erect; petals obovate, 3–10 mm long, yellow, spotted orange basally; capsules 2–3.5 cm long, 1–3 mm wide, sigmoid or C-shaped at maturity; seed irregularly angled, whitish or tan, tuberculate; n = 27. Creosote bush, Joshua tree, pinyon-juniper, and sagebrush communities at ca 840 m in Washington County; Washington to Colorado, south to California and Texas; 3 (0).

Mentzelia cronquistii Thompson & Prigge Cronquist Stickleaf. Perennial, the stems erect, simple, or branched from the base, 1–4 dm tall, reddish beneath the exfoliating white bark; lower leaves lanceolate to oblanceolate, mainly 5–14 cm long, 0.8–3.7 cm wide, dentate or with rounded lobes; upper leaves narrowly lanceolate, dentate or lobed; bracts linear, entire; calyx lobes 7–10 mm long; petals 10, narrowly obovate, 12–15 mm long, the outer ones pubescent, the inner shorter and narrower; outer stamens petaloid, to 2.5 mm wide; capsule 8–10 (15) mm long, campanulate; seeds ovate, ca 2.5 mm long, shortly winged, tan to dark gray, tessellate; n = 10. Sagebrush, rabbitbrush, salt desert shrub, and pinyon-juniper communities, in various substrates, at 975 to 2075 m in Emery, Garfield, Grand, Kane, San Juan (type from 10 mi E of Hite), Sevier, and Wayne counties; Colorado, Arizona, and New Mexico; 63 (i). This species is similar to *M.*

Var. *integra* Jones [*M. integra* (Jones.) Tidestr.; *Nuttallia lobata* Rydb., type from near St. George, not *M. lobata* Walp.]. Warm desert shrub, chaparral, salt desert shrub, and pinyon-juniper communities at 700 to 2135 m in Beaver, Iron, Kane, and Washington (type from near Rockville) counties; Arizona and Nevada; 33 (iv). This plant has passed under practically every name recognized in the Utah *mentzelias*. It is the Virgin River vicariad of var. *multiflora*.

Var. *multiflora* [*Bartonia multiflora* Nutt.; *M. pumila* Kuntze, not (Nutt.) T. & G.; *M. pumila* var. *multiflora* (Nutt.) Urban & Gilg; *M. speciosa* Osterh.]. Salt desert shrub, warm desert shrub, sagebrush communities at 1250 to 1830 m in Emery, Garfield, Grand, Kane, Piute, San Juan, Sevier, and Wayne counties; Wyoming south to New Mexico and Texas, west to California; Mexico; 49 (0).

Mentzelia obscura Thompson & Roberts Annual; stems erect, branching from the base, 1–3 dm tall; basal leaves lanceolate, usually pinnatifid or acutely lobed; upper leaves ovate-lanceolate, entire or with a few, acute lobes; bracts ovate, entire, lacking a white spot at the base on the dorsal side; calyx lobes 2–3 mm long; petals 5, ovate, 3–5 (6) mm long, yellow with an orange spot basally; capsule cylindrical, tapering to the base, sigmoid or e-shaped at maturity; seed irregularly angled, the margins rounded, the surface papillose, 0.8–1 mm long, white or tan; $n = 18$. Disturbed sites, along roads or in wash bottoms in creosote bush, Joshua tree, salt desert shrub, sagebrush, and pinyon-juniper communities at 915 to 1745 m in Kane, Tooele, and Washington counties; Arizona, Nevada, and California; Mexico; 6 (0).

Mentzelia pterosperma Eastw. Annual or perennial, flowering the first year; stems white, hirsute, divaricately branching above or below; rosette leaves oblanceolate, petiolate, crenate or with short, rounded lobes 3–7.4 cm long; lower cauline leaves lanceolate, crenulate or dentate; bracts linear, entire; calyx lobes 6–11 mm long; petals 10, obovate to lanceolate, 9–15 (20) mm long, 4–8 mm wide; outer stamens petaloid, 5–8 mm wide; capsule obconic, 9–14 (20) mm long, 8–10 mm wide; seeds ovate, to 4.1 mm long, broadly winged, white, granular; $n = 11$. Creosote bush, shadscale, sagebrush, and pinyon-juniper communities at 700 to 1525 m in Duchesne, Emery, Grand, Iron, Kane, Millard, San Juan (type from Willow Creek), Sevier, Tooele, Uintah, Washington, and Wayne counties; California, Nevada, Arizona, and Colorado; 21 (ii). In Washington County the stems of *M. pterosperma* are typically divaricately branched above the middle, the leaves are larger, broader, and dentately margined, but in northern areas the plants are compact, branching from the base, the flowers and leaves somewhat smaller, and these are crenate to sinuate marginally.

Mentzelia pumila (Nutt.) T. & G. [*Bartonia pumila* Nutt.]. Biennial or short-lived perennial from a stout taproot; stems whitish, simple or branched and more or less flexuous, 2–6 dm tall; rosette leaves lanceolate, oblanceolate or oblong, 8.5–10 (20) cm long, petiolate, sinuate-dentate, shortly lobed or pinnatifid, the apex acute or obtuse; lower cauline leaves lanceolate or oblong, shortly petiolate, 1.9–8.5 cm long, sinuate-dentate to shallowly pinnatifid, the sinuses broad, or deeply pinnatifid, the sinuses narrow; middle and upper leaves sessile, lanceolate, irregularly dentate or lobed, the sinuses broad, more or less clasping, or the leaves pinnatifid to lacinate, the sinuses narrow and the base not

clasping; bracts linear, entire; inflorescence of 1–3 flowers; calyx lobes 4–8 (10) mm long; petals 10, lanceolate or obovate, sometimes ciliate at the tip, 9–15 mm long; outer stamens petaloid; capsule urceolate or cylindrical, tapering to a narrow base, sometimes striate 15–20 mm long; seeds 2.5–3.5 mm long, narrowly or broadly winged, tan or gray; $n = 11$. Two varieties are treated.

1. Leaves deeply pinnatifid, the lobes obtuse or acute; upper leaves oblong, cut almost to midrib; seeds gray, winged, 3–3.5 mm long *M. pumila* var. *lagarosa*
- Leaves sinuate-dentate, shortly lobed, or merely pinnatifid, cut less than half way to midrib; upper leaves lanceolate to ovate-lanceolate, the base apparently clasping, sinuate, dentate, or lobed; seed tan, narrowly winged, 2.5–3 mm long *M. pumila* var. *pumila*

Var. *lagarosa* Thorne Mixed desert shrub, sagebrush, grass, pinyon-juniper, and bristle cone pine communities on limestone, clay, shale, and igneous gravels at 1765 to 2745 m in Duchesne, Garfield, Kane, Piute, Sevier, Uintah (type from near Watson), and Wayne counties; Lincoln County; Nevada; 9 (i).

Var. *pumila* Sagebrush, grass, scattered juniper, and mountain brush communities at 1675 to 2045 m in Daggett and Duchesne counties; Colorado and Wyoming; 5 (0).

Mentzelia rusbyi Woot. [*M. pumila* var. *rusbyi* (Woot.) Urban & Gilg; *M. nuda* var. *rusbyi* (Woot.) Harrington]. Biennial or short-lived perennial from a stout taproot; stems usually branched above or simple, whitish, hirsute, 2–5 dm tall; rosette leaves oblanceolate or oblong, entire, sinuate or remotely dentate, 5–20 (25) cm long; lower leaves lanceolate or oblong, coarsely dentate or dentate, 7–15 cm long, ca 10–15 mm wide, petiolate; middle and upper leaves sessile, ovate-lanceolate, 3–7 cm long, ca 2.1 cm wide, coarsely dentate; bract on lower 1/3 of capsule lanceolate, entire, dentate, or lacinate; inflorescence congested; calyx lobes 5.4–8 cm long; petals 5, creamy yellow, obovate to oblanceolate, 1.5–3 cm long, 4–8 mm wide; outer stamens petaloid, to 1.4 cm wide; capsules cylindrical, 15–30 mm long, 10–13 mm wide; seeds ovate, to 4 mm long, broadly winged, whitish tan, truncately tuberculate; $n = 10$. Stream banks, meadows, and other moist sites in sagebrush, rabbitbrush, mountain brush, and pinyon-juniper communities at 1830 to 2565 m in Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Sanpete, Uintah, Utah, and Wasatch counties; Colorado, New Mexico, Arizona, and Wyoming; 16 (0).

Mentzelia shultzeorum Prigge Perennial, suffruticose, from a woody caudex; stems diffusely branched, 3–5 dm tall, greenish white, striate, more or less flexuous, hispid above; lower leaves ovate-lanceolate to broadly elliptic, dentate, sinuate, obtuse apically, shortly petiolate, 10–31 mm long, 7–20 mm wide; upper leaves ovate, elliptic, dentate, obtuse to acute apically, 7–21 mm long, 5–14 mm wide; bracts linear to oblanceolate, entire or occasionally denticulate; inflorescence terminal; calyx lobes 6–10 mm long; petals 5, obovate, 9–14 mm long; outer stamens petaloid, spatulate, shorter than the petals; capsule 5–8 (10) mm long, urceolate, rounded basally; seeds oval, 3–4 mm long, 2–2.5 mm wide, pale brown. Shadscale, eriogonum, cphedra community on the Cutler Formation (and Paradox?) along Onion Creek (type locality) Grand County; endemic; 4 (0).

Mentzelia thompsonii Glad Annual; stems erect, 1–2 dm tall, simple or moderately branched, somewhat compact; lower leaves lanceolate or ovate-lanceolate, to 7 cm long, entire or occasionally with a few lobes, tapering to a narrow petiole; upper leaves lance-ovate, smaller, usually entire, sessile; bracts oblanceolate, entire; inflorescence crowded, terminal, sometimes obscured by leaves or bracts; calyx lobes 2–3 mm long; petals 5, obovate, 1–4 mm long, retuse; capsules erect, 12–20 mm long, to 4 mm wide, cylindrical, scarcely tapering basally; seed irregularly angled, truncate-tuberculate, ca 1.5–1.8 mm long. Salt desert shrub communities at 1495 to 1895 m mostly on Mancos Shale in Grand and Uintah counties; Colorado; a Plateau endemic; 7 (0).

Mentzelia tricuspis Gray Annual; stems erect, 1–3 dm tall, branched from the base or simple, greenish white; rosette leaves lanceolate, crenate or coarsely dentate, 6.2–9 cm long; lower cauline leaves lanceolate or oblanceolate, dentate or coarsely dentate, short-petiole, the upper ones similar but smaller; bracts lanceolate, deeply dentate or laciniate; calyx lobes 1–1.5 cm long; petals 5, cream colored, broadly obovate, mucronate, 0.8–3.5 cm long; outer stamens dilated, tricusped apically, the 2 lateral cusps usually longer than the anther-bearing, central cusp; capsules cylindrical, tapering to the base, 1–18 mm long, reflexed at maturity; seeds ovate, constricted at the middle, tuberculate; n = 10. Creosote bush, Joshua tree, and other warm desert shrub communities at ca 730 m in Washington County; Nevada, Arizona, and California; 1 (0).

Petalonyx Gray

Shrubs or subshrubs; leaves alternate, petiolate or sessile, entire, toothed or crenate; inflorescence spicate or racemose, bracteate or ebracteate; calyx tube adnate to the ovary, the lobes free; petals cream to white, clawed, glabrous ventrally, hispid dorsally; stamens 5, free; style filamentous; stigma unbranched; fruit an irregularly dehiscent capsule; seed 1, oblong-ovoid, shining, brownish.

Davis, W. S. and H. J. Thompson. 1967. A revision of *Petalonyx*. Madrono 19: 1–18. 1967.

1. Subshrubs, predominantly herbaceous; leaf margins coarsely few-toothed; inflorescence a bracteate raceme; petals less than 11 mm long *P. nitidus*
- Shrubs, predominantly woody; leaf margins entire to crenate; inflorescence a naked, terminal raceme; petals more than 11 mm long *P. parryi*

Petalonyx nitidus Wats. [*P. thurberi* var. *nitidus* (Wats.) Jones]. Suffruticose perennial; stems 1.5–4.5 dm tall; leaves ovate to broadly ovate, 1.5–4.5 cm long, 1–3 cm wide, serrate to coarsely few-toothed, the surfaces muricate-scabrous; petiole 1–5 mm long; inflorescence a dense, 10– to 30-flowered raceme; bracts ovate, scabrous, short-ciliate, 6–8 mm long; sepals linear, 1.4–3 mm long; petals cream, 5–11 mm long; claws linear, 4–7 mm long, 0.3–0.4 mm wide; stamens exerted, 7–14 mm long; capsule 1.3–3 mm long; n = 23. Warm desert shrub at ca 850 m in Washington County; Arizona, Nevada, and California; 1 (0).

Petalonyx parryi Gray [*P. nitidus* ssp. *parryi* (Gray) Urban & Gilg]. Shrubby, 8–15 dm high; leaves oblong-ovate to broadly elliptic, 1.5–4 cm long, 1.2–3 cm wide, entire or crenate, the surface muricate-scabrous; petiole

0.5–2.5 mm long; inflorescence a naked spicate raceme, congested apically, to 65-flowered; bracts lanceolate to lance-ovate, scabrous, 6–14 mm long; sepals linear, 2.5–4 mm long; petals cream, 10–15 mm long; claws linear, 6.3–10 mm long; stamens exerted, 11–17 mm long; capsules 2–4 mm long; n = 23. Warm desert shrub at ca 780 to 915 m in Washington (type from St. George) County; Nevada, Arizona, and California; 6 (iv).

LYTHRACEAE J. St. Hil.

Loosestrife Family

Herbs, shrubs, or trees; leaves opposite or alternate, simple, entire; flowers perfect, regular or occasionally irregular, solitary or clustered; calyx 4– to 6-toothed, often with many accessory ones in the sinuses, the tube free from the ovary but closely investing it; petals 4 or 5 (7), borne on the throat of the hypanthium; stamens 4 to many, borne on the hypanthium margin; pistil 1, the ovary superior, 2– to 6-loculed, becoming 1-loculed; style 1; stigma capitate; fruit a capsule; x = 5–11. Note: The beautiful shrub, *Lagerstroemia indica* L. or crepe myrtle, is grown as an ornamental in Washington County.

1. Hypanthium much longer than broad, strongly nerved; petals 5–7, usually showy *Lythrum*
- Hypanthium about as long as broad, not strongly nerved; petals usually 4, not showy 2
- 2(1). Hypanthium lacking intersepal appendages; petals lacking *Didiplis*
- Hypanthium with intersepal appendages; petals 4, often deciduous *Ammannia*

Ammannia L.

Glabrous, annual herbs; stems commonly 4-angled; leaves opposite, sessile, entire; flowers small, borne in axillary clusters; sepals 4, the hypanthium campanulate or globose, 4-angled, with small, hornlike appendages in each sinus; petals 4, caducous; stamens 4–8; ovary 2– to 4-loculed; capsule opening irregularly.

Ammannia coccinea Rottb. Plants ascending to erect, the lower branches often decumbent-ascending, 1–5 dm tall; leaves 1.5–8 cm long, 2–8 mm wide, linear to oblong or lanceolate to oblanceolate, acute apically, cordate-clasping basally; cymes closely (1) 2– to 5-flowered, nearly sessile; calyx 3–5 mm long and 3–5 mm wide in fruit, the lobes short; corolla pink to purple, 1–2 mm long, the petals obovate; capsule ca 4 mm long; n = 33. Mud flats, canal banks, marshes, and flood plains at 1220 to 1435 m in Cache, Emery, Millard, and Uintah counties; widely distributed in the U. S.; South America; 9 (i). Utah plants seem to belong to ssp. *robusta* (Heer & Regel) Koehne [A. *robusta* Heer & Regel].

Didiplis Raf.

Glabrous, annual, amphibious herbs; leaves opposite, narrow, sessile; flowers sessile, minute, solitary in leaf axils, lacking bracteoles; hypanthium campanulate; sepals 4, appearing as triangular lobes; intersepal appendages lacking; petals none; stamens 2 or 4, included; ovary imperfectly 2-locular; style short or obsolete; disk lacking; fruit globose, indehiscent; seeds many.

Didiplis diandra (Nutt.) Wood [*Peplis*? *diandra* Nutt. ex DC.; *Didiplis linearis* Raf.] Plants submersed or grow-

ing on mud; stems 1–4 dm long, usually branched; leaves numerous, dimorphic, the submerged ones linear and 1–2.5 cm long, sessile and truncate basally, the emerged ones shorter, narrowly elliptic, and tapering at the base; flowers ca 1 mm long at anthesis, enlarging to 2 mm long in fruit; sepals subequal to the hypanthium; fruit 2 mm thick; seeds many, ca 0.7 mm long, oblanceolate, planoconvex. Marshy places (reported by Tidestrom 1925) from Fish Lake, Sevier County; Minnesota to Ohio, south to Texas and Florida; 0 (0).

Lythrum L.

Annual or perennial herbs; stems mostly 4-angled; leaves opposite, alternate, or whorled, entire; flowers usually solitary in the upper axils; hypanthium cylindrical, 8- to 12-ribbed, 4- to 7-toothed, with an equal number of alternating teeth in the sinuses; petals 4–7, attached to the hypanthium margin; stamens 4–14, borne on the hypanthium margin; capsules cylindrical, included in the calyx tube, 2-loculed, regular, dehiscent.

- 1. Leaves mostly alternate, the main ones 1.5–5 cm long; stamens 4–7; plants indigenous in Washington County *L. californicum*
- Leaves opposite, the main ones 5–10 cm long; stamens 10–14; plants adventive in central Utah *L. salicaria*

Lythrum californicum T. & G. Perennial herbs from creeping rhizomes; stems 4–10 (13) dm tall, pale green and glabrous, erect, much branched; leaves alternate, 1.5–5 cm long, 1–8 mm wide, linear to oblong or the lowermost lanceolate to oblanceolate, glabrous; calyx tube cylindrical, glabrous, 5–7 mm long, the teeth subulate; petals 4–7, obovate, pink purple, 4–6 mm long; capsule cylindroid to club shaped. Saline seeps and canal banks in creosote bush, blackbrush, and pinyon-juniper communities at 900 to 1340 m in Washington County; California to Kansas and Texas, south to Mexico; 7 (iv).

Lythrum salicaria L. Loosestrife. Perennial herbs from creeping rhizomes; stems 7–30 dm tall, green, with coarse hairs, erect, much branched; leaves opposite or whorled, 2–10 cm long, 4–20 mm wide, lanceolate to rounded or cordate at the base, acute to attenuate apically, hairy; calyx tube 5–8 mm long, cylindrical, coarsely hairy, the appendage of the calyx twice or more longer than the teeth; petals rose purple, 5–10 mm long; stamens 10–14; capsule cylindroid to club shaped; 2n = 30, 60. Cultivated ornamental, escaping and established in moist sites at 1390 to 2070 m in Cache, Davis, Emery, Salt Lake, Utah, and Weber counties; introduced from Europe; 8 (i).

MAGNOLIACEAE A. L. Juss.

Magnolia Family

Deciduous or evergreen trees or shrubs; leaves alternate, simple, entire or lobed, stipulate, the stipules enclosing the buds, deciduous or caducous, and leaving a circular scar; flowers regular, perfect solitary, terminal and axillary, large and showy, the floral parts spirally arranged; sepals often 3, the petals 6 to many; stamens numerous, separate, hypogynous, the anthers 2-loculed;

pistils several to many, each 1-loculed and 1-carpelled; style 1, the stigma 1; fruit a follicle or samara.

- 1. Leaves lobed, truncate or broadly retuse at the apex; flowers borne after the leaves *Liriodendron*
- Leaves entire, acute, or acuminate; flowers borne before or after the leaves *Magnolia*

Liriodendron L.

Trees, the leaves large and 4-lobed; flowers large, not brightly colored; sepals 3, soon reflexed; petals 6, ascending to erect, forming a tuliplike corolla; anthers extrose; pistils many, en masse becoming conelike, the individual samaras eventually deciduous.

Liriodendron tulipifera L. Tulip Tree, Yellow Poplar. Deciduous, cultivated trees to 40 m tall or more, the trunks to 10 dm in diameter or more; leaves long-petioled, the blades 6–15 cm long and almost as wide; flowers solitary, terminal; sepals green; petals 3.7–6 cm long, yellow green, with usual basal orange spot within; samaras narrow, 3–4 cm long; 2n = 38. Occasional shade tree in more moderate, low elevation portions of Utah; introduced from the eastern U. S.; 8 (0).

Magnolia L.

Trees or shrubs; leaves large, entire; flowers large, conspicuous or inconspicuous; sepals 3, colored like the petals; petals 6–12, erect or spreading; anthers introrse; pistils many, en masse becoming conelike, the individual follicles finally dehiscent.

- 1. Plants shrubs or small trees, deciduous; flowers showy, cream to pink or suffused with rose or lavender, borne before the leaves appear *M. soulangeana*
- Plants moderate to large trees, deciduous or evergreen; flowers greenish and inconspicuous or, if showy, white in color and trees evergreen 2
- 2(1). Plants evergreen, the leaves dark green, leathery; flowers white *M. grandiflora*
- Plants deciduous, the leaves not both dark green and leathery; flowers greenish yellow *M. acuminata*

Magnolia acuminata L. Cucumber-tree. Deciduous trees to 30 m tall or more; leaves short-petioled, the blades 8–25 (3) cm long and 4–15 cm wide; flowers solitary, terminal; perianth greenish yellow, 5–8 cm long. Cultivated shade tree, uncommon, hardy in the major cities of the state; introduced from the eastern U. S.; 2 (0).

Magnolia grandiflora L. Bull Bay. Evergreen tree to 30 m tall; leaves evergreen, short-petioled, the blades mostly 8–20 cm long and 3–8 cm wide; flowers solitary, terminal; perianth white, mostly 8–12 cm long; 2n = 114. Cultivated ornamental, uncommon, not hardy except in favorable sites in moderate to warm portions in Utah; introduced from southeastern U. S.; 1 (0).

Magnolia soulangeana Soul.-Bod. Showy Magnolia. Shrubs or small trees to about 4 m tall; leaves deciduous, short-petioled, the blades mostly 8–14 cm long and 3.5–10 cm wide; flowers solitary, terminal; perianth cream to pink or suffused with rose or lavender, 6–12 cm long or more; 2n = 95, 123, 133, 152. Cultivated ornamental, occasional in more moderate climatic areas of Utah; a hybrid of *M. denudata* Desr. and *M. liliflora* Desr., both native of China; 3 (0).

MALVACEAE A. L. Juss.

Mallow Family

Herbs or less commonly shrubs, usually pubescent with branched or stellate hairs, annual, biennial, or perennial with mucilaginous juice; leaves alternate, simple, mostly palmately veined, stipulate; flowers perfect (or imperfect), regular, solitary or in thyrsoïd cymes or more or less racemose or paniculate, sometimes with an involucl of sepaloid bractlets; sepals 5, more or less persistent; petals 5, separate, adnate to the staminal sheath; stamens numerous, united by the filaments (monadelphous); ovary superior, 3- to many-loculed; fruit a capsule or schizocarp; x = 6-17+, 20+.

Welsh, S. L. 1980. Utah flora: Malvaceae. Great Basin Naturalist 40: 27-37.

- 1. Involucl lacking 2
- Involucl of 1 or more bractlets or, if lacking (as some *Sphaeralcea* specimens), the flowers orange (grenadine) 3
- 2(1). Petals white, pink, or lavender; plants of moist sites, usually at middle and higher elevations *Sidalcea*
- Petals yellow or pink to red; plants of cultivated lands or of arid sites, usually at middle and lower elevations *Abutilon*
- 3(1). Petals orange or rarely purplish pink; indigenous perennial herbs of arid habitats at middle and lower elevations *Sphaeralcea*
- Petals variously colored, but not orange; indigenous or adventive perennial, biennial, or annual plants of various distribution 4
- 4(3). Flowers rose pink or rarely white; plants indigenous, 7-15 dm tall, perennial, of middle and higher elevations *Iliamna*
- Flowers white, pink, rose, yellow, or other hues; plants differing in one or more ways from above 5
- 5(4). Flowers mostly 6-10 cm broad, opening flat; plants tall adventive or cultivated biennials *Althaea*
- Flowers less than 6 cm broad or, if broader, the plants shrubby 6
- 6(5). Style branches 5, elongate; fruit a capsule; plants low annuals or shrubs *Hibiscus*
- Style branches more than 5, short; fruit a schizocarp; plants annual or biennial 7
- 7(6). Style branches filiform, with elongate stigmatic lines; plants annual or biennial *Malva*
- Style branches with capitate or truncate stigmas 8
- 8(7). Petals yellow, or orange to pink or red; plants annual with awned carpels, or subshrubs with unawned carpels *Abutilon*
- Petals yellowish white to lavender or whitish; carpels few to many, not awned; plants spreading annuals or herbaceous perennials 9
- 9(8). Petals yellow white; leaves reniform-orbicular, merely crenate-serrate *Malcella*
- Petals lavender or whitish; leaves palmately cleft, with rounded lobes *Malcastrum*

Abutilon Miller

Plants herbaceous, annual or perennial, with stellate or simple hairs; leaves alternate, petioled, cordate at base, not or only obscurely lobed; flowers solitary and axillary or in leafy panicles; involucl lacking; calyx 5-cleft;

corolla yellow to orange pink or red; fruit truncate-cylindric or subglobose, the carpels smooth sided, dehiscent nearly to the base; ovules 2 or more per carpel.

- 1. Plants perennial, with slender spreading or trailing branchlets; carpels 5, lacking awn-beaks; plants rare, known only from Washington County *A. parvulum*
- Plants annual, with robust erect stems; carpels usually more than 10, each with a long divergent awn; plants uncommon, in agriculture regions *A. theophrasti*

Abutilon parvulum Gray Perennial, the stems slender and spreading or trailing, the caudex woody, grayish tomentose with minute stellate hairs, the branchlets pilose; leaves 0.5-5 cm long, ovate, cordate basally, dentate and sometimes obscurely 3-lobed; peduncles slender, axillary, 1-flowered, longer than the leaves; calyx lobes ovate-acuminate, reflexed in fruit; petals orange pink to red or sometimes yellowish, 4-6 mm long; carpels 5, somewhat tomentose, to 8 mm long; n = 7. Known in Utah only from Veyo, Washington County (Meyer 4111); Colorado to California and south to Texas and Mexico, 1 (0).

Abutilon theophrasti Medicus Velvet-leaf. Annual, the stems robust, erect, velvety and cinerous with short, soft hairs; leaves 3-10 cm long (from sinus to apex) and as broad or broader, orbicular-ovate, cordate at the base, abruptly acuminate at the apex, velvety pubescent; peduncles shorter than the leaves, 1- or few-flowered; calyx lobes broadly ovate-acuminate; petals yellow, to ca 6 mm long; carpels 10 or more, each with a long divergent awn; 2n = 42. Adventive weedy species of disturbed or cultivated areas, occasional in Davis, Sanpete, Tooele, Utah, and Washington counties; widespread in North America; native to Europe; 5 (i).

Althaea L.

Plants herbaceous, biennial, with coarse stellate hairs; leaves alternate, petiolate, cordate at the base, lobed; flowers solitary or in racemes; involucl of 6-9 bractlets, connate at the base; calyx 5-cleft; corolla of various colors; fruit flattened wheellike, invested by the calyx, the numerous carpels separating at maturity.

Althaea rosea (L.) Cav. Hollyhock. [*Alcea rosea* L.]. Coarse biennials to 20 dm tall or more, the stems erect, stellate-hairy; leaves (3-)5- to 7-lobed, mostly 3-15 cm long (from sinus to apex) and often much broader; flowers shortly pedicellate, 6-12 cm wide or more, variously colored, often rose to pink or lavender or sometimes white, usually with a dark center; calyx lobes triangular, investing the fruit at maturity, the involucl calyxlike; carpels numerous, stellate along the margins, and reticulate on the sides, 5-7 mm long; 2n = 42. Cultivated ornamental, persisting and escaping, to be expected in all counties in Utah; widespread in North America; introduced from China; 17 (i).

Hibiscus L.

Plants herbaceous or woody, annual or perennial, with stellate or simple hairs; leaves alternate, petiolate, obtuse to truncate or cordate basally, lobed to incised; flowers axillary, solitary; involucl of 5-10 distinct bractlets; calyx 5-cleft, more or less accrescent in fruit; fruit a loculicidal capsule, the carpels 5; seeds several in each locule.

1. Plants annual; calyx strongly veined; petals cream colored, with a purple center *H. trionum*
 — Plants shrubs; calyx herbaceous, not distinctly veined; petals variously colored, but usually rose pink to lavender *H. syriacus*

***Hibiscus syriacus* L.** Althaea; Rose-of-Sharon. Shrubs, 20–40 dm tall or more, glabrous or softly stellate-hairy; leaves 2.5–8 cm long, 1.5–6 cm wide, triangular-ovate to rhombic, strongly 3-ribbed, commonly 3-lobed; flowers axillary, 4–7.5 cm wide; bractlets usually 5, linear, subequal to the calyx, glabrous to obscurely hairy; corolla variously colored and often double; fruit oblong-ovoid, to 25 mm long; $n = 20, 40$. Cultivated ornamental, rarely persisting; widely cultivated in North America; introduced from eastern Asia; 4 (i).

***Hibiscus trionum* L.** Flower-of-an-Hour. Annual, commonly 1.5–5 dm tall, the lower branches often prostrate, coarsely hispid-stellate to glabrate; leaves 3-lobed or more commonly 3- to 5-parted, the main lobes cuneate basally, the middle lobe the largest; flowers solitary, axillary, mostly 3–6 cm wide; bractlets usually 10, linear, often coarsely hispid, much shorter than the fruiting calyx; corolla cream colored to yellowish, with a purple center, closing in shade; $2n = 28, 56$. Weedy species of cultivated land at lower elevations in Box Elder, Cache, Davis, Salt Lake, Sanpete, Utah, and Washington counties; widespread in North America; adventive from central Africa; 8 (i).

Iliamna Greene

Plants herbaceous, perennial, sparingly and minutely stellate-hairy; leaves alternate, petiolate, cordate to truncate narrow, the margin lobed; flowers in thyrsoïd panicles; involucre of 3 narrow, persistent bractlets; calyx 5-cleft; fruit a loculicidal capsule, the carpels many; seeds usually 3 in each locule.

Wiggins I. L. 1936. A resurrection and revision of the genus *Iliamna* Greene. Contr. Dudley Herb. 1: 213–229.

***Iliamna ricularis* (Dougl.) Greene** Wild Hollyhock. [*Malva ricularis* Dougl. ex. Hook.; *Sphaeralcea ricularis* (Dougl.) Torr. ex. Gray; *Phymosia ricularis* (Dougl.) Rydb.]. Perennial, the stems few to many from a woody caudex, mostly 7–15 dm tall, minutely stellate-puberulent, green; leaves 3- to 7-lobed, cordate to truncate basally, 2.5–15 cm long (from petiole apex to tip), 2–16 cm broad, the lobes triangular, crenate-serrate, finely stellate; pedicels mostly less than 1 cm long; bractlets linear-lanceolate, shorter than the calyx; calyx lobes 3–5 mm long (to 8 mm long in fruit); petals rose pink (rarely white), 20–37 mm long; carpels 6–10 mm long in fruit, hispid and stellate; $n = 33$. Along streams and other mesic sites in mountain brush, ponderosa pine, aspen, and spruce-fir communities, 1430 to 2900 m in Cache, Daggett, Davis, Duchesne, Iron, Juab, Kane, Millard, Morgan, Piute, Salt Lake, Sanpete, Sevier, Summit, Tooele, Utah, Wasatch, and Weber counties; Colorado, Idaho, Nevada, and Washington; 59 (vii).

Malva L.

Herbaceous, annual, biennial, or perennial, from tap-roots, the pubescence simple to branched or stellate; leaves alternate, petiolate, usually more or less cordate basally, commonly lobed; flowers in axillary clusters

(sometimes solitary) or in subterminal panicles; involucre of 3 narrow to broad persistent bractlets; calyx 5-cleft; fruit a schizocarp, the carpels mostly 10–15.

1. Petals commonly 1.5–2 cm long, very showy; bractlets of involucre ovate to oblong *M. sylvestris*
 — Petals usually less than 1 cm long; bractlets of involucre linear to narrowly lanceolate 2
 2(1). Stems prostrate spreading from the caudex; leaves obscurely lobed; plant a common weedy species *M. neglecta*
 — Stems erect; leaves definitely lobed; plant cultivated, rarely escaping *M. verticillata*

***Malva neglecta* Wallr.** Cheeses; Mallow. Annual or biennial, the stems prostrate-spreading, commonly 1–6 dm long, stellate hairy; leaf blades reniform-orbicular, 0.6–3 cm long (from sinus to apex) or more, and much broader, crenate and not at all to only shallowly 5- to 7-lobed, the petioles to 20 cm long or more; flowers clustered (or solitary) in the axils; bractlets linear; calyx (3) 4–6 mm long at anthesis, the lobes acuminate; petals white to pink or lilac, about twice as long as the sepals; carpels hairy, rounded on the back; $2n = 42$. Weeds of disturbed sites and cultivated land, in much of Utah (specimens known from Cache, Garfield, Grand, Iron, Kane, Millard, Rich, Salt Lake, San Juan, Summit, Uintah, Utah, and Washington counties); widespread in North America; adventive from Eurasia; 22 (ii). Note: Two other species *M. parviflora* L. and *M. rotundifolia* L., might be present in Utah. They are similar to *M. neglecta*, but have petals subequal to the sepals. *Malva parviflora* has glabrous petal claws, whereas in *M. rotundifolia* the claws are bearded.

***Malva sylvestris* L.** High Mallow. Biennial, the stems ascending, mostly 3–10 dm tall, rough hairy to glabrate; leaf blades 3–8 cm long or more and often broader, orbicular to cordate or reniform, crenate and with 5–7 lobes, the petioles to 10 cm long or more; flowers clustered in the leaf axils; bractlets ovate to elliptic; calyx 5–7 mm long at anthesis, the lobes short and broad; petals 15–20 mm long, rose purple; carpels glabrous or nearly so, sharp edged; $2n = 42$. Cultivated ornamental, rarely escaping; widespread in North America; adventive from Europe; 3 (0).

***Malva verticillata* L.** Curled Mallow. Annual, the stems erect, mostly to 10 dm tall or more, sparingly stellate-hairy; leaf blades mostly 1.5–7 cm long and as broad or broader, orbicular to reniform, undulate-crested and distinctly 5- to 7-lobed, long-petioled; flowers solitary or clustered, subsessile or some pedicelled; bractlets linear to narrowly lanceolate; calyx 3.5–5 mm long, the lobes acuminate; petals white, only somewhat surpassing the sepals; carpels glabrous, the edges rounded; $2n = 84$ (ca 76, ca 126). Cultivated ornamental, rarely escaping (Washington County, Galaway in 1934 BRY); widely scattered in the U. S.; adventive from the Old World; 1 (0). Our material belongs to var. *crispa* L.

Malvastrum Gray

Plants herbaceous, annuals, stellate-hairy; leaves alternate, petiolate, the blades subcordate to truncate basally, palmately lobed; flowers solitary in the axils or in the terminal bracteate clusters; involucre of usually 3 slender bractlets; calyx 5-cleft, the lobes long-acuminate; carpels 10–15; fruit a schizocarp.

Malvastrum exile Gray [*Malveopsis exile* (Gray) Kuntze; *Eremalche exile* (Gray) Greene; *Sphaeralcea exile* (Gray) Jepson]. Annual, the stems spreading-decumbent to prostrate, branching from near the base, 0.3–4 dm long, rather sparingly stellate-hairy; leaf blades suborbicular, 8–32 mm wide, palmately 3- to 5-cleft, with rounded or cuspidate teeth; petioles 1–5 cm long; bractlets narrowly lanceolate to sublinear; calyx 3–5 mm long; petals whitish to pinkish or lavender, only somewhat surpassing the sepals; carpels transversely wrinkled. Blackbrush and creosote brush communities at 850 to 1200 m in Washington counties; Arizona and southern California; 6 (0).

Malvella Jaub. & Spach

Herbaceous, perennial, decumbent from spreading rhizomes, densely stellate-canescens; leaves alternate, petiolate, crenate-serrate; flowers solitary in leaf axils, the calyx bearing 1–3 linear, deciduous bractlets; calyx 5-lobed; petals 5, stellate-pubescent externally where exposed in bud; carpels 5–10, 1-seeded; fruit a schizocarp.

Fryxell, P. A. The North American Malvellas (Malvaceae). *Southwestern Naturalist* 19: 97–103.

Malvella leprosa (Ortega) Krap. Alkali Mallow; Dollar Weed. [*Malva leprosa* Ortega; *Sida hederacea* (Dougl.) Torr.; *Malva hederacea* Dougl.; *M. californica* Presl; *Disella hederacea* (Dougl.) Greene]. Perennial, the stems from elongate rhizomes, decumbent to prostrate, the surface obscured by overlapping stellate hairs, 1–4 dm long; leaf blades reniform to orbicular, often oblique, dentate, obscurely if at all lobed, the petioles 0.3–2.5 (3) cm long; bractlets sublinear; calyx 5–7 mm long; petals cream or yellowish (fading orange), 10–12 mm long; carpels reticulate on the sides. Saline meadows and seeps, at lower elevations in Cache, Emery, Millard, Salt Lake, San Juan, Tooele, Uintah, Utah, Washington, and Weber counties; Washington south to California, Texas, and Mexico; South America; 19 (iv).

Sidalcea Gray

Herbaceous, perennial from taproots or short rhizomes, usually stellate and somewhat hirsute; leaves alternate, petiolate, often dimorphic, the lowermost merely palmately lobed, the upper ones commonly cleft and with linear lobes, flowers borne in semispicate racemes, dimorphic, those of plants with perfect flowers the largest; involucre lacking; calyx 5-cleft; carpels 5–10, 1-seeded, tardily separating.

Hitchcock, C. L. 1957. A study of the perennial species of *Sidalcea*. *Univ. Wash. Publ. Biol.* 18: 1–79.
 Roush, E. M. F. 1931. A monograph of the genus *Sidalcea*. *Ann. Missouri Bot. Gard.* 18: 117–244.

- 1. Petals white or merely pinkish tinged, often drying yellow; anthers bluish pink; plants rhizomatous; stems hirsute below *S. candida*
- Petals pink to lavender; anthers usually yellow to white; plants rhizomatous or not; stems hirsute to glabrous or tomentose below 2
- 2(1). Plants from rather fleshy taproots; stems commonly hirsute below; calyx hirsute with pustulose hairs (at least in part) *S. neomexicana*

Plants often rhizomatous; stems stellate to glabrous below; calyx seldom with pustulose hairs *S. oregana*

Sidalcea candida Gray Plants from slender rhizomes, the stems 4–10 dm tall, glabrous to hirsute with simple hairs below, more or less stellate above; leaf blades 6–20 cm wide, the basal ones shallowly 5- to 7-lobed and coarsely crenate, the upper ones divided into 3–5 entire segments; calyx 7–10 mm long, variously stellate-hairy and glandular puberulent; petals white to pinkish, often drying yellow, 12–20 mm long; carpels ca 3 mm long. Stream banks, lake shores, and seeps, mainly in sagebrush, mountain brush, and aspen communities, at 1370 to 2870 m in Beaver, Cache, Daggett, Duchesne, Garfield, Grand, Kane, Iron, Millard, Morgan, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Uintah, Utah, and Wasatch counties; Wyoming and Colorado west to Nevada and south to New Mexico; 47 (vi). Plants with the calyx lobes rather uniformly hairy have been designated as var. *candida*, while those with the base of the calyx more hairy than the lobes have been regarded as var. *glabrata* C. L. Hitchc.

Sidalcea neomexicana Gray Plants from thickened tap or fascicled roots, the stems 2–9 (10) dm tall, hirsute below (or rarely glabrous) with simple or bifurcate hairs; leaf blades 1.5–11 cm wide, the basal ones crenate to shallowly 5- to 7-lobed, the cauline ones divided usually into 5 lacinate to entire segments; calyx 5–10 mm long, usually with some simple pustulose hairs interspersed with the stellate ones; petals rose pink (fading blue purple), 11–19 mm long; carpels 2–3 mm long. Wet meadows, stream banks and seeps at 1370 to 2150 m in Box Elder, Cache, Davis, Garfield, Iron, Juab, Piute, Rich, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Utah, Wasatch, and Washington counties; Oregon, Idaho, and Wyoming, south to California, Arizona, and Mexico; 40 (iv). Our materials have been treated as belonging to two or more or less confluent and at least partially sympatric varieties. The var. *neomexicana* is distinguished by having hairs of the lower stem nearly all simple, the calyx coarsely hirsute (lacking appressed stellate hairs), and upper stems usually glabrous. In var. *crenulata* [*S. crenulata* A. Nels., type from Juab, Utah; *S. neomexicana* ssp. *crenulata* (A. Nels.) C. L. Hitchc.] the hairs of the lower stem are often forked, the calyx is pubescent with appressed stellate hairs in addition to coarse ones, and the upper stems are often stellate hairy.

Sidalcea oregana (Nutt.) Gray [*Sida oregana* Nutt. ex T. & G.; *Sida nervata* A. Nels.]. Plants from taproot, lacking or rarely with rhizomes, the stems 3–11 dm tall or more, glabrous or usually appressed-stellate hairy below, appressed-stellate above; leaf blades 2.5–17 cm wide, the basal ones shallowly 5- to 7-lobed and coarsely crenate, the cauline ones deeply lobed, with 3–7 coarsely toothed to entire lobes; calyx 3.5–9 mm long, variously stellate-hairy and sometimes bristly; petals 7–23 mm long, pale pink to rose pink (fading blue purple); carpels 2.5–3 mm long. Meadows, stream banks, and open woods, at 1680 to 2750 m in Cache, Davis, Juab, Morgan, Rich, Salt Lake, Sanpete, Sevier, Summit, Utah, Wasatch, and Weber counties; Washington and Idaho south to California, Nevada, and Utah. Our materials belong to var. *oregana*; 52 (ii).

Sphaeralcea J. St. Hil.

Herbaceous, perennial, from taproots or rhizomes, glabrescent to canescent with stellate hairs; leaves alter-

nate, petiolate, sometimes dimorphic, the lowermost merely toothed or palmately lobed (rarely entire), the upper ones cleft to entire; flowers borne in racemose to thyrsoid cymes; involucre of 3 or fewer filiform bractlets; calyx 5-cleft; carpels 8–20, the seeds 1 or 2 per carpel; fruit a schizocarp, the mature fruit segments divided into a basal indehiscent, reticulate portion and an apical dehiscent portion.

Jefferies, J. A. M. 1972. A revision of the genus *Sphaeralcea* (Malvaceae) for the state of Utah. Unpublished thesis. Brigham Young University. 92 pp.

1. Inflorescence racemose, rarely with more than one flower per node or, if more as in *S. caespitosa*, the plants restricted to Millard County 2
- Inflorescence thyrsoid to thyrsoid-glomerate, with usually more than one flower per node; distribution various 6
- 2(1). Leaf blades only slightly, if at all, 3- to 5-lobed, the margins irregularly crenate-dentate; hairs with rays radiating in more than a single plane; plants seldom more than 1.5 dm tall, known only from western Beaver and Millard counties *S. caespitosa*
- Leaf blades distinctly 2- to 5-lobed, -parted, or -divided; hairs of rays radiating in a single plane (except *S. coccinea*); plants often 1.5 dm tall or more, of different distribution 3
- 3(2). Leaves trifoliolate, the leaflets linear to narrowly oblanceolate and entire, or the upper ones simple and entire; plants of southeastern Utah 4
- Leaves various but, if trifoliolate, the leaflets oblanceolate and entire to toothed or, if the uppermost simple, then toothed or lobed; distribution various 5
- 4(3). Leaves green; rays of hairs steeply ascending; plants simulating *Psoraleidum junceum* *S. janaeae*
- Leaves gray; rays of hairs spreading; plants not psoraloid *S. leptophylla*
- 5(3). Lowermost leaves simple and entire or trifoliolate, or some broadly toothed or lobed; involucre present; rays of hairs steeply ascending *S. psoraloides*
- Lowermost leaves usually 3- to 5-lobed, the lobes usually toothed or again lobed; involucre present or lacking (caducous); rays of hairs usually radiating in several planes; plants of broad distribution *S. coccinea*
- 6(1). Plants only sparingly pubescent, the herbage bright green 7
- Plants moderately to densely pubescent, the herbage yellowish, whitish, or grayish 9
- 7(6). Leaves 3- to 5-parted or -divided, the lobes with narrow, regularly pinnatifid margins, the teeth nearly at right angles to the vein; carpels often with transparent lacunae, 4–6 mm high; plants rare, of southern Utah only *S. rusbyi*
- Leaves variously lobed, divided, or parted, the lobes with broader margins irregularly toothed or lobed, but not as above; carpels with opaque lacunae, 3–4.5 mm high 8
- 8(7). Leaves slightly lobed, the margins unevenly toothed or, in some, deeply parted or divided with the margin coarsely and irregularly lobed, the base subcordate to cuneate; plants of northern Utah *S. munroana*
- Leaves 3- to 5-parted or -divided, the margins regularly cleft, lobed, or toothed, the base subcordate to deeply cordate; plants mostly of southern Utah *S. grossularifolia*

- 9(6). Inflorescence loosely thyrsoid (appearing paniculate), leafy; flowers not numerous at each node; peduncles generally elongate; calyx surpassing the fruit; carpels with reticulae extending onto back of carpel; plants of southwestern Utah *S. ambigua*
- Inflorescence contracted thyrsoid-glomerate; flowers often numerous at each node, not especially leafy; calyx often shorter than the fruit; carpels with reticulae confined to lateral face of carpel; plants of various distribution 10
- 10(9). Leaves 3- to 5-cleft, -parted, or -divided, carpels with well-defined reticulae on less than half of carpel face; plants of all but the northeastern one-fourth of Utah, transitional to the following *S. grossularifolia*
- Leaves shallowly 3- to 5-lobed; carpels with well-defined to nearly obscure reticulae on the lower 1/3 of the carpel; plants mainly of eastern and southern Utah, scattered elsewhere *S. parvifolia*

Sphaeralcea ambigua Gray Stems arising from a woody caudex, several to numerous, 3–10 dm tall, whitish to yellowish canescent; leaf blades 1–6 cm long (from sinus to apex), 0.8–5 cm wide, thickish, usually rugose, with veins prominent beneath, ovoid, deltoid, or nearly orbicular, the base cordate to deeply cordate, obscurely to definitely 3- to 5-lobed, the lobes crenate; inflorescence an open panicle, sometimes narrowly thyrsoid; pedicels usually shorter than calyx; calyx uniformly pubescent to glabrate, 6–20 mm long at anthesis, the lobes lanceolate to acuminate; petals 15–22 mm long, orange to orange pink (fading pinkish); carpels 12–16 mm high, the indehiscent portion comprising about 1/3 of the carpel, prominently reticulate; $n = 5$ ($2n = 37$). Creosote bush, blackbrush, and mixed warm desert shrub communities at 700 to 1750 m in western Kane and Washington counties; Nevada, Arizona, and California; Mexico; 15 (iv). Our materials belong to var. *ambigua*.

Sphaeralcea caespitosa Jones Jones Globemallow. Stems solitary or more commonly few to several from the summit of a branching woody caudex, 0.2–2.5 dm tall, whitish to grayish canescent; leaf blades 1.2–5.5 cm long, 1.2–6 cm wide, thickish, not rugose, veins apparent but not especially prominent, ovate to deltoid or orbicular, the base truncate to obtuse, obscurely if at all lobed, crenate to crenate-dentate; inflorescence thyrsoid, the flowers tightly clustered or solitary; pedicels shorter than the calyx; calyx uniformly stellate, the rays of hairs not radiating in a single plane, the lobes lance-acuminate; petals 15–21 mm long, orange; carpels 12–14, 4–6 mm high, the indehiscent portion forming slightly more than 1/3 of the carpel, reticulate on the sides. Mixed desert shrub communities (shadscale, rabbitbrush, winterfat), mainly on the Sevy Dolomite Formation and on calcareous gravels, at 1370 to 1955 m in Beaver (type from Wah Wah) and Millard counties; endemic; 25 (viii). Material from Nevada identified as *S. caespitosa* passes by degree into *S. ambigua*, and possibly is not equivalent to that in Utah.

Sphaeralcea coccinea (Nutt.) Rydb. Common Globemallow. [*Malva coccinea* Nutt.; *Cristaria coccinea* (Nutt.) DC.; *Malvastrum coccineum* (Nutt.) Gray; *Sida dissecta* Nutt.; *M. coccineum* var. *dissectum* (Nutt.) Gray; *M. dissectum* (Nutt.) Cockerell; *Sphaeralcea dissecta* (Nutt.) Rydb.; *S. coccinea* ssp. *dissecta* (Nutt.) Kearney; *S. coccinea* var. *dissecta* (Nutt.) Kearney; *M. c. var. elatum* Baker; *M. elatum* (Baker) A. Nels.; *S. elata* (Baker)

Rydb.; *S. c.* var. *elata* (Baker) Kearney; *Malvastrum cockerellii* A. Nels.; *M. micranthum* Woot. & Standl.]. Stems solitary or few to many from the apex of a woody caudex or less commonly from creeping rhizomes, 0.6–4.2 dm tall, white to yellowish canescent; leaf blades 1.1–3.7 cm long, 1.2–5.2 cm wide, usually wider than long, ovate to cordate-ovate in outline, the base often cordate, usually 3- to 5-lobed, with main divisions cleft almost or quite to the base, the lobes usually again toothed or lobed; inflorescence racemose, sometimes paniculate, rarely thyrsoid; pedicels shorter than calyx; calyx uniformly stellate, the rays of hairs not radiating in a single plane, the lobes lance-acuminate; petals 8–15 mm long, orange; carpels 8–14, 2–3 mm high, the indehiscent part forming 2/3 or more of the carpel, reticulate on the sides and on the back. Blackbrush, salt desert shrub, mixed desert shrub, juniper-pinyon, mountain brush, and ponderosa pine communities at 920 to 2750 m, in all counties (except Morgan); Saskatchewan and Alberta south to Arizona, New Mexico, and Texas; 214 (xix). Our materials have been recognized as belonging to vars. *dissecta* and *elata*, but the segregation of these entities appears to have been wholly arbitrary, with intermediates more numerous than the supposed taxa.

Sphaeralcea grossulariifolia (H. & A.) Rydb. Gooseberry-leaved Globemallow. [*Sida grossulariifolia* H. & A.; *Malvastrum grossulariifolium* (H. & A.) Gray; *Sphaeralcea pedata* Torr. in Gray; *S. g.* ssp. *pedata* (Torr.) Kearney; *S. g.* var. *pedata* (Torr.) Kearney]. Stems few to many from a woody caudex, 1–10 dm tall or more, whitish, to yellowish canescent to subglabrous and green; leaf blades 1.3–5 cm long, 1.3–5 cm wide, usually longer than wide, ovate to cordate-ovate in outline, the base cordate to truncate or obtuse, usually 3- to 5-lobed, the main division usually cleft or parted to irregularly toothed; inflorescence thyrsoid, with usually more than 1 flower per node; pedicels shorter than to much longer than the calyx; calyx uniformly stellate, the rays of hairs not radiating in a single plane, the lobes ovate to lance-acuminate; petals 8–20 mm long, orange or rarely rose pink; carpels 10–14, 2.5–4.5 mm high, the indehiscent portion forming from 2/5–3/5 of the carpel, reticulate on the sides. A phase with green herbage and thin leaves occurs along Glen Canyon. It is distinctive where it grows alone, but is transitional to the typical material when in contact. The plants are identified as follows:

1. Herbage bright green; leaves thin-textured, often narrowly lobed; plants of eastern Kane and Garfield, and western San Juan counties . . . *S. grossulariifolia* var. *moorei*
- Herbage gray green to whitish canescent; leaves thick textured; plants widespread *S. grossulariifolia* var. *grossulariifolia*

Var. *grossulariifolia* Salt, warm, and cool desert shrub, pinyon-juniper, and ponderosa pine communities at ca 790 to 2290 m in Beaver, Box Elder, Carbon, Emery, Garfield, Juab, Kane, Millard, Piute, Salt Lake, San Juan, Sanpete, Tooele, Uintah, Utah, Washington, and Wayne counties; Washington, Oregon, California, Nevada, and Arizona; 159 (xv). This is the common and widely distributed phase of the species in Utah. It forms intermediates with *S. coccinea*, *S. parvifolia*, and with the more northern *S. munroana*. The report by Kearney (l. c., p. 90) of *S. digitata* (Greene) Rydb. apparently belongs here.

Var. *moorei* Welsh Moore Globemallow. Warm desert shrub and hanging garden communities at 1125 to 1375 m in Garfield, Kane, and San Juan counties; endemic; 16 (vii). This is the low elevation phase of sandy tracts along Glen Canyon (type locality) and the San Juan River. Some plants with uncut leaves are included here also. The variety is transitional to the typical material, but not more so than for taxa as a whole in this genus and the plants could reasonably be treated at specific rank.

Sphaeralcea janeae (Welsh) Welsh Jane Globemallow. [*S. leptophylla* var. *janeae* Welsh, type from White Rim, San Juan County]. Stems few to many from a woody caudex, 3–9 dm tall, yellow green throughout; leaf blades 12–30 mm long, digitately 3-lobed, the lobes entire, linear to linear-oblancoolate, 0.8–3 mm wide, or the upper leaves simple and linear; inflorescence racemose, elongate, usually with one flower per node; pedicels from much shorter to longer than the calyx; calyx uniformly stellate, the rays of hairs radiating in a single plain, the lobes lance-attenuate; petals 8–12 mm long, orange; carpels 7–10, 3–3.5 mm high, the indehiscent portion forming 3/4–4/5 the carpel, coarsely reticulate, rough but not ridged or tuberculate on the back. Warm and salt desert shrub on the White Rim and Organ Rock members of the Cutler formation at 1220 to 1405 m in Grand, San Juan, and Wayne counties; endemic; 5 (iv). This plant simulates *S. leptophylla* in general habit during early anthesis, but at maturity they are dissimilar in both color and stature. The plants become much taller than the allopatric *S. leptophylla*, simulating the growth form and color of *Psoralidium junceum* and *Amsouia tomentosa*.

Sphaeralcea leptophylla (Gray) Rydb. [*Malvastrum leptophyllum* Gray]. Stems few to many from woody a caudex, 2–5.5 dm tall, grayish canescent throughout; leaf blades 10–32 mm long, digitately 3-lobed, the lobes entire, linear to oblanceolate, 1–4 mm wide, or the upper leaves simple and linear; inflorescence racemose, elongate, usually with one flower per node; pedicels from much shorter to longer than the calyx; calyx uniformly stellate, the rays of hairs radiating in a single plain, the lobes lance-attenuate; petals 8–12 mm long, orange; carpels 7–9, 3–3.5 mm high, the indehiscent portion forming 2/3–3/4 of the carpel, coarsely reticulate, ridged or tuberculate on the back. Blackbrush and mixed semidesert shrub communities at 1200 to 1520 m, in Emery, Garfield, Grand, San Juan, and Wayne counties; New Mexico, Arizona, Texas, and Mexico; 11 (iv).

Sphaeralcea munroana (Dougl.) Spach in Gray Munroe globemallow. [*Malva munroana* Dougl. in Lindl.; *Nuttallia munroana* (Dougl.) Nutt.; *Malvastrum munroanum* (Dougl.) Gray; *S. subrhomboidea* Rydb., type from Midway, Wasatch County; *S. m.* ssp. *subrhomboidea* (Rydb.) Kearney; *S. m.* var. *subrhomboidea* (Rydb.) Kearney]. Stems several to many from branching caudex, 1.8–7 dm tall or more, yellowish green to somewhat grayish canescent, the foliage usually bright green; leaf blades 1–6 cm long, 0.8–6 cm wide, ovate to orbicular or rhombic in outline, the base truncate to obtuse or subcuneate, usually 3- to 5-lobed, the sinuses shallow to very deep, the main divisions merely toothed or the lateral ones incised; inflorescence narrowly thyrsoid, usually with more than 1 flower per node; pedicels usually much shorter than the calyx; calyx uniformly stellate, the rays of hairs not radiating in a single plane, the lobes deltoid-ovate to ovate; petals 8–15 mm long, orange;

carpels 10–13, 2.5–3 mm high, the indehiscent portion forming about half the carpel, reticulate on the sides. Mixed desert shrub, or more commonly, in sagebrush and mountain brush communities at 1370 to 2440 m, in Box Elder, Cache, Duchesne, Morgan, Rich, Salt Lake, Summit, Tooele, Utah, Wasatch, and Weber counties; Montana, Idaho, Washington, Wyoming, Nevada, and California; 35 (i). This entity is much like both *S. parvifolia* and *S. grossulariifolia*, but is typically montane, whereas those entities are mainly of lower elevations. The green color of herbage is diagnostic of *S. munroana* from both, except for the allopatric var. *moorei* of *S. grossulariifolia*.

Sphaeralcea parvifolia A. Nels. Nelson Globemallow. [*S. marginata* York, ex Rydb., *S. arizonica* Heller, ex Rydb.]. Stems few to many from branching woody caudex, 1.5–5.5 cm long, 1.2–5.2 cm wide, ovate to orbicular, reniform, or cordate-ovate, the base cordate to truncate or obtuse, usually shallowly 3- to 5-lobed, the sinuses usually shallow, the lobes crenate-dentate; inflorescence commonly narrowly thyrsoid, typically with more than 1 flower per node; pedicels usually shorter than the calyx; calyx uniformly stellate, the rays of hairs not in a single plane, the lobes lance-ovate to deltoid; petals 7–15 mm long, orange; carpels 10–12, 3–4 mm high, the indehiscent part forming from 1/4–1/3 of the carpel, faintly reticulate on the sides. Blackbrush, other warm desert shrub, salt desert shrub, sagebrush, pinyon-juniper, and mountain brush communities at 820 to 2700 m in Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Kane, Millard, Piute, San Juan, Sevier, Tooele, Uintah, Washington, and Wayne counties; Nevada, Arizona, New Mexico, and California; 187 (xxxi). *S. parvifolia* has been compared by Kearney (l.c.) with *S. ambigua*, which it resembles. The relationship of *S. parvifolia* in Utah seems to lie with the largely sympatric *S. grossulariifolia*, but it is probably transitional with both *S. ambigua* and *S. rusbyi*.

Sphaeralcea psoraloides Welsh Psoralea Globemallow. Stems few to many from branching caudex, 1.4–3.5 dm tall or more, sparsely yellowish canescent, the foliage yellow green; leaf blades 1.3–6 cm long, 0.4–3.8 cm wide, oblanceolate to cuneate-ovate in outline, cuneate to obtuse or rounded basally, trifoliolate or simple to 3-lobed below, deeply 3- to 5-cleft above, the lobes entire to few toothed or lobed, usually more than 5 mm wide; inflorescence racemose, the flowers solitary in the upper axils; calyx uniformly stellate, the rays of hairs radiating in a single plane, the lobes lance-acuminate; petals 8–15 mm long, orange, carpels 10, 3–4 mm high, the indehiscent part forming 2/3–3/4 of the carpel, reticulate on the sides, the reticulum extending on to the margins of the back. Zuckia-ephedra community on saline and gypsiferous Entrada siltstone at 1220 to 1830 m in southwestern Emery and adjacent Wayne (type from Salt Wash) counties; endemic; 6 (ii).

Sphaeralcea rusbyi Gray Stems few to many from a caudex, or rarely subrhizomatous, mostly 2–6.5 (8.5) dm tall, yellowish green to somewhat grayish canescent; leaf blades 1.3–4.5 cm long, 1.2–4 cm wide, ovate to orbicular in outline, the base truncate-obtuse to prominently cordate, parted to divided or merely cleft, the lobes again toothed (the teeth spreading at nearly right angles); inflorescence thyrsoid to paniculate, with more than 1 flower per node; pedicels usually shorter (to much longer) than

the calyx; bractlets often dark red; calyx uniformly stellate (more densely so than on the herbage), the rays of hairs not radiating in a single plane, the lobes ovate to lance-ovate; petals 9–18 mm long, orange; carpels 10–12, 4–6 mm high, the indehiscent part forming from 1/4–3/5 of the carpel, finely reticulate on the sides. Blackbrush, creosote brush, and mixed warm desert shrub communities at 820 to 1220 m in Washington County; Arizona; 5 (i). *S. rusbyi* forms apparent intermediates with phases of *S. grossulariifolia* and *S. parvifolia*.

MELIACEAE A. L. Juss.

Mahogany Family

Trees with hard, scented wood; leaves usually alternate, pinnate, estipulate; flowers perfect, regular, often in cymose panicles; sepals 4–6, connate at the base; petals 4–6, distinct; stamens 8–10, commonly monadelphous; pistil 1, the ovary superior, 2- to 5-loculed, with 2 ovules per locule; style 1 or lacking; fruit a drupaceous berry; seeds often winged; $x = 10-14+$.

Melia L.

Deciduous trees; leaves large, 1- to 3-times pinnately compound; flowers white to purple, in large axillary many-flowered panicles; fruit yellow, persistent.

Melia azedarach L. Chinaberry. Trees to 15 m tall, with a broad rounded crown; leaves usually bipinnate; leaflets numerous, ovate to lance-elliptic, acuminate, to ca 6 cm long and 3 cm wide, crenate-dentate; flowers fragrant, on pedicels to 3 mm long; sepals 1–2 mm long, elliptic; petals oblanceolate to spatulate, white to pale lavender, ca 1 cm long; staminal tube purplish, cylindrical, 8–10 mm long, with numerous irregular teeth at the orifice and 10–12 included anthers; fruit yellow, subglobose, fleshy, 8–15 mm thick, bitter, a single seed in each locule; $2n = 28$. Cultivated, escaping, and persisting (established ?) at 850 to 915 m in Washington County; widely grown in warm portions of the U. S.; introduced from Asia; 8 (iii).

MENYANTHACEAE Dumort.

Buckbean Family

Plants aquatic or semiaquatic, glabrous herbs with thick rhizomes; leaves alternate, long-petiole, trifoliolate, the petioles sheathing basally; flowers perfect, regular, arranged in paniculate cymes or racemes; sepals 5, adnate to the lower portion of the ovary; petals 5, united, the corolla rotate or funnelform; stamens 5, alternate with the corolla lobes; pistil 1, the ovary partially inferior, 1-loculed, styles long or wanting, the stigma simple or 2-lobed; fruit a septicidal capsule, tardily dehiscent to indehiscent; seeds smooth and shining; $x = 9, 17$.

Menyanthes L.

Plants scapose, the leaves all basal; calyx 5-lobed, the lobes distinct; corolla lobes spreading, each with numerous scaly hairs on the inner surface; capsules 1-loculed.

Menyanthes trifoliata L. Buckbean. Rhizomes covered with membranous leaf bases; petioles 5–30 cm long, the sheathing stipules subequal in length to the free petioles;

leaflets elliptic to oblanceolate or obovate, 2-9 (12) cm long, 0.9-5 cm broad; scapes 5-30 cm long; sepals 2-5 mm long, oblong, spreading, the adnate calyx tube short-conic; corolla white to pink, funnellform, the tube 5-8 mm long, the lobes 5-8 mm long, usually purplish tinged apically; capsules ellipsoid, almost superior. Lake margins and bogs, mainly at 2895 to 3145 m in Duchesne, Summit, Uintah, and Wasatch counties, but also at ca 1680 m in Kane (Hidden Lake near Orderville) County; Alaska and Yukon, south to California and Colorado, and east to the Atlantic; circumboreal; 10 (0).

MORACEAE Link

Mulberry Family

Deciduous trees or shrubs with milky juice; leaves alternate, simple, pinnately or palmately veined, entire, serrate, or lobed, stipulate, the stipules small and distinct or each pair forming a cap over the bud and leaving a scar around the stem; flowers imperfect, minute, regular, borne in cymes or much modified inflorescences; sepals usually 4 (2 in *Ficus*) stamens 4, the filaments distinct; pistil 1, the ovary typically superior, 1-loculed, the styles and stigmas 2 (1 in *Maclura*); fruit a multiple (*Morus*, *Maclura*) or a syconium (*Ficus*); $x = 7$ to many.

- 1. Fruit a fleshy hollow receptacle with flowers borne inside (syconium); leaves palmately veined and lobed; cultivated plants in Washington County, and under glass elsewhere *Ficus*
- Fruit a multiple (formed of several flowers and a common axis); leaves various 2
- 2(1). Leaves crenate-serrate, palmately veined and often palmate lobed as well, flowers, both sterile and fertile, borne in catkinlike spikes; fruit seldom more than 1 cm thick *Morus*
- Leaves entire, pinnately veined, not lobed; flowers borne in dissimilar inflorescences, the sterile in racemes, the fertile in globular heads; fruit globular, more than 5 cm thick *Maclura*

Ficus L.

Trees or large shrubs; leaves alternate, simple, palmately veined and lobed, the stipules forming a circular scar around the stem; flowers minute, numerous, borne inside a hollow receptacle which ripens to form a syconium; staminate perianth 2- to 6-parted, with 1 or 2 stamens; pistillate perianth reduced or lacking; receptacles perfect or imperfect; fruits of individual flowers of achenes.

***Ficus carica* L.** Common Fig. Deciduous trees to 8 m tall, rarely more, often sprawling in age; leaves prominently veined, thick, to 25 cm long or more and to 20 cm broad, 3- to 5-lobed, the lobes undulate-serrulate; fruits obovoid, mostly 2.4-4.5 cm long and 2-3 cm thick; $2n = 26$. Cultivated fruit plant in Washington (and formerly at Hite, Garfield) County, frost sensitive elsewhere except under glass; introduced from the Mediterranean region of the Old World; 6 (iii). This is the fig of commerce. Plants in Washington County bear heavily, the fruit being of excellent quality, produced in two or more successive crops per year.

Malcura Nutt.

Dioecious trees with hard yellow wood; leaves entire, the stipules minute, the scar not encircling the stem; staminate flowers numerous in loose, peduncled, axillary heads or umbels, the calyx 4-parted and with 4 stamens; pistillate flowers coherent in dense, globose, axillary heads, the calyx 4-lobed, the single filiform style very long; fruit a globose multiple.

***Malcura pomifera* (Raf.) Schneider** Osage Orange. [*Toxylon pomiferum* Raf.]. Trees to 10 m tall, rarely more; stems usually armed with stout thorns 1-2 cm long; leaves petiolate, the blades 5-10 cm long and 1.8-6.5 cm wide, ovate, entire, rounded to obtuse basally, attenuate to acuminate apically; clusters of staminate flowers 2.5-3.5 cm across; heads of pistillate flowers 2-2.5 cm across; multiple fruit mostly 8-14 cm thick. Cultivated ornamental and botanical curiosity of low elevation regions in Utah, long persisting; introduced from the eastern U. S.; 5 (i). The wood of this tree is very strong, and has served as a source of bows for American Indians and others.

Morus L.

Dioecious trees; leaves palmately veined, serrate to dentate, sometimes lobed; stipules lanceolate, the scar not encircling the stem; flowers monoecious or dioecious, those of both sexes borne in stalked, axillary, catkinlike clusters; calyx 4-parted; stamens 4; styles 2, deeply parted; fruit a multiple.

- 1. Leaves glabrous above and beneath or pubescent beneath only along main veins and/or in vein axils; our common mulberry *M. alba*
- Leaves pubescent over much of the lower surface, scabrous above; rarely cultivated *M. nigra*

***Morus alba* L.** White Mulberry. Cultivated ornamental and shade tree to 10 m tall or more; leaves obliquely ovate and crenate-serrate or irregular lobed, mostly 3.5-14 cm long and 2.5-10 cm wide, truncate to subcordate basally, acute to acuminate apically, glabrous above and below except along veins and in vein axils; fruit 1-2 cm long and 0.6-1 cm thick, white, pink, red purple, or nearly black; $2n = 14, 28, 42$. Persisting and occasionally escaping in most of Utah at lower elevations; introduced from China; widespread in North America; 33 (vi). This plant was introduced into southern Utah to provide food for silkworms in an attempt to develop a silk industry. The fruit is edible, but is consumed mainly by birds. Reports from Utah of red mulberry, *M. rubra* L., belong here. Red mulberry is easily recognized by the densely hairy lower and scabrous upper leaf surfaces. So-called fruitless phases are known.

***Morus nigra* L.** Black Mulberry. Small trees to about 10 m; leaves cordate-ovate, crenate-serrate, seldom lobed, 5-20 cm long, 3-15 cm, wide, cordate basally, obtuse to acuminate apically, scabrous above and hairy over veins and at least some intervein areas below; fruit 1-2.5 cm long and to 1 cm thick, purple to black; $2n = 28, 42+$. Sparingly cultivated ornamental, mainly in warm regions of Washington County; widely cultivated in temperate regions of the earth for its fruit; introduced from Asia; 5 (0).

NYCTAGINACEAE A. L. Juss.

Four O'Clock Family

Annual or perennial herbs, often with stems swollen at the nodes; leaves simple, mostly opposite; flowers perfect, regular, the perianth reduced to a petaloid connate calyx, this subtended by sepaloid bracts; stamens 1 to many; pistil 1, 1-carpellate, the ovary superior, enclosed by the persistent perianth base (the anthocarp), 1-loculed, 1-ovuled; style 1; fruit indehiscent; seed erect; x = 10, 13, 17, 29, 33+.

- 1. Perianth mainly 1-4 cm long, tubular-funnelform, the tube mostly 1-3 mm wide; flowers in heads 2
 - Perianth mostly 0.5-1 cm long and campanulate, or if longer and funnelform, the tube more than 3 mm wide (compare *Selinocarpus*); flowers not in heads 3
- 2(1). Perianth 5-lobed; receptacle rounded to conic, lacking pedicels; wings of fruit, if any, thickish and opaque, not continuous around the fruit; plants perennial or annual *Abronia*
 - Perianth 4- or 5-lobed; receptacle flat, bearing pedicels mainly 1-2 mm long; wings of fruit thin, translucent, continuous around the fruit; plants annual *Tripterocalyx*
- 3(1). Plants prostrate, the stems radiating from the root crown; perianth pink, showy *Alltonia*
 - Plants with stems ascending to erect; perianth whitish, greenish, or pink 4
- 4(3). Plants annual from a slender taproot; perianth less than 5 mm long *Boerhaavia*
 - Plants perennial from a caudex; perianth more than 1 cm long 5
- 5(4). Fruits winged, the wings conspicuous, 2-3 mm wide; perianth greenish, 3-4 cm long, the tube less than 5 mm wide *Selinocarpus*
 - Fruits wingless; perianth white to pink or pink purple, 1.5-6 cm long, the tube more than 5 mm wide *Mirabilis*

Abronia Juss.

Annual or perennial herbs from a taproot or caudex; leaves opposite, unequal, the blades entire or lobed; inflorescence capitate, the 5-10 bracts distinct; receptacle rounded to conic, lacking pedicels; perianth 2-parted, the upper part corollalike and deciduous, the lower part forming the anthocarp; flowers 5-merous; perianth lobes flaring; anthocarps winged or merely ribbed; wings, if present, usually 2-5, opaque, not surrounding the anthocarp, the veins not prominent; achenes free.

Galloway, L. A. 1975. Systematics of the North American desert species of *Abronia* and *Tripterocalyx* (Nyctaginaceae). *Brittonia* 24: 328-347.

- 1. Perianth bright pink purple (magenta); plants annual, densely viscid-villose, of Washington County *A. villosa*
 - Perianth white or pale pinkish to rose; plants perennial, variously hairy or villose 2
- 2(1). Plants subseapose, the leaves essentially all basal; caudex commonly with a thatch of marcescent leaf bases *A. nana*
 - Plants definitely caulescent, the peduncles evidently axillary; caudex seldom with a thatch of marcescent leaf bases 3

- 3(2). Bracts subtending heads mainly 1.5-5 mm wide; fruits, at least some, usually winged, the firm thin wings wider than the body near the apex; plants of Cache County *A. mellifera*
 - Bracts subtending inflorescence mainly 4-10 mm wide or more; fruits wingless or winged, but if so, seldom wider than the body; plants of various distribution 4
- 4(3). Plants essentially glabrous; stems suffused with purple (at least basally); involucrel bracts orbicular to obovate; anthocarps glabrous, wingless, finally beakless; known from clayey and silty substrates in Grand and Uintah counties *A. argillosa*
 - Plants variably pubescent and glandular (sand grains often adhering), usually with moniliform hairs in the inflorescence; stems green, pinkish, or uncommonly suffused with purple; known mainly from sandy substrates, widespread in Utah *A. fragrans*

Abronia argillosa Welsh & Goodrich Clay-verbena. Plants perennial from a branching caudex; stems slender, (6) 15-30 (38) cm tall, glabrous, suffused purplish throughout or at the base only; leaf blades 5-35 (55) mm long, 3-38 mm wide, elliptic, ovate, obovate, or suborbicular, entire, glabrous, glaucous, thick; peduncles 1-8 (12) cm long, glabrous or rarely puberulent; bracts 7-15 mm long, 6-15 mm wide, oval to orbicular, scarious, white or suffused with purple, glabrous dorsally, ciliate; flowers 15-20 per head; perianth tube 10-15 mm long, greenish, glabrous or rarely puberulent, the limb ca 6 mm wide, white; receptacle shortly conic; anthocarps wingless, the beak short or lacking, slightly angled or not, mainly 7-9 mm long, 3-4 mm wide, scarious, glabrous, rugose, oblanceolate in outline. Mat-saltbush, other salt desert shrub, and pinyon-juniper communities, on Mancos Shale and Green River formations, at 1310 to 1830 m in Grand (type from 6 mi S of Cisco) and Uintah counties, Utah and Mesa County, Colorado; 11 (vi). This is a beautiful plant, with the glaucous, glabrous, and thickened foliage blending with the sere substrate of gray to whitish shaley clays that support it, and with the large usually pure white bracts and flowers standing ghostlike above.

Abronia fragrans Nutt. ex Hook. Fragrant Sand-verbena. [*A. fragrans* var. *pterocharpa* Jones, type from St. George; *A. bakeri* Greene; *A. elliptica* A. Nels.; *A. fragrans* var. *elliptica* (A. Nels.) Jones; *A. fallax* Heimerl ex Rydb., type from Salt Lake City; *A. glabra* Rydb.; *A. pumila* Rydb., type from Emery; *A. salsa* Rydb., type from Salt Lake City; *A. turbinata* var. *marginata* Eastw., type from Bartons range, San Juan County]. Plants perennial from a taproot, the caudex sometimes developed; stems thickish to slender, 1.8-8 (10) dm tall, glabrous to densely glandular-hairy (sand grains adhering) below or throughout, green to straw colored to reddish tinged, rarely suffused purplish; leaf blades 8-90 mm long, 3-30 mm wide, lanceolate to ovate or lance-linear, entire, glabrous or hairy; peduncles 2-18 cm long, puberulent to villose or glandular; bracts 5-25 mm long, 2-12 mm wide, ovate to lanceolate, obovate, or elliptic, puberulent to glandular-villose; flowers 25-80 per head; perianth tube 10-25 mm long, greenish to rose or purplish, puberulent to glandular-villose, the limb 5-10 mm wide, usually white; anthocarps 5-12 mm long, 2.5-8.5 mm wide, obdeltoid to obliquely so in outline, often polymorphic in a head, 1- to 5-winged or un-angled, puberulent to subglabrous. Creosote bush, blackbrush, Vanclevea-ephedra, shadscale, mixed desert shrub, pinyon-juniper,

sagebrush, and ponderosa pine communities, in various substrates but often in sand, at 750 to 2500 m in all Utah counties, except Morgan and Rich; Montana to South Dakota, south to Nevada, Arizona, New Mexico, Texas, and Mexico; 229 (xxxi). Our material has been regarded as belonging to at least two entities, either at specific or varietal rank, i.e., as *A. fragrans* and *A. elliptica*, or as *A. fragrans* var. *fragrans* and *A. fragrans* var. *elliptica*. Main diagnostic features used to segregate Utah specimens into two taxa involve the nature of the anthocarp, with var. *elliptica* being 2-winged, with a groove between the wings, and with var. *fragrans* being 2- to 5-winged, but not especially grooved. The variation in structure of the anthocarp in Utah includes both types, often within the same head, with the latter one being most common in southeastern Utah, but the separation seems to be arbitrary and is not correlated with other features.

Abronia mellifera Dougl. ex Hook. Honey Sand-verbena. [*A. lanceolata* Rydb.]. Plants perennial from a taproot, the caudex sometimes developed; stems 2–8 dm tall, usually green (or reddish at the nodes), glabrous to glandular puberulent; bracts 5–12 mm long, 1–5 mm wide, lanceolate to ovate, elliptic, or obovate, glabrous to glandular; flowers 25–60 per head; perianth tube 15–25 mm long, glabrous to glandular, usually greenish, the limb 7–12 mm wide; anthocarps 6–10 mm long, 4–10 mm wide, beaked, puberulent to glandular, winged (rarely wingless), obdeltoid in outline. Cool desert shrub community at ca 1450 m in Cache County (fide Galloway 1975); Washington, Oregon, Idaho, and Wyoming; 0 (0). The similarity of this plant to *A. fragrans*, sens. lat., is striking. It differs only in minor technical characteristics, especially in the narrow bracts, and could be expanded to include *A. fragrans* without serious injustice to its taxonomy. I follow tradition in maintaining them separately. Occasional specimens from within the range of *A. fragrans* have slender bracts, even in spring flowering plants. However, this is especially true for plants flowering a second time late in the season.

Abronia nana Wats. Low Sand-verbena. Plants 5–16 (20) cm tall, perennial from a taproot and usually with a well-developed, branched caudex, this typically clothed with marcescent leaf bases; stems without developed internodes, or rarely short-caulescent; herbage more or less glandular-puberulent to glandular-villous; leaf blades 6–30 (45) mm long, 3–15 mm wide, elliptic to oval, oblong, or ovate, entire; peduncles 3–12 cm long; bracts 6–10 mm long, 3–7 mm wide, elliptic to obovate or ovate; flowers 7–25 per head; perianth tube 10–18 mm long, rose to purplish or white, the limb 5–8 mm wide; anthocarps 7–9 mm long, 5–8 mm wide, orbiculate to obdeltoid, 5-winged. Warm, salt, and mixed desert shrub and pinyon-juniper communities at 1585 to 2170 m in Beaver (type from near Beaver), Emery, Garfield, Juab, Kane, Millard, Sevier, and Washington counties; Colorado, Nevada, Arizona, and California; 40 (viii). Most of our specimens are strictly acaulescent and have best developed leaves mainly less than twice as long as broad. These represent var. *nana*. However, in the San Rafael Swell, Emery County, Utah, there occur caulescent plants with main leaves 2–4 times longer than broad. These are designated as var. *harrisii* Welsh.

Abronia villosa Wats. Sticky Sand-verbena. Annual herbs from a taproot; stems decumbent to prostrate or

ascending, mainly 0.8–5 dm long; herbage glandular puberulent to viscid-villous (sand grains adhering); leaf blades 8–50 mm long, 4–45 mm wide, elliptic to ovate, oblong, deltoid, suborbicular, or rhombic, succulent, entire or sinuate; peduncles 2–10 cm long; bracts 3–11 mm long, 1–3 mm wide, lanceolate to narrowly ovate; flowers 15–35; perianth tube 13–20 mm long, the limb 6–13 mm wide, pink purple (magenta) or rarely white; anthocarps 5–8 mm long, 4–13 mm wide, often pitted. Creosote bush and other warm desert shrub communities at 750 to 900 m in Washington County; Nevada, Arizona, California, and Mexico; 3 (i).

Allionia L.

Annual or perennial herbs; stems prostrate, the branches more or less dichotomous; herbage glandular-villous; leaves opposite, very unequal in the pair, ovate to oblong; flowers sessile, perfect, borne in peduncled axillary clusters of 3, each subtended by a bract that encloses the fruit; perianth campanulate, 4- or 5-lobed; stamens 4–7, exerted; stigma capitate; fruit leathery, flattened, the inner face with 2 rows of stipitate glands, the margins inrolled, toothed.

Allionia incarnata L. Trailing Four-O'Clock; Windmills. Perennial or winter annual herbs; stems prostrate, 1–8 dm long or more, radiating from the root crown; leaf blades 8–30 (55) mm long, 3–23 (43) mm wide, ovate to elliptic, entire or undulate to roundly lobed or toothed; peduncles 3–25 mm long; bracts ovate, 4–9 mm long; perianth pink-purple to magenta, rarely white, 6–15 mm long; fruits 3–4 mm long, the inner side 3-veined, the margins usually toothed and incurved. Warm, salt, and mixed desert shrub communities at 800 to 1830 m in Garfield, Kane, San Juan, Washington, and Wayne counties; Colorado, Nevada, California, and Texas, south to Mexico; South America; 32 (iv). The showy bright flowers contrast strongly with the dull, even drab, herbage.

Borhaavia L.

Annual herbs; stems usually branched from the base; herbage usually glandular-viscid; leaves opposite, petiole, usually unequal in the pair; flowers perfect, small, variously arranged; bracts small, distinct; perianth funnelform to campanulate, shallowly 5-lobed; stamens 1–5, the filaments connate below; ovary stipitate; style slender, the stigma peltate; anthocarp obovoid or obpyramidal, nerved or angled.

Borhaavia spicata Choisy Spiderling. [*B. spicata* var. *torreyana* Wats.; *B. torreyana* (Wats.) Standley]. Plants erect or procumbent, 2–6 dm long; stems slender, puberulent to glandular-hirtellous or viscid; leaf blades 1–4.5 cm long, 0.4–2.5 cm wide, lanceolate to ovate, obtuse to rounded or acute apically, entire to sinuate, green above, paler beneath; inflorescence racemose to paniculate, much branched, the branches capillary, glabrous or sparingly glandular; flowers with pedicels 0.5–2 mm long, spaced along the axis; bracts ovate, scarious, 0.5–0.8 mm long, soon deciduous; perianth ca 1 mm long, pink to white; stamens 1 or 2; anthocarp 2.5–3 mm long, clavate, rounded apically, 5-ridged, the furrows open and with v-shaped indentations into the ridges. Sandy soil in pinyon-juniper community at ca 1650 m in Kane County (Atwood & Kaneko 3389 BRY); Arizona, New Mexico, and Texas; 2 (i).

Mirabilis L.

Perennial herbs, often from tuberous roots; stems erect to sprawling, simple or branched from the base or throughout; leaves opposite, subequal in the pair; involucre axillary or terminal or both, 1- to 10-flowered, of 5 distinct bracts or these connate from below to above the middle, sometimes accrescent in fruit; perianth variously colored, the tube constricted above the ovary, the limb campanulate to salverform or funnellform; stamens 3-6, the filaments filiform, united into a cup below; anthocarp 5-angled or -ribbed.

Pilz, C. E. 1978. Systematics of *Mirabilis* subgenus *Quamoclidion* (Nyctaginaceae). *Madrono* 25: 113-176.

- 1. Perianths varicolored, 4-6 cm long; plants cultivated *M. jalapa* L.
- Perianths not especially varicolored in populations, mainly shorter than 4 cm long (except in *M. multiflora*); plants indigenous 2
- 2(1). Leaves linear to linear-lanceolate, mainly 10-20 times (or more) longer than broad 3
- Leaves lanceolate, ovate, cordate, or orbicular, mainly less than 5 times longer than broad 4
- 3(2). Stems, involucre, perianths, and anthocarps glabrous or sparingly strigose; plants reported for Utah, but no specimens have been seen . . . *M. glabra* (Wats.) Standley
- Stems, involucre, perianths, and anthocarps sparingly to copiously strigose to pilose and often more or less glandular; plants widespread and locally common in much of Utah *M. linearis*
- 4(2). Leaves lanceolate to ovate (rarely broader), cuneate to obtuse; plants of western and southwestern Utah *M. pumila*
- Leaves ovate to cordate or orbicular, truncate to cordate basally; plants variously distributed 5
- 5(4). Involucres papery, conspicuously veined, much enlarged in fruit; plants rare in Utah *M. nyctaginea*
- Involucres herbaceous, not conspicuously veined or expanding in fruit 6
- 6(5). Perianths 0.8-1.2 cm long, white (rarely pinkish); plants of Washington County *M. bigelovii*
- Perianths variously shorter or longer than above, but if shorter, not white and the plants not of Washington County 7
- 7(6). Plants with sprawling, slender stems; perianth 7-9 mm long; uncommon plants of mesic sites . . . *M. oxybapheides*
- Plants with thickish, decumbent-ascending stems; perianths 15-60 mm long 8
- 8(7). Limb of perianth campanulate; perianths mainly 15-20 mm long; plants of low quality substrates in the Uinta Basin, central western Utah, and Kane County . . . *M. alipes*
- Limb of perianth rotate; perianth mainly 30-60 mm long; plants often with pinyon and juniper in the southern third of the state *M. multiflora*

Mirabilis alipes (Wats.) Pilz Watson Four-O'Clock. [*Hernidium alipes* Wats; *H. alipes* var. *pallidum* C. L. Porter, type from Uintah County]. Plants mainly 15-35 (40) cm tall, clump-forming; stems arising from a caudex, this atop a tuberous root, decumbent-ascending, constricted below ground level, mainly 3-6 mm thick, tapering upwards; herbage pale green, glaucous, glabrous or sparingly puberulent; leaves petiolate to subsessile, the blades mainly 2.5-7 (9) cm long and 1.5-6.5 cm wide,

suborbicular to ovate or lanceolate, entire, rounded to obtuse or acute apically; peduncles 3-10 mm long, erect; bracts of involucre distinct or united to the middle, mainly 15-30 mm long; involucre 6- to 9-flowered, the flowers on pedicels to 1 mm long, borne on midvein of the bract; perianth campanulate, 15-20 mm long, pink purple, pink, or white, glabrous; stamens subequal to the perianth, the filaments pubescent below; anthocarp ellipsoidal, 5.5-7 mm long, obscurely 10-ribbed, mucilaginous when wet. Mat-saltbush, shadscale, other salt desert shrub, mixed desert shrub, and pinyon-juniper communities at 1250 to 1955 m in Duchesne, Juab, Kane, Milard, Tooele, and Uintah counties; Colorado, Nevada, and California; 41 (v). This is an attractive thick-leaved plant, in which the bracts are often suffused with purple and are almost as colorful as the perianth. Its distribution is tripartite; i.e., Uinta Basin, on Duchesne River and Uinta formations; Kane County, on Tropic Shale Formation, and Great Basin, on various formations.

Mirabilis bigelovii Gray Bigelow Four-O'Clock. Plants erect or ascending from a woody caudex, clump-forming, mainly 2-5 dm tall; stems slender, mainly 2-3.5 mm thick; herbage glabrous or scaberulous to puberulent or viscid-villous; leaves short-petiolate, the blades 0.8-3.8 cm long, 0.5-3.4 cm wide, orbicular to broadly ovate, entire, rounded to obtuse apically, truncate to subcordate basally; involucre on peduncles 5-6 mm long, the bracts connate to above the middle, mainly 4-5 mm long; perianth 8-12 mm long, white to pale pink or suffused with purple; fruit ovoid-ellipsoid, ca 3 mm long, smooth or rugulose. Creosote bush, Joshua tree, and blackbrush communities at 820 to 1340 m in Washington County; Arizona, Nevada, and California; 13 (i). Our plants have been assigned to var. *retrorsa* (Heller) Munz [*M. retrorsa* Heller; *Hesperonia glutinosa* (A. Nels.) Standley; *M. glutinosa* A. Nels., type from near St. George, not Kuntze; *M. limosa* A. Nels.].

Mirabilis linearis (Pursh) Heimerl Narrowleaf Umbrellawort. [*Allionia linearis* Pursh; *Oxybaphus linearis* (Pursh) Robins.; *M. glabra* authors, not (Wats.) Standley?]. Plants erect, from a woody caudex, clump-forming, mainly 2-10 dm tall; stems glabrous or puberulent below, viscid-puberulent to viscid-villous above, usually glaucous; leaves sessile or short-petiolate, linear to linear-lanceolate (rarely lanceolate), mostly 2-10 cm long, 1-10 (13) mm wide, entire to sparingly toothed, green on both sides or glaucous below; inflorescence paniculate (a branching cyme); involucre of connate bracts, these ca 4 mm long at anthesis, 6-10 mm long in fruit, viscid-villous, usually 3-flowered; perianth 8-12 mm long, white to pink or red purple, the limb deeply lobed; anthocarps 4-5 mm long, obovoid, 5-angled, pubescent, the ridges cut with triangular notches. Two rather weak varieties are present in Utah.

- 1. Flowers mainly red purple; leaves linear-lanceolate, more or less petiolate; plants uncommon *M. linearis* var. *decipiens*
- Flowers mainly white to pink; leaves linear, sessile; plants common and widespread *M. linearis* var. *linearis*

Var. *decipiens* (Standley) Welsh [*Allionia decipiens* Standley]. Pinyon-juniper, ponderosa pine, riparian, aspen, and spruce-fir communities at 1890 to 3050 m in Garfield, Piute, and San Juan counties; Colorado, Arizona, and New Mexico; 11 (v).

Var. *linearis* [*Oxybaphus angustifolius* var. *viscidus* Eastw., type from Butler Spring, San Juan County; *O. glaber* Wats., type from Kanab; *Mirabilis glabra* (Wats.) Standley]. Salt Desert shrub, mixed desert shrub, riparian, hanging garden, pinyon-juniper, sagebrush, mountain brush, and aspen communities at 1125 to 2535 m in Beaver, Daggett, Duchesne, Emery, Garfield, Grand, Juab, Kane, Millard, Salt Lake, San Juan, Sevier, Tooele, Uintah, Utah, Washington, and Wayne counties; Montana to South Dakota, south to Arizona, New Mexico, Texas, Missouri, and Mexico; 90 (xv).

Mirabilis multiflora (Torr.) Gray in Torr. Large Four-O'Clock. [*Oxybaphus multiflorus* Torr.; *Allionia multiflora* (Torr.) D. C. Eaton; *Quamoclidion multiflorum* (Torr.) Torr. ex Gray]. Plants mainly 3–8 dm tall, from a caudex; stems decumbent to ascending, clump-forming, mainly 4–10 mm thick, tapering upwards; herbage green, puberulent to glabrous; leaves short-petiolate, the blades mainly 2–10 cm long and about as broad, orbicular to ovate, entire, truncate to subcordate basally, rounded to obtuse or acute apically; peduncles 0.5–7 cm long; involucre campanulate, 20–35 mm long, connate to above the middle, 5-lobed, 6-flowered, the flowers on pedicels to 2 mm long, on midvein of the subtending bract; perianth 4–6 cm long, funnelliform, pink-purple (magenta), the tube colored like the limb or green; stamens exerted, 5–10 or more, the filaments glabrous to pubescent; anthers ellipsoidal, 6–11 mm long, smooth or with 10 tan longitudinal ribs alternating with 10 dark brown ones. Creosote bush, blackbrush, and pinyon-juniper communities at 760 to 2380 m in Carbon, Garfield, Grand, Kane, San Juan, Washington, and Wayne counties; Nevada, Colorado, New Mexico, Arizona, California, Texas, and Mexico; 44 (ix). Three difficultly discernable and partially sympatric varieties have been recognized from Utah. The varieties *multiflora* and *glandulosa* (Standley) Macbr. occur in southeastern Utah, and the var. *pubescens* Wats. is present in Washington County. Diagnostic features include fruit characteristics (mucilaginous or not, and ribbed versus smooth) and shape of bract lobes. The latter character grades continuously and the former is not possible to apply in most cases due to lack of fruiting specimens. Recognition of infraspecific taxa therefore seems moot.

Mirabilis nyctaginea (Michx.) Macmillan Wild Four-O'Clock. [*Allionia nyctaginea* Michx.; *Oxybaphus nyctagineus* (Michx.) Sweet]. Plants erect, mainly 3–10 dm tall, from a caudex; stems branched, glabrous or somewhat hairy, ridged and often purplish; leaves petiolate to sessile, the blades 3–12 cm long, ovate-lanceolate to cordate, entire, cordate to truncate basally, acute to attenuate apically; flowers 3–5 per involucre, these borne on umbellate peduncles in forked terminal clusters, the involucre 5–6 mm long in anthesis, 10–15 mm long in fruit, 5-lobed, scarious and veiny in fruit; perianth 5-lobed, pink to purple or reddish; stamens 3–5, exerted; anthers 4–6 mm long, cylindrical to obovoid, rugose or warty, 5-ribbed; $2n = 58$. Ruderal habitat at ca 1525 m in Utah County (Arnow and Albee 4103 BRY); Montana to Wisconsin, south to Colorado, Texas, Mexico, and Alabama; adventive elsewhere in the U. S.; 1 (0). The specimen examined is likely introduced, but the possibility of persistence and of reintroduction is great.

Mirabilis oxybaphoides (Gray) Gray in Torr. Spread-ing Four-O'Clock. [*Quamoclidion oxybaphoides* Gray;

Allionella oxybaphoides (Gray) Rydb.]. Plants prostrate, decumbent, or ascending (often clambering), mainly 3–8 dm long, forming extensive mats or clumps; herbage viscid-puberulent to glabrous, the raphide bundles apparent within the tissues; stems swollen at the nodes; leaves petiolate, the blades mainly 1.5–7 cm long and 1–6 cm wide, cordate-ovate to deltoid, entire, cordate to subcordate basally, alternate to acuminate apically; inflorescence of axillary or terminal cymes; involucre 4–6 mm long, deeply 5-cleft; perianth 5–9 mm long, pink to pink purple or white; anthers 2.5–3 mm long, obovoid-ellipsoid, rugose or smooth. Riparian, mountain brush, and pinyon-juniper communities at 1645 to 2500 m in Beaver, Garfield, Iron, Piute, San Juan, and Wayne counties; Colorado, Arizona, New Mexico, Texas, and Mexico; 6 (iii).

Mirabilis pumila (Standley) Standley Standley Four-O'Clock. [*Allionia pumila* Standley; *Oxybaphus pumilus* (Standley) Standley]. Plants erect or ascending, mainly 2–5 dm long, clump-forming; herbage more or less glandular-hirtellous or viscid-villous, with raphide clusters apparent in the tissues; stems not much swollen at the nodes; leaves petiolate to sessile, the blades mainly 1.8–6 cm long, 0.6–2.5 cm wide, ovate to lanceolate, sinuate to entire, cuneate to obtuse basally, attenuate to a rounded apex; inflorescence axillary or in terminal paniculate cymes; involucre 3–4 mm long at anthesis, 7–10 mm long in fruit, 5-lobed; perianth 8–11 mm long, pink; stamens exerted; anthers 4.5–5.2 mm long, ellipsoid above the constriction, 5-ribbed, pubescent. Desert shrub communities at ca 1615 to 1770 m in Beaver, Millard, and Washington counties; Nevada, California, Arizona, and New Mexico; 6 (i). Dwarf plants, lacking viscid-villous pubescence in the inflorescence, are known from Washington County (Atwood 9386 and Higgins 15921, both BRY).

Selinocarpus Gray

Perennial herbs; stems erect or ascending, dichotomously branched; leaves opposite, unequal in the pair, the blades thick; flowers perfect, appearing axillary, sessile or short-pedicellate, often cleistogamous, each subtended by 2 or 3 narrow bracts; perianth tubular-funnelform; stamens 3–5, the filaments filiform, adherent to the perianth tube; ovary oblong, with filiform style and peltate stigma; anther compressed, broadly 3- to 5-winged, the wings striate but not veined.

Selinocarpus diffusus Gray. Moonpod. Plants 0.8–3 dm tall, clump-forming, from a caudex and woody root-crown; herbage with short, appressed, white, inflated hairs and often more or less glandular; leaves petiolate, the blades 0.8–2.5 cm long and about as broad, orbicular to oval or ovate, truncate to obtuse basally, rounded to obtuse apically; bracts linear-subulate, 3–6 mm long; perianth greenish, 3–4 cm long, caducous, slender, the limb 10–15 mm wide, greenish yellow; anthers 6–7 mm long the wings 2–3 mm long. Creosote bush and other warm desert shrub communities at 850 to 1000 m in San Juan and Washington counties; California, Nevada, Arizona, New Mexico, and Texas; 11 (i). Our material is regarded as ssp. *nevadensis* Standley [*S. nevadensis* (Standley) Fowler & Turner]. It differs in features of leaves, and the perianth is said to be more slender than those of the more eastern ssp. *diffusus*. Our specimens are largely, if not entirely, cleistogamous and typically lack a developed perianth.

Tripterocalyx (Torr.) Hook.

Annual, more or less succulent herbs from a taproot; stems simple or branched, often reddish; herbage usually viscid to glandular hairy, sometimes glabrous; leaves opposite, subequal or unequal in the pair; inflorescence capitate, subtended by distinct bracts, or these connate near the base; receptacles flat or nearly so, bearing pedicel-like projections; perianth 2-parted, the lower portion persistent (forming the anthocarp), the upper part deciduous; flowers perfect; perianth 4- or 5-lobed; stamens 3-5; stigmas linear; anthocarps surrounded completely by 2-4 thin, membranous, conspicuously veined wings.

1. Flowers 2 cm long or less, the limb of perianth 3-6 mm wide *T. micranthus*
- Flowers more than 2 cm long, the limb of perianth 8-11 mm wide or more *T. carnea*

Tripterocalyx carnea (Greene) Galloway Wootton Sandverben. [*Abronia carnea* Greene]. Plants more or less succulent, erect or procumbent to ascending; stems mainly 1-7 dm long, variously pubescent and glandular (sand grains adhering) or glabrous; petioles 1-6 cm long; leaf blades 1-8 cm long, 0.6-5 cm wide, ovate to elliptic, oblong, or ovate-lanceolate, entire to undulate, truncate to cuneate basally, obtuse to acute apically; peduncles 1-11 cm long; bracts 5-8, 5-14 mm long, linear-lanceolate to lance-attenuate; flowers 10-25 per head; perianth tube 12-30 mm long, pink to pinkish red, the limb 8-11 mm wide, white to pink; anthocarps 2- to 4-winged, 13-27 mm long. Blackbrush, ephedra-Vancevea, sand sagebrush, and indigo bush communities at 1125 to 1375 m in Garfield, Kane, and San Juan counties; Arizona, Colorado, New Mexico, Texas, and Mexico; 17 (iii). Our material is regarded as var. *wootonii* (Standley) Galloway [T. *wootonii* Standley]. This is a remarkably beautiful species, when in full flower.

Tripterocalyx micranthus (Torr.) Hook. Sandpuffs. [*Abronia micrantha* Torr. in Frem.; *A. micrantha* var. *pedunculata* Jones, type from St. George; *A. pedunculata* (Jones) Rydb.; *T. pedunculatus* (Jones) Standley]. Plants not especially succulent, decumbent to ascending or erect; stems mainly 1-6 dm long, viscid (with sand adhering) or glabrous to glandular-pubescent; petioles 1-4 cm long; leaf blades 1-6 cm long, 0.4-2.5 cm wide, lanceolate to lance-ovate, oblong, or elliptic, entire to sinuate or undulate, obtuse basally; bracts 3-9 mm long; peduncles 1.5-10 cm long; flowers 5-15 per head; perianth tube 6-13 mm long, green to pink, the limb 3-6 mm wide; anthocarps 2- to 4-winged, 10-20 mm long. Creosote bush, blackbrush, sandy desert shrub, and mixed desert shrub, usually in sand, at 820 to 1770 m in Daggett, Duchesne, Emery, Garfield, Grand, Juab, Kane, Millard, San Juan, Tooele, Uintah, Washington, and Wayne counties; Montana and North Dakota, south to Nevada, California, Arizona, New Mexico, and Kansas; 52 (ix).

NYMPHAEACEAE Salisb.

Waterlily Family

Perennial aquatic plants from submersed rhizomes; leaves alternate, simple, the blades floating on the surface

or rarely emergent, cordate; flowers perfect, regular, solitary, long-pedicel; perianth segments distinct; sepals mostly 3-12, green or petaloid; petals usually many, showy (scalelike in *Nuphar*); stamens numerous; pistil 1; ovary superior or partly inferior, several- to many-loculed; fruit a leathery berry; $x = 12-29+$.

1. Flowers yellow; sepals yellow, 5-12, more conspicuous than the petals; plants of high elevation lakes and ponds *Nuphar*
- Flowers usually pink; sepals greenish, 4, the petals conspicuous; plants of low elevation ponds *Nymphaea*

Nuphar J. E. Sm.

Herbs with thick rhizomes; leaves alternate (appearing spirally arranged), arising from the rhizome, the blade laterally attached; flowers long-pedicellate, solitary, arising from the rhizomes, yellowish; sepals 5-12, yellowish to greenish or reddish, petaloid; petals 10-20, small and inconspicuous; stamens numerous, the filaments flattened; pistil 1, the ovary with several carpels and several locules; stigma broad, forming a circular disk; fruit a capsule, many-seeded, opening irregularly.

Beal, E. O. 1956. Taxonomic revision of the genus *Nuphar*, Sm. of North America and Europe. J. Elisha Mitchell Sci. Soc. 72(2): 317-346.

Nuphar polysepalum Engelm. Yellow Pondlily; Spatterdock. [*N. luteum* ssp. *polysepalum* (Engelm.) Beal]. Coarse aquatic herbs; leaves with petioles to 10 dm long or more (length depending on water depth), the blades floating to emergent, or rarely submersed, ovate, sagittately lobed basally, 8-25 cm long from sinus to apex, 10-23 cm wide, leathery; sepals 5-12, yellow or tinged with green or red, 3-6 cm long, 2-5 cm wide; petals yellowish to purple, subequal to the stamens; fruit ovoid, mostly 4-6 cm long. Ponds and lakes, especially at a depth of ca 8-14 dm, at 2745 to 3355 m in Duchesne, Summit, and Uintah counties; Alaska to Mackenzie, south to California, Colorado, and South Dakota; 11 (ii). Position of plants in lakes and ponds is evidently determined by water depth, the rhizomes surviving in water of a certain depth only, forming a ringlike zone between the margin and the center of the body of water. Thus, the plants are seldom available to collectors, except by wading into icy water by the most determined of botanists.

Nymphaea L.

Herbs with thick rhizomes; leaves alternate, appearing spirally arranged, arising from the rhizome, the blade laterally attached; flowers long-pedunculate, solitary, arising from the rhizome; sepals usually 4, greenish; petals numerous, pink, white, or variously colored, conspicuous; stamens numerous, transitional with the petals, the filaments flattened; pistil 1, the ovary with several to many carpels and locules; stigmas several to many, broad, petaloid; fruit a capsule, many-seeded, tardily dehiscent.

Nymphaea odorata Ait. Fragrant Waterlily. Slender herbs; leaves with petioles to 12 dm long or more, depending on water depth, the blades floating, orbicular, sagittately lobed basally, mainly 10-20 cm long from sinus to apex, 15-25 mm wide, leathery; sepals 4 or 5, 3-7 cm long; petals numerous, pink or white, subequal to the sepals, longer than the stamens; capsules 2-4 cm long. Ponds and springs at ca 850 to 1710 m in Kane, Utah, and Washington (?) counties; eastern U. S.; proba-

bly introduced in Utah and now established, 3 (i). The plants from Kane County have fresh pink flowers; those from Utah County are startlingly white.

OLEACEAE Hoffsgg. & Link

Olive Family

Trees or shrubs; leaves opposite (or rarely alternate), simple or pinnately compound, stipulate; flowers perfect or imperfect, borne in axillary or terminal racemose, paniculate, or thyrsoid inflorescences; calyx commonly 4-lobed or absent; corolla usually of 4 united or distinct petals, or lacking; stamens 2, distinct; pistil 1, the ovary superior, 2-carpelled and 2-loculed; style 1, or lacking, the stigmas 1 or 2; fruit a berry, drupe, loculicidal capsule, circumscissile capsule, or samara; x = 10, 11, 13, 14, 23, 24.

- 1. Leaves pinnately compound; fruit a samara *Fraxinus*
- Leaves simple, or rarely compound, fruit various 2
- 2(1). Leaves ovate to orbicular, crenate-serrate; fruit a samara; plants indigenous *Fraxinus*
- Leaves various, but seldom ovate to orbicular and crenate-serrate; fruit a drupe, capsule, or berry; plants cultivated or indigenous 3
- 3(2). Shrubs with yellow flowers appearing before the leaves; plants cultivated *Forsythia*
- Shrubs, subshrubs, or trees with flowers variously colored but, if yellow, not as above, and appearing with or after the leaves (before in *Forestiera*) 4
- 4(3). Corolla none or rudimentary, the flowers often unisexual; fruit a drupe; shrubs of stream banks in southeastern Utah *Forestiera*
- Corolla well developed, the flowers perfect; fruit a berry or capsule 5
- 5(4). Corolla yellow; fruit a membranous, circumscissile capsule; plants indigenous subshrubs of southern Utah *Menodora*
- Corolla commonly lavender to red, purple, white, or cream; fruit a loculicidal capsule or a berry; plants cultivated shrubs or trees 6
- 6(5). Flower clusters usually less than 6 cm long; flowers white to cream; fruit a berry *Ligustrum*
- Flower clusters usually 6–30 cm long or more; flowers lavender to red, purple, lilac, white, or cream *Syringa*

Forestiera Poir.

Sprawling indigenous shrubs; leaves opposite, simple, serrate to entire; flowers inconspicuous, polygamo-dioecious, borne sessile or in cymes, appearing before the leaves; calyx minute, unequally 5- to 6-cleft, or lacking; corolla lacking, or rarely with 2 or 3 petals; stamens 2 or 4; ovary 2-loculed, with 2 ovules per locule; style slender; stigma 1; fruit a drupe.

Forestiera pubescens Nutt. Desert Olive. [*F. neomexicana* Gray; *Adelia neomexicana* (Gray) Kuntze; *A. parvifolia* Cov.]. Shrubs to 2 m tall or more; leaves (0.8) 1.5–5.5 cm long, (0.3) 0.5–2 cm wide, oblanceolate to elliptic, entire to serrulate; staminate flowers sessile; pistillate flowers pedicellate; drupe 5–7 (8) mm long, ellipsoid, blue black. Sandy terraces along the Colorado and San Juan rivers and tributaries at 1130 to 1800 m in Emery, Garfield, Grand, Kane, and San Juan counties;

California east to Oklahoma and Texas, and south to Chihuahua; 8 (iii). The fruit is eaten by fox and coyotes, and the purple-stained, stone-laden fecal pellets are to be found far from the rivers. Long known as *F. neomexicana*, our materials form a portion of a complex whose definition is included within *F. pubescens*, and that name has priority.

Forsythia Vahl

Cultivated shrubs; leaves opposite, simple or some compound, entire to serrate; flowers perfect, showy, borne in axillary clusters of 3–5, or solitary, appearing before the leaves; calyx 4-lobed; corolla 4-lobed, campanulate; stamens 2, inserted at corolla base; ovary 2-loculed, with several ovules per locule; fruit a loculicidal capsule, with many winged seeds (ours seldom fruiting).

Forsythia suspensa (Thunb.) Vahl Golden-bell. [*Syringa suspensa* Thunb.]. Shrub to 2 m tall or more; branchlets somewhat 4-angled; leaves 6–10 cm long, ovate to lanceolate, acute apically, cuneate to rounded basally, usually serrate; flowers to 25 mm long, golden yellow; fruit lance-ovoid, to 15 mm long, seldom developing. Cultivated ornamental, common, persisting but not spreading at lower elevations throughout Utah; widespread; introduced from China. Numerous horticultural varieties are present; 6 (0).

Fraxinus L.

Deciduous, cultivated and/or indigenous trees or shrubs; winter buds often prominent, gray to brown or black; leaves opposite, pinnately compound (simple in *F. anomala*); flowers perfect or unisexual, inconspicuous, borne in panicles; calyx 4-lobed or lacking; corolla lacking or of 2 or more usually distinct petals; stamens commonly 2; ovary 2-loculed; styles 1; stigmas 1 or 2; fruit a samara.

- 1. Leaves normally simple, sometimes with 1 or 2 leaflets below the terminal one; indigenous shrubs or small trees of eastern and southern Utah *F. anomala*
- Leaves normally pinnately compound with 5–9 or more leaflets; trees, either indigenous or cultivated 2
- 2(1). Branchlets, petioles, and axis of panicle commonly spreading hairy, seldom glabrous; leaflets usually 5 or fewer; trees, indigenous in southwestern Utah, cultivated elsewhere *F. velutina*
- Branchlets, petioles, and axis of panicle variously hairy or glabrous, but seldom spreading hairy; leaflets usually 7 or more; trees, cultivated and sometimes escaping 3
- 3(2). Flowers appearing after leaves formed; corolla present *F. ornus*
- Flowers appearing before leaves formed, corolla lacking 4
- 4(3). Fruit with calyx persisting as a campanulate cap; anthers oblong; leaflets usually 5–7 5
- Fruit with calyx early deciduous or lacking (except *F. quadrangulata*); anthers often cordate; leaflets usually 9–11 or more 6
- 5(4). Petiolules of middle and lower mature leaflets wingless nearly their entire length; winter buds black; leaf scars horseshoe-shaped; wing of fruit terminal, not or only slightly decurrent *F. americana*

- Petiolules of middle and lower mature leaflets winged nearly to the base; winter buds brown; leaf scars semi-circular or shield-shaped; wing of fruit decurrent to below the middle *F. pennsylvanica*
- 6(4). Branchlets 4-sided, 4-angled; bark broken into plates; flowers with a minute, deciduous calyx *F. quadrangulata*
- Branchlets terete, not or only slightly 4-angled; bark smooth or irregularly roughened; flowers with calyx lacking 7
- 7(6). Leaflets glabrous or somewhat hairy along veins beneath; commonly cultivated tree *F. excelsior*
- Leaflets definitely pubescent beneath, especially along the veins, the long reddish hairs extend onto and along the leaf rachis; uncommon to rarely cultivated trees *F. nigra*

***Fraxinus americana* L.** White Ash. Moderate to large trees; branchlets terete, green to brown, glabrous; winter buds black; leaflets usually 7 (5-9), 6-15 cm long, petiolulate, ovate to lanceolate, acuminate apically, cuneate to rounded basally, entire to serrate, glaucous beneath and usually glabrous; anthers oblong, apiculate; calyx persistent; corolla lacking; samaras (20) 25-35 mm long, 4-7 mm wide, the wing not decurrent along the terete base. Shade tree of lower elevations in Utah; introduced from eastern North America; 5 (0).

***Fraxinus anomala* Torr. ex Wats.** Singleleaf Ash. Shrub or small tree, commonly 2.5-4 m tall, usually with many stems; branchlets 4-angled; leaves glabrous, ovate, crenate-serrate to subentire, 1.5-6.5 cm long, 1-6 cm wide, acute to obtuse or subcordate basally, acute to rounded or emarginate apically, sometimes 2- or 3-foliolate or transitional to simple; flowers usually perfect; anthers oblong; calyx campanulate, persistent; petals lacking; samaras winged almost to the base, 12-27 mm long, 5-11 mm wide. Mixed desert shrub, mainly on rimrock or along drainages, and in pinyon-juniper woodland at 900 to 2625 m in Emery, Garfield, Grand, Iron, Kane, San Juan (? type from Labrynth Canyon), Uintah, Washington, and Wayne counties; Colorado, New Mexico, Arizona, and California; 80 (xv).

***Fraxinus excelsior* L.** European Ash. Moderate to large trees; branchlets terete, glabrous; winter buds black; leaflets 7-11, 5-12 cm long, sessile, ovate to oblong or lanceolate, acuminate apically, cuneate basally, serrate, green beneath, glabrous except along midrib, the hairs sometimes extending to the rachis; flowers polygamous; anthers ovoid; calyx lacking; corolla lacking; samaras 25-35 (40) mm long, 5-11 mm wide, the blade decurrent almost or quite to the base of the flattened body; $2n = 46$. Shade trees of habitations and streets at lower elevations throughout Utah; introduced from Europe; 11 (0).

***Fraxinus nigra* Marshall** Black Ash. Moderate trees; branchlets terete, glabrous; winter buds black; leaflets 7-11, mostly 6-12 cm long, sessile, lanceolate to oblong, obtuse to rounded basally, long-acuminate apically, serrate, green and glabrous except reddish-hairy along veins, the pubescence extending along the leaf rachis; flowers dioecious; anthers oblong; calyx lacking; corolla lacking; samaras mostly 25-35 mm long and 6-10 mm broad, the blade decurrent to the base of the flattened body; $2n = 46$. Sparingly cultivated shade tree at lower elevations in at least the major population centers; introduced from eastern North America; 4 (0).

***Fraxinus ornus* L.** Flowering Ash. Small to moderate trees; branchlets terete; winter buds gray to brownish; leaflets usually 7 (7-11), mostly 2.5-7 cm long, petiolulate, lance-ovate to obovate (terminal one), rounded to obtuse basally, acuminate apically, crenate-serrate, glabrous except along midrib; flowers perfect; calyx present, persistent, with 4 triangular-acuminate, spreading lobes; petals present, linear; samaras 20-25 mm long, 3-6 mm wide, the blade terminal on the terete base. Rarely cultivated shade and ornamental tree of lower elevations in Utah; introduced from Europe; 2 (0).

***Fraxinus pennsylvanica* Marshall** Red Ash. Moderate trees; branchlets terete, pubescent to glabrous, sometimes glandular; winter buds olive to brown; leaflets usually 7 (5-9), 6-15 cm long, petiolulate, lanceolate to lance-oblong, acuminate apically, acute to obtuse or rounded basally, serrate to entire, green and glabrous or hairy (especially along the veins) beneath; anthers oblong, apiculate; calyx campanulate, persistent; corolla lacking; samaras 27-40 (50) mm long, the blade decurrent to the middle of the terete body or below; $2n = 46$. Common shade tree of lower elevations throughout Utah, persisting and escaping in Box Elder, Cache, Davis, Iron, Juab, Millard, Salt Lake, Utah, and Washington counties; introduced from eastern North America; 28 (0). The escaped plants have become established along streams and on lake margins at lower elevations. Much of our material has glabrous branchlets and petioles and has been designated as *F. pennsylvanica* var. *lanceolata* (Borkh.) Sarg. (*F. lanceolata* Borkh.). This phase is known as green ash.

***Fraxinus quadrangulata* Michx.** Blue Ash. Small to moderate trees; branchlets sharply 4-angled, glabrous; winter buds black; leaflets 7-11, mostly 5-12 cm long, petiolulate, lanceolate, acute to rounded basally, acute to acuminate apically, serrate, glabrous except along the midrib or rarely hairy over the lower surface; flowers perfect; calyx minute, caducous; corolla lacking; anthers cordate-oblong, blunt; samaras 20-40 (50) mm long, the blade decurrent to the base of the flattened body; $2n = 46$. Sparingly cultivated shade tree at lower elevations in Utah; introduced from eastern North America; 1 (0).

***Fraxinus velutina* Torr.** Velvet Ash. (*F. pennsylvanica* ssp. *velutina* (Torr.) C. N. Miller). Moderate trees; branchlets terete, densely spreading hairy to merely sparingly so or glabrous; winter buds brown; leaflets 3-5 (or leaves simple), lanceolate to ovate, elliptic, or orbicular, petiolulate, cuneate to acute basally, acuminate to rounded apically, serrate, glabrous or hairy over the lower surface; flowers imperfect; calyx campanulate, persistent; corolla lacking; anthers oblong, apiculate; samaras 16-34 mm long, 4-6 mm wide, the blade decurrent about half way along the terete body. Indigenous tree of stream courses and flood plains in Washington and Iron counties, and cultivated there and elsewhere in Utah; Arizona and New Mexico; 25 (ii). The plants with coriaceous leaflets has been treated as var. *coriacea* (Wats.) Rehder (*F. coriacea* Wats.), but seem not to be worthy of taxonomic recognition, at least in Utah. Note: The shrubby *Fraxinus dipetala* H. & A. is reported for Utah in Kearney & Peebles, 1961. Flora of Arizona, supplement p. 1063. The related *F. cuspidata* Torr. is known from adjacent Mohave and Coconino counties, Arizona, and might occur in Utah. Both species have corollas present; the former has two petals and the latter has four.

Ligustrum L.

Shrubs; leaves opposite, simple, entire; flowers perfect, white, showy through small, borne in terminal panicles, appearing after the leaves; calyx 4-toothed; corolla 4-lobed, funnelform; stamens 2, inserted on the corolla tube; ovary 2-loculed, 1- or 2-seeded; fruit a berry.

Ligustrum vulgare L. Common Privet. Deciduous or semievergreen shrub to 3 m tall or more, with puberulent to glabrate branchlets; leaves 2-6 cm long, 0.8-2 cm wide, oblong to elliptic or ovate-lanceolate, glabrous; panicle dense, 3-6 cm long; corolla tube shorter than the lobes, white; anthers exerted; fruit 6-8 mm long, black, ovoid to subglobose; 2n = 46. Cultivated hedge plant throughout Utah at lower elevations, persisting and established in Utah County; introduced from Europe; 3 (0).

Menodora Humb. & Bonpl.

Subshrubs; leaves alternate or the lowermost opposite, simple, sessile or nearly so; flowers perfect, arranged in cymes; calyx 5- to 15-lobed; corolla yellow, subrotate, 5- to 6-lobed; stamens 2, inserted on the corolla tube; ovary 2-loculed, with 2-4 ovules per locule; style slender, the stigma capitate; fruit a circumscissile capsule.

Steyermark, J. A. 1932. Revision of the genus *Menodora*. Ann. Missouri Bot. Gard. 19: 87-176.

- 1. Plants armed with spines; corolla lobes white, shorter than the tube; known from southwestern Washington County *M. spinescens*
- Plants unarmed; corolla lobes yellow, longer than the tube; known from a broader distribution *M. scabra*

Menodora scabra Gray Plants erect or ascending, commonly 2-3.5 dm tall, woody at the base only; leaves 0.5-2.9 cm long, 2-5 mm wide, narrowly elliptic to oblong or lanceolate, glabrous or scaberulous; calyx minutely puberulent, the lobes linear; corolla bright yellow, subrotate, the lobes 5-9 mm long; capsule 8-12 mm thick, membranous; seeds 4-5 mm long; 2n = 22. Pinyon-juniper community at 1525 to 1830 m in Garfield, Kane, and Washington counties; California, Arizona, New Mexico, Texas, and Mexico; 3 (i).

Menodora spinescens Gray Low rounded shrubs 1.5-8 dm tall, the branches spreading, ultimately modified as thorns; leaves 4-12 mm long, 2-4 mm wide, linear to oblong or spatulate, entire, appressed puberulent; calyx lobes linear-subulate; corolla white, tinged brownish-purple, 9-15 mm long, funnelform, the lobes 3.5-4.5 mm long; capsule 7-9 mm thick; seeds 5-6 mm long. Mixed warm desert shrub at ca 670 to 765 m on the lacustrine member of the Muddy Creek Formation, in southwestern Washington County; California, Nevada, and Arizona; 2 (0).

Syringa L.

Shrubs or small trees; leaves opposite, simple, petiolate; flowers perfect, in terminal or lateral panicles; calyx campanulate, 4-toothed to nearly truncate, persistent; corolla tubular, the limb 4-lobed and rotate or nearly so; stamens 2, inserted on the corolla tube; ovary 2-loculed, each locule with usually 2 ovules; style with a 2-lobed stigma; fruit a loculicidal capsule.

- 1. Flowers cream to whitish, borne in large panicles; corolla tube 1-2.2 mm long, only half as long as the calyx; fragrance musky, not that of lilac; plants flowering in summer, often tree-like 2
- Flowers lilac, violet, purplish white, or white; corolla tube mostly 6-12 mm long or more, several times longer than the calyx; fragrance usually of lilac; plants commonly shrubs, flowering in spring or summer 3
- 2(1). Leaves ovate, rounded or subcordate basally, the veins prominent on the lower surface *S. amurensis*
- Leaves lanceolate to elliptic or ovate-lanceolate, obtuse to cuneate basally, the veins not prominent *S. pekinensis*
- 3(1). Panicles from terminal buds; leaves of current season borne on branch with panicle; plants flowering in summer *S. villosa*
- Panicles from lateral (or terminal) buds, the terminal buds often lacking; leaves of current season not borne on the branch with panicle; plants flowering in springtime 4
- 4(3). Leaves ovate to cordate, the base subcordate to obtuse; our most common species *S. vulgaris*
- Leaves lanceolate to elliptic or ovate, obtuse to cuneate basally; common to uncommon 5
- 5(4). Leaves mostly less than 4 cm long, some often irregularly lobed; individual panicles short, mostly 7 cm long or less *S. persica*
- Leaves often over 4 cm long, entire; individual panicles usually 8-12 cm long *S. x chinensis*

Syringa amurensis Rupr. Amur Lilac. Shrubs or small trees to 5 m tall or more; leaf blades 3.5-13 cm long, 1.3-8 cm wide, ovate, rounded to obtuse or short acuminate basally, acuminate apically, the lower surface hairy to glabrous, the veins prominent; petioles mostly 1-2 cm long; panicles 10-15 cm long, the clusters of panicles usually much longer; flowers cream to white; stamens exerted. Sparingly cultivated ornamental of lower elevations in Utah; introduced from Japan; flowering in summer; 4 (0).

Syringa x chinensis Willd. Chinese Lilac. Shrub to 4 m tall or more, with spreading and often arching branches; leaves 2.5-8 cm long, 1.5-4 (5) cm wide, ovate-lanceolate, obtuse to cuneate basally, acuminate apically, glabrous, the veins not prominent; petioles 0.5-1.5 cm long; panicles mostly 8-12 cm long, the clusters of panicles much longer; flowers purple, lilac, or otherwise; stamens included. Commonly cultivated ornamental almost throughout Utah; introduced from the Old World; 3 (0). This plant is evidently of hybrid origin, having resulted from a cross between *S. persica* and *S. vulgaris* q.v.; flowering in springtime.

Syringa pekinensis Rupr. Peking Lilac. Shrub or small tree to 5 m tall or more, with spreading branches; leaves 5-12 cm long, 2-4 (6) cm wide, lanceolate to ovate, cuneate basally, acuminate apically, glabrous, the veins not prominent; petioles 1.5-3 cm long; panicles mostly 8-15 cm long, the clusters of panicles to 30 cm long or more; flowers cream to yellow white; stamens exerted. Uncommon, cultivated ornamental in northern Utah, but to be expected elsewhere; introduced from China; flowering in early summer; 1 (0).

Syringa persica L. Persian Lilac. Shrub to 2 m tall, with upright to arching branches; leaves 1.5-6 cm long, 0.6-3 cm wide, lanceolate to elliptic, sometimes lobed, cuneate to obtuse basally, acute to acuminate apically, glabrous,

the veins not prominent; petioles 0.5–1 cm long; panicles mostly 3–7 cm long; flowers usually lilac but purple phases are known; stamens included. Uncommonly cultivated ornamental, especially in northern Utah; introduced from Asia Minor; flowering in springtime; 5 (0).

Syringa villosa Vahl Shrub to 3 m tall, rarely more, with erect branches; leaves 4–15 cm long (or more), 2.5–9 cm wide, ovate to elliptic, acute basally, abruptly acuminate apically, spreading hairy below, especially along the prominent veins; petioles 0.8–2 cm long; panicles mostly 10–18 cm long; flowers pink lilac to white; stamens included. Sparingly but widely planted ornamental, mainly in northern Utah; introduced from China; flowering in summer; 4 (0).

Syringa vulgaris L. Common Lilac. Shrubs to 4 m tall or more, the branches usually erect; leaves 3–12 cm long, 1.5–8 cm wide, ovate to cordate, cordate to rounded, truncate or obtuse basally, acute to acuminate apically, glabrous; petioles 0.8–3 cm long; panicles mostly 10–20 cm long; flowers lilac or white, seldom purple; stamens included; 2n = 44, 46. Abundantly cultivated ornamental, long persisting in most of Utah; introduced from Europe; flowering in springtime; 7 (0). Many horticultural forms are known.

ONAGRACEAE A. L. Juss.

Evening Primrose Family

Caulесcent or acaulescent herbs, or rarely woody plants; leaves alternate, opposite, or basal; flowers perfect; hypanthium adnate to the ovary and usually prolonged beyond; sepals 4 or 2; petals distinct, 4 or 2, inserted near or at the summit of the hypanthium; stamens as many or twice as many as the petals; ovary inferior, usually 4-loculed; styles 1; stigma capitate, 4-lobed, or discoid; fruit a capsule, nut, or berry; x = 6–18.

- 1. Sepals, petals, and stamens 2; leaves opposite; fruit indehiscent, about as broad as long, usually bearing hooked hairs *Circaea*
- Sepals and petals 4; stamens usually 8; fruit various, but not usually bearing hooked hairs 2
- 2(1). Seeds with a tuft of hairs at one end 3
- Seeds naked or pubescent overall 4
- 3(2). Hypanthium less than 1 cm long, not scaly within; flowers pink, lavender, white, or yellowish *Epilobium*
- Hypanthium 1.5–3 cm long, with a row of 8 scales within; flowers scarlet *Zauschneria*
- 4(2). Fruit indehiscent; flowers pink to red orange or white, often irregular *Gaura*
- Fruit dehiscent, capsular; flowers usually white or yellow, regular or nearly so 5
- 5(4). Ovary 2-loculed; hypanthium not prolonged beyond the apex of the ovary; flowers minute, the petals 1.5 mm long or less *Cayophytum*
- Ovary 4-loculed; hypanthium prolonged beyond the ovary; flowers larger, the petals mostly more than 2 mm long 6
- 6(5). Sepals erect; petals small or lacking *Boisduvalia*
- Sepals reflexed, or the apices united and turned to one side at anthesis; petals small to large 7

- 7(6). Anthers attached near one end; petals pink to lavender or white *Clarkia*
- Anthers versatile or if attached at one end, the petals not white; petals white, yellow, or lavender 8
- 8(7). Stigmas peltate; plants caulescent from a ligneous caudex *Calylophus*
- Stigmas 4-cleft or hemispheric to subglobose; plants of various habit 9
- 9(8). Stigmas 4-cleft; pollen hanging in long strands *Oenothera*
- Stigmas hemispheric to subglobose, entire or merely 4-lobed; pollen not as above *Camissonia*

Boisduvalia Spach

Annual, caulescent herbs; leaves opposite below, alternate above; flowers axillary, solitary; hypanthium shortly prolonged beyond the ovary with hairs below the summit; sepals 4, erect, deciduous with the hypanthium in fruit; petals 4, deeply emarginate; stamens 8; stigmas 4-lobed or capitate; ovary 4-loculed; fruit a capsule; seeds lacking a tuft of hair.

- 1. Sepals 2–4 mm long; petals 4–8 mm long; capsule with 1 row of seeds per locule *B. densifolia*
- Sepals ca 2 mm long; petals 2–4 mm long; capsule with 2 rows of seeds per locule *B. glabella*

Boisduvalia densiflora (Lindl.) Wats. [*Oenothera densiflora* Lindl.]. Stems erect or ascending, simple or branched, commonly 1–6 dm tall; herbage pilose with hairs mainly 0.5–2.5 mm long and sometimes glandular as well; leaves sessile, 1.5–5 cm long, 3–10 mm wide, lanceolate to lance-ovate, serrulate to entire; flowers subtended by broad, leafy bracts; hypanthium 1–4 mm long; sepals 2–4 mm long; petals lavender to pink or white, 4–8 mm long; stigma obscurely 4-lobed; capsules 5–10 mm long, dehiscent to the base; seeds 1 row per locule, 1.2–1.8 mm long. Marshy areas at ca 1310 to 1435 m in Cache and Weber counties; British Columbia to Montana, south to California and Idaho; 1 (0).

Boisduvalia glabella (Nutt.) Walp. [*Oenothera glabella* Nutt. ex T. & G.]. Stems simple and erect or with decumbent branches from the base, mainly 1–3 dm long; herbage puberulent to sparingly villous with crinkly hairs; leaves sessile, 1–2.2 cm long, 2–7 mm wide, lanceolate to ovate-lanceolate, serrulate; flowers subtended by broad, leafy bracts; sepals 1–2 mm long; petals purplish, 1–4 mm long; capsules 5–9 mm long; seeds in 2 rows per locule, 1–1.3 mm long. Shores of lakes and ponds at 1525 to 2200 m in Cache, Salt Lake, Uintah, and Utah counties; British Columbia to the Dakotas, south to California, Nevada, and Arizona; 3 (0).

Calylophus Spach

Perennial, caulescent herbs (or somewhat suffrutescent); leaves alternate; flowers axillary, opening at most times of day; hypanthium prolonged much beyond the ovary, deciduous; sepals 4, reflexed in anthesis; petals 4; stamens 8, the anthers versatile; stigma peltate, discoid to shallowly lobed; capsules sessile; seeds in 2 rows per locule.

Calylophus lavandulifolius (T. & G.) Raven [*Oenothera lavandulifolia* T. & G.; *Galpinsia lavandulifolia* (T. & G.) Small]. Plants perennial from a taproot and ligneous, pluricipital caudex; stems decumbent to erect,

mainly 2–22 cm long; herbage strigulose to villous; leaves 0.6–3.5 cm long, 1–6 mm wide, linear to oblong, elliptic, or oblanceolate, cuneate basally, obtuse to acute apically; flowers axillary, solitary, the buds erect, expanded below the sepals; hypanthium 2.5–8 cm long above the ovary; sepals 10–23 mm long; anthers 5–10 mm long; capsules 1–2 cm long; seeds 1.5–2.5 mm long; n = 7. Blackbrush, salt and mixed desert shrub, sagebrush, pinyon-juniper, and ponderosa pine communities at 1370 to 2750 m in Beaver, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Juab, Kane, Millard, San Juan, Sanpete, Uintah, Washington, and Wayne counties; Nevada and Arizona, east to Texas, and north to Wyoming and South Dakota; 125 (xvi).

Camissonia Link

Annual or perennial herbs; leaves alternate or basal; flowers axillary, sessile or pedicellate, often disposed in spikes or racemes, opening in day or evening; hypanthium prolonged or short, deciduous from the fruit; sepals 4, reflexed at anthesis; petals 4, inconspicuous to showy, yellow, white, or lavender, fading orange to purple; stamens 8 (4 in *C. exilis*), the anthers versatile or basifixed; stigma hemispheric to globular, sometimes shallowly 4-lobed; capsules loculicidal; seeds in 1 or 2 rows per locule, lacking a tuft of hairs

Munz, P. A. 1928. Studies in Onagraceae. II. Revision of North American species of *Sphaerostigma*, genus *Oenothera*. Bot. Gaz. 85: 233–270.
 Raven, P. H. 1962. The systematics of *Oenothera* subgenus *Chylismia*. Univ. California Publ. Bot. 34: 1–122.
 ———. 1969. A revision of the genus *Camissonia* (Onagraceae). Contr. U.S. Natl. Herb. 376: 161–396.

- 1. Plants acaulescent perennials; flowers yellow, the ovary produced into a sterile tip mainly 1–8 cm long below the hypanthium proper 2
- Plants caulescent annuals; flowers yellow, white or lavender, the ovary not produced below the hypanthium 3
- 2(1). Leaves entire or lobed only near the base; herbage glabrous or essentially so *C. subacaulis*
- Leaves (or most of them) irregularly pinnatifid throughout; herbage short-hairy to almost glabrous *C. breviflora*
- 3(1). Capsules sessile or nearly so, straight, curved, or contorted; seeds in 1 row per locule 4
- Capsules pedicellate (shortly so in some *C. brevipes*), straight to curved; seeds mainly in 2 rows per locule 11
- 4(3). Flowers yellow, opening in morning 5
- Flowers white, opening in evening 7
- 5(4). Capsules 0.5–1 cm long, thickened near the base; leaves congested at the stem ends *C. andina*
- Capsules mainly more than 1.5 cm long, not thickened at the base; leaves not clustered at stem ends ... 6
- 6(5). Leaves mainly basal or nearly so; herbage spreading-hairy; plants of Beaver, Iron, and Washington counties *C. pusilla*
- Leaves cauline, usually lacking near the base; herbage glabrous to strigose; plants of rather broad distribution *C. parvula*
- 7(4). Capsule cylindrical, not tapering toward the tip 8
- Capsule thickened basally, tapering toward the tip ... 9

- 8(7). Petals 4–8 mm long; style exerted 4–8 mm beyond the hypanthium, the stigma surpassing the petals; anthers 1.5–2 mm long; plants of Washington County *C. refracta*
- Petals 1.5–3 mm long; styles exerted 1–2 mm beyond the hypanthium, the stigma not surpassing the petals; anthers 0.5–1 mm long; plants of Kane, Tooele, and Washington counties . *C. chamaenerioides*
- 9(7). Petals 3.5–8 mm long; style exerted 2.5–8 mm beyond the hypanthium; plants of the Great Basin and Washington and eastern Kane counties *C. boothii*
- Petals 1–3 mm long; style exerted 0.5–2.5 mm beyond the hypanthium; plants of various distribution 10
- 10(9). Leaves entire, mainly basal; plants rather broadly distributed *C. minor*
- Leaves toothed, mainly cauline; plants of Washington County *C. gouldii*
- 11(3). Stamens 4; plants reported from the Cockscomb vicinity in eastern Kane County, but the report has not been verified *C. exilis* (Raven) Raven
- Stamens 8; plants of various distribution in Utah 12
- 12(11). Petals white, with the base yellow; seeds with paired, marginal wings *C. pterosperma*
- Petals yellow or lavender, or if white, the base not yellow; seeds not winged 13
- 13(12). Petals lavender, both at anthesis and upon drying; plants from eastern Kane County *C. atwoodii*
- Petals yellowish or white at anthesis, sometimes fading lavender; plants of various distribution 14
- 14(13). Capsules 4 cm long or more; petals 10–14 mm long; plants of Kane and Washington counties . . *C. brevipes*
- Fruit mainly 0.2–3.5 cm long, but if to 4 cm long, the petals usually shorter; plants of various distribution . 15
- 15(14). Capsules 2–10 mm long; pedicels filiform, 2–10 mm long; herbage pilose with long, slender, white hairs; plants of Washington County *C. parryi*
- Capsules 10–35 mm long; pedicels filiform or not, of various lengths; herbage glabrous or variously hairy; plants of various distribution 16
- 16(15). Plants mostly 2–6 dm tall or more; capsules 1.2–2 mm wide 17
- Plants often less than 2.5 dm tall; capsules 2–3.5 mm wide 18
- 17(16). Petals 5–10 mm long; anthers 1.5–4 mm long; plants of (Kane? and) Washington County *C. multijuga*
- Petals 1.5–5 mm long; anthers 0.5–1.5 mm long; plants of broad distribution *C. walkeri*
- 18(16). Petals 2–5 mm long; anthers 0.5–2.5 mm long *C. scapoidea*
- Petals 7–12 mm long; anthers 2.5–3 mm long 19
- 19(18). Staminal filaments of 2 lengths, the longer ones ca 1.5–2 mm longer than the others; petals bright yellow; plants of eastern Utah *C. eastwoodiae*
- Staminal filaments subequal; petals white; plants of western Utah *C. clavaeformis*

Camissonia andina (Nutt.) Raven [*Oenothera andina* Nutt. ex T. & G.]. Annual herbs from taproots; stems simple or more commonly branched from the base, erect or the branches curved-ascending, mainly 1–8 cm tall and 2–15 cm wide, with leaves clustered near the stem ends; herbage rather densely strigulose-puberulent; leaves 0.6–3 cm long, 1–3 mm wide, linear to linear-oblance-

olate, cuneate to a slender petiole, entire; flowers solitary, axillary in most leaf axils, minute (self-pollinated or cleistogamous); hypanthium prolonged 0.8–2 mm beyond the ovary; sepals 1–2.5 mm long, reflexed at anthesis; petals yellow, 1–2.5 mm long; stamens dimorphic, or one set sometimes obsolete; anthers 0.3–0.5 mm long; style exerted 0.7–2 mm beyond the hypanthium; capsule sessile, 6–11 mm long, tapering from the thick base; seeds in 1 row per locule, 0.7–1.3 mm long, brown, shining; $n = 14, 21$. Sagebrush communities at ca 1675 to 2290 m in Beaver, Cache, and Wasatch counties; British Columbia to Alberta, south to California, Nevada, and Wyoming; 0 (0). Reports of distribution are taken from Raven (1969).

***Camissonia atwoodii* Cronq.** [*C. megalantha* authors, not (Munz) Raven]. Robust annual (or winter annual) herbs from taproot; stems 0.5–1.5 m tall and 2–8 dm broad, usually branched, and with leaves basally disposed or near branch bases; herbage stipitate-glandular; leaves petiolate, the blades 1.2–7.5 cm long, 0.8–5 cm wide, ovate to lanceolate or suborbicular, subcordate to truncate basally, serrulate to serrate-dentate; flowers numerous in panicles, open pollinated, showy; hypanthium 0.6–1 mm long; sepals 5–7 mm long, reflexed in anthesis; petals lavender with purple spots, 8–14 mm long; stamens dimorphic, the longer ones surpassing the shorter ones 3–4 mm, the filaments copiously pilose near the base; anthers 1.5–2 mm long; capsules 11–20 mm long, the seeds in 2 rows per locule, 1.5–1.8 mm long. Salt desert shrub community at ca 1525 m in eastern Kane County (Smokey Mt.); endemic; 2 (0).

***Camissonia boothii* (Dougl.) Raven** [*Oenothera boothii* Dougl.]. Annual herbs from taproots; stems simple or branched from near the base, erect or the branches curved-ascending, mainly 4–30 cm tall and 6–45 cm wide, the leaves clustered near the base or scattered along the stem; herbage glabrous, strigulose, pilose, or stipitate-glandular; leaves 0.8–14 cm long, 2.5–26 mm wide, the blades elliptic to lanceolate or ovate, entire or irregularly toothed, tapering to a petiole; flowers numerous, but solitary in bract axils, clustered at stem apices, opening in evening; hypanthium prolonged 2–8 mm beyond the ovary; sepals 3–6.7 mm long, reflexed separately or some clinging at the apices; petals white, 4.2–7.3 mm long, rounded apically; stamens subequal; anthers 1.3–2.5 mm long; style exerted 3.7–7.5 mm beyond hypanthium; capsule sessile, 8–25 mm long, curved, tapering from the thickened base; seeds in 1 row per locule, 1–1.5 mm long, pale; $n = 7$. Two distinctive varieties are present in our material.

- Sepals 3–4.5 mm long; style exerted 3.7–4.2 mm beyond the hypanthium; herbage strigulose to pilose or stipitate-glandular; plants of the Great Basin in Utah *C. boothii* var. *villosa*
- Sepals 4.7–6.7 mm long; style exerted 4.5–7.5 mm beyond the hypanthium; herbage glabrous or puberulent; plants of Kane, and Washington counties *C. boothii* var. *condensata*

Var. *condensata* (Munz) Cronq. [*Oenothera decorticans* var. *condensata* Munz; *C. boothii* ssp. *condensata* (Munz) Raven]. Creosote bush, bursage, Joshua tree, shadscale, and other warm or mixed desert shrub communities at 750 to 1220 m in Kane and Washington counties; Arizona, Nevada, California, and Mexico; 19 (vii).

Var. *villosa* (Wats.) Cronq. [*Oenothera alyssoides* var. *villosa* Wats., type from Great Salt Lake; *Sphaerostigma utahense* Small, type from Milford; *Oenothera gauriflora* var. *hitchcockii* H. Levl., type from Simpson's Park (probably Tooele County); *C. boothii* ssp. *alyssoides* (H. & A.) Raven]. Shadscale, galleta, hopsage, rabbitbrush, desert almond, sagebrush, and pinyon-juniper communities at 1280 to 1925 m in Beaver, Box Elder, Cache, Davis, Iron, Juab, Millard, Salt Lake, Sanpete, Tooele, and Utah counties; Oregon and Nevada; 39 (vi). Pubescence varies from merely crisp-puberulent to villos-pilose and more or less glandular.

***Camissonia breviflora* (T. & G.) Raven** [*Oenothera breviflora* T. & G.; *Taraxia breviflora* (T. & G.) Nutt. ex Small]. Perennial, acaulescent herbs from taproots and a simple or branched caudex; herbage crisp-puberulent to hirtellous or almost glabrous; leaves all basal, 2–14 cm long, 3–20 mm wide, most or all of them lobed to irregularly pinnatifid almost throughout; flowers opening in morning (self-pollinated?), sessile in leaf axils, numerous, clustered; ovary apex prolonged into a slender tube 5–15 mm long below the hypanthium proper—this 15–25 mm long; sepals 2.8–6.5 mm long, reflexed at anthesis or sometimes some adherent at the apex; petals 5–8.5 mm long, yellow, fading cream; stamens dimorphic; anthers 0.7–1.4 mm long; style exerted 1.5–5 mm beyond hypanthium; capsules sessile, ovoid to lance-ovoid, 8–20 mm long, 4–5 mm thick, beaked; seeds 1.2–1.5 mm long, tan; $n = 7$. Aspen, sagebrush, and spruce-fir communities, mainly in damp meadows and on streambanks and lake shores, at 1585 to 3325 m in Beaver, Cache, Carbon, Garfield, Iron, Kane, Piute, Rich, Sanpete, Sevier, Summit, Utah, and Wasatch counties; British Columbia and Alberta to California and Nevada; 27 (v).

***Camissonia brevipes* (Gray) Raven** [*Oenothera brevipes* Gray; *Chylismia brevipes* (Gray) Small; *Oe. brevipes* var. *pallidula* Munz; *C. brevipes* ssp. *pallidula* (Munz) Raven]. Annual herbs from taproots; stems simple or branched above, mainly 15–48 (60) cm tall, with leaves mainly near the base; herbage variably spreading-hairy to crisp-puberulent, glabrous, or more or less glandular; leaves petiolate, 1.5–18 cm long, the blades consisting of a terminal, ovate to lanceolate, serrate-dentate lobe 1–7.5 (10) cm long and 0.7–4 (6) cm wide, and with (0) 2 to numerous, much smaller, irregular, lateral lobes along the rachis; flowers few to numerous in bracteate racemes or panicles, open-pollinated, showy; hypanthium prolonged 3–8 mm beyond the ovary; sepals 5–14 mm long, glabrous, puberulent, or with long, spreading hairs; petals yellow, often red-spotted, 8–20 mm long; stamens 8, subequal; anthers 2.5–7 mm long; style exerted 7–15 mm beyond hypanthium; fruits pedicellate, subcylindric, mostly 4–5 cm long, the pedicel 3–12 mm long; seeds in 2 rows per locule, 1–1.5 mm long, not winged; $n = 7$. Creosote bush, Joshua tree, and other warm desert shrub communities at 750 to 1100 m in Kane and Washington counties; Arizona, Nevada, and California; 21 (vi). The specimen from eastern Kane County (Welsh & Neese 21002 BRY) was initially identified as *C. eastwoodiae* (q.v.), but is immediately distinctive because of its copiously long, slender hairs.

***Camissonia chamaeneroides* (Gray) Raven** [*Oenothera chamaeneroides* Gray; *Sphaerostigma chamaeneroides* (Gray) Small]. Annual herbs from taproots; stems simple or branched from near the base, 12–40 cm tall, with the

largest leaves near the base; herbage sparingly stipitate-glandular to crisp-puberulent; leaves petiolate, the blades entire or irregularly toothed, mainly 0.8–6 cm long and 1–17 mm wide, elliptic to lanceolate, tapering to a short or elongate petiole; flowers few to numerous, borne in terminal racemes or panicles, inconspicuous; hypanthium prolonged 1.5–2.3 mm beyond the ovary; sepals 1.5–2.5 mm long, puberulent, spreading-reflexed; petals white, fading pinkish, 1.8–3 mm long; stamens 8, subequal; anthers 0.5–1.1 mm long; style exerted 1–2 mm beyond the hypanthium; capsules sessile, cylindrical, mostly 3–6.5 cm long, ca 1 mm thick, curved; seeds in 1 row per locule, ca 0.9–1 mm long; $n = 7$. Creosote bush, bursage, Joshua tree, other warm desert shrub, sagebrush, and pinyon-juniper communities at 820 to 1375 m in Kane, Tooele, and Washington counties; California east to Texas, south to Mexico; 10 (ii).

Camissonia claviformis (Torr. & Frem.) Raven [*Oenothera claviformis* Torr. & Frem. in Frem.; *Oe. scapoidea* var. *claviformis* (Torr. & Frem.) Wats.; *Chylisma claviformis* (Torr. & Frem.) Heller]. Annual herbs from taproots; stems simple or branching from near the base, mainly 7–40 cm tall, with leaves basal or near the base; herbage scabrid-puberulent, puberulent, or sessile-glandular; leaves petiolate, the blades consisting of a terminal, ovate to lanceolate or elliptic, serrate to serrate-dentate lobe 1–5.5 cm long and 3–28 mm wide and (0) few to numerous, irregular, lateral, much smaller segments; flowers few to numerous in nodding, terminal racemes, conspicuous; hypanthium 5–7 mm long; sepals 4–6 mm long, reflexed-spreading, some often adherent apically; petals white, fading cream or pink, 5–7 mm long; stamens subequal; anthers 2.5–5 mm long; fruit with pedicels 4–16 mm long, the capsules subcylindric to subclavate, 12–25 mm long; seeds in 2 rows per locule, 1–1.5 mm long, not winged; $n = 7$. Two rather distinctive varieties occur in Utah.

1. Lateral leaflets lacking or few and small; leaves in a definite basal rosette; plants of Beaver and Millard counties *C. claviformis* var. *purpureus*
- Lateral leaflets usually present and conspicuous; leaves cauline in the lower 1/4–1/2 of the stem; plants of Washington County *C. claviformis* var. *claviformis*

Var. *claviformis* Salt desert shrub and creosote bush-Joshua tree communities at 750 to 1220 m in Washington County; Arizona, Nevada, and California; 5 (iii).

Var. *purpurascens* (Wats.) Cronq. [*Oenothera scapoidea* var. *purpurascens* Wats.; *C. claviformis* ssp. *integrrior* (Raven) Raven; *Oe. claviformis* ssp. *integrrior* Raven]. Shadscale, ricegrass, winterfat, galleta, and rabbitbrush communities at 1555 to 1710 m in Beaver and Millard counties; Nevada and California; 11 (i).

Camissonia eastwoodiae (Munz) Raven [*Oenothera scapoidea* var. *eastwoodiae* Munz; *Oenothera eastwoodiae* (Munz) Raven]. Annual herbs from taproots; stems simple or branched from near the base, mainly 6–40 cm tall, with leaves in the lower quarter; herbage glabrous or less commonly puberulent or glandular; leaves petiolate, the blade simple, entire or irregularly toothed, 0.8–7 cm long, 0.6–4 cm wide; flowers numerous in terminal, nodding racemes, conspicuous; hypanthium 3.5–9 mm long; sepals 4–9 mm long, spreading-reflexed, some often adherent apically; petals yellow, spotted red, fading cream,

5.5–15 mm long; stamens dimorphic, the longer ones 1.5–2 mm longer than the others; pedicels slender, 4–20 mm long or more; capsules 1.8–4 cm long, subcylindric, usually curved; seeds in 2 rows per locule, 1.2–1.7 mm long, tan; $n = 7$. Mat-saltbush, shadscale, blackbrush, and juniper communities at 1190 to 1800 m in Carbon, Emery, Garfield, Grand, Kane, San Juan, and Wayne counties; Colorado and Arizona (at Lee's Ferry); a Colorado Plateau endemic; 51 (vii). Plants of this species occur mainly on the Bluegate and Tununk members of the Mancos Shale Formation and on the Tropic Shale (Tununk equivalent?), but are also present on other strata in the vicinity.

Camissonia gouldii Raven [*Oenothera gouldii* (Raven) Welsh & Atwood]. Annual, caulescent herbs from taproots; stems simple or branched from near the base, mainly 6–20 cm tall; herbage glandular-hairy throughout; leaves petiolate, the blade mostly 1–1.5 cm long and 0.5–1 cm wide, elliptic to almost rhombic, usually denticulate; flowers (self pollinated) few to many in terminal, nodding spikes, inconspicuous; hypanthium 1.5–3 mm long; sepals 1–1.5 mm long; petals white, fading pink, 1.5–3 mm long; stamens subequal; anthers 0.4–0.9 mm long; style exerted 1.5–2.5 mm beyond the hypanthium; capsules sessile, 8–12 mm long; seeds in 1 row per locule, ca 1 mm long, smooth. Volcanic ash at 1068 m, with *Phacelia palmeri*, in Washington (type from N of St. George) County; Arizona: 2 (0). This plant is allied to *C. boothii* var. *villosa* (q.v.).

Camissonia minor (A. Nels.) Raven [*Oenothera alyssoides* var. *minutiflora* Wats., type from Stansbury Island; *Sphaerostigma minor* A. Nels.; *Oe. minor* (A. Nels.) Munz]. Annual, caulescent herbs from taproots; stems 2–28 cm tall, usually branched from near the base, 4–20 cm broad, the largest leaves at the base; herbage strigulose to crisp-puberulent, often more or less glandular upward; leaves 0.5–4.8 cm long, 0.2–1.5 cm wide, lanceolate to elliptic or oblanceolate, petiolate; flowers few to many, borne singly in axils of foliose bracts from near the stem base and upward; hypanthium 0.5–1.9 mm long; sepals 0.8–1.8 mm long, reflexed; petals white, drying pink, 0.8–1.5 mm long; stamens subequal, the anthers 0.4–0.8 mm long; style exerted 0.5–1.5 mm beyond the hypanthium; capsule sessile, contorted, 8–25 mm long, subcylindric to tapering; seeds 1.1–1.2 mm long, gray; $n = 7$. Sagebrush, winterfat, rabbitbrush, shadscale, greasewood, and mixed grass communities at 1430 to 1985 m in Beaver, Box Elder, Carbon, Emery, Juab, Millard, Salt Lake, Sanpete, Sevier, Tooele, Uintah, and Utah counties; Washington to Wyoming, south to California and Nevada; 11 (ii).

Camissonia multijuga (Wats.) Raven [*Oenothera multijuga* Wats., type from near Kanab?]. Annual, subscapose herbs from taproots and basal rosettes; stems mainly 1–12 dm tall, nearly leafless above the rosette; herbage villous-pilose to puberulent, becoming glabrous or glandular upward; leaves 4–30 cm long, the blades oblanceolate in outline, sometimes purple-dotted, commonly pinnate-pinnatifid into few to numerous lateral segments (or these lacking in depauperate plants), the terminal segments 1–6 cm long, 0.8–4 cm wide, petiolate; flowers numerous, borne in minutely bracteate panicles; hypanthium 1–3 mm long; sepals 3–8 mm long, spreading to deflexed at anthesis, the tips often adherent; petals yellow to cream, fading cream or purplish, 4–14

mm long; stamens dimorphic, the shorter ones surpassed by 1–1.5 mm; anthers 2–4 mm long; style surpassing the hypanthium by 3.5–8 mm; capsules pedicellate, 10–50 mm long, 1.3–2 mm thick, straight to gently curved; pedicels 7–20 mm long; $n = 7$. Creosote bush, bursage, Joshua tree, shadscale, mesquite, blackbrush, sagebrush, live oak-cliffrose, and juniper communities at 730 to 1285 m in Kane (?) and Washington counties; Arizona and Nevada; 25 (ii).

Camissonia parryi (Wats.) Raven [*Oenothera parryi* Wats. type from near St. George; *Oe. tenuissima* Jones, type from Rockville]. Caulescent, annual herbs from taproots; stems mainly 5–40 cm tall, leafy mainly below the middle; herbage sparingly to densely pilose with straight or contorted hairs mainly 0.5–2.3 mm long; leaves petiole, the blades simple (or less commonly with minute lateral segments also), 0.8–5 cm long, 0.6–3.5 cm wide, ovate to elliptic or oblanceolate to lanceolate; flowers numerous in terminal and lateral, bracteate panicles; hypanthium 0.5–2 mm long; sepals 1.5–4 mm long, reflexed or spreading; petals bright yellow, often red-spotted, fading yellow or rose; stamens dimorphic, the longer ones surpassing the others by 0.5–1 mm or more; anthers 0.9–1.2 mm long; style surpassing the hypanthium by 3–4 mm; capsules 4–10 mm long, subcylindric, straight or curved; seeds in 1 row per locule, 0.7–1.2 mm long; $n = 7$. Creosote bush, shadscale, mesquite, bursage, and other warm-desert shrub communities at 730 to 1100 m in Washington County; Arizona; a Virgin-Mohave endemic; 16 (i).

Camissonia parvula (Nutt.) Raven [*Oenothera parvula* Nutt. ex T. & G.]. Diminutive, caulescent, annual herbs from taproots; stems 1–18 cm tall, simple or branched from near the base, the lower branches often subopposite, leafy mainly above the base; herbage strigose to sparingly hirtellous or subglabrous; leaves linear, the lowermost subopposite, mainly 5–30 mm long, 0.4–1.2 mm wide, involute, essentially entire; flowers few to many, borne singly in bract or leaf axils from above the middle of the stem; hypanthium 0.8–1.5 mm long; sepals 1–2.5 mm long; petals yellow, 2.5–4.3 mm long; stamens dimorphic, the longer ones somewhat surpassing the others; style exerted ca 1–2 mm beyond the hypanthium; capsules 1.5–3 cm long, 1 mm thick or less; seeds in 1 row per locule, 0.7–0.9 mm long, brown; $n = 7$. Shadscale, rabbitbrush, sagebrush, pinyon-juniper, and lodgepole pine communities at 1280 to 2745 m in Beaver, Duchesne, Garfield, Kane, Tooele, Uintah, and Washington counties; Washington to Wyoming, south to California, Nevada, and Colorado; 26 (iii).

Camissonia pterosperma (Wats.) Raven [*Oenothera pterosperma* Wats.]. Annual, caulescent herbs from taproots; stems erect, typically branched from near the base, 1–15 cm tall; herbage hirsute-hirtellous to subglabrous, becoming glandular above; leaves scattered along the stem, the lower ones opposite or nearly so, short-petiole, 3–15 mm long, 1–5 mm wide, obovate to elliptic or lanceolate, entire; flowers opening during the day, few to many, solitary in leaf axils; hypanthium 1–4 mm long; sepals 1.5–2.5 mm long, reflexed at anthesis; petals 1.5–3 mm long; stamens 8, the longer ones surpassing the others by 0.5–0.7 mm; style surpassing the hypanthium by 2–3 mm; anthers 0.3–0.4 mm long; capsules pedicellate, 12–18 mm long, curved-ascending; pedicels 4–9 mm long; seeds in 1 row per locule, 1–1.5 mm long, with a pair

of broad, thick wings marginally; $n = 7$. Mixed shrub and pinyon-juniper communities at 1220 to 1830 m in Kane, Millard, Tooele, Uintah, and Washington counties; Arizona, Nevada, and California; 5 (0).

Camissonia pusilla Raven Annual, caulescent herbs from a taproot; stems 2–15 (22) cm tall, simple or typically branched from the base, with leaves mainly clustered near the base; herbage spreading-hairy below, becoming glandular to almost glabrous above; leaves 1–3 cm long, 0.4–1.8 mm wide, linear, entire or irregularly serrate-serrulate; flowers few to many, sessile or short-pedicellate in axils of bracteate leaves; hypanthium 0.8–1.5 mm long; sepals 1.2–2.5 mm long, separately reflexed at anthesis; petals yellow, often fading orange to lavender, 1.5–3.5 mm long, commonly red-spotted near the base; stamens 8, dimorphic, the longer ones surpassing the others by ca 1 mm; anthers 0.3–0.5 mm long; style exerted 1–2 mm beyond the hypanthium; capsules sessile or with pedicels to 2 (4) mm long, 1.8–4 cm long, 0.6–0.9 mm thick; seeds in 1 row per locule, 0.7–0.8 mm long, shining, brown; $n = 7$. Mixed desert shrub, sagebrush, and mountain brush communities at ca 1220 to 1830 m in Beaver, Iron, and Washington counties; Washington and Idaho, south to California and Nevada; 3 (0).

Camissonia refracta (Wats.) Raven [*Oenothera refracta* Wats.]. Annual, caulescent herbs from taproots; stems typically 6–30 (45) cm tall, soon branched from near the base and 6–30 cm broad or more, the branches curved-ascending; herbage more or less strigose to stipitate-glandular or glabrous; leaves basally disposed initially, finally mainly along the stem, the lower ones commonly withered and fallen by anthesis, mostly 1–6 cm long, 1–8 mm wide, narrowly elliptic to lance-linear, weakly and irregularly denticulate, the basal ones petiole; flowers several to numerous, aggregated in terminal, nodding, bracteate spikes or panicles, sessile or nearly so (the slender ovary simulating a pedicel), opening in afternoon (?); hypanthium 4–6.5 mm long; sepals 3–6 mm long, reflexed to spreading at anthesis; petals white, fading cream to yellow or pinkish, 3.5–8 mm long; stamens 8, subequal; anthers 1.5–2.5 mm long; style exerted 3–8 mm beyond the hypanthium; capsules sessile or nearly so, 2–5 cm long, 0.7–1 mm thick, straight or contorted, ascending to reflexed; seeds in 1 row per locule, 1–1.5 mm long; $n = 7$. Creosote bush and other warm desert shrub communities at 670 to 950 m in Washington County; Nevada, California, and Arizona; 4 (ii).

Camissonia scapoidea (T. & G.) Raven [*Oenothera scapoidea* T. & G.; *Chylisma scapoidea* var. *seorsa* A. Nels.]. Annual herbs from taproots; stems mainly 3–30 (45) cm tall, simple or branched from near the base, with main foliage leaves in lower portion; herbage glabrous, strigose, puberulent, or sparingly glandular; leaves petiole, the blades simple (or less commonly with few to many, small, lateral segments), 1–6 cm long, 4–35 mm wide, lanceolate, ovate, or elliptic, entire to denticulate; flowers several to many, aggregated in terminal, minutely bracteate, nodding racemes; hypanthium 1–4.5 mm long; sepals 1.2–5 mm long, reflexed at anthesis; petals yellow, often red-spotted near the base, 2–5.5 mm long; stamens 8, dimorphic, the longer usually surpassing the shorter by 1–2 mm; anthers 0.5–2.5 mm long; pedicels ascending to deflexed, 5–20 mm long; capsules 10–30 (40) mm long, 1.8–3 mm thick; seeds in 2 rows per locule, 1–2 mm long, not winged; $n = 7$, 14. Two rather distinctive varieties are present in Utah.

1. Leaves with several prominent lateral segments, borne in a loose basal rosette; plants mainly of southwestern Utah *C. scapoidea* var. *utahensis*
- Leaves usually lacking lateral segments but, if so, these small and inconspicuous; plants of broad distribution, but evidently missing from southwestern Utah *C. scapoidea* var. *scapoidea*

Var. *scapoidea* [*Oenothera scapoidea* ssp. *brachycarpa* Raven; *C. scapoidea* ssp. *brachycarpa* (Raven) Raven]. Mixed salt and cool desert shrub and pinyon-juniper communities at 1310 to 1985 m in Box Elder, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Juab, Kane, Millard, Sanpete, Sevier, Tooele, Uintah, and Wayne counties; Oregon to Wyoming, south to Nevada, Arizona, and New Mexico; 73 (ix)

Var. *utahensis* (Raven) Welsh [*Oenothera scapoidea* ssp. *utahensis* Raven, type from Black Rock; *C. scapoidea* ssp. *utahensis* (Raven) Raven Brittonia 16: 282. 1964]. Mixed desert shrub communities at ca 1525 to 1944 m in Beaver, Juab, Millard, Salt Lake, and Sevier counties; Nevada, Oregon, and Idaho; 7 (iii). This phase of the species has been mistaken for various other species, especially *C. multijuga*, from which it differs in the type of pubescence, thicker capsules, and usually longer hypanthium.

Camissonia subcaulis (Pursh) Raven [*Jussiaea subcaulis* Pursh; *Taraxia subcaulis* (Pursh) Rydb.; *Oenothera subcaulis* (Pursh) Garrett; *Oe. heteranthera* Nutt. var. *taraxifolia* Wats.; *Oe. subcaulis* var. *taraxifolia* (Wats.) Jepson]. Perennial, acaulescent herbs from thick taproots and a simple (or branched) caudex; herbage glabrous or the leaves merely puberulent; leaves all basal, 2–16 (20) cm long, 3–35 (50) mm wide, the blade entire or irregularly and sparingly lobed near the base; flowers opening in morning, sessile in leaf axils, numerous, clustered; ovary apex prolonged into a slender tube 1.5–3 mm long below the hypanthium proper—this 1.5–3 mm long; sepals 6–15 mm long, reflexed at anthesis, separate; petals 7–15 mm long, yellow, fading yellowish or cream; stamens dimorphic; anthers 1–2.5 mm long; style exerted 2–7 mm beyond the hypanthium; capsules sessile, ovoid to lance-ovoid, 10–25 mm long, 5–7 mm thick, beaked; seeds 1.3–1.9 mm long; $n = 7$. Sagebrush, aspen, and grass-sedge communities at 2070 to 2850 m in Cache, Carbon (?), Duchesne, Emery, Salt Lake, Sanpete, Summit, Utah, and Wasatch counties; Washington to Montana, south to California, Nevada, and Colorado; 21 (i).

Camissonia walkeri (A. Nels.) Raven [*Oenothera brevipes* var. *parviflora* Wats., type from near St. George, not *Oe. parviflora* L.; *Chylisma walkeri* A. Nels.; *Oe. walkeri* (A. Nels.) Raven; *Oe. scapoidea* var. *tortilis* Jepson; *C. walkeri* ssp. *tortilis* (Jepson) Raven; *Oe. multijuga* var. *orientalis* Munz, type from near Moab]. Annual or winter annual, subscauose herbs from taproots and a basal rosette; stems 0.8–7.5 dm tall, nearly leafless above the rosette; herbage typically spreading hairy, at least below, the hairs, when present, mainly 0.5–1.5 mm long, and/or more or less glandular puberulent; leaves 2–22 cm long, the blades oblanceolate to elliptic or ovate in outline, often purple-dotted, commonly pinnate-pinnatifid into few to numerous lateral segments, the terminal segment 1–5 cm long, 1–3 cm wide, petiolate; flowers numerous, borne in minutely bracteate panicles; hypanthium 0.5–2 mm long; sepals 1.2–4 (5) mm long, reflexed at anthesis;

petals 1.2–5 (6) mm long, yellow, fading pinkish to lavender; stamens 8, dimorphic, the longer ones surpassing the others by ca 1 mm; anthers 0.5–1.5 mm long; style exceeding the hypanthium by 1–3 mm; capsules pedicellate, 12–30 (40) mm long, mostly 1.2–1.8 mm thick, straight to gently curved; pedicels 4–20 mm long; $n = 7$, 14. Blackbrush, rabbitbrush, matchweed, shadscale and pinyon-juniper communities at 1125 to 1770 m in Beaver, Box Elder, Emery, Garfield, Grand, Juab, Kane, Millard, San Juan, Tooele, Uintah, Washington, and Wayne counties; Colorado, Nevada, Arizona, and California; 48 (xii). Recognition of infraspecific taxa seems not to be warranted.

Circaea L.

Perennial herbs from rhizomes, stolons, or tubers; leaves opposite, petioled; flowers irregular, inconspicuous, borne in terminal racemes or panicles; hypanthium prolonged somewhat beyond the ovary; sepals 2, reflexed; petals 2, emarginate; stamens 2, alternate with the petals; ovary 1- or 2-loculed, the ovules 1 per locule; fruit indehiscent, pubescent with hooked or straight hairs.

Munz, P. A. 1965. *Circaea*. N. Amer. Fl. II. 5: 24–25.

Circaea alpina L. Enchanter's Nightshade. Plants mostly 0.5–5.5 dm tall; stems simple or branched; leaves petiolate, the blades 1–7 (9.5) cm long, 0.8–5.7 cm wide, ovate to cordate or suborbicular, the base cordate to truncate or rounded basally, acute to acuminate apically, irregularly serrate-dentate to subentire; racemes few to many-flowered, the pedicels subtended by minute bracts; sepals 1–2 mm long, white to pinkish, or greenish at the apex; petals 1–2 mm long, white to pinkish, notched to near the middle; fruit obovoid, 1-loculed, 1–2 mm long, clothed with usually uncinoid hairs; $2n = 22$, 24. Mountain brush, white fir–Douglas fir, and aspen communities at 1890 to 2350 m in Box Elder, Cache, Davis, Duchesne (?), Juab, Salt Lake, Tooele, Uintah, Utah, and Weber counties; widespread in North America; 18 (ii). Our material belongs to var. *pacifica* (Asch. & Mag.) Jones [*C. pacifica* Asch. & Mag.].

Clarkia Pursh

Annual herbs; leaves simple, alternate or the lower ones opposite; flowers few to several, borne singly in axils of more or less foliose bracts; hypanthium shortly prolonged beyond the ovary, deciduous after anthesis; sepals 4, spreading or reflexed at anthesis; petals 4, usually brightly colored; stamens 8 (or 4); anthers basifixed; stigma 4-lobed, capsule elongate.

Clarkia rhomboidea Dougl. Broad-leaved Clarkia. Plants mainly 1.5–5 (10) dm tall, simple or branched above; herbage puberulent to subglabrous; leaves petiolate, the blade 1.2–6 cm long, 0.4–3.2 cm wide, ovate, ovate-lanceolate, or elliptic, obtuse to acute apically, acute basally; flowers short-pedicellate, borne in nodding, bracteate, terminal, spicate racemes; hypanthium 1–3 mm long; sepals 5–9 mm long, lanceolate, green or purplish; petals 6–12 mm long, pink purple (or white); stamens 8, 1–4 mm long, often curved at anthesis; fruit 1–3 cm long, 4-angled, straight or curved. Mountain brush communities at 1585 to 2475 m in Box Elder, Cache, Davis, Salt Lake, Utah, Wasatch, and Weber

counties; Washington and Idaho, south to California and Arizona; 11 (0).

Epilobium L.

Perennial, or less commonly, annual herbs from rhizomes, stolons, bulblike offsets (turions), and taproots or fibrous roots; stems decumbent to ascending or erect; leaves all opposite, the upper ones alternate, or all alternate (or rarely whorled), simple, entire to toothed; flowers perfect, regular or nearly so, solitary in leaf axils or in terminal racemes; hypanthium short or lacking; sepals 4; petals 4, entire or emarginate; stamens 8; stigma capitate, cylindrical, or 4-lobed; fruit a loculicidal, 4-carpellate, 4-loculed, elongate capsule; seeds with a tuft of hair. Note: This genus is considered to be taxonomically complex, partly due to hybridization within the section *Epilobium*, and partly due to its circumboreal distribution, wherein different interpretations are the result of poor typification of ancient collections and poor descriptions that tend to be inclusive, but not exclusive.

- 1. Plants annual from taproots, growing in dryish sites *E. brachycarpum*
- Plants perennial from rhizomes, stolons, turions, or fibrous roots 2
- 2(1). Petals (8) 10–30 mm long, rounded apically, spreading; hypanthium not extending beyond the ovary (the calyx cleft to the apex of the ovary); stigma 4-lobed (Chamaenerion, the fireweeds) 3
- Petals 2–10 mm long, emarginate apically; hypanthium produced beyond the ovary (*Epilobium*, the willowherbs) 4
- 3(2). Plants erect; style pubescent at the base; floral bracts much reduced; herbage glabrous or nearly so; inflorescence with usually more than 15 flowers; plants widespread *E. angustifolium*
- Plants decumbent; styles glabrous; floral bracts foliose; herbage usually minutely pubescent; inflorescence with usually fewer than 10 flowers; plants of Salt Lake and Summit counties *E. latifolium*
- 4(2). Stigma 4-lobed, plants of arid sites *E. nevadense*
- Stigma not 4-lobed; plants often of moist sites 5
- 5(4). Plants often grayish-hairy, at least in the inflorescence, producing slender stolons ending in turions; leaves linear to narrowly lanceolate 6
- Plants glabrous to glandular, but if hairy, not grayish, with or without stolons and/or turions; leaves typically lanceolate or broader, rarely some of them linear 7
- 6(5). Upper leaf surface glabrous or nearly so; plants not definitely known from Utah, but to be expected in the Uinta Mts *E. palustre* L.
- Upper leaf surface finely pubescent *E. leptophyllum*
- 7(5). Plants producing bulblike offsets (turions) at the base of the stem, the fleshy, overlapping scales often persistent at the base of the current stem 8
- Plants arising from short to elongate rhizomes or stolons, or neither, not producing turions 10
- 8(7). Petals 5–10 mm long; stems coarse, simple or with erect-ascending branches from near the apex *E. glandulosum*
- Petals mostly 2–5 mm long; stems typically slender, simple or branching from near the base 9
- 9(8). Leaves mostly sessile and clasping; fruit sessile or short-pedicellate, the pedicels to 5 (8) mm long *E. saximontanum*

- Leaves sessile or petiolate, but the blades not clasping; fruit with pedicels 5–10 mm long or more *E. halleanum*
- 10(7). Plants often more than 3 dm tall, from leafy, overwintering basal rosettes, not with stolons or rhizomes; leaves often denticulate; seeds minutely striate-roughened (use 10–30 x) *E. ciliatum*
- Plants mostly less than 3 dm tall, either soboliferous or subrhizomatous, or the stems borne at the summit of a root-crown; seeds variously roughened but typically not striate 11
- 11(10). Stems glabrous and glaucous, at least below the inflorescence *E. glaberrimum*
- Stems pubescent in lines or generally 12
- 12(11). Leaves sessile, steeply ascending, at least the upper oblong to linear; plants not definitely known from Utah, but to be sought in the Uinta Mts *E. oregonense* Hausskn.
- Leaves various, sessile or petiolate, spreading-ascending or spreading, lanceolate to ovate 13
- 13(12). Plants typically 2–4 dm tall, the stems straight; capsules typically 4–7 cm long *E. hornemannii*
- Plants typically 0.3–2 dm tall, the stems often S-shaped; capsules typically 1.5–4 cm long *E. alpinum*

Epilobium alpinum L. Alpine Willowherb. Stems often S-shaped, 1–20 (25) cm long, arising from short rhizomes or stolons, lacking turions, puberulent in lines or sometimes generally, or somewhat glandular upward; leaves sessile or short-petiolate, 4–30 mm long, ovate to obovate, lanceolate, oblanceolate, or elliptic, entire or obscurely toothed; flowers few to several in terminal, bracteate, nodding to erect racemes; pedicels 2–10 mm long; hypanthium very short; sepals 2, 2–4 mm long, commonly purplish; petals 3.5–6 mm long; capsules 1.5–3.2 cm long, 0.8–2 mm wide; seeds 0.7–2 mm long, the coma white; 2n = 36. The approach to the *alpinum* complex by C. L. Hitchcock in his summary review of the plants in the Pacific Northwest, in which *anagallidifolium*, *clavatum*, *hornemannii*, and *lactiflorum* are regarded as varieties of an inclusive *E. alpinum*, has considerable merit. The subunits are closely allied, a fact noted in my summary revision of the Alaskan flora, where Hitchcock was followed. The present treatment represents a compromise between the views of Hitchcock and traditionalists, who still recognize the four taxa at specific rank. The complex, as treated herein consists of two species, *E. alpinum* and *E. hornemannii*, each with two varieties.

- 1. Capsules linear, mainly 0.8–1.2 mm wide; inflorescence nodding in bud; leaves lanceolate to elliptic or oblong; seeds smooth, ca 1 mm long *E. alpinum* var. *alpinum*
- Capsules clavate, mainly 1.5–2 mm wide; inflorescence often erect in bud; seeds roughened, ca 1.5–2 mm long; leaves ovate, more or less serrulate *E. alpinum* var. *clavatum*

Var. *alpinum* [*E. anagallidifolium* Lam.]. Lodgepole pine, spruce-fir, grass-sedge, and alpine tundra communities at 2055 to 3390 m in Box Elder, Duchesne, Juab, and Summit counties; widespread in North America; circumboreal; 8 (ii). The original description of *E. alpinum* by Linnaeus is sufficiently broad as to include not only this portion of the complex but others as well. I follow recent tradition in restricting the concept of this species

to include what has been called *E. anagallidifolium* Lam. Stipulations of the International Code of Botanical Nomenclature allow for typification of a name, even where the concept is based on discordant elements, when at least some portion is included within the concept. There does not seem to be any obstacle to using the name to include the traditionally accepted portion of the species complex.

Var. *clavatum* (Trel.) C. L. Hitchc. [*E. clavatum* Trel.]. Lodgepole pine, spruce-fir, and alpine tundra communities at 2680 to 3355 m in Box Elder, Cache, Duchesne, Salt Lake, Sanpete, Summit, Uintah, Utah, and Wasatch counties; Alaska to Northwest Territories, south to California and Nevada; Eurasia; 20 (0).

***Epilobium angustifolium* L.** Fireweed. Plants mostly (3) 5–20 dm tall, arising from rhizomelike roots that bear buds freely; stems often purplish, at least above, basally decumbent to erect, usually simple (less commonly branched), glabrous below, commonly puberulent above; leaves alternate, lanceolate to elliptic (or linear), 5–20 cm long, 0.5–4 cm broad, entire or nearly so, sessile or subsessile, glabrous or pubescent only along the lower midvein; sepals 7.5–17 mm long, puberulent; petals 8–20 mm long, pink purple, pink, or rarely white; styles longer than the stamens, pubescent near the base; stigma 4-lobed; capsules 8–9 cm long, pubescent; seeds 1–1.5 mm long, the hair white to dingy; $n = 36$. Sagebrush, mountain brush, Douglas fir, aspen, lodgepole pine, and spruce-fir communities at 1525 to 3620 m in all Utah counties, except Carbon, Daggett, Emery, Kane, Morgan, and Salt Lake; widely distributed in North America; 77 (ix). Most of our material belongs to var. *canescens* Wood [*Chamaenerion angustifolium* var. *abbreviatum* Lunell; *E. angustifolium* var. *abbreviatum* (Lunell) Munz; *C. angustifolium* var. *platyphyllum* Daniels; *E. angustifolium* var. *platyphyllum* (Daniels) Fern.; *E. angustifolium* ssp. *circumvagum* Mosquin].

***Epilobium brachycarpum* Presl** Autumn Willowherb. [*E. paniculatum* Nutt. ex T. & G.; *E. tracyi* Rydb., type from Ogden]. Annual herbs from taproots; stems mostly (2) 3–7 (10) dm tall, simple to much branched; herbage glabrous to glandular-puberulent, the bark often exfoliating; leaves mostly alternate, 0.8–7 cm long, 1–9 mm wide, linear to lance-linear or elliptic, often folded, entire or toothed, spinulose to glandular-subulate, the axils often with clusters of secondary leaves; flowers few to numerous in terminal, bracteate racemes or panicles; pedicels filiform, 5–20 mm long, the bracts often adnate to the petiole base; hypanthium 1–6 mm long; sepals 1–4 mm long; petals white or pink, 3–8 mm long; stigma shortly 4-lobed; capsules 1.3–3 cm long, 1–2.2 mm wide; seeds 1.5–2.5 mm long, the coma caducous; $n = 18$. Sagebrush, pinyon-juniper, mountain brush, ponderosa pine, Douglas fir, and aspen communities at 1525 to 2745 m in all Utah counties, except Box Elder, Carbon, Emery, Grand, San Juan, Wasatch, and Wayne; British Columbia to the Dakotas, south to California, New Mexico, and Mexico; 81 (vii).

***Epilobium ciliatum* Raf.** Northern Willowherb. [*E. watsonii* Barbey in Brewer & Wats.; *E. ciliatum* ssp. *watsonii* (Barbey) Hoch & Raven; *E. americanum* Hausskn.; *E. adenocaulon* ssp. *americanum* (Hausskn.) Love & Love; *E. adenocaulon* Hausskn.; *E. glandulosum* var. *adenocaulon* (Hausskn.) Fern. Perennial (or annual?) herbs from a shallowly subterranean cluster of spreading

roots, lacking rhizomes (but rooting along the stem when buried) and turions; stems mainly 2–12 dm tall, erect, simple or branched, pubescent in lines below the leaf bases, or puberulent almost overall, sometimes grayish canescent, often glandular upward; leaves opposite and some alternate, lanceolate or lance-ovate, serrulate to subentire; flowers numerous, borne in terminal, leafy-bracteate racemes or panicles; hypanthium 0.5–2 mm long; sepals 2–6 mm long, sometimes suffused with red; petals 2–5 mm long, white or pink; capsules 4–10 cm long, 0.9–1.8 mm wide; pedicels 2–20 mm long or more; seeds 0.7–1.2 mm long, longitudinally striate; $n = 18, 36+$. Willow-cottonwood, hanging garden, sagebrush, pinyon, juniper, white fir-Douglas fir, aspen, lodgepole pine, spruce-fir, and grass-sedge communities at 885 to 3050 m in all Utah counties; widespread in North America; Mexico; Central and South America; 206 (xxx). This is the most common species of willowherb in Utah. It is almost ubiquitous along streams, lake margins, irrigation canals, and near seeps and springs. It hybridizes with *E. glaberrimum*, *E. glandulosum*, *E. halleanum*, *E. hornemannii*, *E. leptophyllum*, and *E. saximontanum*, inter alia.

***Epilobium glaberrimum* Barbey** in Brewer & Wats. Barbey Willowherb. Perennial herbs from sobols or short wiry rhizomes, lacking turions; stems 1–6 dm tall; herbage glabrous and glaucous throughout or only sparingly glandular-puberulent in the inflorescence; leaves mostly opposite, 1–7 cm long, lanceolate to ovate, subsessile, clasping, denticulate to entire; flowers few to many in terminal, bracteate racemes; hypanthium 1–2 mm long; sepals 3–7 mm long; petals 3–10 mm long, pink to pink purple or white; capsules 3–7 cm long; pedicels 5–25 mm long; seeds ca 1 mm long, longitudinally finely striate, the coma caducous; $n = 18$. Alpine or subalpine talus, ridges, and stream courses at 2195 to 2745 m in Salt Lake County; northwestern U. S.; 1 (0).

***Epilobium glandulosum* Lehm.** Glandular Willowherb. [*E. ciliatum* ssp. *glandulosum* (Lehm.) Hoch & Raven; *E. brevistylum* Barbey in Brewer & Wats.]. Perennial herbs from taproots or fibrous roots or from short to elongate rhizomes; stems mainly 3–10 dm tall, sometimes purplish, erect, simple or branched above, glabrous below, often glandular above, the pubescence commonly in lines below the leaf bases; leaves mostly opposite, 2.5–10 cm long, 0.5–4 cm wide, narrowly lanceolate to ovate-lanceolate, rounded to subcordate basally, acuminate to acute (the apex usually blunt) apically, serrulate, glabrous or pubescent, sessile and sometimes clasping to short-petiolate; flowers numerous in terminal, bracteate racemes or panicles; sepals 3–5 mm long, glandular-puberulent; petals 3–10 mm long, pink to purplish; capsules 3–7 cm long, usually glandular puberulent; seeds 1–1.8 mm long, raggedly roughened in parallel lines, the coma dingy or white. Streamsides and other moist sites at 1495 to 2440 m in Juab, Kane, Rich, Salt Lake, Tooele, Uintah, and Utah counties; widely distributed in North America; Asia; 8 (0). This entity is perplexingly difficult to distinguish from *E. ciliatum*, but the more conspicuously roughened and mostly larger seeds, and flowers that average larger, seem diagnostic, even when turions (only rarely collected) are not present. The basal part of the stem is often submersed in water or mud and supports numerous adventitious roots along the submersed portion. The species hybridizes with *E. ciliatum*, *E. hornemannii*, and *E. saximontanum*, inter alia.

Epilobium halleanum Hausskn. Plants perennial, the stems typically decumbent basally, otherwise erect and usually straight, arising from turions and short, rhizomatous sobols, mainly 1–3 (5) dm tall, puberulent in lines to subglabrous or glandular upward; leaves mainly opposite, sessile or short-petiolate, 5–40 mm long, 2–10 (15) mm wide, lanceolate to elliptic, oblong, or sublinear, mostly erect; flowers solitary or few to several in bracteate, terminal racemes, these more or less nodding; hypanthium very short; sepals 1.5–3 mm long; petals 3–5 mm long, white, pink, or lavender; pedicels 5–35 mm long; capsules 2–5 cm long; seeds 1–1.5 mm long, minutely roughened, the coma deciduous. Aspen, lodgepole pine, spruce-fir, and sedge-grass communities, often where wet, at 2530 to 3355 m in Beaver, Box Elder, Cache, Daggett, Duchesne, Emery, Grand, Iron, Juab, Morgan, Salt Lake, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, and Weber counties; British Columbia to Saskatchewan, south to California, Nevada, Arizona, Colorado, and South Dakota; 22 (iii).

Epilobium hornemannii Reichenb. Hornemann Willowherb. Stems decumbent basally, otherwise straight or merely curved, arising from rhizomatous sobols, lacking turions, mainly 3–30 cm tall, puberulent in lines or sometimes generally, or somewhat glandular upward; leaves sessile to short-petiolate, 8–40 mm long, ovate to lanceolate or elliptic, entire or serrulate; flowers few to many in terminal, bracteate, nodding to erect racemes; pedicels 3–42 mm long or more; hypanthium very short; sepals 2.2–4 mm long, often purplish; petals 3–8 mm long, pink, pink purple, or white; capsules 2–6 cm long, 1–2 mm wide; seeds 0.9–2 mm long, the coma white to dingy, deciduous; $2n = 36$. Two more or less distinctive varieties are present.

1. Petals white (less commonly pinkish), 2–4 (5) mm long; seeds smooth *E. hornemannii* var. *lactiflorum*
- Petals pink to pink purple (rarely white), 5–8 mm long; seeds more or less roughened *E. hornemannii* var. *hornemannii*

Var. *hornemannii* [*E. nutans* Hornem., not F. W. Schmidt; *E. alpinum* var. *nutans* (Hornem.) Lehm. in Hook.]. Sagebrush, aspen, spruce-fir, lodgepole pine, and sedge-forb communities, mainly in wet areas, at 2500 to 3890 m in Beaver, Cache, Box Elder, Duchesne, Emery, Garfield, Juab, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Wasatch, and Weber counties; widespread in North America; circumboreal; 42 (vi).

Var. *lactiflorum* (Hausskn.) D. Love [*E. lactiflorum* Hausskn.; *E. alpinum* var. *lactiflorum* (Hausskn.) C. L. Hitchc.]. White fir-Douglas fir, aspen, spruce-fir, and sedge-forb communities, mainly in wet areas, at 1890 to 3175 m in Duchesne, Juab, Millard, Summit, Uintah, Utah, and Wasatch counties; widespread in North America; circumboreal; 22 (iii).

Epilobium latifolium L. Dwarf Fireweed. Plant perennial, the stems mostly 1–4 (7) dm long, arising from a caudex, lacking rhizomes, occasionally purplish, decumbent to ascending, glabrous below, puberulent above; leaves opposite (or whorled below), usually alternate above, lanceolate to elliptic or ovate, 1.5–8 cm long, 0.5–3 cm broad, entire or denticulate, sessile or nearly so, glaucous, usually pubescent; sepals 10–18 mm long, puberulent; petals 15–30 mm long, bright pink to pink

purple or rarely white; style shorter than the stamens, glabrous, the stigma 4–lobed; capsules 3–9 (10) cm long, glabrate to pubescent, usually purplish; seeds (1) 1.5–2 mm long, smooth, the hair dingy; $2n = 36, 54, 72$. Lodgepole pine, aspen, and spruce-fir communities, usually on gravel bars along streams, at ca 2285 to 2745 m in Salt Lake and Summit counties; widely distributed in North America; circumboreal; 4 (ii).

Epilobium leptophyllum Raf. Slender Willowherb. [*E. oliganthum* var. *gracile* Farw.]. Perennial herb, the stems erect or bent at the base, arising from rhizomes or stolons, these terminated in late summer by a turion, mainly 4.5–8 (10) dm tall, puberulent overall or glabrous below, the inflorescence sometimes somewhat glandular; leaves mainly opposite, sessile or nearly so, 1–7 cm long, 1–6 mm wide, linear to lance-linear, often with fascicled, axillary leaves, puberulent overall, the lower ones often withered at anthesis; flowers numerous in terminal, bracteate racemes or panicles; hypanthium short; sepals 2–3 mm long; petals 4–6 mm long, white, pink, or lavender; pedicels 3–18 mm long; capsules 3–7 cm long, 1–2 mm thick; seeds 1.3–1.5 mm long, smooth; coma more or less persistent. Cattail-bullrush and sedge-spikerush communities at 1420 to 1830 m in Cache, Duchesne, and Uintah counties; British Columbia to Newfoundland, south to California, Nevada, Kansas, and North Carolina; 3 (0). Differences between this species and *E. palustre* are slight, and it might be best regarded at infraspecific rank within that species. Such a combination is neither intended nor implied herein.

Epilobium nevadense Munz Nevada Willowherb. Perennial, suffrutescent plants from persistent woody branches and a stout taproot; stems 15–40 cm tall, erect or curved-ascending, puberulent to glabrous or glandular upward; leaves mostly alternate, or the lower ones opposite, sessile or short-petiolate, the blades 4–20 (30) mm long, 1–6 mm wide, oblanceolate to elliptic, folded, entire or denticulate, often with fascicled, axillary leaves, puberulent to glabrous, the lower ones often withered at anthesis; flowers few to several in terminal, bracteate, racemes or panicles; hypanthium 2–4.5 mm long; sepals 2–4 mm long, purplish; petals 5–7.5 mm long, pink purple; stigma with 4 broad lobes; pedicels 1–2 mm long; capsules 8–15 mm long; seeds 2–2.5 mm long, the coma deciduous. Mountain brush community at 2135 to 2685 m in Millard and Washington counties; Nevada; a Basin and Range endemic; 5 (0).

Epilobium saximontanum Hausskn. Rocky Mt. Willowherb. [*E. palmeri* Rydb., type from S. Utah]. Perennial herbs from taproots and turions; stems mainly 1–5 dm tall, puberulent to glandular-puberulent upward, or subglabrous; leaves mostly opposite, sessile or short-petiolate and often clasping, the blades 8–55 mm long, 3–16 (25) mm wide, lanceolate to elliptic or lance-ovate, entire or denticulate; flowers few to many in terminal, bracteate racemes; hypanthium short; sepals 1–3 mm long; petals 2–4.5 mm long, white (rarely pink); capsules 2–6 cm long, erect (often appressed to the stem), sessile or the pedicel 1–8 mm long; seeds 1–1.5 mm long, minutely roughened, longitudinally striate; coma deciduous. Sagebrush, mountain brush, willow-cottonwood, white fir, lodgepole pine, and spruce-fir communities at 2075 to 3420 m in Beaver, Box Elder, Cache, Carbon, Daggett, Davis, Duchesne, Emery, Garfield, Grand, Iron, Juab, Millard, Piute, San Juan, Sanpete, Sevier, Summit,

Tooele, Uintah, Wasatch, and Washington counties; Oregon to Alberta and Montana, south to California and New Mexico; disjunctly in eastern Canada, 57 (ix). This species forms hybrids with *E. glandulosum*, *E. halleanum*, *E. ciliatum*, and *E. hornemannii*.

Gaura L.

Annual, biennial, or perennial herbs (sometimes frutescent); leaves mainly cauline, attenuate; flowers numerous, borne in terminal spikes or racemes; hypanthium tubular-funnelform, deciduous at maturity; sepals 4, reflexed at anthesis; petals 4, somewhat disposed to one side (appearing irregular); stamens 8, with a scale at each filament base; ovary 4-loculed, each locule with 1 or 2 ovules; stigma 4-lobed; fruit hard, indehiscent.

- 1. Plants mainly 1.5–3.5 (4.5) dm tall, perennial, clump-forming; flowers modestly showy; known from Cache, Daggett, San Juan, and Washington counties . . . *G. coccinea*
- Plants mainly 5–15 dm tall or more, annual or biennial, not clump-forming; flowers tiny, inconspicuous; broadly distributed *G. parviflora*

Gaura coccinea Pursh Scarlet Gaura. Perennial herbs from a caudex and spreading rootstock; stems clustered, mostly 1.5–4.5 dm tall, strigose to villous or subglabrous; leaves 0.5–5 cm long, 1–7 mm wide, lanceolate to elliptic or oblong to linear, entire or few-toothed; flowers few to numerous in spikes or panicles; bracts 1–5 mm long, more or less persistent; hypanthium 3–11 mm long; sepals 4.5–9 mm long; petals 3–7 mm long, pink to salmon, becoming red orange to maroon in age; anthers 3–5 mm long; fruit 4-angled, 3–8 mm long; seeds usually 3 or 4; n = 14. Creosote bush, Joshua tree, blackbrush, shadscale, juniper, mountain brush, and sagebrush communities at 885 to 1740 m in Cache, Daggett, San Juan, and Washington counties; Alberta to Manitoba, south to California, Arizona, New Mexico, Texas, and Mexico; 24 (iv).

Gaura parviflora Dougl. ex Lehm. in Hook. Willow Gaura. Annual or biennial, tall, plain herbs; stems mainly 5–15 dm tall or more, spreading-hairy and glandular; leaves 2–10 cm long, 2–42 mm wide, elliptic to lanceolate, oblanceolate or oblong, the lower ones often withered at anthesis, the upper ones greatly reduced; flowers numerous in elongate spikes or panicles; bracts 1–5 mm long, caducous; hypanthium 1.5–5 mm long; sepals 2–3.5 mm long; petals 1.5–3 mm long, whitish or pinkish, radially disposed; anthers 0.5–1 mm long; fruit 5–10 mm long, 4-angled; seeds 3 or 4. Moist riparian, riverine, or palustrine communities at 885 to 1955 m in Cache, Duchesne, Emery, Garfield, Grand, Juab, Kane, Millard, Salt Lake, San Juan, Tooele, Uintah, Utah, Washington, Wayne, and Weber counties; Washington to Indiana, south to California, Arizona, Texas, and Louisiana; 33 (iv).

Gayophytum A. L. Juss.

Annual herbs from taproots; stems erect, simple or branched, the cortex often exfoliating; leaves alternate (or the lower subopposite); flowers few to numerous in leafy-bracteate racemes, spikes, or panicles or solitary in leaf axils, opening in morning; sepals 4, reflexed individually or in pairs at anthesis; hypanthium very short; petals 4, white, variously marked with yellow, becoming pink to red in age; stamens 8, dimorphic; anthers versatile;

stigma entire, subglobose or hemispheric; ovary 2-loculed; capsules 4-valved, subsessile or pedicellate. Note: This is a difficult genus, due in part to the existence of diploids, tetraploids, hybrids, and a complacent to overlapping morphology. Often the taxa are poorly marked, and the following arbitrary key is tentative at best.

Cronquist, A. 1984. *Gayophytum*. Intermountain Flora Project, unpublished manuscript.
 Lewis, H. and J. Szwejkowski 1964. The genus *Gayophytum* (Onagraceae). *Brittonia* 16: 343–391.

- 1. Flowers and fruits sessile or the pedicels less than 2 mm long; fruit erect 2
- Flowers and fruits evidently pedicellate, the pedicels more than 2 mm long; fruits erect to deflexed 4
- 2(1). Capsules strongly dorsiventrally compressed, much broader than thick; dorsal and ventral valves of capsule remaining attached to the septum at maturity, the lateral ones free; plants rare *G. humile*
- Capsules quadrangular (and subterete) or somewhat dorsiventrally compressed, seldom much broader than thick; valves of capsule all free from the septum; plants uncommon to common 3
- 3(2). Plants branched only in the lower half; secondary branches few or none; capsules somewhat broader than thick *G. racemosum*
- Plants branched throughout or at least in the upper half; capsules about as broad as thick *G. decipiens*
- 4(1). Petals typically 3–6 mm long, the flowers modestly showy *G. diffusum*
- Petals 0.5–3 mm long, the flowers inconspicuous 5
- 5(4). Capsules 3–6 mm long; pedicels often spreading to reflexed, petals 0.5–1.5 mm long; seeds in 2 rows per locule *G. ramosissimum*
- Capsules 6–12 mm long; pedicels variously oriented; seeds in 1 row per locule 6
- 6(5). Lateral branches separated by 2 or more nodes; first flower borne in the lowermost 1–3 (5) nodes . . . *G. decipiens*
- Lateral branches borne at adjacent nodes or separated by only 1 node; first flower borne commonly 5 or more nodes above the base *G. lasiospermum*

Gayophytum decipiens Lewis & Szwejkowski Plants erect, typically branched, usually with 2 or more nodes between the branches, 5–50 cm tall; stems glabrous or with spreading or appressed hairs; leaves 4–20 (30) mm long, 1–2.5 (4) mm wide, linear or essentially so, sessile or with petioles to 5 mm long; flowers subsessile or the pedicels 0.5–2 mm long, the first one borne 1–3 (5) nodes above the base; petals 1–1.8 mm long; anthers ca 0.2 mm long, usually connivent with the stigma; capsules 6–15 mm long, 0.6–0.8 (1) mm thick, constricted between the seeds, opening by 4 subequal valves free from the septum; pedicels 0.3–3 (5) mm long; seeds 8–25, in 1 row per locule, 0.8–1.8 mm long, dark brown. Sagebrush, mountain brush, pinyon-juniper, and spruce-fir communities at 2255 to 2810 m in Beaver, Cache, Duchesne, Garfield, Salt Lake, San Juan, Sevier, Summit, Uintah, Wasatch, and Washington counties; Washington to Montana, south to California, Arizona, and Colorado; 12 (0).

Gayophytum diffusum T. & G. Plants erect, usually branched, mainly 1–5 dm tall; stems glabrous to strigose, puberulent, or hirtellous; leaves 8–50 mm long, 1–4 mm wide, linear; flowers showy (for the genus), pedicellate,

the lowest ones commonly 5 nodes above the base; sepals 2.5–5 mm long; petals 3–6 mm long; capsules 5–12 mm long, 0.8–1 mm thick, constricted between the seeds; pedicels 3–11 mm long; seeds 3–18, in 1 row per locule, 1–1.6 mm long; $2n = 28$. Sagebrush and mountain brush communities reported in Cache, Juab, Summit, and Utah counties; Washington to Wyoming, south to California and Nevada; 0 (0).

***Gayophytum humile* A. L. Juss.** [*G. nuttallii* T. & G.]. Plants erect, typically branched in the lower half, mainly 5–30 cm tall; stems glabrous or merely glandular; leaves 10–25 mm long, 1–3 mm wide, linear to oblong; flowers sessile or nearly so, the first one borne 1–3 nodes from the base; petals 0.5–1.5 mm long; anthers 0.2–0.3 mm long, connivent with the stigma; capsules 8–17 mm long, 1–2 mm broad, much-flattened, the dorsal and ventral valves twice as wide as the lateral ones and remaining attached to the septum; pedicels less than 0.5 mm long; seeds 24–50, in 1 row per locule, 0.7–1.1 mm long. Reported for Cache County by Albee (unpublished map 1985) and Wasatch County by Cronquist (1984); Washington to Montana, south to California and Wyoming; 0 (0).

***Gayophytum lasiospermum* Greene** [*G. nuttallii* authors, not Hook.; *G. intermedium* Rydb.; *G. diffusum* ssp. *parviflorum* Lewis & Szweykowski]. Plants erect, typically branched, usually at consecutive nodes, mainly 5–50 cm tall; stems glabrous to strigulose, puberulent, or hirtellous; leaves 4–50 mm long, 0.8–4 mm wide, linear lanceolate to linear or oblong; flowers pedicellate, the first borne 5–10 nodes above the base; sepals 0.8–2 mm long; petals 1.5–2.5 mm long; anthers minute; capsules 6–13 mm long, 0.8–1 mm thick, constricted between the seeds, opening by 4 subequal valves free from the septum; pedicels 2–10 mm long, ascending to deflexed; seeds 6–16 in 1 row per locule, 1–1.6 mm long. Sagebrush, mountain brush, ponderosa pine, aspen, and spruce-fir communities at 1765 to 3175 m in all Utah counties, except Box Elder, Iron, Juab, Millard, San Juan, and Wayne; British Columbia to Montana and South Dakota, south to California, Arizona, and New Mexico; Mexico; 48 (xi).

***Gayophytum racemosum* T. & G.** Plants erect, usually branched in the lower half, unbranched above, mainly 5–30 (4) cm tall; stems glabrous or puberulent to hirtellous; leaves 6–25 mm long, 0.8–3 mm wide, linear to narrowly elliptic; flowers subsessile, usually the first borne 1–3 nodes above the base; petals 1.3–1.8 mm long; anthers 0.2–0.3 mm long, connivent with the stigma; capsules 10–15 mm long, 0.8–1.4 mm wide, flattened, splitting into 4 valves free from the septum, the dorsal and ventral valves somewhat broader than the others; pedicels 0.4–2 mm long; seeds 10–34, with 1 row in each locule, 0.8–1 mm long. Sagebrush, pinyon-juniper, ponderosa pine, Douglas fir, aspen, and lodgepole pine communities at 1830 to 3172 m in Beaver, Cache, Daggett, Duchesne, Juab, Millard, Salt Lake, Summit, Uintah, and Utah counties; Washington to Montana, south to California, Nevada, and Colorado; 16 (0).

***Gayophytum ramosissimum* T. & G.** Plants erect, branched usually at every other node; stems glabrous or puberulent; leaves 6–40 mm long, 1–5 mm wide, linear or essentially so; flowers pedicellate, the first ones borne 5–10 or more nodes above the base; petals 0.7–1.5 mm long; anthers connivent with the stigma; capsules 3–6 (9) mm long, ca 1 mm thick, the 4 subequal valves free from

the septum; pedicels (3) 5–12 mm long, ascending to deflexed; seeds 10–30, usually in 2 rows per locule, 1–1.5 mm long. Pinyon-juniper, sagebrush, mountain brush, ponderosa pine, aspen, and lodgepole pine communities at 1735 to 2870 m in probably all Utah counties; Washington to Montana, south to California, Nevada, Arizona, and New Mexico; 76 (iii).

***Oenothera* L.**

Annual, biennial, or more commonly perennial herbs; leaves alternate or basal; flowers typically sessile in leaf or bract axils, fragrant, opening in evening (pollinated by moths); hypanthium much surpassing the ovary, deciduous in fruit; sepals 4, reflexed at anthesis; petals 4, white or yellow, fading pink, lavender, orange, bronze, or purple to brownish; stamens 8, dimorphic or subequal, the anthers versatile; stigma 4-lobed; capsules loculidial; seeds lacking a coma.

Cronquist, A. 1984. *Oenothera*. Intermountain Flora Project. Unpublished manuscript.

- 1. Plants caulescent or essentially so 2
- Plants caulescent 6
- 2(1). Petals white when fresh, fading pink to lavender or purple 3
- Petals yellow when fresh, fading yellow to bronze or pinkish 4
- 3(2). Plants annual; petals less than 2.5 cm long; flowers not fragrant; known from San Juan and Washington counties *Oe. cavernae*
- Plants perennial; petals mostly more than 2.5 cm long; flowers fragrant; widespread *Oe. caespitosa*
- 4(2). Plants annual (or winter annual), occurring in Washington (also in Emery and Kane?) County; capsules ribbed, but hardly winged *Oe. primiveris*
- Plants perennial, seldom of Washington County; capsules winged 5
- 5(4). Leaves pubescent, subtire; capsules broadly winged throughout; petals 3–7 cm long *Oe. howardii*
- Leaves glabrous or essentially so; capsules winged apically or basally, not throughout; petals 1.5–5 cm long *Oe. flava*
- 6(1). Flowers yellow when fresh, fading orange to bronze or purplish 7
- Flowers white or pink when fresh, fading pink to lavender 9
- 7(6). Petals 1–2 cm long; sepals 1–2 cm long; style exerted from hypanthium ca 1.5 cm *Oe. biennis*
- Petals 2.5–5 cm long; sepals 2–4.5 cm long, styles exerted from the hypanthium 2–4 cm 8
- 8(7). Hypanthium 6–12 cm long, plants of southeastern and southern Utah *Oe. longissima*
- Hypanthium 2.5–5 cm long; plants variously distributed *Oe. elata*
- 9(6). Plants annual, biennial, or perennial, from taproots, not or seldom sod-forming, seldom from creeping rootstocks 10
- Plants perennial from creeping rootstocks, sod-forming 12
- 10(9). Leaves strongly dimorphic, the lower ones subtire to merely toothed or lobed, the cauline ones deeply pinnatifid, capsules erect to steeply ascending, with 2 rows of seeds per locule; plants of southeastern Utah *Oe. albicaulis*

- Leaves not strongly dimorphic, all entire or all pinnatifid; capsules variously oriented, with 1 row of seeds per locule; plants of other distribution 11
- 11(10). Leaves commonly subentire; plants of Beaver, Iron (?), and Washington counties *Oe. deltoidea*
- Leaves lobed to pinnatifid; plants of the Uinta Basin *Oe. pallida*
- 12(9). Petals bright pink when fresh and when dried; plants cultivated and escaping *Oe. speciosa*
- Petals white when fresh, fading pink to lavender when dried; plants indigenous 13
- 13(12). Herbage conspicuously pubescent; petals typically 2.5–3.5 cm long; plants of Beaver, Iron, Millard, and Washington counties *Oe. californica*
- Herbage not especially pubescent, petals various; plants of broad or other distribution 14
- 14(13). Petals 1–1.5 (2) cm long; leaves deeply pinnatifid, the lobes and rachis mainly 2.5 mm wide or less; throat of hypanthium with copious, long, white hairs; plants mostly of upper elevations *Oe. coronopifolia*
- Petals typically 1.5–3 cm long; leaves subentire to variously lobed, the lobes and rachis commonly over 3 mm wide; throat of hypanthium glabrous or essentially so; plants of upper to lower elevations . *Oe. pallida*

Oenothera albicaulis Pursh Whitestem Evening-primrose. [*Anogra albicaulis* (Pursh) Britt.]. Annual or winter annual herbs from taproots, mainly 5–25 (30) cm tall; stems simple or branched from the base, not exfoliating; herbage puberulent and sometimes with longer hairs intermixed (especially on the sepals); basal leaves in a rosette, 1–10 cm long, 3–25 mm wide, entire or more or less lobed, but evidently different than the cauline ones, those deeply pinnatifid, both segments and rachis narrow; flowers nodding in bud; hypanthium 1.5–3 cm long; sepals 1.5–2.5 cm long; petals white, fading pink, typically 2–3.5 cm long; anthers 6–10 mm long; style exerted 1.5–2.2 cm beyond the hypanthium; capsules erect-ascending, 2–4 cm long, 3–4 mm thick; seeds ellipsoid, ca 1 mm long. Blackbrush, spiny hopsage, shadscale, galleta-ricegrass, and pinyon-juniper communities at 1250 to 1830 m in Garfield, Grand, Kane, San Juan, and Wayne counties; Montana and South Dakota, south to Arizona, Colorado, Texas, and Mexico; 31 (iv).

Oenothera biennis L. Biennial Evening-primrose. [*Oe. villosa* Thunb.]. Biennial (or annual to perennial) herbs, mainly 3–12 (15) dm tall or more; stems simple or sparingly branched, strigose to hirsute and usually with longer hairs intermixed; basal and lower cauline leaves petiolate, becoming sessile or subsessile upward, mainly 3–20 cm long, 0.6–3.5 cm wide, lanceolate to oblong or oblanceolate, acute to attenuate, entire to undulate or serrate-dentate; flowers few to numerous in terminal, bracteate spikes, self-pollinated; hypanthium 2–4 cm long; sepals 1–2 cm long; petals 1–2 cm long, yellow, often whitish or orange in age; anthers 4–8 cm long; style protruding 0.8–1.5 cm beyond hypanthium; capsules erect-ascending, 1.8–4 cm long, tapering; seeds numerous, in 2 rows per locule, ca 1–1.5 mm long; 2n = 14. Moist, disturbed sites at 1280 to 2350 m in Box Elder, Cache, Daggett, Duchesne, Rich, San Juan, Summit, Uintah, Utah, and Wasatch counties; widespread in the U. S. and Canada; 22 (i).

Oenothera caespitosa Nutt. Morning-lily. Perennial herbs from taproots and simple or branched, sometimes

spreading caudices or rootstocks, acaulescent or rarely with stems to 5 dm long; herbage typically puberulent to villous (especially along leaf margins), glandular, or glabrous; leaves typically in a basal rosette, less commonly along a stem (up to 60 cm long) with elongate internodes, mostly 1.5–20 (30) cm long, 0.5–4 cm wide, petiolate, the blades entire, toothed, lobed, or pinnatifid; flowers solitary in leaf axils, sessile or pedicellate, erect or drooping in bud, opening in evening (pollinated by moths), fragrant; hypanthium 3–14 cm long or more, with nectary glands at the base within; sepals 1.5–5.5 cm long, reflexed at anthesis; petals white, fading white to pink or purplish, 2–6 cm long; anthers 6–15 mm long or more; capsules erect-ascending, 2–5 mm long, woody, tuberculate; seeds numerous, in 2 rows per locule, 2.5–3.5 mm long; 2n = 14. This is a most beautiful species, which occurs throughout Utah, except at highest elevations. The morphology is tremendously variable, and some of that variability is geographically or edaphically correlated. Segregation of the units of variability into taxonomic groups is, however, based on morphologically transitional features. The confluence is sufficiently great that only arbitrary separation is possible in the following key, but at least most of the determinations seem to represent taxa and not mere mechanical separation of similar specimens. The following key will serve to segregate most specimens into the proposed infraspecific taxa.

1. Hypanthium mostly (6) 7–14 cm long or more; petals 3–6 cm long, often white to pink in age 2
- Hypanthium mostly 3–8 cm long; petals 2–4 cm long, often fading pink to purple 3
- 2(1). Leaves merely toothed, at least in large part *Oe. caespitosa* var. *macroglottis*
- Leaves more or less pinnatifid; plants common over much of Utah *Oe. caespitosa* var. *marginata*
- 3(1). Plants glabrous or nearly so, or the leaves puberulent marginally with hairs mainly less than 0.5 mm long *Oe. caespitosa* var. *caespitosa*
- Plants definitely hairy, with hairs mainly 0.5–1 mm long, at least some 4
- 4(3). Plants more or less villous throughout, tending to be colonial, forming dense mats, confluent with the next, mainly of the western half of Utah *Oe. caespitosa* var. *crinita*
- Plants pubescent mainly along leaf margins and on the flowers, seldom colonial or, if so, not forming dense mats, mainly of eastern Utah *Oe. caespitosa* var. *navajoensis*

Var. *caespitosa* [*Oe. montana* Nutt. in T. & G.; *Oe. marginata* var. *purpurea* Wats.; *Pachylophus canescens* Piper]. Cheatgrass, bunchgrass, sagebrush, pinyon-juniper, and mountain brush communities at 1370 to 2015 m in Cache, Daggett, Duchesne, Emery, Juab, Morgan, Sanpete, Sevier, Uintah, and Utah counties; Washington to Saskatchewan, south to Oregon, Nevada, Colorado, and Nebraska; 16 (ii). This taxon is transitional to varieties *marginata* and *navajoensis*.

Var. *crinita* (Rydb.) Munz [*Pachylophus crinitus* Rydb., type from Rabbit Valley; *Oe. caespitosa* var. *jonesii* Munz, type from Fish Springs]. 2n = 14. Shadscale, horsebrush, pinyon-juniper, mountain brush, sagebrush, ponderosa pine, and bristlecone pine communities at 1400 to 2595 m in Beaver, Box Elder, Davis, Garfield,

Iron, Juab, Kane, Millard, Piute, Sevier, Utah, and Wayne counties; Nevada and California; 44 (vi). The type of this variety was taken at its easternmost known locality, immediately adjacent to the known distribution of var. *navajoensis*. Should the type be interpreted as representing that taxon, the varietal names would have to be realigned. Specimens from the Red Canyon vicinity and from similar fine-textured substrates in adjacent Kane County are very densely hairy, and often compactly colonial. They might constitute still another taxon of about equal validity as those recognized herein.

Var. *macroglottis* (Rydb.) Cronq. [*Pachylophus macroglottis* Rydb.; *Oe. caespitosa* ssp. *macroglottis* (Rydb.) W. L. Wagner, Stockhouse, & Klein]. Igneous substrates in pinyon-juniper and mountain brush communities in the La Sal and Abajo mountains of Grand and San Juan counties; Wyoming south to New Mexico; 2 (0).

Var. *marginata* (Nutt.) Munz [*Oe. marginata* Nutt. ex H. & A.]. Galleta, sagebrush, mountain brush, pinyon-juniper, ponderosa pine, and aspen communities at 1310 to 2900 m in Beaver, Box Elder, Cache, Daggett, Davis, Duchesne, Emery, Garfield, Grand, Juab, Kane, Millard, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, Wasatch, Washington, Wayne, and Weber counties; Washington to Wyoming, south to California, Nevada, Arizona, New Mexico, Texas, and Mexico; 94 (iv). This taxon forms the center with which all other phases are involved; it forms intermediates with all of them.

Var. *navajoensis* (W. L. Wagner, Stockhouse, & W. Klein) Cronq. [*Oe. caespitosa* ssp. *navajoensis* W. L. Wagner, Stockhouse, & W. Klein, type from Paria River, Kane Co., Utah]. Shadscale, greasewood, blackbrush, galleta, rabbitbrush, ephedra, sagebrush, pinyon-juniper, and mountain brush communities at 1125 to 2380 m in Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Kane, San Juan, Uintah, and Wayne counties; Colorado, New Mexico, and Arizona; 70 (xvi). Two of the other recognized segregates of *Oe. caespitosa* grow at or near the type locality of var. *navajoensis*; i. e., *crinita* and *marginata*. Distinctive plants of var. *navajoensis* occur mostly to the east of the type locality along the canyons of the Colorado. Plants placed within this variety in the Uinta Basin are often more or less morphologically intermediate to varieties *marginata* and *caespitosa*.

***Oenothera californica* (Wats.) Wats.** Watson Evening-primrose. [*Oe. albicaulis* var. *californica* Wats.; *Oe. pallida* var. *californica* (Wats.) Jepson; *Oe. californica* ssp. *avita* W. Klein, type from near Leeds; *Oe. avita* (W. Klein) W. Klein]. Perennial herbs from spreading rootstocks, acaulescent to strongly caulescent, 5–50 cm tall, simple or branched from near the base; epidermis often exfoliating; herbage puberulent and often with longer spreading hairs intermixed (especially on the calyx); basal rosette developed or not, often withered in caulescent forms; leaves petiolate or sessile upwards, the blades 1.5–12 cm long, 0.4–2 cm wide, irregularly toothed to subentire or pinnatifid; flowers sessile in middle to upper leaf axils, nodding in bud; hypanthium 2–4.5 cm long; sepals 12–25 mm long, reflexed (often in pairs) at anthesis; petals white, drying pink to lavender or white, 2–4 cm long; anthers 7–10 mm long; style extending 1.5–2.5 cm beyond the hypanthium; capsules spreading to spreading-ascending, sessile, 2.5–5 cm long, 2–4 mm thick; seeds in 1 row per locule, 1.5–2.2 mm long. Creosote

bush-joshua tree, blackbrush, other warm desert shrub, mountain brush, sagebrush, pinyon-juniper and ponderosa pine communities at 820 to 2500 m in Beaver, Iron, Millard, and Washington counties; Nevada, California, Arizona, and Mexico; 28 (v).

***Oenothera cavernae* Munz** Munz Evening-primrose. Annual herbs from taproots, acaulescent or essentially so; herbage glandular-pubescent, or with some longer hairs intermixed; leaves all basal, mostly 2–15 cm long, 0.8–2.5 cm wide, oblanceolate in outline, lyrate-pinnatifid, the terminal segment large, usually with numerous, much smaller, lateral segments; flowers sessile, opening in evening, not fragrant; hypanthium prolonged 2–4 cm beyond the capsule; sepals 5–12 mm long, often reflexed in pairs; petals white, fading white or pinkish, 0.6–2.5 cm long; anthers 2–6 mm long; capsules lance-ovoid or ellipsoid, 1.5–3 cm long, tuberculate; seeds in 2 rows per locule, 2.5–3 mm long. Warm desert shrub communities in San Juan and Washington counties (Cronquist 1984); Arizona and Nevada; 0 (0).

***Oenothera coronopifolia* T. & G.** Rootstock Evening-primrose. Perennial herbs from a spreading rootstock, mainly 1–6 dm tall; stems simple or branched at ground level, the epidermis not exfoliating; herbage strigose to puberulent and often with some longer hairs intermixed; leaves mainly cauline, 1–7 cm long, 0.8–1.5 cm wide, deeply pinnatifid and with narrow segments or the lower ones merely toothed or lobed; fascicled axillary leaves often present; flowers solitary in upper axils, nodding in bud; hypanthium 1–2.5 cm long, the throat with long white hairs; sepals 1–2.2 cm long, separately reflexed at anthesis; petals white, fading pink or white, 1–2.2 cm long; anthers 4–7 mm long; style exerted 6–18 mm beyond the hypanthium; fruits erect or erect-ascending, 1–2.5 cm long, 3–5 mm thick; seeds in 2 rows per locule, ca 2 mm long. Sagebrush, mountain brush, pinyon-juniper, ponderosa pine, Douglas fir, lodgepole pine and aspen communities at 2135 to 2810 m in Duchesne, Garfield, Grand, Juab, Millard, Piute, Rich, San Juan, Sevier, Summit, Tooele, Uintah, Wasatch, and Wayne counties; Idaho to South Dakota, south to Arizona and New Mexico; 42 (ii).

***Oenothera deltoides* Torr. & Frem.** Annual Evening-primrose. Annual herbs from taproots, caulescent to subacaulescent; stems 0.5–3.5 dm tall, simple or more commonly branched from the base, the epidermis typically exfoliating, glabrous or short-hairy; leaves mainly cauline, puberulent to glabrous, 2–15 cm long, 3–25 mm wide, the blades oblanceolate to elliptic or oblong, subentire, toothed, or lyrate-pinnatifid, long-petioled below, becoming subsessile upward; flowers sessile in middle to upper leaf axils, tending to nod in bud; hypanthium 2–3.5 cm long; sepals 1–2.5 cm long, reflexed separately at anthesis; petals white, fading white (cream) or pink, 1.5–4 cm long; anthers 5–10 mm long; style exerted 12–25 mm beyond the hypanthium; capsules spreading to spreading-ascending, often curved, sessile, 2–5 cm long, 2–5 mm thick; seeds in 1 row per locule; 1.5–2 mm long. Two varieties are present in southwestern Utah.

1. Leaves green or yellow green, the blades subentire to serrulate-denticulate; plants commonly of low elevation sandy sites *Oe. deltoides* var. *decumbens*
- Leaves gray green, the blades, or some of them, more or less lyrate-pinnatifid; plants mainly of shadscale and pinyon-juniper communities at higher elevations *Oe. deltoides* var. *deltoides*

Var. decumbens (Parry) Munz [*Oe. albicaulis* var. (?) *decumbens* Parry, type from near St. George; *Oe. ambigua* Wats., type from near St. George; *Oe. deltooides* var. *ambigua* (Wats.) Munz; *Oe. deltooides* ssp. *ambigua* (Wats.) W. Klein]. Creosote bush and blackbrush communities, mainly in sand, at 760 to 915 m in Washington County; Nevada and Arizona; 4 (0).

Var. deltooides [*Anogra deltooides* (Torr. & Frem.) Small]. Shadscale and pinyon-juniper communities at ca 1370 to 1560 m in Beaver, Iron (?), and Washington counties; Nevada, Arizona, California, and Mexico; 3 (0).

Oenothera elata H.B.K. Hooker Evening-primrose. [*Oe. hookeri* T. & G.; *Oe. hookeri* var. *angustifolia* Gates, type from S of Thistle, Utah County]. Biennial (rarely perennial) herbs from taproots; stems mainly 3–15 dm tall, simple or branched; herbage hirsute to puberulent or with long hairs intermixed; leaves mainly cauline, the lower ones petiolate, becoming sessile or subsessile upward, 3–30 cm long, 0.5–3.8 cm wide; flowers sessile or subsessile in upper leaf axils, erect or nodding in bud; hypanthium 2.5–5 cm long; sepals (2) 2.5–4 cm long; petals 2.5–4.5 cm long, yellow, fading yellow to orange or purple; anthers 7–12 mm long; style surpassing the hypanthium by 2–3.5 cm; capsules 2–4.5 cm long, erect, 4–6 mm thick; seeds in 2 rows per locule, ca 1.5 mm long. Typically in riparian, riverine, or palustrine sites in sagebrush, rabbitbrush, pinyon-juniper, ponderosa pine, lodgepole pine, aspen, and spruce-fir communities at 1370 to 2840 m in most Utah counties; Washington to Montana, south to Panama; 69 (iv). The flowers are strikingly beautiful, but the plants tend to be coarse and open.

Oenothera flava (A. Nels.) Garrett Yellow Evening-primrose. Perennial acaulescent herbs from a taproot and simple or branched caudex, sometimes spreading by rootstocks; leaves basal, 5–30 cm long, 0.3–6 cm wide, subtire or more commonly toothed or pinnatifid, puberulent to subglabrous; flowers solitary in leaf axils; hypanthium 3–10 cm long or more; sepals 1–4 cm long, reflexed as a unit and with red margins; petals 1–5 cm long, yellow, fading red orange to bronze or pink; capsules 1–3 cm long, evidently winged above the middle, the wings 1–5 mm wide; seeds in 2 rows per locule, 1–2.6 mm long. Two rather distinctive varieties are present.

1. Flowers large and showy, the petals 2.8–5 cm long; plants of Daggett and Uintah counties . . . *Oe. flava* var. *acutissima*

— Flowers smaller, but still more or less showy, the petals 1–3 cm long; plants widespread *Oe. flava* var. *flava*

Var. acutissima (W. L. Wagner) Welsh [*Oe. acutissima* W. L. Wagner, type from Flaming Gorge vicinity]. $n = 7$. Sagebrush, grass-forb, and ponderosa pine communities, often where temporarily moist in spring and early summer, at 1830 to 2380 m in Daggett and Uintah counties; Colorado; 9 (i).

Var. flava [*Lavauxia flava* A. Nels.; *Oe. triloba* var. *ecristata* Jones, type from Kanab]. Palustrine, riparian, and moist meadow habitats in sagebrush, ponderosa pine, aspen, lodgepole pine, and spruce-fir communities at 1250 to 3355 m in Beaver, Cache, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Millard, Piute, San Juan, Sanpete, Sevier, Summit, Wasatch, Washington, and Wayne counties; Washington to Saskatchewan, south to California, Arizona, New Mexico, and Texas; 66 (ix).

Oenothera howardii (A. Nels.) W. L. Wagner Bronze Evening-primrose. [*Lavauxia howardii* A. Nels., type

from Dugway, Utah; *Oe. brachycarpa* (Gray) Britt., misapplied]. Perennial, acaulescent herbs from a taproot and simple or branched caudex; leaves 2–20 cm long, 0.6–3 cm wide, the blades oblanceolate to elliptic, entire or repandly toothed, petiolate; herbage puberulent to glabrous; flowers solitary in leaf axils, large and showy; hypanthium 5–10 cm long or more; sepals 3–7 cm long, usually reflexed as a unit; petals 3–7 cm long, yellow, fading bronze, yellow, maroon, or red; capsules 3–3.5 cm long, 1–2 cm thick, broadly winged; seeds in 1 row per locule (or 2 rowed near the base), mostly 2–5 mm long. Shadscale, other salt-desert shrub, sagebrush, pinyon-juniper, and ponderosa pine communities at 1525 to 2410 m in Beaver, Daggett, Duchesne, Emery, Garfield, Juab, Millard, San Juan, Sevier, Tooele, Uintah, Utah, Washington, and Wayne counties; Nevada, Colorado, and Kansas; 43 (vi).

Oenothera longissima Rydb. Bridges Evening-primrose. Perennial (or biennial) herbs from taproots; stems (2) 4–12 dm tall or more, simple or branched, puberulent and often with longer hairs intermixed; leaves basal and cauline, mostly 2–25 (35) cm long, 0.3–4.5 cm wide, lanceolate to oblanceolate, oblong, or elliptic, entire to undulate-serrate, petiolate or the upper sessile; flowers solitary, sessile, in upper leaf axils; hypanthium 6–12 cm long; sepals 1.4–4.6 (5.5) cm long, reflexed separately, in pairs, or all together at anthesis; petals yellow, fading yellow to purple or orange, 2.5–5 cm long; anthers 9–18 mm long; style protruding 2–5.5 cm beyond the hypanthium; capsules erect, 2–4.5 cm long, 4–7 mm thick; seeds in 2 rows per locule, ca 1–1.5 mm long. Riparian and hanging garden communities at 790 to 1925 m in Garfield, Grand, Kane, San Juan (type from Natural Bridges National Monument), Washington, and Wayne counties; Colorado, Arizona, Nevada, and California; 29 (ix).

Oenothera pallida Lindl. Pale Evening-primrose. [*Anogra pallida* (Lindl.) Britt.; *Oe. pallida* var. *leptophylla* T. & G.; *Oe. albicaulis* var. *runcinata* Engelm.; *Oe. pallida* var. *latifolia* Rydb.; *Oe. trichocalyx* Nutt. in T. & G.; *Oe. pallida* ssp. *trichocalyx* (Nutt.) Munz & W. Klein]. Perennial or annual to biennial herbs from rootstocks or taproots, a caudex often more or less developed; stems mainly 1–7 dm tall, usually with exfoliating epidermis, glabrous or puberulent; leaves 1–8 cm long, 1–20 mm wide, oblanceolate, elliptic, oblong, linear, lanceolate, or ovate, entire, toothed, lobed, or pinnatifid, glabrous to puberulent or villosulose; flowers sessile, solitary in leaf axils, nodding in bud; hypanthium 1.5–3.5 cm long, the mouth lacking hairs within; sepals 7–25 mm long, typically reflexed together or in pairs, puberulent or with spreading, long hairs intermixed; petals white, fading pink to cream or lavender, 1–3 cm long; style exerted 1–2.2 cm beyond the hypanthium; capsules spreading, straight, curved, or S-shaped, 1.5–5 cm long, 1.5–3 mm thick; seeds in 1 row per locule, 1.4–2.2 mm long. Shadscale-greasewood, mixed warm desert shrub, blackbrush, sagebrush-rabbitbrush, pinyon-juniper, mountain brush, and ponderosa pine communities at 1155 to 2505 m in probably all Utah counties; Washington to South Dakota, south to Nevada, Arizona, New Mexico, and Texas; 227 (xxxiv). Our material has received varying treatments in the past several decades. It has been regarded as belonging to *Oe. pallida* and *Oe. trichocalyx*, or when these were combined, as an expanded *Oe. pallida* with two

subspecies. The subspecies *pallida* has been further proposed for segregation into three varieties. Careful examination of our abundant material has not demonstrated consistent diagnostic criteria for segregation of any of the proposed infraspecific categories; either the criteria occur haphazardly, resulting in sympatry of the proposed entities, or the plants cannot be separated except arbitrarily. Some of the plants in the Uinta Basin simulate *Oe. albicaulis* in being annual and having a distinctive basal rosette, but others from the Basin are perennial from spreading rootstocks. Indeed, the phalanx of specimens from the Uinta Basin contains almost every variation found within the specimens from elsewhere in Utah. There does not seem to be any practical way to recognize the annual plants (as ssp. *trichocalyx*), which sometimes have long, spreading hairs on the calyx, without regarding the remainder of the material within the Basin as ssp. *pallida*. Specimens from elsewhere are annual and have long hairy calyces also.

Oenothera primiveris Gray Early Evening-primrose. [*Oe. johnsonii* Parry, type from near St. George]. Annual or winter annual herbs from taproots, acaulescent or essentially so; herbage with spreading, long, white hairs produced above a shorter layer of hairs; leaves 2–15 cm long (or more), 0.4–4 cm wide, oblanceolate in outline, petiolate, the blades entire to deeply once or twice pinnatifid; flowers solitary, sessile in leaf axils, erect in bud; hypanthium 4–8 cm long; sepals 20–32 mm long, reflexed separately, in pairs, or wholly at anthesis; petals yellow, fading yellow or pink to purplish, 2–4 cm long; anthers 7–10 mm long; style exserted 1.5–2.5 cm beyond the hypanthium; capsules 2–4.5 cm long; seeds in 2 rows per locule, 2.5–3 mm long; $2n = 14$. Joshua tree, creosote bush, blackbrush, and pinyon-juniper communities at 750 to 1500 m in Emery (?), Kane (?), and Washington counties; New Mexico and Texas to California and Mexico; 18 (v). Our material has been designated as var. *bufonis* (Jones) Cronq. [*Oe. bufonis* Jones]. This species has been collected in full flower as early as 29 January.

Oenothera speciosa Nutt. Nuttall Evening-primrose. Perennial caulescent herbs from spreading rootstocks; stems mainly 2–5 dm tall, erect or sprawling; herbage strigose to puberulent; leaves 0.9–6 cm long, 2–12 mm wide, lanceolate to elliptic or oblanceolate; flowers solitary in axils of upper bracteate leaves, nodding in bud; hypanthium 10–15 mm long; sepals 15–20 mm long, reflexed in pairs or wholly at anthesis; petals 2.5–4 cm long, bright pink, fading pink; anthers 6–8 mm long; style extending 15–20 mm beyond the hypanthium; capsules 1–2 cm long. Cultivated ornamental, persisting and escaping in Utah and Washington counties; indigenous from Kansas to Missouri and Texas; 2 (0).

Zauschneria Presl

Perennial herbs from a caudex, often woody at the base; leaves cauline, opposite or alternate above; flowers scarlet, showy, somewhat zygomorphic, pollinated by hummingbirds; hypanthium produced much beyond the ovary; sepals 4, erect or nearly so; petals 4, notched apically; stamens 8; style exserted; stigma 4-lobed; fruit a capsule; seeds with a coma.

Zauschneria latifolia (Hook.) Greene Hummingbird Flower. [*Z. californica* var. *latifolia* Hook.]. Plants clump-forming, 1.5–4 (6) dm tall; herbage glandular-puberulent to stipitate-glandular and commonly with some

longer white hairs intermixed, or subglabrous; leaves 0.8–4 cm long, 2–15 mm wide, lanceolate to elliptic or ovate, serrate, cuspidate apically; flowers sessile or subsessile in terminal, bracteate, spicate racemes; hypanthium 15–28 mm long, scarlet; sepals 6–12 mm long, scarlet; petals 10–15 mm long, scarlet; capsules 18–25 mm long, puberulent; seeds many, ca 1.5 mm long; $2n = 30$. Rock outcrops and talus slopes in juniper, mountain brush, ponderosa pine, white fir, Douglas fir, and aspen communities at 1675 to 3070 m in Box Elder, Cache, Davis, Juab, Kane, Millard, Morgan, Salt Lake, San Juan, Sanpete, Sevier, Tooele, Utah, Wasatch, Washington, and Weber counties; Idaho and Wyoming to California, Nevada, and Arizona; 46 (v). Our material belongs to var. *garrettii* (A. Nels.) Hilend [*Z. garrettii* A. Nels, type from Big Cottonwood Canyon, Salt Lake County; *Epilobium canum* ssp. *garrettii* (A. Nels.) Raven]. I follow tradition in maintaining the genus *Zauschneria* apart from the closely allied *Epilobium*, to which it is related through *E. nevadense*, of section *Cordylaphorum*. The bright red, hummingbird-pollinated, slightly zygomorphic flowers provide the basis for this decision.

OROBANCHACEAE Vent.

Broomrape Family

Herbaceous perennials, lacking chlorophyll, and parasitic on the roots of other green plants; stems fleshy; leaves reduced and scalelike, alternate; flowers mostly perfect, rarely dioecious, irregular, in spikelike or racemose clusters; sepals united, the 4 or 5 lobes subequal; petals united, irregular, the 5 lobes oblique, persistent; stamens 4, didynamous, included in the corolla tube and adnate to it; pistil 1, the ovary 1-loculed, with 4 parietal placentae; style 1; stigma peltate; fruit a 2-valved capsule; seeds many; $x = 12, 18-21$.

Orobanche L.

Plants commonly parasitic on species of *Artemisia*, glandular-pubescent throughout; stems bracteate, purplish, brownish, or yellowish white; flowers solitary or clustered in terminal spikes; calyx equally 5-lobed; corolla purplish, reddish, or yellowish, the tube slightly curved, the limb bilabiate; capsule 1-loculed, with 4 placentae.

1. Flowers without bracts, solitary or several on a stem borne on long slender pedicels 2
- Flowers with 2 (or 3) bracts, sessile or pedicellate; inflorescence a spike, corymb, or panicle 3
- 2(1). Stems slender, very short, bearing 1 or sometimes 2 or 3 flowers; pedicels many times longer than the stem; calyx lobes awl-shaped, with a long tip, longer than the tube *O. uniflora*
- Stems stout, each bearing 3–12 pedicels, these subequal to the stem or shorter; calyx lobes triangular, shorter than the tube *O. fasciculata*
- 3(1). Corolla lobes rounded, obtuse, the upper ones erect, corolla tube much paler than the lobes; styles persistent *O. multiflora*
- Corolla lobes triangular, acute, the upper ones erect or reflexed; corolla tube not markedly paler than the lobes; style deciduous or persistent 4

- 4(3). Inflorescence compactly corymbose; anthers woolly; calyx lobes 9–16 mm long; plants to 10 cm tall *O. corymbosa*
- Inflorescence an elongate spike or raceme, the axis much elongating in age; anthers woolly to glabrous; calyx lobes 5–20 (12) mm long; plants 10–40 cm tall *O. ludoviciana*

Orobanche corymbosa (Rydb.) Ferris [*Myzorhiza corymbosa* Rydb.]. Fleshy yellowish or purplish herbs; stems mostly below ground level, 5–13 cm tall, glabrous to glandular-puberulent; inflorescence corymbose, dense, broad, 2.5–6 cm long; pedicels 4–15 (30) mm long; bract 1, with 1 or 2 smaller bractlets above; calyx 12–20 mm long, the tube 2–7 mm long, the lobes 9–16 mm long, linear; corolla 18–25 mm long, pale purplish, streaked with pink lines and mottled with yellow near the base of the lower lobes, these 3–6 mm long, the lower ones spreading; anthers woolly. Shadscale, greasewood, sagebrush, pinyon-juniper, mountain brush, and mixed conifer communities at 1200 to 2670 m in Beaver, Duchesne, Garfield, Juab, Millard, Salt Lake, Sevier, Tooele, Uintah, Utah, and Washington counties; Washington to Wyoming, south to California and Nevada; 26 (vi).

Orobanche fasciculata Nutt. Cluster Cancerroot. Fleshy purplish or yellowish herbs; stems forked, mostly below ground level, extending above ground for 5–10 cm, glandular pubescent; inflorescence of 3–12 erect, crowded, naked, axillary pedicels to 12 cm long; bractlets near the calyx lacking; calyx 7–10 mm long, campanulate, the lobes 3–5 mm long, triangular, shorter than the tube; corolla purple to pinkish or yellow, the tube curved, 15–30 mm long, the lobes rounded, spreading, 2–5 mm long; anthers glabrous to woolly. Warm desert shrub, saltbush, greasewood, sagebrush, pinyon-juniper, mountain brush, aspen, and fir communities at 1230 to 3260 m in all Utah counties; Yukon Territory, south to California and Mexico, east to Michigan and Texas; 85 (xv). The material with yellow flowers has been designated as var. *lutea* (Parry) Achey (*Phelipaea lutea* Parry), but its distribution is apparently random, indicating a minor, reoccurring genetic trait.

Orobanche ludoviciana Nutt. Fleshy yellowish or purplish herbs; stems mostly simple, 10–30 (40) cm tall, viscid pubescent to nearly glabrous below; inflorescence spicate or racemose, elongating in age, to 20 cm long; pedicels 0–15 mm long; bractlets adjacent to the calyx 1 or 2; calyx 7–15 mm long, the lobes lance-linear, somewhat unequal in length, 5–12 mm long; corolla dull purple, the throat pale, 17–28 mm long, the lobes triangular-lanceolate, acute or rounded, 3–7 mm long; anthers glabrous to woolly pubescent. Records indicate that this plant parasitizes species of *Artemisia*, *Quercus*, *Gutierrezia*, and probably others. Two rather weak varieties occur in Utah.

1. Corolla lobes rounded or obtuse; calyx lobes 9–12 mm long *O. ludoviciana* var. *arancosa*
- Corolla lobes acute; calyx lobes 5–8 mm long *O. ludoviciana* var. *cooperi*

Var. *arancosa* (Suksd.) Cronq. [*O. multiflora* var. *arancosa* (Suksd.) Munz]. Creosote bush, bursage, saltbush, blackbrush, sagebrush, pinyon-juniper, and mountain brush communities at 760 to 2800 m in Emery, Garfield, Grand, Kane, San Juan, Uintah, Utah, and Washington

counties; Colorado to Washington, California, and Arizona; 20 (vii).

Var. *cooperi* (Gray) Beck [*Aphyllon cooperi* Gray; *O. cooperi* (Gray) Heller]. Creosote bush, bursage, blackbrush, Mormon tea, and sagebrush communities below 1330 m in Kane, San Juan, and Washington counties; Nevada to Texas, south to Sonora and Baja; 3 (i).

Orobanche multiflora Nutt. Plants commonly stout, mainly 1–3 dm tall, viscid-pubescent, often grayish, sometimes branched; cauline scales 5–12 mm long; inflorescence dense, corymbosoid or spicate, often branched, purplish; flowers sessile or short-pedicellate; bracteoles adnate or adjacent to calyx; calyx 8–17 mm long, the lobes linear to lance-attenuate; corolla 15–35 mm long, the lips 5–12 mm long, pale purple to yellow, the upper lip erect, the tube pale purple to yellow or whitish, the lobes rounded; anthers woolly or glabrous; stigma peltate; capsule subequal to the calyx. Sandy sites in blackbrush and riparian communities at 1125 to 1345 m in Grand and San Juan counties; Washington to Wyoming, south to California, Texas, and Mexico; 2 (0). The two specimens tentatively assigned here have the technical features of the species. They have been mistaken for the similar *O. ludoviciana*. More work is indicated.

Orobanche uniflora L. One-flower Cancerroot. Small pale, yellowish herbs; stems mostly below ground level, very short and scaly, 0.5–5 cm long, finely glandular puberulent; pedicels 1–3 per stem, mostly 3–10 cm long, much longer than the stem, bractless; calyx 6–12 mm long, the lobes narrowly triangular-lanceolate, 4–9 mm long; corolla curved, 20–25 mm long, whitish, with 2 yellow, bearded folds in the throat, and sometimes with pale purplish lines, the lobes rounded, 2–7 mm long; anthers glabrous to woolly. Sagebrush, pinyon-juniper, mountain brush, ponderosa pine, aspen, and spruce-fir communities at 1870 to 3200 m in Beaver, Cache, Davis, Duchesne, Iron, Millard, Rich, Salt Lake, San Juan, Summit, Tooele, Uintah, and Utah counties; Alaska to Newfoundland, south to California and Florida; 8 (i).

OXALIDACEAE R. Br. in Tuckey

Woodsorrel Family

Herbs with sour juice; leaves palmately 3-foliolate, alternate or basal; flowers in cymose or umbellate inflorescence, or solitary on axillary peduncles; flowers perfect, regular; sepals 5; petals 5; stamens 10, united at the base; pistil 1, the ovary superior, 5-loculed, with 5 styles; fruit a capsule; $x = 5-12$.

Oxalis L.

There is a single genus in Utah with characteristics noted for the family.

1. Stipules present; fruiting pedicels deflexed; hairs straight, simple *O. corniculata*
- Stipules lacking; fruiting pedicels spreading to erect; hairs contorted, moniliform *O. dillenii*

Oxalis corniculata L. Creeping Woodsorrel. Perennial herbs from taproots, caulescent, often rooting at the nodes; stems mainly 0.5–5 dm long, proeumbent to ascending or erect, pubescent with stiff, straight, appressed to spreading simple hairs; stipules present; leaflets obcor-

date, 0.5–2 cm long; flowers 1–7, umbellate, on axillary peduncles; sepals 5, elliptic; petals 5, yellow, 4–8 mm long; capsules erect on pedicels that deflex at maturity; seeds reddish brown with transverse ridges. Ornamental and weedy species of gardens, lawns, and greenhouses at 850 to 1405 m in Salt Lake, Utah, and Washington counties; widespread in the U. S.; native to Europe; 5 (0).

Oxalis dillenii Jacq. [*O. stricta* authors, not L.] Erect Woodsorrel. Perennial herbs from fibrous roots, caulescent, not rooting at the nodes; stems mainly 1–3 dm long, erect or eventually decumbent, pubescent with ascending incurved hairs and with some long, contorted, moniliform ones; leaflets obovate, 0.4–2 cm long; flowers 2–7, umbellate on axillary peduncles; sepals 5, oblong; petals 5, yellow, 5–10 mm long; capsules erect, the pedicels not deflexed at maturity; seeds reddish brown, with transverse ridges. Cultivated ornamental and weedy species at ca 1300 to 1405 m in Cache and Utah counties; widespread in Eastern U. S.; 3 (0).

PAEONIACEAE Rudolphi

Peony Family

Robust perennial herbs; leaves alternate or mostly basal, large, ternately compound, the leaflets again lobed, divided, or toothed, estipulate; flowers large, showy, regular; sepals 5, herbaceous, persistent; petals 5, purplish to red purple; stamens numerous, arising from a fleshy disk; pistils usually 5; fruit a many-seeded follicle; x = 5.

Paeonia L.

There exists a single genus with characteristics of the family.

Paeonia brownii Dougl. ex Hook. Peony. Plants glabrous and glaucous, clump-forming; stems erect or decumbent at the base, 2–6 cm tall; leaves cauline, the ultimate segments 3–10 mm wide; flowers solitary on short leafy, terminal peduncles; sepals unequal, leathery, green or purplish, 1–2 cm long; petals 5, purplish to red purple, deciduous; follicles 3–5 cm long, spreading. Sagebrush and mountain brush communities at ca 1525 to 2135 m in Box Elder County; Washington to Wyoming and Nevada; 2 (0). Many ornamental cultivars are grown in Utah, where they persist for many years. Mainly they are derivatives of *P. lactiflora* Pallas. The genus *Paeonia* is sometimes placed within the Ranunculaceae.

PAPAVERACEAE A. L. Juss.

Poppy Family

Annual or perennial herbs, usually with milky juice; leaves alternate, opposite, or basal, entire, lobed, or divided; flowers solitary or few to several in cymes or racemes; sepals 2 or 3, caducous; petals 4–12, white, yellow, rose, purple, or other colors; stamens few to numerous, the filaments distinct; pistil 1, the ovary superior, unilocular or many loculed by intrusion of false septae; stigmas usually sessile, of the same number as the carpels; x = 5, 6, 7, 8–11, or 19.

- 1. Leaves opposite, or appearing basal, entire; plants scapose, of Washington County *Platystemon*

- Leaves alternate, variously lobed or toothed; plants caulescent or scapose, of various distribution 2
- 2(1). Herbage, sepals, and capsules armed with spines; leaves cauline; plants coarse and thistlelike; sepals 3 *Argemone*
- Herbage pubescent to glabrous, not armed with spines; leaves cauline or basal; plants not thistlelike; sepals usually 2 3
- 3(2). Leaves mainly 3-toothed or -lobed apically, the lobes each with a slender spinulose tip, long hairy; flowers white, showy; plants of gypsiferous substrates in Washington County *Arctomecon*
- Leaves variously lobed or toothed but not as above, sometimes hispid-hairy, but the plants then otherwise; distribution various 4
- 4(3). Leaves multifid into linear or oblong segments; plants indigenous mainly in Washington County, cultivated elsewhere *Eschscholzia*
- Leaves broadly lobed; flowers variously colored; distribution various but, if indigenous, of the Uinta Mts 5
- 5(4). Leaves broadly pinnately lobed; flowers yellow, less than 1 cm long, arranged in umbels; plants adventive *Chelodonium*
- Leaves simple, toothed or variously pinnately lobed; flowers variously colored, often over 1 cm long; plants cultivated, adventive, or indigenous 6
- 6(5). Capsule linear-attenuate; petals brick red; leaves cauline; plants adventive *Roemeria*
- Capsule broader than long or about as broad as long; leaves cauline or basal; plants adventive or indigenous *Papaver*

Arctomecon Torr. & Frem.

Perennial herbs from a caudex and long taproot; leaves cauline and basal, long-hirsute, mostly toothed apically and the teeth spinulose-tipped; flowers large, showy, solitary, or borne in leafy-bracteate cymes, nodding in bud; sepals 2 or 3; petals 4–6; stamens many; styles united, short, the stigmas connate, 3–6; capsule ovoid, 3– to 6-valved; seeds several.

Arctomecon humilis Cov. Low Bearclaw-poppy. Plants forming rounded clumps, 10–25 cm tall, from a branching caudex, this clothed with brown to ash colored marcescent leaf bases; leaves 0.5–8 cm long and 4–16 mm wide, cuneate to obovate, usually 3- or 4-toothed or lobed apically, glaucous and hirtellous as well as sparing long pilose; peduncles mainly 2–9 cm long; sepals 8–12 mm long, glabrous; petals 4–6, white, oval to obovate, mainly 2–4 cm long; capsules obovoid, about as broad as long; seeds shiny black, 2.5–3 mm long, ca 1.2 mm thick, conspicuously arilate. Moenkopi Formation in mixed warm desert shrub communities at ca 790 to 915 m in Washington (type from near St. George) County; endemic (?); 15 (ii). This edaphically restricted endemic belongs to a genus consisting of only two other species; *A. californica* Torr. & Frem., of southern Nevada, and *A. merriamii* Cov., of southern Nevada and adjacent California. All are rare, or moderately so, and thus are subject to endangerment by industrial development and by other impacts of mankind. As irreplaceable portions of our natural heritage they should be regarded as national prizes, as jewels of great price, and protected for future generations, whose advocacy this generation must represent.

Argemone L.

Perennial, robust, thistlelike herbs with yellow or orange latex; stems glaucous, 1 or few, erect or ascending, branched or simple, prickly; leaves sessile, alternate, cauline, oblanceolate to obovate in outline, pinnately lobed or pinnatifid, prickly; sepals caducous, 3 (or more), horned apically and prickly; petals large, white, usually 6; stamens numerous, the filaments filiform; anthers linear, coiled at maturity; stigma 3- to 7-lobed; capsules 3- to 7-carpellate, unilocular, ellipsoid to ovoid, glabrous or spinescent; seeds numerous, subglobose.

Ownbey, G. B. 1958. Monograph of the genus *Argemone* for North America and the West Indies. Mem. Torrey Bot. Club 21(1): 1-159.

1. Leaves green, armed with stout even-sized spines, mainly on the veins; sepal horns unarmed; capsules 25-30 mm long, sparingly spiny; plants of eastern Utah *A. corymbosa*
- Leaves glaucous, armed with spines on veins and on intervein areas, the spines not even-sized; sepal horns spiny; capsules 35-50 mm long, often armed with numerous spines of different sizes; plants of western and southern Utah *A. munita*

Argemone corymbosa Greene San Rafael Prickly-poppy. Plants 2-6 dm tall, moderately branched, green (or pinkish); leaves glaucous or green beneath, green above, 3-16 cm long, oblanceolate, lobed, the sinuses extending one-half or more to the midrib, armed with stout prickles on veins beneath, smooth or sparingly spiny above; sepal horns sometimes flattened; flowers 4-8 cm wide; petals white, the outer ones as broad as long, the inner ones much broader than long; stamens subequal to or shorter than the ovary; stigmas green or purplish; capsules lance-ovoid, 25-35 mm long, armed with stout, even-sized spreading spines; seeds bluish black, ca 2 mm long. Chinle, Morrison, Entrada, and Mancos formations in mixed salt and sandy desert shrub communities at 1155 to 1560 m in Emery, Garfield, Grand, Kane, San Juan, and Wayne counties; Arizona and California; 15 (iv). The specimens from the Colorado Plateau belong to ssp. *arenicola* G. B. Ownbey (type from 37.9 mi SW of Green River, Emery County).

Argemone munita Dur. & Hilg. Armed Prickly-poppy. Plants 4-10 dm tall, moderately branched, often purplish; leaves commonly glaucous on both surfaces, typically 3-15 cm long, oblanceolate to obovate, lobed, the lobes commonly broad and rounded in outline, the sinuses shallow or extending more than half way to the midrib, armed with uneven-sized prickles on veins and commonly on intervening areas; sepal horns usually very prickly; flowers 7-12 cm wide; petals white, obovate to cuneate; stamens subequal to the ovary; stigmas purple; capsules ovoid to elliptic, 30-55 mm long, armed with straight or incurved spines, these interspersed with smaller spines or prickles; seeds ca 2.2-2.6 mm long. Creosote bush-Joshua tree, blackbrush, mixed desert shrub, and pinyon-juniper communities at 760 to 2290 m in Beaver, Box Elder, Cache, Davis, Garfield, Juab, Iron, Kane, Millard, Piute, Salt Lake, Sanpete, Sevier, Tooele, Utah, Washington, and Weber counties; Nevada, California, and Arizona, New Mexico, and northern Mexico; 54 (v). Our specimens belong to ssp. *rotundata* (Rydb.) G. B. Ownbey [*A. rotundata* Rydb.]. The plants and exudates dry black, giving a drab appearance to the herbage,

but the flowers with purple stigmas and yellow stamens are remarkably beautiful, the petals with the appearance of dainty handkerchiefs.

Chelodoniun L.

Biennial herbs with saffron colored juice; leaves alternate, pinnatifid, broadly lobed, the lobes again lobed or crenately toothed; flowers few, borne in umbels; sepals 2, deciduous; petals 4, yellow; stamens numerous, the filaments long and the anthers short; ovary narrowly cylindrical, glabrous; stigma 2-lobed; capsules siliquellike, torulose.

Chelodoniun majus L. Celandine. Plants mainly 2-8 dm tall; leaves mostly cauline, pinnatifid into 3-9 segments, these obovate to oblong or orbicular in outline and 2-8 cm broad; umbels few-flowered; sepals glabrous; petals 6-10 mm long; anthers 1-1.5 mm long; capsules 3-6 cm long, 1-2 mm wide. Cultivated ornamental, sometimes escaping and persisting in low elevation portions of Utah; sporadic in the U. S.; introduced from Eurasia; 1 (0).

Eschscholzia Cham. in Nees

Annual or winter annual herbs, the juice watery; leaves alternate or mostly basal, glabrous, ternately dissected; flowers yellow or orange (or varicolored), peduncled; receptacle dilated, forming a funnel at the pistil base; sepals 2, united into a cap, this pushed away by the expanding petals; petals 4, rarely more; stamens 12 to many, the filaments short; anthers linear; ovary cylindrical, 1-loculed, with 2 placentae; stigma 4- to 6-lobed; capsule 2-valved. Note: The alternative spelling is "*Eschscholtzia*."

Fedde, F. 1909. *Eschscholtzia* Cham. Das Pflanzenreich IV. Fam. 104. Heft 40: 144-202.

1. Receptacle with 2 rims, the inner erect and hyaline, the outer widely spreading (to 1 cm across); plants known in cultivation only, rarely spreading *E. californica*
- Receptacle with only an erect hyaline rim, of if with an outer rim, this not well developed; plants indigenous to southwestern Utah 2
- 2(1). Leaves all in a basal tuft, the plants scapose *E. glyptosperma*
- Leaves cauline and basal 3
- 3(2). Petals 3-8 mm long; capsules 3-6 cm long *E. minutiflora*
- Petals 20-35 mm long; capsules 5-11 cm long *E. mexicana*

Eschscholzia californica Cham. California Poppy. Annual (or perennial?) herbs; stems branched, glaucous, mainly 2-5 dm tall, erect or spreading; leaves ternately dissected, the blades 2-8 cm long; basal leaves long petiole; cauline leaves usually well developed; peduncles 3-15 dm long; receptacles with 2 rims, the inner hyaline, erect, the outer spreading and 2-4 mm wide; sheathing sepals 1-4 cm long; petals orange to yellow, 2-67 cm long; capsules 3-10 cm long; 2n = 12. Cultivated ornamental in lower elevation portions of Utah, occasionally persisting; Washington to California; 2 (0). The species is sometimes included in reclamation seeding mixtures, and might be expected anywhere. Plants identified as belonging to this species from among our indigenous representa-

tives almost certainly belong to the closely allied *E. mexicana* (q. v.).

Eschscholzia glyptosperma Greene Scapose California-poppy. Annual herbs, glaucous, glabrous, scapose, 0.6–3 dm tall; leaves forming a basal tuft, the blades 1–3 cm long, finely ternately dissected; buds erect; receptacle with a narrow erect hyaline rim, lacking an outer one; sheathing sepals ovoid to lance-ovoid, 8–12 mm long, acuminate to acute; petals yellow, 10–25 mm long; capsules 4–7 cm long. Creosote bush, Joshua tree, blackbrush, and other warm desert shrub communities at 760 to 980 m in Iron and Washington counties; California, Nevada, and Arizona; 11 (ii).

Eschscholzia mexicana Greene Annual herbs, mainly 1–3.5 dm tall, glabrous and glaucous, caulescent, or less commonly subscapose; leaves basal and cauline (at least some), the basal ones at least twice as long as the cauline; blades 1.5–5 cm long, ternately dissected; receptacle with a narrow erect hyaline rim and a short flaring outer one; sheathing sepals 0.8–1.3 cm long, lance-ovoid, abruptly apiculate; petals yellow to orange or bronze, 15–35 mm long; capsules 5–11 cm long. Creosote bush-Joshua tree community at ca 1000 to 1250 m in Washington County; Arizona, New Mexico, Texas, and Mexico; 4 (ii). This is the most showy of our indigenous species, and evidently it is closely allied to *E. californica*. The plant is uncommon in Washington County, but stains hillsides bright yellow in years when moisture conditions are adequate.

Eschscholzia minutiflora Wats. [*E. ludens* Greene, type from St. George]. Annual herbs, mainly 0.5–4.5 dm tall, glabrous, glaucous, and caulescent; leaves basal and cauline, the basal ones at least twice longer than the cauline ones; blades mostly 1–3 cm long, receptacle obconic, the outer rim erect, with a hyaline inner margin; sheathing sepals 4–6 mm long, short-apiculate; petals yellow, 3–8 mm long; capsules 3–6 cm long. Creosote bush-Joshua tree, blackbrush, and mixed desert shrub communities at 760 to 1590 m in Millard and Washington counties; Arizona, Nevada, California, and Mexico; 19 (iii).

***Papaver* L.**

Annual, biennial, or perennial herbs with hispid hairy, glabrate, or glabrous herbage; leaves all basal, or cauline and alternate, merely lobed to once or twice pinnatifid; flowers solitary on scapes or on axillary peduncles; nodding in bud, erect or spreading in flower and fruit; capsules oblong to elliptic or cup-shaped, dehiscent by a ring of small valves near margin of stigmatic disk; stigmas radiating from the apex.

- 1. Plants dwarf, scapose perennials; leaves all basal; petals yellow; indigenous in the Uinta Mts. *P. radiculatum*
- Plants with cauline leaves, annual or perennial; petals not yellow; adventive or cultivated species, not of the Uinta Mts. 2
- 2(1). Stem leaves with cordate-clasping bases 3
- Stem leaves petiolate or sessile, but not cordate-clasping 4
- 3(2). Leaves pinnately lobed *P. glaucum*
- Leaves coarsely doubly serrate and undulate-cripsed *P. somniferum*
- 4(2). Stems and peduncles with long, soft, spreading hairs *P. rhoeas*

— Stems and peduncles with coarse, appressed hairs *P. orientale*

Papaver glaucum Boiss. & Hausskn. Tulip Poppy. Plants mainly 2–5 dm tall; herbage glabrous or sparingly appressed hairy, glaucous; cauline leaves cordate-clasping basally, mainly 2–10 cm long, pinnatifid, with ascending lobes again toothed or lobed; flowers 6–10 cm wide; petals scarlet, spotted basally; capsules ca 20 mm long. Widely cultivated ornamentals, escaping and persisting, but hardly established in Juab County (Neese & Goodrich 10410 BRY); introduced from western Asia; 1 (0).

Papaver orientale L. Oriental Poppy. Plants mainly 6–10 dm tall; herbage coarsely hairy, the lower stems and leaves with spreading hairs, the upper stems and peduncles with appressed hairs; cauline leaves petiolate, reduced and becoming sessile upward, mostly 7–45 cm long, pinnatifid, with spreading, serrate, setiferous, oblong to linear-lanceolate lobes; flowers 8–16 cm long; petals orange to scarlet, spotted basally; capsules 20–25 mm long; 2n = 28, 42. Widely cultivated ornamentals, long persisting in Cache, Sanpete, Tooele, and Utah counties; introduced from Eurasia; 4 (0).

Papaver radiculatum Rottb. Plants scapose, caespitose, mostly 4–11 cm tall, from a branching caudex, this clothed with marcescent leaf bases; leaves numerous, in a basal tuft, 1–3 cm long, pinnately lobed, the blades 0.8–2.3 cm long, coarsely strigulose; scapes 3–10.5 cm long, with spreading-ascending, blackish hairs; sepals 8–10 mm long, copiously black hairy; petals yellow, 10–13 mm long, more or less persistent; capsule obconic to obovoid, 11–13 mm long, 5–7 mm wide, beset with stiff, black, ascending bristles; 2n = 42, 56. Rockstripes in alpine tundra communities at 3385 to 3905 m in Duchesne, and Summit counties; widespread in arctic portions of North America, extending south to Colorado; circumboreal; 5 (i). Our material has been variously interpreted. It belongs to a complex of problematical phases in need of monographic study on a worldwide basis. A similar dwarf plant from Montana was named at specific rank by Rydberg, and ours seem to be similar or identical and can be known as var. *pygmaeum* (Rydb.) Welsh [*P. pygmaeum* Rydb.; *P. kluanense* D. Love].

Papaver rhoeas L. Corn Poppy. Plants mainly 3–7 dm tall; herbage pubescent with spreading soft hairs; cauline leaves petiolate, or becoming sessile upward, mostly 2–8 cm long, pinnately lobed, the spreading-ascending lobes again sharply toothed; flowers mostly 4–10 cm wide; petals usually scarlet, spotted basally; capsule glabrous, subglobose, 10–15 mm long. Widely cultivated ornamentals, escaping and persisting in Cache, Utah, and Washington counties; introduced from Eurasia; 2 (0).

Papaver somniferum L. Opium Poppy. Plants commonly 2–10 dm tall; herbage glaucous and glabrous or with some spreading hairs upward; leaves simple, sessile, cordate-clasping, mostly 4–14 cm long, coarsely doubly serrate and more or less undulate-cripsed; flowers 6–10 cm wide; petals white to purple; capsule glabrous, subglobose, 2–5 cm long. Previously widely cultivated ornamental and source of commercial poppy seed, now uncommon but still occasionally grown; introduced from Eurasia; 1 (0). This plant is the source of opium and its derivative, morphine, the “principium somniferum.”

Platystemon Benth.

Annual, subscapose herbs; leaves opposite or mainly basal, entire; sepals 3, deciduous; petals 6, white or yellowish, deciduous; stamens many, the filaments flattened; anthers linear; ovary of 6 or more united carpels, these separate in fruit, each with several seeds, breaking at maturity into 1-seeded, indehiscent segments; seeds quadrangular, sculptured.

Platystemon californicum Benth. [*P. remotus* Greene, type from near St. George; *P. rigidulus* Greene, type from near St. George; *P. terminii* Fedde, type from Diamond Valley]. Plants mainly 1–2.5 dm tall, many-stemmed, pubescent with long, spreading, soft hairs; leaves mainly basal or near the stem base, opposite, 1.2–5 cm long, lance-linear, sessile or subsessile; flowers solitary, on peduncles mainly 10–20 cm long; sepals 6–10 mm long, villous-pilose with long hairs; petals cream (fading yellow), 8–12 mm long (or more); carpels 10–20 mm long, beaked. Creosote bush, blackbrush, and mixed desert shrub communities at 850 to 1680 m in Washington County; Nevada, California, and Arizona; 4 (0).

Roemeria Medicus

Annual herbs; leaves alternate, petiolate, once to twice pinnatifid; sepals 2, separate, deciduous; petals 4, red (fading violet); stamens many, the filaments black; anthers yellow; ovary with 2–4 united carpels; capsules ellipsoid to attenuate, many times longer than broad.

Roemeria refracta DC. Plants mainly 3–8 dm tall, branching from the base, pubescent with long, spreading, soft hairs; leaves 1–15 cm long, petiolate, pinnatifid or doubly so, the axis sometimes broadly foliar, the ultimate lobes linear, ascending, and again toothed or lobed; flowers solitary, on peduncles 3–25 cm long or more; sepals 15–25 mm long, sparingly long-hairy; petals red (fading violet), with a dark basal spot, 3–4 cm long; capsules 4.5–7 cm long, 3–5 mm thick, glabrous; $2n = 14$. Weedy species of fields, roadsides, and canal banks in Box Elder and Cache counties; sparingly established in the U. S.; adventive from Eurasia; 2 (0).

PASSIFLORACEAE A. L. Juss.

Passion-flower Family

Herbaceous or woody vines, climbing by simple tendrils; leaves alternate, simple, stipulate; flowers regular, solitary or fascicled; sepals 5; petals 5; corona present and conspicuous in several radiating series; stamens 5, elevated on an androgynophore; pistil 1, the ovary superior, 3-loculed; styles 3, the stigmas capitate; fruit a unilocular berry; seeds completely enclosed in a fleshy aril; $x = 6$, 9–11.

Passiflora L.

A single genus, with characters of the family.

Passiflora caerulea L. Blue Passionflower. Vines to 4 m long or more; stems somewhat angled and more or less grooved; leaves deeply 5- to 9-lobed, the lobes entire or merely undulate; stipules ovate, foliose; flowers 5–10 cm wide; sepals and petals white or pinkish, subequal in length; corona filamentous, in 4 rings, all purple at the base, white at the middle, and blue apically; fruit ovoid-ellipsoid, ca 5 cm long, yellow. Cultivated ornamental

vine of great beauty, long persisting, in lower elevation portions of Utah (and under glass); introduced from South America; 4 (0). This plant and *P. incarnata* L. (the may-pop) have long been grown in Utah under glass, and artificial hybrids have been produced. *P. incarnata* has serrate leaf lobes.

PEDALIACEAE R. Br.

Sesame Family

Coarse herbs with glandular or eglandular trichomes; leaves opposite or the upper sometimes alternate, simple, entire to variously lobed; flowers perfect, racemose or solitary; calyx lobes usually 5, distinct or mostly united; corolla irregular, sympetalous, slightly spurred or saccate at the base, the oblique limb with 5 imbricate lobes; stamens 4, paired, the fifth rudimentary, or stamens 2, with 3 rudimentary ones; pistil 1, the ovary superior, 2-loculed; fruit with a soft exocarp when young, at maturity the hard endocarp splitting apically into 2 lateral, curved beaks; $x = 8, 13, 14, 15, 18$.

Proboscidea Schmidel

Herbs; leaves opposite or alternate; flowers racemose, terminal, but appearing lateral; bracts small and deciduous or lacking; calyx unequally 5-lobed, cleft to near the base, membranous; corolla 5-lobed, slightly bilabiate, the limb oblique; stamens 4, paired, the fifth a staminodium; ovary 2-loculed; fruit a drupaceous capsule with fleshy exocarp and woody, reticulate, dehiscent endocarp, which gradually tapers and splits into 2 long, stout, incurved beaks.

Proboscidea parviflora (Woot.) Woot. & Standl. [*Martynia parviflora* Woot.]. Annuals, from a stout taproot; stems somewhat fistulose, much branched and ascending or spreading, to 6 dm tall and 2 m broad, viscid-pubescent; leaves cordate, entire to shallowly lobed or undulate, the mature ones 15–25 cm long and almost as broad; petioles subequal to the blades; racemes 2- to 10-flowered; calyx 9–12 mm long at anthesis, slightly accrescent and deciduous at maturity; corolla dirty yellow to pinkish or purplish, with a dark purple spot on the upper side, 24–35 mm long, the limb 15–35 mm broad; fruit at maturity strongly incurved, 15–35 cm long, crested along the concave side at the broadened basal portion. Fields, roadsides, and other open sites or in desert washes in the creosote bush and blackbrush communities at 750 to 1200 m in Washington and Utah counties; Nevada, Arizona, and Mexico; 10 (iii). The young capsules are edible, and very agreeable as pickles, and the seeds are oily and of good flavor. Another species, *P. louisianica* (Miller) Thell. [*Martynia louisiana* Miller], may eventually be found in the southern counties. The racemes are up to 20-flowered, the corolla is 35–40 mm long, and the calyx to ca 20 mm long.

PLANTAGINACEAE A. L. Juss.

Plantain Family

Annual or perennial, acaulescent or short-stemmed herbs; leaves all basal or nearly so; flowers sympetalous, small, perfect or imperfect, regular, borne in bracteate spikes or in heads; sepals 4; corolla scarious, 4-lobed; stamens 4, alternate with the corolla lobes, or only 2; pistil

1, the ovary superior, with 1-4 locules, the carpels 2; style 1; fruit a circumscissile capsule; $x = 4-12+$.

Plantago L.

Plants from taproots; leaves simple, entire or variously lobed; flowers several to many, inconspicuous, each subtended by a bract; calyx sometimes irregular; corolla scarious or membranous, persistent; stamens included or exerted; fruit included in the calyx or exerted.

1. Leaves linear to filiform, rarely more than 1 cm wide; plants annual 2
- Leaves lanceolate or broader, rarely less than 1 cm broad; plants perennial or biennial 4
- 2(1). Stamens 2; corolla lobes (in some flowers) erect and closing over the capsule; flowers more or less dioecious or polygamous; leaves linear-filiform, ca 1 mm wide *P. elongata*
- Stamens 4; corolla lobes spreading or reflexed; flowers all perfect; leaves linear, over 1 mm wide 3
- 3(2). Hairs on upper part of scape spreading at right-angles; bracts broadly ovate, with broad scarious margins *P. insularis*
- Hairs on upper part of scape usually closely ascending or appressed; bracts subulate or narrowly lanceolate, not at all or indistinctly scarious margined *P. patagonica*
- 4(1). Leaf blades broadly ovate, abruptly contracted to the petiole; seeds 6-20 per capsule; spikes mostly more than 6 cm long *P. major*
- Leaf blades lanceolate, oblanceolate, lance-oblong, or elliptic, gradually tapering into the petiole; seeds 2-4 per capsule; spikes various, but often less than 6 cm long 5
- 5(4). Outer pair of sepals (those adjacent to the bract) connate, appearing as a solitary, 2-veined, apically notched or entire sepal; capsule circumscissile near the middle; plants adventive, weedy; spikes compact *P. lanceolata*
- Outer pair of sepals distinct; plants indigenous, not weedy; spikes loose to compact 6
- 6(5). Crown of plants conspicuously woolly-hairy at base of petioles; spikes usually over 5 cm long; leaves thick *P. eriopoda*
- Crown of plants not woolly; spikes usually less than 5 cm long; leaves rather thin *P. tweedyi*

Plantago elongata Pursh [*P. myosuroides* Rydb., type from Salt Lake County]. Plants annual; leaves linear-filiform, 3-8 cm long, ca 1 mm wide, cinereous puberulent; scapes several to many, 3-10 cm long, exceeding the leaves; spikes loosely flowered, 2-10 cm long; bracts triangular-ovate, subequal to the calyx; flowers dioecious or polygamous; sepals 1.5-2 mm long; corolla lobes 0.5-1 mm long, on some flowers becoming erect and closing over the capsule; stamens 2; capsule ovoid, rounded apically, 1.5-3.5 mm long; seeds ca 4, nearly flat on both sides. Moist to dry usually saline sites in salt desert shrub, saltgrass, and pickleweed communities at 1280 to 1600 m in Cache, Salt Lake, Uintah, and Utah counties; Alberta and Montana, south to Oregon, Texas and Florida; 5 (0).

Plantago eriopoda Torr. Plants perennial, with reddish yellow wool on the root crown; leaves thickish, oblanceolate to narrowly elliptic-ovate, 3- to 9-veined or -ribbed, 6-20 cm long, entire to repand-dentate; scapes 10-40 cm long; spikes lax below, dense above, 4-12 cm long, somewhat pilose; bracts subequal to the calyx,

broadly ovate, with a broadly rounded keel; sepals round-elliptic, scarcely keeled, ca 2 mm long; corolla lobes 1-2 mm long, spreading at maturity; stamens 4; capsule ovoid-cylindroid, the apex truncate, ca 3 mm long, circumscissile below the middle; seeds 2-4, reddish brown, shining, elliptic, flat, ca 2 mm long; $2n = 24$. Meadows and riparian habitats in rush, sagebrush, and rabbitbrush communities at 1700 to 2500 m in Box Elder, Cache, Daggett, Duchesne, Garfield, Kane, Rich, Salt Lake, Sanpete, Utah, and Wasatch counties; Alaska and Yukon, east to Mackenzie, south to Mexico, and in eastern North America; 12 (i).

Plantago insularis Eastw. [*P. fastigiata* Morris]. Low annuals; stems short, with even shorter branches, villous and tomentose throughout; leaves 5-10 cm long, 3-8 mm wide, linear-lanceolate, acute, mostly entire; scapes axillary, erect or ascending, to 18 cm long, pilose or tomentose; spikes densely many-flowered, erect, shortly cylindrical, to 2 cm long and 8 mm thick, villous to tomentose; bracts ovate to oblong, scarious with green or brown rigid glabrous to villous midrib, about equalling the calyx; calyx lobes ovate to obovate, the midribs green or brown; corolla lobes ovate, apiculate, concave, ca 2 mm long and 1.5 mm wide, reflexed-spreading, with a brown spot at base of each; capsules twice as long as the calyx, oval, rounded apically, ca 4 mm long and 2 mm thick; seeds 2, brown, narrowly oblong, very finely pitted; $2n = 8$. Creosote bush, Joshua tree, and blackbrush communities at 730 to 1130 m in Washington County; Nevada and California to Texas, south to Mexico; 17 (iii).

Plantago lanceolata L. Plants perennial, not woolly at the base, 1.5-5 dm tall; leaves elliptic to narrowly lanceolate or oblanceolate, 5-30 cm long, 0.3-4 cm broad, somewhat expanded but not membranous at the base, 3- to several-veined, entire to obscurely denticulate; inflorescence dense, 1-8 cm long; bracts ovate, the apex sometimes acuminate and slightly surpassing the flowers, dorsally pubescent to glabrous, ciliate; scapes strigose; corolla lobes 2-2.5 mm long, spreading; stamens 4; capsule 2-4 mm long, circumscissile below the middle, the seeds usually 2; $2n = 12, 24$. Widely distributed weedy plants in numerous vegetative types from 800 to 3170 m in most if not all Utah counties; adventive from Eurasia, now widely naturalized in the U. S.; 27 (ii).

Plantago major L. Broadleaf Plantain. [*P. major* var. *pachyphylla* Pilger, type from Salt Lake City]. Plants perennial, not woolly at the base, mostly 1-5 dm tall; leaves ovate to lanceolate or broadly elliptic, acute to cordate basally, short- to long-petiolate, the blades 3-15 cm long, 2-12 cm broad, expanded and often somewhat membranous basally, 5- to several-veined, denticulate to entire; inflorescence dense to lax (especially below), 3-25 cm long, essentially glabrous; bracts ovate, shorter than the flowers, glabrous, not ciliate; corolla lobes spreading to reflexed, ca 1 mm long; stamens 4; capsules 3-4 mm long, circumscissile below the middle, the seeds several to many; $2n = 12, 24, 36$. Widespread weedy species of lawns, fields, and other disturbed sites at 790 to 2700 m in most if not all Utah counties; adventive from Europe, now widely established in North America; 42 (vi).

Plantago patagonica Jacq. [*P. purshii* R. & S.]. Annuals, usually woolly villous throughout; leaves linear to narrowly oblanceolate, acute to acuminate, the apex commonly callous-tipped, 1-20 cm long, 2-15 mm wide; scapes shorter to longer than the leaves; spikes dense,

cylindrical, 1–10 cm long, 5–8 mm thick; bracts linear to linear-subulate, shorter or longer than the flowers; sepals narrowly oblong-ovate; petals ca 2 mm long, suborbicular to ovate, spreading; stamens 4; capsule ca 3.5 mm long; seeds 2; 2n = 20. Joshua tree, blackbrush, creosote bush, shadscale, sagebrush, pinyon-juniper, and mountain brush communities at 850 to 2150 in Beaver, Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Kane, Rich, Salt Lake, San Juan, Sevier, Uintah, Washington, and Weber counties; British Columbia to Saskatchewan, south to California and Texas; 110 (xviii). Our plants have been placed within three weak varieties., i.e., var. *gnaphaloides* (Nutt.) Gray, with bracts in lower part of spike shorter than to slightly longer than the calyces, var. *spinulosa* (Decne.) Gray, with long conspicuous bracts, and var. *breviscapa* (Shinn.) Shinn., with scapes shorter than the spikes. Perhaps none of them are worthy of taxonomic recognition in our area.

Plantago tweedyi Gray Plants perennial, not woolly at the base, mostly glabrous or somewhat pubescent on the scapes; leaves 3–7 cm long, rather thin, lanceolate to spatulate, tapering gradually to the petiolar base, 3- to 5-veined, entire or nearly so; scapes 10–20 cm long; spikes 1–10 cm long, dense to lax; bracts subequal to or shorter than the calyx; sepals 1.5–2.5 mm long; corolla lobes ca 1 mm long; spreading; stamens 4; capsule narrowly ovoid, circumscissile below the middle, long exerted from the calyx; seeds 2–4; 2n = 12. Meadows, mainly in aspen, fir, and spruce-fir communities at 2100 to 3870 m in Beaver, Cache, Carbon, Duchesne, Emery, Iron, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Utah, and Wasatch counties; Alberta and Idaho to Colorado; 48 (i).

PLATANACEAE Dumort.

Sycamore Family

Monoecious trees with exfoliating, platy bark; leaves alternate, deciduous, palmately 3- to 7-lobed, the petioles hollow basally and enclosing the axillary buds; flowers numerous, in globose, unisexual heads, minute; sepals 3–8, scalelike; petals 3–6, minute, in staminate flowers scarious pointed; stamens 3–8; pistils 3–8, each 1-loculed, surrounded by hairs and staminodia; style terminal; ovules 1 (or 2); fruit an obconic, 1-seeded nutlet; x = 7.

- 1. Leaves with the terminal lobe twice longer than broad; fruiting heads usually 3 or 4 *P. orientalis*
- Leaves with terminal lobe as broad as long or broader; fruiting heads 1 or 2 *P. occidentalis*

Platanus occidentalis L. American Sycamore. Trees of large stature and rapid growth, mainly 10–25 m tall and with trunk diameter 5–10 dm or more; bark platy, exfoliating, thus varicolored white or yellowish green and brown to blackish; leaves with petioles 1.5–9 cm long, the blades 5–27 mm long, from petiole attachment to apex and 6–32 cm wide, the terminal lobe as broad or broader than long, tomentose on one or both sides when young, finally glabrous, or pubescent only along the veins beneath; fruiting heads 1 or 2 per peduncle. Commonly grown shade and street trees in Utah mainly below 1830 m elevation; introduced from the eastern U. S.; 22 (0).

Our plants lack the snow white exfoliating bark of trees of flood plains in the eastern states, but it is not uncommon for tree species grown in Utah to exhibit bark and stature differences from those in their native habitats. A part of the variation might represent products of hybridization between *P. occidentalis* and *P. orientalis*, known as *P. x acerifolia* Willd., which has been distinguished on mainly intangible diagnostic features. I have been unable to distinguish the hybrids from among the specimens available for study. This species suffers in seasons of abnormally high precipitation from a blight that kills all of the leaves, but the trees recover and grow new leaves late in the season.

Platanus orientalis L. Oriental Planetree. Trees of large stature, mainly 10–25 m tall and with trunk diameter of 5–10 dm or more; bark platy, grayish to greenish white in a mosaic pattern; leaves with petioles mainly 3–11 mm long, the blades typically 5–15 cm long, from petiole attachment to apex, 6–20 cm wide, the terminal lobe about twice as long as broad, tomentose on one or both surfaces, becoming glabrous or pubescent only along the veins beneath; fruiting heads (2) 3–6. Uncommonly grown shade and street tree in lower elevation portions of Utah; introduced from Eurasia; 3 (0).

POLEMONIACEAE A. L. Juss.

Phlox Family

Annual, biennial, or perennial herbs, or some suffrutescent; leaves simple alternate or opposite, entire or pinnatifid to palmatifid or compound; flowers perfect, solitary or variously arranged; calyx 5-lobed; corolla usually of 5 united petals; stamens usually 5, inserted on the corolla tube, alternate with the corolla lobes; pistil 1, the ovary superior, 3-loculed; style 1; stigmas 3-lobed; fruit a capsule; x = 6–9.

- 1. Foliage leaves represented only by persistent, connate, entire cotyledons and a whorl of entire bracts subtending the inflorescence; plants diminutive annuals *Gymnosteris*
- Foliage leaves proper present, alternate or opposite; plants annual, biennial, or perennial 2
- 2(1). Leaves mostly opposite, at least below 3
- Leaves mostly alternate, even below 8
- 3(2). Leaves entire, acicular or flat; staminal filaments unequally inserted on the tube 4
- Leaves palmatifid or pinnatifid; staminal filaments variously inserted on the tube 5
- 4(3). Plants perennial; seeds not mucilaginous when wet *Phlox*
- Plants annual; seeds mucilaginous when wet *Microsteris*
- 5(3). Leaves petiolate, pinnatifid; plants delicate annuals with pungent leaf lobes and headlike flower clusters *Navarretia*
- Leaves sessile, palmatifid; plants annual or perennial . 6
- 6(5). Plants annual; leaves flexible; seeds mucilaginous when wet *Linanthus*
- Plants perennial; leaves stiff or flexible; seeds not mucilaginous when wet 7
- 7(6). Leaves stiff, pungent; flowers opening in evening *Leptodactylon*

- Leaves flexible, not pungent; flowers opening any time *Linanthastrum*
- 8(2). Leaves palmatifid, sessile, pungent *Leptodactylon*
- Leaves various, but not both palmatifid and sessile ... 9
- 9(8). Leaves simple, with definite broad blades, petiolate or tapering to a sessile base *Collomia*
- Leaves simple, pinnatifid or more or less compound . . . 10
- 10(9). Leaves pinnate-pinnatifid, with definite broad leaflets in the lower portion *Polemonium*
- Leaves pinnatifid, bipinnatifid, or palmatifid, lacking definite broad leaflets 11
- 11(10). Calyx lobes unequal; leaves pinnatifid, the rachis narrow *Eriastrum*
- Calyx lobes subequal; leaves pinnatifid, bipinnatifid, or palmatifid, the rachis often broad 12
- 12(11). Leaves with bristle-tipped teeth or lobes; plants annual *Langloisia*
- Leaves with spinulose-apiculate or acute to rounded teeth or lobes; plants annual, biennial, or perennial *Gilia*

***Collomia* Nutt.**

Annual or perennial herbs; stems simple or branched; leaves alternate (except the lower ones), linear to obovate, entire or pinnatifid; flowers in cymes, capitate, or axillary; calyx tube green or chartaceous-membranous below the sinuses, campanulate to obconic, the sinuses in age with a projecting fold; corolla funnellform, salmon, lavender, pink, or white, the lobes spatulate to lanceolate; stamens equally or unequally inserted on the corolla tube; capsule ellipsoid to obovoid, each locule 1- or 2-seeded, these more or less mucilaginous when wet.

- 1. Plants perennial from a soboliferous caudex, of alpine sites *C. debilis*
- Plants annual from taproot, from lower elevations to alpine habitats 2
- 2(1). Flowers solitary (or paired) in leaf axils; leaves linear; plants uncommon *C. tenella*
- Flowers in capitate, terminal clusters; leaves lance-elliptic to elliptic, or oblanceolate; plants not uncommon 3
- 3(2). Corolla mostly more than 15 mm long, the tube much longer than the calyx, salmon *C. grandiflora*
- Corolla mostly 5-15 mm long, the tube slightly surpassing the calyx, pink to lavender, bluish, or white 4
- 4(3). Stamens equally inserted, the filaments of unequal lengths; plants typically branched from near the base; leaves typically less than 5 mm wide; plants rare *C. tinctoria*
- Stamens unequally inserted, the filaments subequal; plants typically unbranched; leaves mainly more than 5 mm wide; plants common *C. linearis*

Collomia debilis (Wats.) Greene [*Gilia debilis* Wats., type from Salt Lake County]. Perennial soboliferous herbs from a subterranean root crown and taproot, the caudex branches elongate, terminating in innovations and flowering stems; flowering stems 2.5-12 cm tall (above ground level); herbage pubescent with moniliform, glandular hairs; leaves alternate, mainly 3-40 mm long, enlarging above the stem base, with the largest displayed below the flowers, the blades obovate to oblanceolate, entire to toothed or pinnatifid; flowers solitary or few in compact terminal clusters, sessile or pedicellate; calyx

8-11 mm long, the teeth unequal, subequal to or shorter than the tube; corolla 15-35 mm long, lavender, pink, blue, white, or cream, the lobes 5-7 mm long; stamens exserted; style exserted; capsule 4-5 mm long. Alpine sites, usually in talus, at 2560 to 3660 m in Juab, Salt Lake, Utah, and Wasatch counties; Washington to Montana, south to California, Nevada, and Wyoming; 25 (0). The elongate caudex branches adjust to creep in talus slopes.

Collomia grandiflora Dougl. ex Lindl. Plants annual, erect, simple or branched; herbage glabrous, puberulent, or glandular; stems mainly 1-5 dm tall or more; leaves alternate (except sometimes at stem base), 1.5-6.5 cm long, 3-13 mm wide, oblanceolate to elliptic, lanceolate, or almost linear, entire, transitional upward into lanceovate bracts; flowers sessile or short-stipitate, in dense terminal or axillary heads; calyx 7-10 mm long, with lanceolate or triangular lobes; corolla 15-30 mm long, salmon or white, funnellform to salverform; stamens unequally inserted, of unequal length; stigmas included; capsule ca 5 mm long. Pinyon-juniper, sagebrush, mountain brush, aspen, and spruce-fir communities at 1430 to 2440 m in Beaver, Cache, Davis, Juab, Millard, Piute, Salt Lake, Sanpete, Sevier, Tooele, Utah, Wasatch, Washington, and Weber counties; British Columbia to Montana, south to California, Arizona, and Colorado; 25 (iii).

Collomia linearis Nutt. Plants annual, erect, simple or branched; herbage puberulent to glandular-villous; stems mainly 0.6-5 dm tall or more; leaves alternate (except at the lowermost nodes), 1.2-6 cm long, 3-10 mm wide, elliptic to lanceolate or oblanceolate, entire, transitional upward into lanceolate to lance-ovate bracts; flowers sessile in dense terminal or axillary heads; calyx 4-7 mm long, finally papery, with triangular lobes; corolla 8-15 mm long, pink to purplish, narrowly funnellform; stamens unequally inserted; stigma included; capsule 5-6 mm long; 2n = 16. Sagebrush, mountain brush, aspen, spruce-fir, and grass-forb communities at 1495 to 3265 m in probably all Utah counties; British Columbia to Ontario, south to California, Arizona, New Mexico, Nebraska, and Wisconsin; 94 (ix).

Collomia tenella Gray Plants annual, erect, usually branched; herbage glandular-puberulent; stems mainly 0.4-1 dm tall, the branches very slender; leaves alternate (or the lower ones opposite), 1-4 (5) cm long, 1-5 mm wide, linear, entire; flowers solitary (or paired) in leaf axils almost to the stem base; calyx 3-4 mm long, with triangular lobes; corolla 4-6 mm long, lavender to pink or white, narrowly funnellform; stamens unequally inserted; stigma included; capsules subequal to the calyx. Sagebrush, mountain brush, aspen, and spruce-fir communities at 1980 to 2625 m in Cache, Juab, Millard, Salt Lake, Summit (type from Parleys Park) and Weber counties; Washington to Wyoming and Nevada; 7 (i).

Collomia tinctoria Gray Plants annual, forming low clumps, usually branched from near the base; herbage glandular-villous or -pilose; stems mainly 5-15 cm tall, the branches slender; leaves alternate (or the lower ones opposite), 1-4 (5) cm long, 1-5 mm wide, linear, entire; flowers mainly in clusters of 2 or 3 (5), short-pedicellate, the clusters closely subtended by foliose bracts that surpass them; calyx 3-4 mm long in anthesis, to 9 mm long in fruit, the lobes subulate; corolla 8-14 mm long, pinkish or lavender, narrowly funnellform; stamens equally inserted, the filaments of differing lengths; capsules much

shorter than the calyx. Wet sedge-grass meadow with scattered willows at 2690 m in Sevier County (Fish Lake); Washington and Idaho, south to California and Nevada; 1 (0). Our single collection (Thorne et al. 4171 BRY) seems to be slightly more robust than specimens from Nevada and California.

Eriastrum Woot. & Standl.

Annual herbs; stems simple or more commonly branched; herbage puberulent to arachnoid or villous; leaves alternate (rarely some opposite), entire and linear or pinnatifid; flowers sessile, borne in bracteate heads; calyx 5-lobed, the lobes subulate and pungent, the sinuses with a hyaline membrane; corollas funnelform, blue to pink or purplish to white; stamens exerted or included; capsules ovoid; seeds several per locule, usually mucilaginous when wet.

- 1. Corollas showy, usually bright blue lavender, 13-19 mm long (including the lobes), somewhat irregular; staminal filaments unequal, the longer ones 4-8 mm long *E. eremicum*
- Corollas not especially showy, pale blue lavender to white, 6-13 mm long (including lobes), regular; staminal filaments subequal, less than 3 mm long 2
- 2(1). Plants erect or ascending, usually taller than broad; anthers 0.7-1.3 mm long *E. sparsiflorum*
- Plants prostrate-ascending, usually broader than tall; anthers 0.4-0.6 mm long *E. diffusum*

Eriastrum diffusum (Gray) Mason [*Gilia filifolia* var. *diffusa* Gray]. Plants annual, diffusely branched from near the base, usually broader than tall, the stems 3-15 cm long, pilose to glabrous; leaves 5-23 mm long, simple, linear, or pinnatifid into 3-5 narrow lobes; flowers 3-20 in capitate clusters, lanate; bracts 3- to 7-lobed; calyx 5-7 mm long, the lobes unequal, lance-acicular, spinulose-tipped; corolla pale blue to white, 7-9 mm long, almost regular; stamens 1-2 mm long, the anthers 0.3-0.4 mm long; capsules 3-4 mm long; locules with 2 or 3 seeds. Creosote bush, blackbrush, Vanclevea-ephedra, shadscale, and juniper communities at 800 to 1620 m in Kane, Millard, and Washington counties; California and Nevada to Texas and Mexico; 11 (0).

Eriastrum eremicum (Jepson) Jepson [*Huegelia eremica* Jepson]. Plants annual, diffusely branched from near the base, often taller than broad, the stems 2-25 cm long, floccose to glabrous; leaves 0.6-4 cm long, simple and entire or pinnatifid into 3-5 or more lobes; flowers 2-10 in capitate, lanate clusters; bracts 3- to 7-lobed; calyx 5-7 mm long, the lobes subequal, lance-acicular, spinulose-tipped, glandular; corolla 12-15 mm long, more or less irregular, blue violet, showy; stamens unequal, the longest exerted, 4-8 mm long, the anthers ca 1 mm long; capsules 4-6 mm long; locules several-seeded. Creosote bush, Joshua tree, blackbrush, other warm-desert shrub, and pinyon-juniper communities at 850 to 1680 m in Washington County; California, Arizona, and Nevada; 16 (i).

Eriastrum sparsiflorum (Eastw.) Mason [*Gilia sparsiflora* Eastw.]. Annual herbs, simple or much branched from near the base, usually taller than broad; stems 4-25 cm tall or more, commonly floccose; leaves 0.4-3 cm long, linear, or with a pair of lobes at the base; flowers 2-5 in capitate, lanate clusters; bracts simple or 3- to 5-lobed; calyx 4-5 mm long, the lobes subequal, lance-

acicular, spinulose-tipped; corolla 7-13 mm long, pale blue to white or pinkish; stamens 2-3 mm long, the anthers 0.7-1.3 mm long; capsules 3-5 mm long; seeds 2-4 per locule. Creosote bush, blackbrush, hopsage, ephedra, and pinyon-juniper communities at 850 to 2000 m in Garfield, San Juan, Tooele, and Washington counties; Washington to Idaho, south to California, Nevada, and Arizona; 11 (0).

Gilia Ruiz & Pavon

Annual, biennial, or perennial herbs from taproots; leaves alternate, entire or pinnatifid to palmatifid, often borne in a basal rosette and more or less well developed along the stem; flowers solitary and axillary, paniculate, thyrsoïd, or capitate; calyx lobes 5, subequal, the ribs green, the interveinal areas usually membranous; corolla 5-lobed, funnelform to salverform, regular or nearly so, scarlet, lavender, blue, violet, pink, yellow, or white; stamens more or less equally inserted on the corolla tube, the filaments subequal to unequal in length; capsules dehiscent apically; seeds 1 to many per locule.

- 1. Inflorescences capitate, thyrsoïd, or spicate 2
- Inflorescences of solitary axillary flowers, or more commonly in open paniculate clusters 10
- 2(1). Inflorescence thyrsoïd, usually more than half the plant height; plants of Carbon, Duchesne, Emery, and Uintah counties *G. stenothyrsa*
- Inflorescence capitate, spicate, or thyrsoïd, but in any case less than half the plant height; plants of various distribution 3
- 3(2). Cauline leaves apically 3-lobed or -toothed, at least some more or less palmatifid; plants perennial, with a definite caudex, occurring in the Tushar Mts. and at Cedar Breaks *G. tridactyla*
- Cauline leaves various, but if as above, otherwise differing; plants of various duration and distribution ... 4
- 4(3). Inflorescences spicate; cauline leaves 3-5 cm long; plants of Daggett County *G. spicata*
- Inflorescence capitate, or with branches terminating in capitate clusters; cauline leaves usually much less than 3 cm long; plants of various distribution 5
- 5(4). Inflorescences not especially involucrate; plants perennial; locules 1-seeded 6
- Inflorescences usually definitely involucrate; plants annual, locules with more than 1 seed (except in some *G. gunnisonii*) 7
- 6(5). Flowers cream (fading yellow), the corolla tube much exerted from the calyx; calyx 5.5-8.5 mm long; plants often woody at the base; staminal filaments subequal to the anthers in length; plants of eastern Utah *G. roseata*
- Flowers white, sometimes fading yellowish, the corolla tube included in the calyx; calyx 3-5 mm long; plants seldom woody at the base; staminal filaments much longer than the anthers; plants widely distributed *G. congesta*

- 7(5). Leaves entire or nearly all entire 8
 — Leaves pinnatifid to subpalmatifid 9
- 8(7). Leaves and bracts with definite flat blades, tapering to the base; plants of western Utah *G. depressa*
 — Leaves and bracts linear or acicular, not tapering to the base; plants of southeastern Utah ... *G. gunnisonii*
- 9(7). Leaves trifid or pinnately 5-cleft; corolla lobes mostly 2–3.5 mm long; plants of eastern Utah *G. pumila*
 — Leaves sharply pinnatifid, usually with 5–9 teeth or lobes; corolla lobes 1–1.8 mm long; plants widespread *G. polycladon*
- 10(1). Plants perennial from a branching caudex; flowers red; plants from western Wayne County . . . *G. caespitosa*
 — Plants annual or biennial, a caudex not developed; flowers variously colored; distribution various 11
- 11(10). Overall corolla length 1.5–4.5 cm or more 12
 — Overall corolla length 0.2–1 cm 15
- 12(11). Basal leaves obovate-spatulate, merely dentate; corollas usually carmine; plants of southeastern Utah *G. subnuda*
 — Basal leaves variously shaped, definitely pinnatifid; flowers variously colored; distribution various 13
- 13(12). Basal leaves with a rachis 2–4 mm wide; flowers lavender to blue purple, funnelform, 1.5–2 cm long; plants of San Juan County *G. haydenii*
 — Basal leaves with the rachis commonly less than 2 mm wide; flowers scarlet, salmon, pink, white, or blue; distribution various 14
- 14(13). Flowers usually white to blue; lateral lobes of cauline leaves mostly 1–2 cm long; plants of lower elevations in southeastern Utah *G. longiflora*
 — Flowers scarlet, salmon, pink, or white; lateral lobes of cauline leaves usually less than 1 cm long; distribution almost universal *G. aggregata*
- 15(11). Leaves about as broad as long, dentate, the teeth spinulose; plants uncommon, of southeastern and southern Utah *G. latifolia*
 — Leaves usually much longer than broad, entire to dentate and sometimes with spinulose teeth; distribution various 16
- 16(15). Corolla yellow; leaves linear-filiform, mainly cauline; plants of Washington County *G. filiformis*
 — Corolla lavender, pink, blue, or purple (rarely white); leaves mainly basal or mainly cauline; plants of various distribution 17
- 17(16). Stamens exerted, subequal to or longer than the corolla lobes; flowers usually blue; plants of eastern to southcentral Utah *G. pinnatifida*
 — Stamens included, much surpassed by the corolla lobes; flowers variously colored; distribution various. . . 18
- 18(17). Leaves entire or nearly so (sometimes prominently lobed in *G. gilioides*), all or mainly cauline, the lowermost sometimes opposite 19
 — Leaves toothed, pinnatifid, or palmatifid, mainly in a basal rosette 21
- 19(18). Leaves definitely lobed or strongly toothed, at least some; plants of southwestern Utah *G. gilioides*
 — Leaves entire; plants of south-central to northern Utah 20
- 20(19). Corollas 1.5–3 mm long; capsules 1.5–2 mm long, plants along the central highlands from south-central to northern Utah *G. tenerrima*
- Corollas mostly 4–9 mm long, capsules 1.5–3 mm long; plants reported for northern Utah . . . *G. capillaris*
- 21(18). Basal and lower cauline leaves and stem base villous to pilose; plants of Washington County 22
 — Basal and lower cauline leaves and stem base glabrous or glandular (or rarely arachnoid-tomentose); distribution various 23
- 22(21). Corolla tube much longer than the calyx *G. scopulorum*
 — Corolla tube included in the calyx *G. stellata*
- 23(21). Upper stem with purplish black, peglike glands; corolla limb as wide as the corolla length; plants of Kane County *G. flavocincta*
 — Upper stem variously glandular or glabrous, seldom as above (in *G. inconspicua*); corolla limb narrower than the corolla length; plants more widely distributed 24
- 24(23). Lower leaves spatulate-oblongate, toothed or lobed, the lobes not exceeding twice the width of the rachis; corolla 2–6.5 mm long, the lobes tridentate or cuspidate-acuminate apically *G. leptomeria*
 — Lower leaves variously shaped, pinnatifid to bipinnatifid, but if as above, the corolla more than 7 mm long and the lobes commonly rounded 25
- 25(24). Leaves pinnatifid to bipinnatifid and with a broad to narrow rachis; stem base and lower leaves often arachnoid-tomentose; corolla tube included in the calyx *G. inconspicua*
 — Leaves usually bipinnatifid, the rachis much narrower than the length of the divisions; corolla tube surpassing the calyx *G. hutchinsifolia*

Gilia aggregata (Pursh) Sprengel Scarlet Gilia. [*Cantua aggregata* Pursh; *Ipomopsis aggregata* (Pursh) V. Grant; *G. a.* ssp. *a.* var. *attenuata* f. *utahensis* Brand, type from Alta]. Biennial (or perennial?), mephitic herbs; stems arising from a basal rosette and taproot, 1–10 dm tall, stipitate-glandular or with crinkly white hairs; basal leaves mainly 2–8 cm long, pinnatifid to sub-bipinnatifid, the rachis and segments narrow, the segments mainly 1–12 mm long; cauline leaves reduced upward; flowers short-pedicellate, thyrsoid to more or less paniculate, this more or less bracteate; corolla 1.5–5 cm long, the lobes spreading, 5–12 mm long, scarlet, pink, salmon, bluish, or white and sometimes maculate; staminal filaments subequally inserted on the corolla tube, the anthers included or exerted; seeds 1 to several per locule; capsules 4–8 mm long; seeds 2–4 mm long, becoming mucilaginous when wet; $n = 7$. Warm desert shrub, sagebrush, pinyon-juniper, mountain brush, ponderosa pine, aspen, spruce-fir, and alpine meadow communities at 820 to 3295 m in all Utah counties; British Columbia to Montana, south to California, Arizona, New Mexico, Texas, and Mexico; 297 (xxxviii). This strikingly beautiful species, with the odor of a skunk, is practically ubiquitous in Utah, but is collected even where uncommon because it is so easily seen. There are four more or less completely intergrading phases among our specimens that have been recognized at various taxonomic ranks. Their recognition at varietal rank is tenuous, but some of the phases are remarkably distinct in the extreme. Because of the apparent differences, the plants are traditionally segregated at varietal level. They consist of: 1) high elevation plants with multicolored flowers having the corolla tube mainly less than 3 mm wide apically, known as var. *macrosiphon*

Kearney & Peebles [*G. tenuituba* Rydb., type from near Beaver]; 2) ubiquitous, scarlet-flowered plants with corolla tube more than 3 mm wide apically and calyx lobes usually longer than the tube in anthesis, known as var. *aggregata*; 3) scarlet-flowered plants with calyx teeth subequal to or slightly longer than the broad tube and exserted anthers from Emery, Garfield, Grand, and San Juan counties, known as var. *maculata* Jones; and 4) scarlet, short-flowered plants with calyx teeth subequal to the broad tube or slightly longer and with stamens included from Iron, Kane, and Washington counties, known as var. *arizonica* (Greene) Fosberg [*Callisteris arizonica* Greene; *G. arizonica* (Greene) Rydb.]. The varieties *macrosiphon* and *arizonica* are most easily distinguished from the type variety, but transitional specimens are present.

Gilia caespitosa Gray Rabbit Valley *Gilia*. Pulvinate-caespitose herbs from a taproot and branching caudex, the caudex clothed with persistent leaf bases and terminated by rosettes of leaves; herbage stipitate-glandular, commonly with adherent sand grains; flowering stems 3–8.5 cm tall; basal leaves 3–20 mm long, 1–3 mm wide, oblanceolate to linear, entire or few-lobed, spinulose-apiculate; cauline leaves with few, reduced leaves; flowers solitary or few to several in cymes; calyx 4–6 mm long, the lobes subequal to the tube; corolla scarlet (sometimes fading maroon or blue purple), salverform, the tube 9–17 mm long, the lobes 4–6 mm long; stamens included, the filaments subequally inserted; capsule 4–5 mm long, few-seeded; seeds not mucilaginous when wet; $2n = 14$. Pinyon-juniper-cercocarpus communities at 1735 to 2595 m on Carmel and Navajo formations in Wayne County (type from Rabbit Valley); endemic; 6 (ii). This beautiful low plant was collected first in 1875 by L. F. Ward of the Powell Survey, but remained obscure for almost seven decades until it was rediscovered by Ripley and Barneby in 1947.

Gilia capillaris Kellogg Annual, mephitic herbs, with stipitate-glandular stems and branches, these mainly 0.5–3 dm tall; leaves 0.5–3.5 cm long or more, 1–4 mm wide, linear to narrowly oblong, alternate or the lower ones opposite, all cauline and reduced upward; flowers terminal and solitary or somewhat cymose; calyx 2.3–5 mm long, the lobes often unequal, about as long as the tube or shorter; corolla lavender to bluish or white, 4–9 mm long, the lobes short; the filaments equal; capsule 3–4 mm long; seeds 0.8–1.5 mm long, mucilaginous when wet. Reported for northern Utah in the Intermountain Flora (Cronquist 1984), but not seen by me; Washington to Idaho, south to California and Nevada; 0 (0).

Gilia congesta Hook. [*Ipomopsis congesta* (Hook.) V. Grant]. Perennial herbs or subshrubs from taproots, the caudex more or less developed, superficial, below, or above ground; stems 0.5–8 dm tall, simple or branched; herbage with white, villous tomentum or varying to glabrous; leaves basal and/or cauline, entire (and linear) to pinnatifid or palmatifid, 0.5–4 cm long or more; flowers numerous in dense, terminal, more or less bracteate, cymose heads; calyx 3–5 mm long, the lobes spinulose-tipped, usually shorter than the tube; corolla white (or purplish), the tube 3–5 mm long, subequal to the calyx or slightly longer; corolla lobes 1.5–3 mm long; stamens attached to the sinuses, the filaments longer than the anthers, these 0.4–0.8 mm long, produced above the corolla tube; ovules 1 or 2 per locule; capsule 2.5–4 mm

long, usually with 1 seed per locule; seeds 1.6–2.5 mm long, mucilaginous when wet. Four rather clearly definable but partially confluent varieties are present in Utah.

- 1. Leaves glabrous (rarely some tomentose), usually green 2
- Leaves arachnoid-tomentose, usually appearing whitish or grayish 3
- 2(1). Leaves entire (rarely some trifid); plants 3–12 cm tall *G. congesta* var. *crebrifolia*
- Leaves commonly trifid (or some pinnatifid to entire); plants mainly 10–30 cm tall ... *G. congesta* var. *palmifrons*
- 3(1). Plants mainly 1.5–8 dm tall, usually woody at the base; leaves commonly entire; plants of southern Utah
- *G. congesta* var. *frutescens*
- Plants mainly 0.3–2 dm tall, seldom woody at the base; leaves palmatifid to pinnatifid (or some entire); plants widespread *G. congesta* var. *congesta*

Var. *congesta* [*G. congesta* var. *paniculata* Jones, type from Huntington; *G. burleyana* A. Nels.; *G. congesta* var. *burleyana* (A. Nels.) Const. & Rollins]. Shadscale, greasewood, sagebrush, and pinyon-juniper communities at 1525 to 2290 m in Beaver, Box Elder, Carbon, Daggett, Duchesne, Emery, Iron, Juab, Millard, Piute (?), Sanpete, Sevier, Tooele, Uintah, Washington, and Wayne counties; Oregon to Wyoming, south to California, Nevada, and Colorado; 105 (xxii).

Var. *crebrifolia* (Nutt.) Gray [*G. crebrifolia* Nutt.]. Sagebrush, pinyon-juniper, mountain brush, white fir and bristlecone pine communities at 1830 to 2780 m in Beaver, Millard, Rich, San Juan, and Summit counties; Montana and Wyoming south to New Mexico; 13 (iii). The disjunct distribution of this variety is unique for infraspecific taxa in this species. Perhaps this indicates arbitrary assignment of similar but independently derived populations. Independent origin of Beaver and Millard counties material is suggested by the presence of some specimens transitional to var. *congesta*.

Var. *frutescens* (Rydb.) Cronq. [*G. frutescens* Rydb., type from Springdale, Washington County; *Ipomopsis frutescens* (Rydb.) V. Grant]. Sandy desert shrub and grassland, pinyon-juniper, hanging garden, mountain brush, pinyon-juniper, and ponderosa pine communities at 1155 to 2290 m in Garfield, Kane, San Juan, and Washington counties; Colorado and Arizona; 24 (ix). This is the most distinctive phase of the *congesta* complex. Plants are often woody for 1–2 dm above ground level.

Var. *palmifrons* (Brand) Cronq. [*G. congesta* ssp. *palmifrons* Brand]. Shadscale, greasewood, rabbitbrush, sagebrush, and pinyon-juniper communities at 1495 to 1680 m in Beaver, Juab, Millard, and Tooele counties; Oregon, Idaho, and Nevada; 9 (0). Identification of our specimens with this variety is tentative. More work is indicated.

Gilia depressa Jones [*Ipomopsis depressa* (Jones) V. Grant]. Annual, mephitic herbs, the herbage puberulent to villous with crinkly multicellular hairs, these often glandular; stems branching from the base (or simple), 2.5–12 cm long; leaves mostly cauline, 0.5–1.8 cm long, 1.5–6 mm wide, elliptic to lanceolate or linear, entire or irregularly toothed; flowers few, in leafy-bracteate cymes or some axillary and solitary; calyx 3.5–6 mm long, the lobes spine-tipped, subequal to or longer than the tube; corolla white, 5–8 mm long, almost regular, the lobes

1–1.8 mm long; stamens inserted near the top of the corolla tube; anthers exerted; capsule 3–4 mm long, shorter than the calyx; seeds several per locule, 1.2–1.4 mm long, mucilaginous when wet. Shadscale, winterfat, galleta, and Indian ricegrass communities at 1340 to 1710 m in Beaver, Juab, and Millard (type from Deseret) counties; Nevada and California; 6 (0).

Gilia filiformis Parry ex Gray Yellow *Gilia*. Annual, slender herbs, 0.8–1.5 dm tall, branched from below the middle, stipitate-glandular to glabrous; leaves cauline, 0.6–3 cm long, 0.5–1 mm wide, linear to filiform; flowers solitary or few in open cymes, the pedicels capillary; calyx 2.5–4 mm long, the lobes lance-acuminate, usually longer than the tube; corolla yellow, 3.5–7 mm long, campanulate, lobed almost to the base; staminal filaments inserted near the base of the tube; capsules 2.5–3 mm long; seeds several to many per locule, ca 0.8 mm long, mucilaginous when wet. Creosote bush and Joshua tree communities at 820 to 980 m in Washington County (type from St. George); Arizona, Nevada, and California; 3 (0).

Gilia flavocincta A. Nels. Annual or winter annual herbs from taproots and basal rosettes; stems mainly 1–3 dm tall, arachnoid-tomentose below and stipitate-glandular with purplish-black, peglike glands upward; basal leaves 0.8–6 cm long, pinnatifid to bipinnatifid, the rachis narrower than the length of the longest lobes; inflorescences compactly to openly cymose, inconspicuously bracteate; calyx 3–5 mm long, the triangular lobes shorter than the tube; corolla white to pale lavender, with yellow tube, 7–9 mm long, the limb 7–9 mm wide; stamens equally inserted; capsules equaling or surpassing the calyx; seeds 1 per locule, ca 3.5 mm long. Salt desert shrub at ca 1340 m in Kane County (Atwood 4547 BRV); Arizona and New Mexico; 1 (0). Our specimen has been identified as belonging to *ssp. australis* (A. & V. Grant) Day & V. Grant [*G. ophthalnoides* *ssp. australis* A. & V. Grant].

Gilia glioides (Benth.) Greene [*Colomia glioides* Benth.]. Mephitic caulescent annual; stems ascending to almost erect, mostly 0.5–3 dm tall, glandular-hairy; leaves mainly or all cauline, entire or some or most of them with 1 or more irregularly disposed lateral lobes, mainly 1–3 cm long, 1–3 mm wide exclusive of the lobes; flowers terminating branches, but often appearing lateral because of the branching pattern; pedicels short to elongate, often paired; calyx 3–4.5 mm long at anthesis, with rather narrow intercostal membranes, the slender lobes subequal to or longer than the tube; corolla blue to violet, 5–8 mm long, funnelform; staminal filaments subequally inserted on the corolla tube; anthers included or essentially so, surpassed by the corolla lobes; capsule 2.5–3.5 mm long; seeds ellipsoid, 1.5–2.5 mm long, usually 1 per locule, becoming mucilaginous when wet; $2n = 18$. Pinyon-juniper and sagebrush communities at ca 1745 m in northwestern Washington County; Arizona, Nevada, California, and Oregon; 1 (0). The species is known from Utah by a collection taken by L. C. Higgins in 1985 (15737 BRV).

Gilia gunnisonii T. & G. Gunnison *Gilia*. [*Ipomopsis gunnisonii* (T. & G.) V. Grant]. Annual (or winter annual) herbs; herbage puberulent to stipitate-glandular or glabrous; stems simple or branched from near the base, 6–25 cm long; leaves cauline, 0.5–4 cm long, 0.5–1.2 mm wide, linear, entire, or with 2–4 lateral lobes; flowers few to many in terminal, cymose, more or less bracteate clusters; calyx 3.5–4.5 mm long, the lance-subulate teeth

spinescent, shorter than the tube, often ruptured in fruit; corolla white to lavender, 6–10 mm long; stamens equally inserted, unequal, exerted; capsule 2.5–3.5 mm long; seeds 1 or 2 per locule, 1.5–2.5 mm long. Sandy desert shrub, shadscale, sagebrush, purple sage, and pinyon-juniper communities at 1125 to 1830 m in Emery, Garfield, Grand, Kane, and San Juan counties; Arizona and New Mexico; 72 (xi). The type was collected at Green River by F. Creutzfeldt of the ill-fated Gunnison expedition in 1853.

Gilia haydenii Gray Hayden *Gilia*. Biennial (or winter annual) herbs from taproots and basal rosettes; stems mainly 1.5–4.5 dm tall; herbage glandular to stipitate-glandular or coarsely villous (especially on the leaves); basal leaves pinnatifid, the rachis broad, but usually narrower than the length of the longest lateral lobes; inflorescence paniculately cymose, inconspicuously bracteate; calyx 3.5–5.5 mm long, the narrowly triangular lobes shorter than the tube; corolla rose purple to pink lavender, drying blue purple, the tube 13–16 mm long, the limb 10–12 mm wide; stamens equally inserted, the anthers slightly exerted; capsules subequal to the calyx; seeds several per locule. Blackbrush, matchweed, and shadscale communities at ca 1370 to 1525 m in southeastern San Juan County; Colorado and Mexico; 4 (0).

Gilia hutchinsifolia Rydb. [*G. arenaria* *ssp. leptantha* var. *rubella* Brand, type from St. George; *G. leptomeria* *ssp. rubella* (Brand) Mason & Grant]. Annual (or winter annual) herbs from taproots and basal rosettes; stems mainly 0.7–3.5 dm tall; herbage stipitate-glandular and sometimes with nonglandular hairs as well; basal leaves 1–11 cm long, doubly pinnatifid, the rachis narrower than the length of the primary divisions; cauline leaves reduced upward; inflorescence paniculately cymose, inconspicuously bracteate; calyx 3–3.8 mm long, the oblong to triangular lobes subequal to or shorter than the tube; corolla 7–13 mm long, lavender to white, the lobes rounded to obtuse, the limb 5–10 mm wide, the tube white to yellowish; stamens attached at the corolla sinuses, the anthers surpassed by the corolla lobes; capsules 4–5.5 mm long, subequal to the calyx; locules several-seeded, the seeds 0.6–0.9 mm long, not mucilaginous when wet. Blackbrush, other warm desert shrub, shadscale, winterfat, horsebrush, ephedra, and Indian ricegrass-galleta grass communities at 915 to 1740 m in Garfield, Juab, Kane, Millard, San Juan, Tooele (Carrington Island), and Washington counties; Arizona, Nevada, and California; 26 (iv).

Gilia inconspicua (J. E. Sm.) Sweet [*Ipomopsis inconspicua* J. E. Sm.; *G. sinuata* Dougl. ex Benth; *G. inconspicua* var. *variegata* Brand, type from Kanab; *G. ophthalnoides* Brand; *G. brecciarum* Jones; *G. straminea* Rydb., type from St. George; *G. clokeyi* Mason; *G. ochroleuca* *ssp. transmontana* Mason & Grant]. Annual (or winter annual) herbs from taproots and basal rosettes; stems mainly 0.5–4.5 dm tall; herbage typically arachnoid-tomentose below, becoming stipitate-glandular and often with peglike, purplish glands above; basal leaves 0.3–8 cm long, pinnatifid to bipinnatifid or merely lobed, the rachis narrower to broader than the length of the lateral segments; cauline leaves much reduced upward, inflorescence spicately to paniculately cymose; calyx 3–6.1 mm long, the triangular-attenuate lobes subequal to or shorter than the tube; corolla 4–12 mm long, funnelform, blue to lavender or white, the limb mostly 4–7

mm wide, the lobes rounded to obtuse apically; stamens inserted at the sinuses of the corolla, subequal to or longer than the anthers, these ca 0.5 mm long; capsules 3–6 mm long; seeds 1.4–2 mm long, mucilaginous when wet. Creosote bush, Joshua tree, blackbrush, other warm desert shrub, shadscale, hopsage, pinyon-juniper, sagebrush, and mountain brush communities at 760 to 2290 m in Beaver, Box Elder, Carbon, Daggett, Duchesne, Emery, Garfield, Juab, Kane, Millard, Piute, San Juan, Sanpete, Sevier, Tooele, Uintah, Utah, Washington, and Wayne counties; Washington to Wyoming, south to California, Nevada, Arizona, and New Mexico; 185 (xviii). Plants with merely lobed to once-pinnatifid leaves belong to var. *sinuata* (Hook.) Gray; those with bipinnatifid leaves are var. *inconspicua*. It is unfortunate that this distinctive species should have borne so many epithets, but the large number of names is indicative of the variation within this and the other annual, small-flowered gilia.

Gilia latifolia Wats. Spiny Gilia. Annual herbs from taproots, the basal rosette not well developed; stems 0.5–4.6 dm tall, usually branched from near the base; herbage stipitate-glandular; leaves petiolate, the blades 0.5–4.5 cm long, 4–30 mm wide, ovate to oval or elliptic, coarsely dentate, the teeth spinulose-tipped; flowers numerous in paniculate cymes; calyx 2.9–4.5 mm long, the subulate teeth spinulose apically; corolla 6–11 mm long, salverform to funnellform, pink to purplish; stamens inserted in the corolla tube; capsule shorter to longer than the calyx; seeds several per locule, 0.5–0.9 mm long, yellow brown, not mucilaginous when wet. Mixed warm and cool desert shrub communities at 1000 to 1590 m in Emery, Garfield, Kane, San Juan, Washington (type from near St. George), and Wayne counties; California, Arizona, and Nevada; 13 (vi). The specimens from the San Rafael Swell, Cataract Canyon, and Warm Creek appear to have somewhat smaller capsules, more confluent leaves, and ultimately more intricately branched inflorescences than do those from the body of the species to the west. Possibly they warrant taxonomic recognition, but no single feature or combination of features seem sufficient to segregate all specimens.

Gilia leptomeria Gray Annual, ill-scented herbs from taproots and basal rosettes; stems 0.4–2.2 (3) dm tall; herbage hirtellous to stipitate-glandular; basal leaves 0.4–8.5 cm long, 1.5–18 mm wide, oblanceolate to spatulate, dentate to pinnately lobed the rachis broader than the length of the lateral teeth or lobes; cauline leaves much reduced upward; flowers few to numerous in paniculate cymes; calyx 1.5–3.5 mm long, the teeth triangular-oblong, shorter than the tube; corolla 2–6.5 mm long, salverform, pink to lavender or white, the lobes shorter than the tube, mucronate or tridentate; filaments subequal, inserted at the sinuses; anthers ca 0.5 mm long; seeds several per locule, 0.5–0.9 mm long, not mucilaginous when wet. Blackbrush, other warm desert shrub, greasewood, shadscale, sagebrush, mountain brush, pinyon-juniper and ponderosa pine communities at 820 to 2350 m in Beaver, Box Elder, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Kane, Millard, Piute, Salt Lake, San Juan, Sanpete (?), Sevier, Tooele, Uintah, Utah, Washington (type from near St. George), and Wayne counties; Washington to Wyoming, south to California, Nevada, Arizona, and New Mexico; 98 (xiv). Two varieties are recognized; var. *micromeria*

(Gray) Cronq. [*G. micromeria* Gray; *G. leptomeria* ssp. *micromeria* (Gray) Mason & Grant], with calyx less than 2.5 and corolla less than 3.5 mm long; and var. *leptomeria* [*G. triodon* Eastw., type from San Juan County; *G. leptomeria* var. *tridentata* Jones, type from near Emery], with longer calyx and corollas.

Gilia longiflora (Torr.) D. Don [*Cantua longiflora* Torr.; *Ipomopsis longiflora* (Torr.) V. Grant]. Annual (winter annual) or biennial, inodorous (?) herbs; stems arising from a taproot, the basal rosette poorly developed and usually withered at anthesis, 1.5–6 dm tall; herbage sparingly white villous (leaves), glabrous, or minutely glandular (on calyces especially); cauline leaves 1–5 cm long, pinnatifid, the rachis and segments linear, somewhat reduced upward; flowers on short to very long pedicels, borne in more or less flat-topped, paniculate, cymes, these more or less bracteate; calyx 4.5–8 mm long, the lance-attenuate lobes subequal to the tube or shorter; corollas 2.5–5.5 cm long, the lobes spreading, 5–12 mm long, pale blue to white, salverform; staminal filaments subequally inserted on the corolla tube, the anthers included or exerted; capsules 7–14 mm long; seeds 3–4 mm long, becoming mucilaginous when wet. Sandy desert shrub, warm desert shrub, sagebrush, and pinyon-juniper communities at 975 to 2135 m in Garfield, Grand, Kane, San Juan, Washington, and Wayne counties; South Dakota to Texas, west to Colorado and Arizona; 28 (ix).

Gilia pinnatifida Nutt. [*G. calcarea* Jones; *G. mcvickeae* Jones, type from near Marysvale]. Annual (winter annual) or biennial to short-lived perennial herbs from taproots and basal rosettes; stems 1–6 dm tall; herbage glandular to stipitate-glandular or subglabrous; basal leaves 1–7 cm long, 5–15 mm wide, the rachis narrow to broad, but mostly narrower than the length of the lateral segments; inflorescence paniculately cymose, more or less bracteate; calyx 2.5–5.2 mm long, the lobes shorter than the tube; corolla blue to blue purple, the tube 3–9 mm long, the lobes 3–5 mm long, spreading; stamens inserted below the sinuses, long-exserted; capsules subequal to or longer than the calyx; seeds 2 or more per locule, mainly 1.2–1.5 mm long, not mucilaginous when wet. Mixed desert shrub and grass, sagebrush, pinyon-juniper, and mixed conifer communities at 1585 to 2900 m in Daggett, Emery, Garfield, Iron, Kane, Piute, Sevier, and Uintah counties; Wyoming and Nebraska to New Mexico; 23 (v).

Gilia polycladon Torr. [*Ipomopsis polycladon* (Torr.) V. Grant]. Annual or winter annual herbs; herbage more or less villous with crinkly, multicellular hairs and commonly more or less glandular; stems branched from near the base (or simple), 2.5–24 cm long; leaves basal and cauline, the basal ones 0.6–3 cm long, pinnatifid, the cauline ones few, subequal to the bracts; flowers few to several in leafy-bracteate, terminal cymes, the bracts pinnately toothed or lobed; calyx 4–6 mm long, the thick-end, ovate-acuminate lobes spinulose-tipped, shorter than the tube; corolla white, 3–6 mm long, the lobes 1–1.8 mm long; stamens inserted near the sinuses of the corolla; anthers barely exerted; capsules 3–4.5 mm long; seeds several per locule, 1.5–2.5 mm long, mucilaginous when wet. Creosote bush, Joshua tree, blackbrush, other warm desert shrub, shadscale, galleta, horsebrush, sagebrush, and pinyon-juniper communities at 730 to 1895 m in Beaver, Carbon, Duchesne, Emery, Garfield, Grand,

Iron (?) Juab, Kane, Millard, San Juan, Sevier, Tooele, Uintah, Washington, and Wayne counties; California, Nevada, Idaho, Colorado, Arizona, New Mexico, and Texas; 71 (vi).

Gilia pumila Nutt. [*Ipomopsis pumila* (Nutt.) V. Grant]. Annual or winter annual herbs; herbage more or less villous with crinkly, multicellular hairs and sometimes finely glandular; stems branching near the base or above, or simple, 2–23 cm long; leaves mainly cauline, the basal rosettes only weakly developed, pinnately or subpalmately 3- to 7-lobed, or the lower ones entire, mainly 0.6–3 cm long; flowers few to several in leafy-bracteate, terminal cymes, or with some solitary in leaf axils, the bracts pinnatilobate or palmatifid like the leaves; calyx 3.5–5.2 mm long, the lance-acuminate lobes spinulose (or bristle)-tipped, subequal to or shorter than the tube; corolla tube 7–9 mm long, mucilaginous when wet. Shadscale-greasewood, other salt desert shrub, sagebrush, and pinyon-juniper communities at 1370 to 1955 m in Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Kane, Sevier, Uintah, and Wayne (?) counties; Colorado, Arizona, New Mexico, and Texas; 33 (v).

Gilia roseata Rydb. [*Ipomopsis roseata* (Rydb.) V. Grant; *G. congesta* var. *nuda* Eastw., type from San Juan County]. Perennial herbs or subshrubs from taproots, the caudex typically well developed, usually above ground; stems 5–35 cm tall, branched; herbage sparingly villous with crinkly, multicellular hairs to subglabrous or minutely to stipitate glandular; leaves mainly cauline, entire (and linear) or more commonly pinnatifid and with 2–4 pairs of lobes, 0.5–4 cm long or more; flowers few to numerous in dense, more or less bracteate, cymose heads; calyx 5.5–8.5 mm long, the ovate-acuminate lobes spinulose apically; corolla tube 7–9 mm long, well-exserted from the calyx, the lobes 2.5–4 mm long; stamens inserted at the sinuses, the filaments about as long as the anthers, produced beyond the corolla tube; capsules 3–5 mm long, with 1 seed per locule, the seeds 3–4 mm long, mucilaginous when wet. Blackbrush, warm, salt, and sand desert shrub, pinyon-juniper, and sagebrush communities at 1190 to 2290 m in Duchesne, Emery, Garfield, Grand, San Juan, and Uintah counties; Colorado; a Colorado Plateau endemic; 57 (viii). Cross appearance of this plant places it with *G. congesta*, but it is probably more closely allied to *G. spicata* (q. v.).

Gilia scopulorum Jones [*G. scopulorum* var. *deformis* Brand, type from near St. George]. Annual, mephitic to inodorous herbs from taproots, the basal rosettes developed or not; stems 1.5–4 dm tall; herbage glandular-villous, with long multicellular, often crinkly hairs, or merely stipitate-glandular upwards; leaves basal or borne in the lower 1/4–1/2 of the plant, 1–6 (10) cm long, 5–22 (35) mm wide, irregularly pinnately lobed to sub-bipinnatifid, the upper ones reduced, bracteate; flowers numerous, borne in open, paniculate, more or less bracteate cymes; calyx 3.5–5.8 mm long, the lance-subulate lobes usually shorter than the tube; corollas 10–16 mm long, the tube much longer than the calyx, salverform to funnellform, the lobes acute to obtuse; filaments subequal, inserted below the sinuses; anthers ca 0.5–0.6 mm long; seeds few per locule, 1.4–2 mm long, mucilaginous when wet. Creosote bush, Joshua tree, blackbrush, and mountain brush communities at 730 to 1100 m in Washington County (type from near St. George); Arizona, Nevada, and California; 17 (iv). Irregularly lobed leaves are almost a hallmark of this species

Gilia spicata Nutt. [*Ipomopsis spicata* (Nutt.) V. Grant]. Perennial herbs from a taproot and simple or branched caudex, the caudex clothed with persistent leaf bases; stems 0.5–4 dm tall, erect, simple; herbage villous-tomentose, becoming glandular upward; leaves basal and cauline, 1.5–7 cm long, 1–2 mm wide, linear and entire or pinnatilobate; flowers numerous, borne in a compact, cylindroid, thyrsoid-spicate inflorescence, this often more than half the plant height; calyx 4.5–6 mm long, the triangular lobes spinulose-tipped, usually shorter than the tube; corolla whitish to yellowish brown, the tube 5–7 mm long, equaling or somewhat longer than the calyx, the lobes spreading, 2–4 mm long; staminal filaments attached at the sinuses, very short, the anthers 0.6–1 mm long; capsules subequal to the calyx, each locule 1-seeded; seeds 2.5–3 mm long, mucilaginous when wet. Juniper and sagebrush communities, often on barrens, at 1750 to 1890 m in Daggett County; Idaho and Montana, south to New Mexico; 6 (i). Our material belongs to var. *spicata*. There is a specimen at BRY (Cora Shoop 43, 16 May 1930) that bears the locality data of “near Ogden, Utah.” The supposition that the specimen is correctly labeled is supported by a previous report for the species from Weber or Morgan County by the Hayden expedition in 1871.

Gilia stellata Heller Annual herbs from taproots and basal rosettes; stems 1.5–4 dm tall; herbage white-villous (especially on leaves and lower stem), often stipitate-glandular or intermixed glandular and villous trichomes upward; basal leaves 1.5–8.5 cm long, 3–30 mm wide, once or more commonly twice pinnatifid; cauline leaves reduced upward; flowers several to many, borne in paniculate, more or less bracteate cymes; calyx 2.5–5.5 mm long, the lobes triangular-attenuate, shorter than the tube, bearing purple, capitate glands on multicellular hairs; corolla 5–8 mm long, the tube included in the calyx, salverform or funnellform, lavender to white; staminal filaments inserted at the sinuses, the filaments about as long as the anthers, those 0.2–0.4 mm long; capsules equaling or surpassing the calyx; seeds 1.2–1.6 mm long. Creosote bush, Joshua tree, and other warm desert shrub communities at 730 to 915 m in Washington County; Arizona, Nevada, and California; 5 (ii).

Gilia stenothyrsa Gray Biennial (or perennial?) herbs from taproots and thick basal rosettes; stems 1–5 (6) dm tall; herbage minutely glandular to subglabrous below, becoming stipitate-glandular above; leaves 1–5 (6) cm long, 3–12 mm wide, pinnately toothed and with the blade broader than the length of the teeth or lobes, or pinnatifid and with the segments much longer than the rachis width; cauline leaves much reduced above; inflorescence thyrsoid-paniculate, cylindroid to obconic, comprising half or more of the plant height, more or less bracteate; calyx 3.5–6 mm long, the triangular lobes usually shorter than the tube, bristle-tipped; corolla white to lavender, blue, or purple, the tube 6–10 mm long, the lobes spreading, 3–5 mm long; staminal filaments inserted in the corolla tube, long-exserted; capsules surpassing the calyx; seeds several per locule, 1.5–2 mm long, not mucilaginous when wet. Shadscale, greasewood, other salt desert shrub, black sagebrush, and pinyon-juniper communities, often on barrens, at 1555 to 2840 m in Duchesne (type locality), Emery, and Uintah counties; endemic; 65 (x). This plant was collected first by John Charles Fremont on his second expedition in 1844.

Gilia subnuda Torr. ex Gray [*G. superba* Eastw., type from Hache's Wash, San Juan County]. Biennial or perennial, more or less mephitic herbs from taproots and basal rosettes, a caudex more or less developed, simple or branched, clothed with marcescent leaf bases; stems 1.3–5 dm tall; herbage sparingly to densely glandular-viscid, typically with adhering sand grains, becoming stipitate-glandular above, or with the leaves more or less puberulent; basal leaves 2–9 cm long, 0.6–2.5 cm wide, spatulate to oblanceolate or obovate, merely toothed or pinnately lobed to entire, the blade much broader than the length of the teeth or lobes; inflorescence paniculately cymose, inconspicuously bracteate, the flowers typically clustered near branch ends; calyx 5–7.5 mm long, the triangular to lance-attenuate lobes longer to shorter than the tube; corolla carmine to vermilion, the tube 11–19 mm long, the limb 12–18 mm wide; stamens equally inserted, the anthers included; capsules subequal to the calyx; seeds few per locule, not mucilaginous when wet. Warm desert shrub, sagebrush, and pinyon-juniper communities in Emery, Garfield, Kane, San Juan, and Wayne counties; Colorado, New Mexico, and Arizona; 62 (xviii).

Gilia tenerrima Gray Annual herbs from taproots; stems 5–15 (20) cm tall; herbage stipitate-glandular, the capitate glands purplish black, or the leaves subglabrous; leaves mainly 3–20 mm long, 0.4–4 mm wide, linear to narrowly oblong, cauline and alternate or the basal in a weakly developed rosette, reduced in the inflorescence; flowers numerous in diffusely branched, paniculate cymose, the inflorescences often comprising more than half the plant height; calyx 1–1.8 mm long, the triangular lobes shorter than or subequal to the tube; corolla white to lavender, campanulate, 1.5–3.5 mm long, the lobes subequal to the tube or shorter; filaments inserted below the sinuses; capsules subequal to the calyx; seeds 0.8–1.2 mm long, mucilaginous when wet. Mountain brush, sagebrush, juniper, and ponderosa pine communities at 2070 to 2595 m in Cache, Salt Lake, Sevier, and Summit (type from valley of the Bear River) counties; Oregon to Montana, south to Nevada and Wyoming; 4 (i).

Gilia tridactyla Rydb. [*G. spicata* var. *tridactyla* (Rydb.) Const. & Rollins]. Perennial herbs from a taproot and usually branched caudex, the caudex clothed with brown, marcescent leaf bases; stems 5–12 (15) cm tall, erect, simple or branched above; herbage villous-tomentose, becoming villous-pilose upward; basal leaves rosettelike at the caudex apices, linear and entire or trifid, 0.3–2.5 cm long, 1–5 mm wide; flowers numerous, borne in compact, inconspicuously bracteate, terminal or lateral, headlike cymes, these usually much less than half the plant height; calyx 5–6.2 mm long, the triangular-acuminate teeth shorter than the tube; corolla whitish or yellowish (fading brown), the tube 6–8 mm long, commonly surpassing the calyx, the lobes spreading, 2–4 mm long; staminal filaments inserted in the corolla tube, the anthers 0.8–1 mm long; capsules subequal to the calyx or shorter; seeds 2.2–4 mm long, mucilaginous when wet. Spruce-fir, grass-forb, and sedge-forb communities, often on talus, at 3050 to 3450 m in Iron and Piute (type from Brigham Peak) counties; endemic; 9 (iii).

Gymnosteris Greene

Diminutive, annual herbs from slender taproots and with persistent connate-clasping cotyledons; stems naked except for the few-flowered, terminal, bracteate heads,

the bracts connate basally; calyx 5-lobed, urn-shaped, scarious basally, the lobes green or suffused with red; corolla salverform to funnelliform, persistent; stamens sessile, inserted in throat of corolla; capsules many-seeded; seeds mucilaginous when wet.

Gymnosteris parvula (Rydb.) Heller [*Gilia parvula* Rydb.]. Plants 1–5 cm tall; cotyledons 1–3 mm long, often purplish; bracts 4–13 mm long, 1–5 mm wide, lance-attenuate to ovate, often purplish; calyx 3–5 mm long, the triangular-acuminate teeth bristle-tipped, usually shorter than the tube; corollas 5–7 mm long, white to yellowish, persistent, the tube expanded and calyptrale like on the fruit; capsule 3.5–4.5 mm long. Sagebrush-grass, ponderosa pine, aspen, and lodgepole pine communities at 2255 to 2745 m in Sevier and Uintah counties; Oregon to Wyoming, south to California, Nevada, and Colorado; 6 (ii).

Langloisia Greene

Low, annual (or short-lived perennial) herbs from taproots; leaves alternate, the basal rosette more or less developed, pinnately toothed to lobed, or pinnately bristly in the lower portion and with bristle-tipped teeth or lobes near the apex; flowers few in terminal, bracteate, cymose heads, or some axillary; bracts foliose, with teeth and bristles like the leaves; calyx 5-lobed, the green lobes terminating in long, white bristles or spines, the tube scarious between the ribs; corolla tubular-funnelform, regular or irregular; stamens 5, inserted in the corolla throat; capsules 2– to many-seeded; seeds mucilaginous when wet.

1. Leaves pinnately toothed almost to the base, the teeth each with a single apical bristle; corollas irregular *L. schottii*
- Leaves pinnately bristly in the lower portion with paired or trifid spines or bristles, toothed mainly above the middle; corolla almost regular *L. setosissima*

Langloisia schottii (Torr.) Greene [*Navarretia schottii* Torr. in Emory]. Plants simple or typically branched from the base and with the lower branches ultimately prostrate, 2–11 cm long; herbage villous with long, crinkly, multicellular hair; leaves 0.5–3 cm long, mostly 2–6 mm wide, narrowly oblanceolate to linear, pinnately toothed, with each tooth bearing a single, apical bristle; bracts cuneate-oblanceolate, mainly 1–2.2 cm long, similar to the leaves; calyx 4–5.5 mm long to base of bristles, these 2–2.5 mm long, the lobes exclusive of spines subequal to the tube; corolla 8–12 mm long, white, yellowish, or pink, the upper lip 3-lobed, purple maculate; stamens long-exserted; capsules 3–4 mm long; seeds 0.6–1.2 mm long. Creosote bush, bursage, and Joshua tree communities at 730 to 960 m in Washington County; Arizona, Nevada, and California; 5 (i).

Langloisia setosissima (T. & G.) Greene [*Navarretia setosissima* T. & G. ex Torr. in Ives, type possibly from Washington County; *L. setosissima* var. *canpyloclados* Brand, type from near St. George]. Plants annual or rarely perennial (?), simple or typically branched from near the base, the lower branches commonly prostrate, 1–14 cm long; herbage more or less villous to subglabrous; leaves 0.6–3.5 mm long, linear and entire or most of them cuneate and with 3 apical to subapical teeth, but some also linear to oblanceolate and with 1 or 2 pairs of lateral teeth or lobes, the segments with a single spine

apically, the margin below armed with usually paired or 3-pronged spines; bracts similar to the leaves; calyx 5–6 mm long, to the base of the spines, these 3.5–5.5 mm long, the lobes, exclusive of spines, subequal to the tube; corolla 12–17 mm long, violet to lavender, lined and spotted with purple; stamens exserted; capsules 5–6 mm long; seeds ca 1 mm long. Creosote bush, bursage, Joshua tree, blackbrush, other warm desert shrub, and pinyon-juniper communities at 730 to 1315 m in Kane and Washington counties; Arizona, Nevada, and California; 20 (0). The type material was taken by John Charles Fremont during his expedition of 1844 (possibly on May 11) at about the time when his companion Tabeau was killed by Indians. This is possibly the earliest collection from southern Utah.

Leptodactylon H. & A.

Perennial herbs or subshrubs, sprawling to compact; leaves opposite or alternate, palmatifid or subpinnatifid into linear, pungent lobes, often with axillary, tufted leaves; flowers solitary and axillary or in terminal cymes; calyx lobes entire, pungent, the sinuses membranous; corolla funnellform to salverform, white to cream (rarely pink to purplish); stamens inserted in the corolla tube or throat, included; filaments subequal to the anthers; capsules subcylindric, the locules several-seeded.

- 1. Leaves mainly alternate; plants loosely open; flowers 5-merous *L. pungens*
- Leaves opposite; plants pulvinate-caespitose to clump-forming 2
- 2(1). Corolla lobes 10–14 mm long; flowers ordinarily 6-merous; plants clump-forming; ovary 3- or 4-carpelled *L. watsonii*
- Corolla lobes 3–6 mm long; flowers ordinarily 4-merous; plants pulvinate-caespitose (phloxlike); ovary usually 3-carpelled *L. caespitosum*

Leptodactylon caespitosum Nutt. Pulvinate-caespitose perennial herbs, mat-forming, mainly 10–50 cm wide; stems obscured by overlapping, 3- to 5-cleft, spinulose, opposite leaves; herbage glabrous to glandular or the leaves irregularly ciliate; flowers 4-merous; calyx 6–8.2 mm long, the lobes unequal, much shorter than the sparingly villous tube; corolla white or cream, 12–20 mm long, the lobes 3–6 mm long; ovary 2-loculed; stigmas 2 (rarely 3). Sagebrush, pinyon-juniper, ponderosa pine, and bristlecone pine communities, often in barrens, at 1675 to 2350 m in Daggett (Browns Park), Emery (Buckhorn and Salt Washes), Garfield (Red Canyon-Bryce Canyon-Johns Valley), and Juab (House Range) counties; Wyoming, Colorado, Nebraska, and Nevada; 12 (i). Specimens of this taxon are often misidentified as *Phlox* species. The roselike nature of the caudex branches, with marcescent, grayish leaves of previous seasons, and the usually 4-merous corollas are diagnostic. The disjunct distribution of this plant is related, at least in part, to the peculiar edaphic conditions of the substrates occupied.

Leptodactylon pungens (Torr.) Nutt. [*Cantua pungens* Torr.; *L. brevifolium* Rydb., type from Iron County]. More or less open shrubs or subshrubs, mainly 1–5 dm tall, more or less aromatic; herbage puberulent to glandular-puberulent or -villous to glabrous; stems obscured or the internodes apparent; leaves alternate to subopposite (or the lower opposite), 3- to 9-cleft, spinulose; flowers

5-merous; calyx 7–11.5 mm long, the lobes more or less unequal, commonly shorter than the tube; corolla 12–25 mm long, the lobes 5–15 mm long, cream to yellowish, often suffused with purple externally; capsule 4–5.5 mm long, usually 3-loculed; stigmas 3; 2n = 18. Shadscale, sagebrush, mountain brush, pinyon-juniper, and ponderosa pine communities at 1400 to 2745 m in all Utah counties, except Daggett, Davis, Grand, Morgan, Salt Lake, Sanpete, Summit, Utah, Wasatch, and Weber; British Columbia to Montana, south to California, Arizona, New Mexico, and Nebraska; 97 (viii).

Leptodactylon watsonii (Gray) Rydb. [*Gilia watsonii* Gray, type from Salt Lake County; *G. floribunda* var. *arida* Jones, type from Wayne County]. Plants cushion-like (depressed hemispheric) to open and sprawling (or pendulous) subshrubs; herbage puberulent to stipitate-glandular or glabrous; leaves opposite, 3- to 9-cleft, spinulose; flowers 6-merous; calyx 7–12 mm long, the lobes unequal, shorter than the tube; corolla 15–28 mm long, the lobes 7–15 mm long, white to cream; capsules 4–5 mm long, usually 4-loculed; stigmas 4. Blackbrush, sagebrush, pinyon-juniper, mountain brush, and mixed conifer communities (often in crevices) at 1220 to 3050 m in Beaver, Box Elder, Cache, Emery, Garfield, Grand, Kane, Salt Lake, San Juan, Sanpete, Tooele, and Utah counties; Idaho to Wyoming, south to Nevada and Colorado; 32 (iv).

Linanthastrum Ewan

Perennial subshrubs, erect to ascending; leaves opposite, palmatifid or trifid into linear, subulate-tipped lobes, often with tufted, axillary leaves; flowers borne in bracteate, terminal, headlike cymes, 5-merous; calyx lobes entire, subulate, the sinuses narrowly membranous; corolla salverform, white to cream; stamens inserted in the throat, slightly exserted; capsules 3-loculed, the locules few-seeded.

Patterson, R. 1977. A revision of *Linanthus* sect. *Siphonella* (Polemoniaceae). *Madrono* 24. 36–48.

Linanthastrum nuttallii (Gray) Ewan [*Gilia nuttallii* Gray; *Linanthus nuttallii* (Gray) Greene ex Milliken; *Leptodactylon nuttallii* (Gray) Rydb.]. Plants 8–25 (30) cm tall, clump-forming, compact to open; herbage puberulent (stems) or glabrous (otherwise); leaves opposite, 5- to 9-cleft, the lobes linear, subulate to minutely spinulose apically; flowers subsessile; calyx 6–9.5 mm long, the lobes lance-linear to subulate, 3-veined, ciliate with slender hairs; corolla tube 6–10 mm long, white, the lobes 5–8 mm long, spreading; capsules 4–5.5 mm long; 2n = 18. Sagebrush, pinyon-juniper, ponderosa pine, mountain brush, bristlecone pine, aspen, and spruce-fir communities at 1370 to 3265 m in Cache, Garfield, Kane, Salt Lake, Uintah, Utah, and Washington counties; Washington to Montana, south to California, Arizona, New Mexico, and Mexico; 34 (iv).

Linanthus Benth.

Annual or winter annual herbs from taproots; leaves opposite (the upper sometimes alternate), palmatifid, the segments linear; flowers solitary in leaf axils or paniculately to capitately cymose at branch ends; calyx 5-lobed, usually membranous below the sinuses; corolla campanulate to funnellform or salverform; stamens subequally inserted in the corolla tube or throat; capsules 3- or

4-loculed, ellipsoid to cylindrical; seeds 1 to many per locule.

1. Flowers typically long-pedicellate; distribution various 2
- Flowers sessile or subsessile; known from Kane and Washington counties 4
- 2(1). Corollas bright yellow, 7–15 mm long; plants rare, known from Washington County *L. aureus*
- Corollas white or pink to purplish, 1.5–6 mm long; plants uncommon to common, widely distributed 3
- 3(2). Corollas 1.5–2.5 mm long, less than 1.5 times longer than the calyx, glabrous within *L. harknessii*
- Corollas 2.5–5 mm long, ca 1.5 times longer than the calyx, hairy or glabrous within *L. septentrionalis*
- 4(1). Inflorescence few- to several-flowered, capitate; plants caespitose, forming low clumps or mats *L. demissus*
- Inflorescence of 1 or few flowers, not capitate; plants neither clump- nor mat-forming 5
- 5(4). Corolla 18–25 mm long or more, the lobes 5–10 mm wide *L. dichotomus*
- Corolla 8–15 mm long or more, the lobes less than 5 mm wide *L. bigelovii*

Linanthus aureus (Nutt.) Greene [*Gilia aurea* Nutt.]. Plants 5–15 cm tall; stems simple or branched from near the base; herbage subglabrous or puberulent and often glandular; leaves much shorter than the internodes, 3- to 7-cleft, the lobes linear to oblong, 2–6 mm long; flowers on pedicels mainly 3–15 mm long; calyx 5–7 mm long, the triangular-ovate lobes shorter than the tube, glandular-hirtellous, ciliate; corolla 6–14 mm long, yellow, funnellform, the tube included in the calyx; stamens glabrous, inserted in the throat of the corolla; capsules included; $n = 9$. Ponderosa pine community at ca 1650 m in Washington County; Arizona, New Mexico, Nevada, California, and Mexico; 1 (0). This is a strikingly beautiful plant. Our single specimen is without collector.

Linanthus bigelovii (Gray) Greene [*Gilia bigelovii* Gray]. Plants 6–40 cm tall; stems simple or variously branched; herbage sparingly villous to glabrous or glandular; leaves longer to much shorter than the internodes, entire or 2–3 cleft, mainly 0.8–4 cm long; flowers solitary in axils of dichotomous cymes; calyx 8–14 mm long, the thickened, subulate, spinulose-tipped lobes much shorter than the tube, often curved; corolla 10–15 mm long, surpassing the calyx by 2–5 mm, white to cream or suffused with purple in part; stamens glabrous, inserted in the corolla tube; capsules included; $n = 9$. Creosote bush, bursage, Joshua tree, and pinyon-juniper communities at 800 to 1650 m in Kane and Washington counties; Arizona, Nevada, and California; 7 (i).

Linanthus demissus (Gray) Greene [*Gilia demissa* Gray; *G. dactylophyllum* Torr. in Ives, nomen confusum?; *L. dactylophyllum* (Torr.) Rydb.]. Prostrate to ascending or erect, clump- or mat-forming plants, 2–10 cm long; stems simple or more commonly branched from the base; herbage more or less villous with crinkly, multicellular hairs and often glandular; leaves shorter to longer than the internodes, simple or 3- to 5-cleft, the lobes 2–10 mm long, acicular, minutely spinulose-tipped; calyx 3–6.5 mm long, the unequal lobes lance-attenuate, spinulose-tipped, much longer than the tube; corolla white, often streaked with purple, 6.5–8.5 mm long, campanulate, the lobes 2.5–3.5 mm wide; stamens inserted at the

base of the throat, glabrous, included; capsule included in the calyx; $n = 9$. Creosote bush, bursage, Joshua tree, and blackbrush communities at 730 to 1130 m in Washington County; Arizona, Nevada, and California; 13 (ii).

Linanthus dichotomus Benth. Evening Snow. Plants erect, simple or dichotomously branched, 3–15 cm tall; herbage glabrous or sparingly villous-ciliate on calyx lobes; leaves opposite, simple or 3- to 7-parted, the lobes (or leaves) mainly 10–20 mm long, linear, apiculate; flowers short-pedicellate in axils of dichotomous, cymose branches, or terminal; calyx 8–14 mm long, markedly bicolorous, the ribs green, alternating with broad hyaline membranes, these sometimes produced as a low protuberance at the sinuses, the lance-oblong lobes much shorter than the tube, apiculate; corolla 15–30 mm long, funnellform, white or marked with purple, the lobes 5–10 mm broad, spreading; capsule included in the calyx. Ponderosa pine-mountain brush community at ca 1800 m in Washington County (Franklin and Baird 468 BRV); Arizona, Nevada, and California; 1 (0).

Linanthus harknessii (Curran) Greene [*Gilia harknessii* Curran]. Plants erect or ascending, simple or branched, mainly 4–25 cm long, glabrous or puberulent; leaves opposite or the upper alternate, simple or palmatifid with 3–7 linear lobes mainly 4–12 mm long; flowers on pedicels mainly 3–15 mm long, solitary or in open cymes; calyx 2.5–3.8 mm long, the lance-attenuate lobes somewhat shorter than the tube, apiculate; corolla 1.5–3.5 mm long, white to blue, funnellform, subequal to the calyx or only somewhat longer; capsule included in the calyx, the locules 1-seeded; seeds mucilaginous when wet. Open sites in mountain brush, sagebrush, and aspen communities at 2070 to 2440 m in Cache, Morgan, Rich, Salt Lake, and Wasatch counties; Oregon to Idaho, south to California and Nevada; 5 (0).

Linanthus septentrionalis Mason Plants erect or ascending, simple or branched, mainly 4–25 cm long, glabrous or puberulent; leaves opposite, simple, or most of them palmately 5- to 7-cleft, the segments mainly 3–20 mm long, linear; calyx 3–4.5 mm long, the lance-attenuate lobes shorter than the tube; corolla 2.5–4 mm long, from slightly surpassing to 1.5 times longer than the calyx; capsule included in the calyx, the locules 1 (or 2)-seeded; seeds becoming mucilaginous when wet. Sagebrush, aspen, and spruce-fir communities at 2135 to 2900 m in Cache, Carbon, Duchesne, Emery, Morgan, Rich, Salt Lake, Sanpete, Summit, Uintah, Utah, and Wasatch counties; British Columbia and Alberta south to California, Nevada, and Colorado; 42 (iii).

Microsteris Greene

Simple or branched low annual herbs; leaves opposite below, the upper alternate, lanceolate, entire; flowers pedicellate, often in axillary pairs; calyx 5-lobed, with broad hyaline membranes between the ribs, the lobes subequal; corolla salverform; stamens unequally inserted on the corolla tube, included; ovary 3-loculed; stigmas 3-lobed; capsule bursting the calyx in age; locules 1-seeded; seeds mucilaginous when wet.

Microsteris gracilis (Hook.) Greene [*Gilia gracilis* Hook.; *Phlox gracilis* (Hook.) Greene; *G. gracilis* ssp. *spirillifera* var. *nana* Brand, type from Fillmore]. Plants mainly 1–20 cm tall, branched above the base or simple; herbage more or less villous with multicellular hairs and often glandular above; leaves 5–26 (30) mm long, 2–7 mm

wide, subsessile to short-petiolate, lanceolate to linear or obovate; cotyledons often persistent, short-petiolate, oval or obovate; calyx 4.5–8 mm long, the lobes usually shorter than the tube; corolla 6–12 mm long, surpassing the calyx, the limb pink to lavender or white; capsule shorter than the calyx, the limb pink to lavender or white; capsule shorter than the calyx; seeds ca 3 mm long. Sagebrush, pinyon-juniper, mountain brush, and ponderosa pine communities at 1220 to 2505 m in Beaver, Box Elder, Cache, Dagget, Davis, Duchesne, Iron, Juab, Millard, Morgan, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Washington, and Weber counties; British Columbia to Montana, south to California, Arizona, and New Mexico; Mexico and South America; 68 (viii). Our specimens belong to var. *humilior* (Hook.) Cronq. [*Collomia gracilis* var. *humilior* Hook.].

Navarretia Ruiz & Pavon

Annual herbs; stems erect, simple or branched; leaves alternate, entire or pinnatifid, bracteate upward, acerose or spine-tipped; flowers borne in dense, bracteate, cymose heads; calyx 5 (or 4) -lobed, the lobes much longer than the tube, entire or toothed; corolla funnellform or salverform; stamens variously inserted in the throat or at the sinuses; stigmas 2 or 3; capsule 1– to 3-loculed; seeds solitary or few to many per locule.

Crampton, B. 1954. Morphological and ecological considerations in classification of *Navarretia* (Polemoniaceae). *Madrono* 12: 225–288.

- 1. Corollas yellow; plants glandular; stigmas typically 3 *N. breweri*
- Corollas white to bluish or lavender; plants villous, puberulent, or almost glabrous; stigmas typically 2 *N. intertexta*

Navarretia breweri (Gray) Greene [*Gilia breweri* Gray]. Plants erect, 1–12 cm tall; herbage glandular-puberulent; leaves 0.4–2 (3) cm long, entire or with 1–4 pairs of lateral, linear, pungent lobes; bracts mainly 4–12 mm long, pinnatifid, the pinnae often again 3-lobed; calyx 6–10 mm long, the lobes unequal, much longer than the scarious, hyaline tube, acerose; corolla 5–7 mm long, yellow, funnellform; stigma 3-lobed; capsule few-seeded, dehiscent from the base. Pinyon-juniper, mountain brush, ponderosa pine, aspen, and grass-forb communities at 2070 to 3250 m in Cache, Duchesne, Morgan, Rich, Salt Lake, San Juan, Sevier, Summit, Uintah, Utah, Wasatch, and Washington counties; Washington south to California, Arizona, and Colorado; 30 (iv).

Navarretia intertexta (Benth.) Hook. [*Aegochloa intertexta* Benth.; *N. propinqua* Suksd.]. Plants simple or branched, mainly 3–15 cm tall; herbage more or less villous (retrorse below the heads); leaves simple or pinnatifid-bipinnatifid, mainly 0.8–2.5 cm long, the lobes acicular-linear, pungent; bracts like the pinnatifid leaves; calyx 8–10 mm long, the lobes simple or pinnatifid, much longer than the scarious base; corolla white to blue or lavender, 5–9 mm long, funnellform; stigmas 2-lobed; capsule 1-loculed, several-seeded. Sagebrush, mountain brush, aspen, and grass-forb communities at 1710 to 2290 m in Cache, Morgan, Summit, Wasatch, Washington, and Weber counties; Washington and Saskatchewan, south to California, Arizona, and Colorado; 8 (0).

Phlox L.

Perennial herbs; stems erect or prostrate to decumbent or ascending; leaves opposite, simple, entire; flowers in corymbiform or paniculate cymes or solitary, showy; calyx 5-lobed and -ribbed, typically with scarious margins and scarious, intercostal membranes between the ribs; corolla salverform, the throat constricted; stamens unequally inserted; ovary 3-lobuled; seeds 1 to several per locule, not mucilaginous when wet.

- 1. Plants 4–10 dm tall or more; leaves 1–3 cm wide; cultivated ornamentals *P. paniculata*
- Plants usually less than 3 dm tall; leaves less than 0.5 cm wide; cultivated or more commonly indigenous 2
- 2(1). Stems sprawling, forming mats mostly 5–10 dm broad or more; flowers usually more than 1 in terminal, bracteate cymes; plants cultivated 3
- Stems erect or more or less cushion or mat-forming, the mats (when formed) mainly less than 3 dm broad; flowers solitary at stem ends or more than 1 in terminal, bracteate cymes; plants indigenous 4
- 3(2). Corolla lobes deeply notched *P. subulata*
- Corolla lobes rounded to retuse or erose *P. nivalis*
- 4(2). Plants more or less open, erect to sprawling, the internodes apparent; flowers usually more than 1 in terminal, bracteate cymes (except in *P. austromontana*) 5
- Plants pulvinate-caespitose to mat-forming or cushionlike, often compact; internodes apparent or not; flowers solitary at stem ends 7
- 5(4). Leaves 3–4 mm wide, oblong-elliptic to lanceolate; plants of San Juan County *P. cluteana*
- Leaves mainly 1–2.5 mm wide, linear to acicular; distribution various 6
- 6(5). Calyces glabrous or merely villous apically, villous on lobes ventrally; flowers solitary at stem tips; plants of Kane and Washington counties *P. austromontana*
- Calyces villous-glandular externally and on the lobes ventrally; flowers commonly more than 1 in terminal, bracteate cymes; plants broadly distributed *P. longifolia*
- 7(4). Plants markedly glandular (at least the calyces) 8
- Plants not glandular (or with sessile, granular glands) 9
- 8(7). Corolla tube coarsely glandular hairy, with long, multicellular hairs; intercostal membranes carinate *P. gladiformis*
- Corolla tube glabrous or with sessile glands; intercostal membranes not carinate *P. pulvinata*
- 9(7). Plants more or less softly woolly-tomentose, the tomentum white 10
- Plants variously hairy to glabrous, but not woolly or tomentose 11
- 10(9). Plants compactly pulvinate-caespitose, forming rounded cushions or mounds; calyx 3–4.5 mm long; plants of central western Utah *P. muscoides*
- Plants mat-forming, or if mound or cushionlike, not compactly pulvinate-caespitose; calyx 5–7.5 mm long; plants broadly distributed *P. hoodii*
- 11(9). Leaves mainly 2–5 mm long; plants forming rounded cushions and mounds, typically pulvinate-caespitose *P. tumulosa*

- Leaves mainly 6–35 mm long or more; plants inat-forming or cushionlike, but not especially pulvinate-caespitose 12
- 12(11). Calyx pubescent with short, stiff, spreading hairs *P. griseola*
- Calyx glabrous or pubescent with crinkly or contorted hairs 13
- 13(12). Flowers pedicellate, the pedicels 3–10 mm long; calyx not carinate on the intercostal membrane; plants of northern Utah *P. multiflora*
- Flowers sessile or subsessile; calyx carinate on the intercostal membrane; plants of the southern 2/3 of Utah *P. austromontana*

Phlox austromontana Cov. Desert Phlox. Plants caespitose, cushion or matlike, from a pluricipital caudex and taproot, mainly 0.5–3 dm wide; herbage pilose-puberulent to subglabrous or the calyx glabrous to villous externally; leaves opposite, mainly 5–20 mm long, simple, linear-subulate; flowers solitary, sessile or subsessile at branch tips; calyx urceolate to campanulate, glabrous to villous, the intercostal membranes carinate, the lobes villous internally; corolla white, blue, pink, lavender, or yellowish, the tube 8–15 mm long; styles 2–9 mm long. This is a complex assemblage of variants, some sufficiently distinctive and with geographic correlation as to warrant taxonomic recognition. The morphology is, however, wholly confluent. Trends within the variation are recognized at varietal level.

1. Plants more or less open, the internodes typically apparent; plants of western Kane and much of Washington counties 2
- Plants variously open to compact; distribution various ... 3
- 2(1). Calyx usually glabrous, the leaves (or some of them) 20–35 mm long; corollas usually bright pink; morphology transitional to the next . . . *P. austromontana* var. *jonesii*
- Calyx usually at least moderately villous, the leaves typically 10–22 mm long; corolla commonly white *P. austromontana* var. *prostrata*
- 3(2). Flowers yellowish (fading lemon yellow); leaves 10–25 mm long; calyx campanulate *P. austromontana* var. *lutescens*
- Flowers white, pink, or lavender (sometimes fading cream); leaves mostly less than 15 mm long; calyx turbinate to subcylindric *P. austromontana* var. *austromontana*

Var. *austromontana* [*P. densa* Brand, type from Frisco]. Mixed desert shrub, salt desert shrub, pinyon-juniper, sagebrush, mountain brush, and ponderosa pine communities at 1525 to 3050 m in Beaver, Carbon, Duchesne, Emery, Garfield, Iron, Juab, Kane, Millard, Piute, Sanpete, Sevier, Tooele, Uintah, Washington (type from Beaver Dam Mts.), and Wayne counties; Nevada, California, and Arizona; 159 (xxiii).

Var. *jonesii* (Wherry) Welsh [*P. jonesii* Wherry, type from Zion Canyon]. Ponderosa pine, pinyon-juniper, and mountain brush communities at 1435 to 2600 m in Kane and Washington counties; endemic; 12 (ii). This variety forms intermediates with both var. *prostrata* and var. *austromontana*. It is partially sympatric with both.

Var. *lutescens* Welsh Blackbrush, ash, and squawbush community at ca 1220 m in eastern Garfield (type along the margin of Cataract Canyon) County; endemic; 1 (i). The plants are suffrutescent, rounded, cushions growing

in crevices in rimrock of Cedar Mesa Sandstone. Because of the peculiar flower color and growth habit, these plants were initially mistaken for the superficially similar *Leptodactylon watsonii*.

Var. *prostrata* E. Nels. Mountain brush and pinyon-juniper communities at 1220 to 2135 m in Washington (type from Silver Reef) County; endemic (?); 14 (0).

Phlox cluteana A. Nels. Navajo Mt. Phlox. Plants with stems single or more or less clumped from subterranean, pluricipital, subrhizomatous caudices, mainly 4–12 (20) cm tall; herbage glandular-puberulent to villous or merely villous to puberulent; leaves elliptic to linear, oblong, oblanceolate, or lanceolate, 0.8–3 (5) cm long, 2–5 mm wide; flowers on pedicels 3–15 mm long, borne singly or 2 to several in terminal cymes; calyx 7–9 mm long, the intercostal membranes not carinate; corolla tube 14–18 mm long, the lobes 7–10 mm long, pink to lavender or white; stamens included or slightly exerted; style 9–14 mm long. Ponderosa pine community at ca 2285 to 3050 m in San Juan (type from Navajo Mt.) County; Arizona; 4 (0).

Phlox gladiiformis (Jones) E. Nels. Cedar Canyon Phlox. [*Phlox longifolia* var. *gladiiformis*, type from Cedar Canyon, Iron County; *P. caesia* Eastw., type from Bryce Canyon]. Plants caespitose, forming cushions or mounds to ca 3 dm wide, from a taproot and pluricipital caudex; herbage glandular-hairy throughout, often with some adhering sand grains; leaves 8–20 (25) mm long, 1–2.5 mm wide, rigid, lance-linear to linear-subulate, spinulose-tipped; flowers subsessile or on pedicels to 3 mm long, borne at stem tips; calyx 3–9 mm long, the subulate lobes spinulose, the intercostal membrane carinate towards the base; corolla tube 8–14 mm long, glandular-villous, the lobes white to pink or lavender, 5–9 mm long; stamens included; style 2–6 mm long. Pinyon-juniper, ponderosa pine, and bristlecone pine communities at 1980 to 2535 m in Garfield, Iron, and Washington counties; Nevada; 20 (ii).

Phlox griseola Wherry Grayleaf Phlox. Plants caespitose, mat-forming, from taproots and pluricipital caudices, the caudex branches usually short and more or less tightly clustered, commonly 5–12 cm wide; herbage hirsute or hirtellous, with stiff, spreading trichomes, not glandular; leaves 4–12 mm long, lance- to linear-subulate, spinulose-tipped; flowers solitary, sessile, borne apically on branches; calyx 7–10 mm long, hirsute like the leaves, the lobes linear-subulate, sharply spinulose, intercostal membranes not carinate; corolla tube 9–14 mm long, the lobes pink to lavender or white, 5–6 mm long; anthers included; styles 1.5–3 mm long. Pinyon-juniper and mountain brush communities at 1525 to 2000 m in Beaver, Iron, and Washington counties; Nevada (Great Basin endemic); 7 (ii). This plant is apparently allied closely with *P. tumulosa*, which is intermediate between *P. griseola* and *P. muscoides*. A specimen tentatively assigned here (Higgins 14407 BRY) has glandular calyces, a feature not known in this species. The specimen was previously identified as *P. pulvinata* but is quite unlike that species. Ultimate disposition awaits additional collections.

Phlox hoodii Richards. Carpet Phlox. Plants cushion or matlike from a taproot and pluricipital, commonly prostrate caudex, mainly 5–30 cm wide; herbage more or less arachnoid-woolly with white hairs; leaves typically 2–12 mm long, 0.5–1 mm long, linear, spinulose-tipped; flow-

ers solitary and sessile at stem ends; calyx 5–7.5 mm long, more or less tomentose or villous with white, multicellular hairs, the lobes linear-subulate, spinulose, intercostal membranes not carinate; corolla tube 6–15 mm long, the lobes 4–8 mm long, white, pink, lavender, or blue; stamens included; style 2–5 mm long; $2n = 28$. Shadscale, greasewood, horsebrush, budsage, pinyon-juniper, ponderosa pine, and less commonly alpine parkland communities at 1460 to 3265 m in virtually all Utah counties, except Beaver, Iron, Kane, and Washington; Alaska and Yukon, south to California, Nevada, Arizona, and Colorado; 122 (xix). Our material belongs to var. *canescens* (T. & G.) Peck [*P. canescens* T. & G., type from S of Great Salt Lake].

Phlox longifolia Nutt. Longleaf Phlox. [*P. speciosa* var. *stansburyi* Torr. in Emory; *P. longifolia* var. *stansburyi* (Torr.) Gray, *P. longifolia* var. *stansburyi* f. *brevifolia* Gray; *P. longifolia* var. *brevifolia* (Gray) Gray; *P. grahmi* Wherry, type from Minnie Maud Creek, Duchesne County, teratological with smut]. Plants with stems solitary or more or less clumped from superficial to subterranean, pluricipital, subrhizomatous caudices, mainly 3–40 cm tall, often woody below; herbage more or less glandular-villous (especially in inflorescence); leaves 1–8 cm long or more, 1–6 mm wide, lance-subulate, linear-subulate, lance-ovate, or elliptic; flowers in leafy-bracteate, terminal cymes, subsessile or on pedicels 3–20 mm long (or more); calyx 7–13 mm long, the intercostal membranes carinate; corolla tube 10–30 mm long, mostly 1–3 times longer than the calyx, the lobes 7–15 mm long, pink to lavender or white; stamens included or somewhat exerted; style 6–20 mm long; $2n = 28$. Salt and mixed cool desert shrub, shrub-grass, sagebrush, pinyon-juniper, mountain brush, ponderosa pine, aspen, and spruce-fir communities at 1340 to 2930 m in all Utah counties; British Columbia to Montana, south to California, Arizona, and New Mexico; 261 (xxxv). This species consists of a complex aggregation of forms. Some of the phases are distinctive, when viewed in the extreme, but they are connected in continuous, intergrading series. Recognition of infraspecific taxa seems to be moot.

Phlox multiflora A. Nels. Plants cushion or matlike from a taproot and pluricipital caudex, mainly 8–25 cm wide; herbage glabrous or glandular-scaberulous; leaves 8–30 mm long, 1–2 mm wide, linear-subulate, spinulose-apiculate; flowers solitary at branch ends, subsessile or on pedicels 3–10 mm long; calyx 11–15 mm long, glabrous, the lobes lance-subulate, spinulose, the intercostal membranes not carinate; corolla tube 10–15 mm long, the lobes white to pink or bluish, 6–11 mm long; stamens included or slightly exerted; styles 5–8 mm long; $2n = 14$. Sagebrush, ponderosa pine, aspen, Douglas fir, and lodgepole pine communities at 2200 to 3265 m in Box Elder, Daggett, Rich, Summit, and Uintah counties; Idaho and Montana, south to Nevada, and Colorado; 19 (i).

Phlox muscoides Nutt. Moss Phlox. Plants densely pulvinate-caespitose, cushion or moundlike from a taproot and pluricipital, spreading to ascending caudex, mainly 3–10 cm wide; herbage arachnoid-woolly with tangled white hairs; leaves 2–5 mm long, oblong- to lance-subulate, 0.5–1 mm wide; flowers solitary and sessile at stem ends; calyx 3–4.5 mm long, tomentose, the lobes lance-subulate to narrowly triangular, spinulose, the intercostal membranes not carinate, obscured by the tomentum;

corolla tube 5–10 mm long, the lobes white to pink, blue, or lavender, 3–5 mm long; stamens included; style 2–5 mm long; $2n = 14$. Black sagebrush, budsage, shadscale, and pinyon-juniper communities at 1400 to 2105 m in Beaver, Juab, and Millard counties; Oregon to Montana, south to Nevada, Colorado, and Nebraska; 21 (vi). The morphology of this taxon lies between those of *P. hoodii* and *P. tumulosa*, at least in part. Suggested is the possibility that *P. muscoides*, as present in Utah, might have arisen independently from those in other places, the similar morphologies having been arrived at more than once. More work is indicated.

Phlox nivalis Lodd. Plants forming broad, carpetlike mats or cushions from a taproot, the caudex branches ultimately prostrate-spreading, the flowering stems erect-ascending, mainly 5–10 dm broad or more; herbage hirtellous to villous with multicellular hairs; leaves mainly 10–20 mm long, 1–2.5 mm wide, linear to elliptic or narrowly lanceolate, ciliate; flowers few to several in terminal, bracteate cymes, the pedicels 3–25 mm long or more; calyx 7–9 mm long, the lobes lance-attenuate, spinulose, the intercostal membranes not carinate, spreading-hairy; corolla tube 12–16 mm long, the lobes purple, pink, or white, rounded to retuse or erose apically, 7–9 mm long; stamens included; style 4–6 mm long. Cultivated ornamental of gardens, long-persisting in lower elevation portions of Utah; introduced from the eastern U. S.; 1 (0). The material examined is markedly similar to *P. subulata*, another beautiful ornamental species grown in our region.

Phlox paniculata L. Garden Phlox. Plants erect, 6–10 dm tall or more; herbage puberulent to subglabrous; leaves 1.2–12 cm long, 0.8–5 cm wide, lanceolate to elliptic or ovate, subsessile or short-petiolate, acuminate apically; flowers numerous, borne in terminal, compound, often closely aggregated, corymbiform cymes, subsessile or short-pedicellate; calyx 6–9 mm long, the lance-linear lobes not spinulose, glabrous or puberulent; corolla tube 20–28 mm long, the lobes 8–12 mm long, pink, lavender, blue, or white; stamens included; $2n = 14$. Cultivated ornamentals, long persisting, in lower elevation portions of Utah; introduced from the eastern U. S.; 3 (i).

Phlox pulvinata (Wherry) Cronq. [*P. caespitosa* ssp. *pulvinata* Wherry; *P. caespitosa* authors, misapplied]. Plants cushion or matlike from taproots and multicipital caudices, these often horizontally spreading, mainly 8–25 cm wide; herbage more or less glandular, especially on the calyx; leaves 2–12 mm long, 0.6–1.5 mm wide, linear to oblong or lance-oblong, spinulose-tipped; flowers solitary, sessile at branch tip; calyx 4.6–9 mm long, the lobes lance-subulate, spinulose-tipped, the intercostal membrane not carinate; corolla tube 8–13 mm long, glabrous, the lobes 4–8 mm long, white or less commonly blue to pink; stamens included; style 2–6 mm long; $2n = 14$. Sagebrush, aspen, lodgepole pine, grass-forb, and alpine tundra communities at 2315 to 3450 m in Beaver, Cache, Daggett, Duchesne, Emery, Garfield, Iron, Juab, Piute, Salt Lake, Sanpete, Summit, Tooele, and Wayne counties; Oregon to Montana, south to California, Nevada, and New Mexico; 66 (xi).

Phlox subulata L. Plants forming broad, carpetlike mats or cushions from a taproot and intricately branched, spreading caudex, mainly 5–10 dm broad or more; herbage hirtellous to villous with multicellular hairs;

leaves 6–20 mm long, 1–1.5 mm wide, linear to elliptic, rather abruptly apiculate, ciliate near the base; flowers few to several in terminal, bracteate cymes, the pedicels 3–15 mm long; calyx 6–8 mm long, the lobes lance-attenuate, spinulose, the intercostal membranes not carinate; corolla tube 10–13 mm long, the lobes lavender to pink or white, emarginate apically, 7–10 mm long; stamens included or slightly exerted; styles 5–8 mm long. Cultivated ornamentals, long persisting, in lower elevation portions of Utah; introduced from the eastern U. S.; 1 (i).

***Phlox tumulosa* Wherry** Plants densely pulvinate-caespitose, cushion or moundlike herbs from a taproot and compactly pluricipital caudex, mainly 3–15 cm wide; herbage glabrous or more or less pubescent with spreading, multicellular hairs; leaves 1–5 mm long, 0.5–1.3 mm wide, oblong-ovate to oblong, or almost linear, spinulose-tipped; flowers solitary and sessile at branch ends; calyx 4–5 mm long, villous-pilose, the lobes lance-subulate, spinulose, the intercostal membranes not carinate, not obscured by hairs; corolla tube 8–11 mm long, the lobes 3–5 mm long, white to pink or lavender; stamens not exerted; style 1.5–3.5 mm long; 2n = 14, 28. Black and big sagebrush and pinyon-juniper communities at 1675 to 2075 m in Beaver and Iron counties, Nevada (Great Basin endemic); 8 (i). This entity is intermediate in its morphology between *P. muscoides* and *P. griseola*. It has the short leaves of the former and intermediate pubescence, but some specimens are transitional.

Polemonium L.

Annual or perennial, commonly mephitic herbs from taproots, rhizomes, or caudices; stems erect or ascending, simple or branched; leaves pinnate-pinnatifid, alternate; flowers in terminal or axillary, often corymbose cymes; calyx herbaceous, campanulate, 5-lobed; corolla 5-lobed, rotate-campanulate to funnellform, the tube and throat often indistinct, mostly blue violet to lavender or white; stamens inserted on the tube, exerted or included; capsule 3-locular, each locule with 1 to many seeds.

- 1. Corolla ochroleucous to pale yellow; leaflets rather remote; plants known from a single early collection from the Tushar Mts., Piute County *P. brandegei* (Gray) Greene
- Corolla blue, royal blue, purple, or white, but not otherwise as above; plants known from modern collections 2
- 2(1). Corolla tubular-funnelform; plants subscapose, from definite caudices; leaflets pseudoverticillate, crowded *P. riscosum*
- Corolla rotate-campanulate; plants caulescent, from caudices or rhizomes; leaflets not pseudoverticillate, not especially crowded or overlapping 3
- 3(2). Plants annual; corolla 2–6 mm long; plants of lower elevations *P. micranthum*
- Plants perennial; corolla 10–15 mm long; montane or alpine 4
- 4(3). Stems decumbent basally, from a horizontal rhizome; plants commonly of wet meadows and streamsides *P. caeruleum*
- Stems erect basally and throughout, from vertical caudices; plants of mesic, but scarcely hydrophytic communities 5
- 5(4). Plants mostly 0.6–2.5 dm tall, compactly clump-forming *P. pulcherrimum*

- Plants mostly 4–12 dm tall, loosely clump-forming *P. foliosissimum*

***Polemonium caeruleum* L.** Blue Jacobs ladder. [*P. occidentale* Greene; *P. caeruleum* var. *occidentale* (Greene) St. John; *P. occidentale* ssp. *amygdalinum* Wherry]. Mephitic, perennial herbs from horizontal rhizomes, the stems decumbent basally, otherwise erect, mainly 4–10 dm tall; herbage glandular-villous to glabrate; leaves 3–25 cm long, the basal and lower ones long-petiolate, with 9–27 leaflets, these lanceolate to elliptic, 5–40 mm long, 1–12 mm wide, the terminal 3 more or less confluent; reduced upward; flowers in narrow, thyrsoid inflorescences; calyx 5–8 mm long at anthesis, the lobes subequal to or shorter than the tube; stamens about equaling the corolla lobes; corollas 10–15 mm long and about as broad, blue purple or white; seeds not mucilaginous when wet; 2n = 18. Moist to wet sites in meadows and along streams at 1340 to 3085 m in Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Iron, Kane, Salt Lake, Sanpete, Sevier, Summit, Utah, and Wasatch counties; Alaska and Yukon, south to California and Colorado; 56 (iv). Our material belongs to var. *pterospermum* Benth. in A. DC.; at subspecific level it is ssp. *amygdalinum* (Wherry) Munz.

***Polemonium foliosissimum* Gray** Leafy Jacobs ladder. Plants perennial from a subrhizomatous, vertical caudex; stems erect, mainly 4–12 dm tall, leafy throughout, lacking a basal tuft of leaves; herbage sparingly to densely villous to puberulent and often glandular upward; leaves mainly 3–15 cm long; leaflets (3) 5–25, lanceolate to elliptic or narrowly oblong, 8–50 mm long, 2–12 mm wide, the terminal the largest, this and the first lateral leaflets commonly confluent; inflorescence in terminal and axillary corymbiform cymes; flowers sessile to pedicellate, more or less compactly clustered; calyx 4.5–9 mm long at anthesis, the triangular-attenuate lobes shorter than the tube to much longer; corolla 10–18 mm long, and as wide or wider, white, blue violet, or cream, open-campanulate; stamens subequal to the corolla lobes; seeds mucilaginous when wet. Two rather distinctive and geographically correlated varieties are present.

- 1. Flowers white; plants robust, mainly 8–12 dm tall, from the northern Wasatch Plateau and northward *P. foliosissimum* var. *alpinum*
- Flowers blue purple (rarely white); plants less robust, commonly 5–9 dm tall, from the northern Wasatch Plateau southward and eastward *P. foliosissimum* var. *foliosissimum*

Var. *alpinum* Brand [*P. albiflorum* Eastw., type from Scofield; *P. foliosissimum* ssp. *albiflorum* (Eastw.) Brand]. Sagebrush, mountain brush, aspen, and spruce-fir communities at 1830 to 3050 m in Cache, Carbon, Davis, Duchesne, Emery, Juab, Morgan, Salt Lake (type from Alta), Summit, Tooele, Utah, Wasatch, and Weber counties; Nevada and Wyoming; 62 (vi).

Var. *foliosissimum* Mountain brush, ponderosa pine, aspen, tall forb, and spruce-fir communities at 1950 to 3295 m in Emery, Grand, Juab, San Juan, Sanpete, Sevier, and Uintah counties; Colorado, Arizona, and New Mexico; 64 (iv).

***Polemonium micranthum* Benth.** Annual herbs from taproots; stem mainly 3–25 cm long, erect or the branches prostrate-ascending; herbage glandular-villous to glabrate; leaves alternate, the basal rosette more or less

developed, 1–6 cm long; leaflets 5–15, elliptic to lanceolate or ovate, 1.5–10 mm long, 1–4 mm wide; flowers solitary, terminal; corolla 2–6 mm long, white, the lobes subequal to the tube; stamens included; seeds mucilaginous when wet; $2n = 18$. Cheatgrass, filaree, and other annual dominated communities at 1310 to 1590 m in Cache, Davis, Salt Lake, and Utah counties; British Columbia to Montana, south to California and Nevada; South America; 7 (0).

Polemonium pulcherrimum Hook. Pretty Jacobsladder. Perennial herbs from a vertical, subrhizomatous caudex; stems mainly 5–25 cm tall, often branched above; herbage glandular-villous; leaves 3–20 cm long, the lower ones more or less tufted and with broadly sheathing bases; leaflets 7–25, lanceolate to oblanceolate or elliptic to ovate, 2–20 mm long, 1–9 mm wide, the three terminal ones confluent; flowers few to many in congested, corymbiform cymes; calyx 4–7 mm long at anthesis, the triangular lobes subequal to or longer than the tube; corolla rotate-campanulate, 8–14 mm long and about as wide, blue to blue violet (or white); stamens subequal to the lobes; seeds not mucilaginous when wet; $2n = 18$. Ponderosa pine, aspen, spruce-fir, and grass-forb communities at 2315 to 3510 m in Beaver, Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Washington, and Wayne counties; Alaska and Yukon, south to California, Arizona, and New Mexico; 62 (xii). Our specimens belong to var. *delicatum* (Rydb.) Cronq. [*P. delicatum* Rydb.].

Polemonium viscosum Nutt. Viscid Jacobsladder. Strongly mephitic, perennial herbs from a definite caudex, this typically clothed with persistent leaf bases; stems mainly 5–25 cm tall, subscapose, the cauline leaves unequally spaced and often much reduced; herbage glandular-villous; basal leaves 3–15 cm long, strongly sheathing basally; leaflets very numerous, 1–7 mm long, 0.5–3 mm wide, most or all of them cleft to the base or nearly so, thus pseudoverticillate, the rachis more or less winged; flowers several to many in dense, subcapitate cymes; calyx 7–12 mm long at anthesis, the lobes shorter than the tube; corolla funnelliform, 15–30 mm long, longer than wide, dark blue purple; stamens commonly shorter than the corolla; seeds not mucilaginous when wet; $2n = 18$. Spruce-fir and alpine tundra communities, often on talus, at 3050 to 3815 m in Beaver, Box Elder, Daggett, Duchesne, Garfield, Grand, Juab, Piute, Salt Lake, San Juan, Sanpete, Summit, Utah, Uintah, and Wayne counties; Washington to Alberta, south to Nevada, Arizona, and New Mexico; 50 (vii).

POLYGALACEAE R. Br. in Flinders

Milkwort Family

Herbs, subshrubs or shrubs; leaves simple, mostly alternate (or whorled); stipules lacking or mere glands; flowers perfect, irregular, borne in racemose, spicate, or paniculate clusters; sepals 5, distinct, the 2 inner ones larger and often petaloid; petals 3 (rarely 5), the upper 2 usually free, the lower one forming a keel; stamens commonly 8 in 2 series, the filaments united, forming a sheath; anthers opening by subterminal pores; pistil 1, the ovary superior, usually of 1 or 2 carpels; style 1; fruit usually capsular; $x = 5-11+$.

Polygala L.

There is a single genus with characteristics of the family.

1. Plants annual herbs, with whorled cauline leaves, evidently rare *P. verticillata*
- Plants, shrubs or subshrubs, with alternate leaves 2
- 2(1). Flowers pink purple, with a yellow keel, 8–14 mm long; plants suffrutescent *P. subspinoso*
- Flowers cream to whitish or yellowish green, 3–5 mm long; plants shrubs *P. acanthoclada*

Polygala acanthoclada Gray Thorny Milkwort. Thorny shrubs with intricately branched stems, mainly 2–12 dm tall; herbage densely hairy or subglabrous, or glabrous in part; leaves 3–25 mm long, 1–5 mm wide, narrowly oblanceolate-spatulate to elliptic; racemes few-flowered, the pedicels subtended by a short bract and by a pair of bracteoles, both of these deciduous; flowers 3–5 mm long, cream to yellowish green, the upper petals often purple-tipped, the keel greenish; fruit broadly elliptic, sessile, 3–6 mm long; $2n = 18, 36$. Blackbrush, shadscale, horsebrush, rabbitbrush, and pinyon-juniper communities at 1150 to 2135 m in Box Elder, Emery, Juab, Millard, San Juan, Tooele, and Washington counties; Nevada, California; and Arizona; 20 (v). Two weakly separable varieties are present in Utah, both based on types from along the San Juan River in Utah. Plants designated as var. *acanthoclada* have pedicels usually spreading hairy and shorter than the flowers. It is known in Utah only in San Juan County. Those known as var. *intricata* Eastw. [*P. intermontana* Wendt] have usually glabrous pedicels a little longer than the flowers. They occur in the range noted for the species as a whole.

Polygala subspinoso Wats. Cushion Milkwort. Subshrubs, forming rounded clumps mainly 5–20 cm high, thorny; herbage hirtellous to subglabrous; leaves 8–30 mm long, 2–10 mm wide, oblanceolate to spatulate or elliptic; racemes several-flowered; pedicels 4–10 mm long; flowers 8–14 mm long, pink to pink purple, the keel yellow; fruit suborbicular, 4–8 mm long, $2n = 18, 36$. Shadscale, sagebrush, pinyon-juniper, mountain brush, and ponderosa pine at 1310 to 2290 m in Emery, Garfield, Grand, Juab, Iron, Millard, San Juan, Sanpete, Sevier, Tooele, Utah, Washington, and Wayne counties; Colorado, New Mexico, Arizona, Nevada, and California; 82 (xii). Report of the species from Vernal is based on a mislabeled specimen.

Polygala verticillata L. Annual herb; stems simple or branched above, 0.8–4 dm tall; herbage glabrous; leaves mostly 10–20 mm long, 1–3 mm wide, linear to oblong, whorled; peduncles elongate; racemes spicate, many-flowered; flowers white, greenish or pinkish, 1–1.5 mm long, the perianth deciduous; capsules ca 1.5 mm long. Meadow at ca 2074 m in Uintah County; (Hutchings 285, 1932 BRY) widely distributed in eastern U. S. and Canada; 1 (0).

POLYGONACEAE A. L. Juss.

Buckwheat Family

Annual or perennial herbs, subshrubs, shrubs, or twin- ing vines; leaves simple, alternate, opposite, or whorled; stipules forming a sheath (ocrea) or absent; flowers perfect or polygamo-dioecious, regular; perianth 2- to 6-parted or -cleft, not readily identifiable as sepals and petals;

stamens 2-9; pistil 1, the ovary superior, 1-loculed, 1-ovuled; styles 2 or 3; fruit an achene; $x = 7-13$.

Welsh, S. L. 1984 Utah flora. Polygonaceae. Great Basin Nat. 44: 519-557.

- 1. Sheathing stipules lacking, flowers subtended by a campanulate, obconic, or cylindrical involucre, or by a folded, 2-toothed bract 2
 - Sheathing stipules present; flowers not subtended by an involucre or with a folded, 2-toothed bract 5
- 2(1). Flowers solitary, subtended by a single, folded, 2-toothed bract, this accrescent and prominently veined in fruit; plants slender, weak, broad-leaved annuals, known from Washington County *Pterostegia*
 - Flowers solitary (in *Chorizanthe*) or several, arising from a campanulate, obconic, or cylindrical involucre; plants various, but not as above 3
- 3(2). Involucres with lobes or teeth not spiny; bracts unarmed; plants annual, perennial, or shrubby *Eriogonum*
 - Involucres and bracts armed with spines; plants annual 4
- 4(3). Involucres with 2 or more flowers, the lobes tipped with straight spines or bristles; main bracts of inflorescence connate-perfoliate, disklike *Oxytheca*
 - Involucres usually with 1 flower, the lobes tipped with hooked or straight spines; bracts not both perfoliate and disklike *Chorizanthe*
- 5(1). Leaves all basal, the blades reniform; sepals 4; styles 2; plants of high elevations *Oxyria*
 - Leaves cauline or basal but, if basal, the blades not reniform and plants not or seldom of high elevations; sepals 5 or 6; styles 2 or 3; plants variously distributed 6
- 6(5). Sepals 5 (rarely 4), all similar and erect in fruit *Polygonum*
 - Sepals 6, in 2 sets, the inner ones erect and winged in fruit, or the wings from the achenes, the outer sepals reflexed and often smaller 7
- 7(6). Stipular sheathes large and prominent; stamens 8-10; leaf blades ovate to orbicular; plants cultivated and persisting *Rheum*
 - Stipular sheathes not prominent, evanescent; stamens 6; leaf blades narrower; plants indigenous or adventive, not cultivated *Rumex*

***Chorizanthe* R. Br. ex Benth.**

Annual herbs; stems more or less dichotomously branched or simple; leaves basal or cauline and alternate, entire, the upper ones often reduced to opposite or whorled bracts; inflorescence cymose or capitate; involucres sessile, cylindrical to urn-shaped or funneliform, mostly 1-flowered, 3- to 6-angled or -ribbed and 3- to 6-toothed or -cleft, the teeth spreading, armed with straight or recurved awns; flowers pedicellate or subsessile; bractlets lacking; perianth 6-parted or -cleft; stamens 3-9; styles 3; achenes glabrous, 3-angled.

- 1. Foliar bracts 3-lobed; involucres with 3, broad, horizontally spreading, saccate horns at the base *C. thurberi*
 - Foliar bracts entire; involucres not horned at base 2
- 2(1). Involucres 6-ribbed, the 6 teeth sparingly recurved apically, less than 2 mm long; stems very brittle and soon falling apart; foliage leaves reduced to subulate bracts *C. brevicornu*
 - Involucres 3-angled, the 3 teeth straight, more than 5 mm long; stems not brittle (the plants persisting and burlike); stems with some foliar leaves like the basal ones *C. rigida*

***Chorizanthe brevicornu* Torr.** Short Spine-flower. Plants erect or ascending, mainly 5-28 cm tall; stems usually several from the base, strigulose, breaking at the nodes when dry; leaves mostly basal, 1-6 cm long, 2-8 mm wide, narrowly oblanceolate, reduced to opposite bracts upward; involucres solitary in axils of branches, subcylindric, conspicuously 6-ridged, straight or curved, ca 4 mm long, the lobes with recurved spinose teeth; flowers 3-4 mm long, glabrous, the perianth lobes whitish, subequal; stamens 3; achenes ca 2 mm long. Creosote bush, blackbrush, and other warm and salt desert shrub communities at 760 to 1220 m in Grand, Kane, San Juan, and Washington counties; Nevada, Arizona, and California; 14 (iv).

***Chorizanthe rigida* (Torr.) T. & G.** Rigid Spine-flower. [*Acanthogonum rigidum* Torr.]. Stems simple, obscured by bracts and leaf bases; main leaves orbicular to obovate, woolly beneath, green and sparingly tomentose above; secondary leaves bracteate, lanceolate to subulate, spine-tipped, indurate and thorny at maturity; inflorescence dense, with involucres clustered in bract axils; tube of involucre ca 2 mm long, 3-angled, with 3 broad, spreading, unequal, straight, spine-tipped lobes 4-12 mm long; perianth yellowish, almost included; stamens 9; achenes ovoid, prominently beaked, ca 2 mm long. Creosote bush, Joshua tree, and other warm desert shrub communities at 760 to 1130 m in Washington County; Arizona, Nevada, California, and Mexico; 8 (i).

***Chorizanthe thurberi* (Gray) Wats.** Thurber Spine-flower. [*Centrostegia thurberi* Gray]. Plants erect, usually simple from the basal rosette and typically dichotomously branched upward, 4-16 cm tall; basal leaves 4-39 mm long, 3-6 mm wide, spatulate, subglabrous; foliar bracts 3-lobed, spine-tipped, 2-4 mm long; involucres solitary, borne in branch axils, 4-6 mm long, 5-toothed, the teeth armed with straight spines, 3-angled and with 3 saccate, spinose horns near the base; perianth included, pubescent; stamens 6 or 9; achenes ca 1.5 mm long. Creosote bush, blackbrush, mountain brush, and pinyon-juniper communities at 850 to 1700 m in Garfield (?), Kane, and Washington counties; Arizona, Nevada, and California; 12 (i). The report for Garfield County is based on a specimen collected "4 miles south of Boulder (probably Nevada), in creosote bush," and might be mislabeled.

***Eriogonum* Michx.**

Annual or perennial herbs, subshrubs, or shrubs; leaves basal or cauline and alternate, or with scalelike to foliaceous alternate or whorled bracts, entire, estipulate; flowers perfect or imperfect, borne in campanulate, obconic, or cylindrical involucres; involucres 4- to 10-lobed or -toothed, or less often in 2 whorls or 3 more or less distinct bracts, awnless, few- to many-flowered, sessile or stipitate; perianth petaloid, 6-segmented, in 2 series; flowers pedicellate, subsessile, or the base attenuated and stipelike; stamens 9, the filaments filiform; ovary 1-loculed, with 3 styles and capitate stigmas; achenes 3-angled or -winged. Note: This is a dual genus, consisting of annual species distinguished by minute diagnostic characteristics, and of perennial herbs, subshrubs, and shrubs that are connected through series of intermediates that defy segregation and construction of keys based on characters similar to those used in the annual species. Taxonomic problems are not easily resolved, and the approach presented below is only tentative.

1. Plants annual (except in some *E. inflatum*, q.v.), from slender taproots Key 1
- Plants perennial herbs, subshrubs, or shrubs 2
- 2(1). Plants definitely shrubby, the stems developed above ground level and with 1 to several elongated internodes Key 2
- Plants acaulescent or, if caulescent, the stems prostrate at ground level or the internodes very short and obscured by a tomentum 3
- 3(2). Flowers with attenuated, stipelike bases, yellow to reddish yellow or cream; plants often with prostrate-spreading stems Key 3
- Flowers not with stipelike bases, variously colored; plants seldom with prostrate-spreading stems 4
- 4(3). Plants pulvinate-caespitose, mound-forming; inflorescences mainly 0.5-5 cm tall; leaves less than 1 cm long Key 4
- Plants not simultaneously pulvinate-caespitose, mound-forming, less than 5 cm tall, and with leaves less than 1 cm long Key 5

Key 1.

Plants annual (except in some *E. inflatum*).

1. Involucres angled to strongly ribbed, usually tightly appressed vertically to the stems and always sessile 2
- Involucres smooth, not ribbed or angled, usually stipitate or, if sessile, not vertically appressed to the stems 9
- 2(1). Leaves puberulent to villous beneath, but not tomentose 3
- Leaves tomentose, at least beneath 5
- 3(2). Cauline leaves more or less bracteate, the blades not well developed, soft-hairy; involucres 4-lobed; flowers white, suffused with red, glabrous or sometimes hispidulous, 1-1.8 mm long; plants of southwestern Utah *E. puberulum*
- Cauline leaves with well-developed blades, variously hairy; involucres 5-lobed; flowers variously colored, 1.5-2 mm long; distribution various 4
- 4(3). Outer perianth segments broadly obovoid, hooded, markedly ciliate, otherwise glabrous; plants of Kane County *E. darrovii*
- Outer perianth segments oblong to ovate, not hooded or markedly ciliate, otherwise hispidulous and more or less glandular; plants of central and eastern Utah *E. divaricatum*
- 5(2). Foliage leaves cauline and basal; plants of Kane and Washington (?) counties *E. polycladon*
- Foliage leaves all basal (some seldom cauline and the plants of other distribution); plants variously distributed 6
- 6(5). Stems tomentose to floccose-tomentose 7
- Stems glabrous 8
- 7(6). Flowers yellow to red, the outer perianth segments broadly obovate *E. nidularium*
- Flowers white, the outer segments narrowly obovate *E. palmerianum*

- 8(6). Involucres 3-5 mm long; achenes ca 2 mm long; plants of Kane and Washington counties *E. davidsonii*
- Involucres 1-2.5 mm long; achenes ca 1 mm long; plants of Beaver County *E. baileyi*
- 9(1). Leaves glabrous or variously pubescent but not tomentose or lanate, even on the lower blade surface 10
- Leaves tomentose to lanate on the lower blade surface, at least 15
- 10(9). Involucres in 2 whorls, each whorl 3-lobed 11
- Involucre consisting of a single whorl, this usually 4- or 5-lobed 12
- 11(10). Foliage leaves all basal; peduncles abruptly bent above the middle *E. flexum*
- Foliage leaves both cauline and basal; peduncles straight or gently curved *E. salsuginosum*
- 12(10). Stems usually strongly inflated; plants of broad distribution, annual or perennial *E. inflatum*
- Stems not inflated (except in some *E. trichopes*, q.v.); plants annual, of various distribution 13
- 13(12). Flowers glabrous, white, fading yellowish; plants of eastern Utah *E. gordonii*
- Flowers hairy, yellowish or reddish; plants of western and southwestern Utah 14
- 14(13). Branches of inflorescence with stipitate, usually purplish glands; flowers densely villous; involucres 5-lobed; plants of western Utah *E. howellianum*
- Branches of inflorescence not glandular; involucres 4-lobed; plants of Washington County *E. trichopes*
- 15(9). Foliage leaves both cauline and basal 16
- Foliage leaves all basal (except in some *E. cernuum*, q.v.) 17
- 16(15). Flowers glabrous, yellow, the outer perianth segments cordate-ovate; leaves linear to narrowly oblanceolate *E. pharmaceoides*
- Flowers minutely glandular-puberulent, white to yellowish or pink, the outer segments oval; leaves obovate to lanceolate *E. maculatum*
- 17(15). Involucres minute, 0.3-1 mm long 18
- Involucres 1-3 mm long 20
- 18(17). Flowers yellow, soon suffused with red, glabrous; plants of southeastern Utah *E. wetherillii*
- Flowers white to pink or yellow, hairy or glabrous; plants of southwestern Utah 19
- 19(18). Flowers yellow; outer perianth lobes with saccate-dilated bases, pubescent *E. thomasii*
- Flowers white to pink; outer perianth lobes not swollen at the base, pubescent or glabrous *E. subreniforme*
- 20(17). Branches of inflorescence or stipes with dark, stipitate glands; plants of Washington County *E. brachypodium*
- Branches of inflorescence or stipes glabrous (or tomentulose) or, if stipes glandular (as in *E. nutans*), plants not of Washington County 21
- 21(20). Involucres and flowers puberulent and more or less glandular; plants of Washington County *E. pusillum*
- Involucres and flowers glabrous (or tomentulose); plants variously distributed 22
- 22(21). Branches of inflorescence more or less tomentose (at least when young) and glandular; leaf margins conspicuously undulate-cripsed; plants of eastern Utah *E. scabrellum*

- Branches of inflorescence glabrous; leaf margins not especially undulate; plants variously distributed 23
- 23(22). Outer perianth segments merely truncate to obtuse basally; involucre usually stipitate 24
- Outer perianth segments cordate at the base; involucre usually sessile 25
- 24(23). Stipes glabrous; outer perianth segments violin-shaped, constricted below the middle, the margins undulate, more or less saccate below; plants common and widespread *E. cernuum*
- Stipes stipitate-glandular; outer segments obovate, not constricted below the middle, the margins not especially saccate; plants uncommon *E. nutans*
- 25(23). Involucres erect on branches of inflorescence; plants of Iron and Washington counties *E. insigne*
- Involucres deflexed on branches of inflorescence; plants of various distribution 26
- 26(25). Involucres broadly campanulate, broader than long; flowers yellow to reddish yellow; plants widespread *E. hookeri*
- Involucres obconic, somewhat longer than broad; flowers white to pink; plants of western and southern Utah *E. deflexum*

Key 2.

Plants definitely shrubby.

- 1. Flowers pubescent, white to pink; leaves fascicled in at least some axils; plants of Washington County *E. fasciculatum*
- Flowers glabrous, variously colored; leaves fascicled or not; plants variously distributed 2
- 2(1). Stems angled or ribbed and more or less grooved, or conspicuously flexuous; plants of Washington County 3
- Stems rounded or terete and not especially, if at all, flexuous; plants variously distributed 4
- 3(2). Stems both flexuous and grooved, usually glabrous; involucre 0.7–1.5 mm long *E. heermannii*
- Stems flexuous, almost terete, tomentose; involucre 2–2.5 mm long *E. plumatella*
- 4(2). Plants completely glabrous; plants of Emery and Wayne counties *E. corymbosum*
- Plants pubescent or tomentose, at least in part, variously distributed 5
- 5(4). Leaves oval to oblong or elliptic, the blades mostly less than 3 times longer than broad 6
- Leaves linear to narrowly oblong or narrowly elliptic, the blades mostly 5–10 times longer than broad 10
- 6(5). Flowers not much exerted from the involucre; leaves typically densely tomentose on both surfaces; plants mainly of the Great Basin and western Kane and eastern Washington counties *E. nummular*
- Flowers conspicuously exerted from the involucre; leaves often only thinly tomentose above; plants of broad or other distribution 7
- 7(6). Inflorescences ca 1/2 as long as plant height, subequal to the leafy portion of current annual growth; involucre racemously arranged; plants of Washington County *E. wrightii*
- Inflorescences usually much less than 1/4 the plant height or, if longer, as in some *E. thompsonae*, the involucre not racemously arranged; plants variously distributed 8
- 8(7). Inflorescence mostly 1/3–1/2 the plant height; leaves mostly near the base of the annual shoots; plants of Kane and Washington counties *E. thompsonae*
- Inflorescence mostly less than 1/4 the plant height; leaves mostly cauline, except in some *E. corymbosum*; plants of broad distribution 9
- 9(8). Leaf apices acute, the blades mostly elliptic and more or less revolute, mainly less than 8 mm wide; plants widespread *E. microthecum*
- Leaf apices typically rounded, the blades orbicular to oblong or ovate to obovate, seldom if at all revolute, mainly more than 8 mm wide *E. corymbosum*
- 10(5). Leaves flat, slightly if at all revolute 11
- Leaves revolute, the lower surface largely obscured by revolute margins 13
- 11(10). Plants semishrubby only; stems of current growth dying to plant base *E. brevicaul*
- Plants definitely shrubby; stems of current growth not dying to plant base each year 12
- 12(11). Leaves with margins at least somewhat revolute; plants broadly distributed *E. corymbosum*
- Leaves mainly flat; plants of northern Uintah County *E. lonchophyllum*
- 13(10). Inflorescences mainly 8–20 cm long or more; involucre racemose; plants of sandy tracts in the Navajo Basin *E. leptocladon*
- Inflorescences mainly 1–6 cm high; involucre cymose; plants variously distributed, but usually not in deep sand 14
- 14(13). Plants low, mat-forming; flowers bicolored, pink and white *E. bicolor*
- Plants low to tall, but not mat-forming; flowers white, pink, reddish, or yellow 15
- 15(14). Flowers yellow; plants of clay and silt substrates in eastern Grand County *E. contortum*
- Flowers white, pink, or reddish; plants variously distributed 16
- 16(15). Leaf axils (at least some) with fascicled leaves; plants of San Juan County *E. clavellatum*
- Leaf axils seldom with fascicled leaves (if ever); plants of various distribution 17
- 17(16). Leaves linear, rather tightly revolute, mainly 2–6 cm long, inflorescence dense, glabrous, green; plants of San Juan County *E. leptophyllum*
- Leaves elliptic to linear, flat to revolute but, if revolute, mainly less than 2 cm long and the inflorescence open and tomentose; plants variously distributed 18
- 18(17). Leaves mainly 3–7 cm long; involucre clustered on inflorescence branch tips; plants of Duchesne County and sometimes elsewhere *E. corymbosum*
- Leaves mainly 0.8–3 cm long; involucre not clustered, plants widespread *E. microthecum*

Key 3.

Flowers with attenuated, stipelike bases.

- 1. Stems with whorled, foliose bracts near the middle; plants of northern Utah *E. heracleoides*
- Stems lacking whorled bracteate leaves, or these closely subtending the plants inflorescences; variously distributed 2
- 2(1). Flowers glabrous *E. umbellatum*
- Flowers hairy 3

- 3(2). Stems with whorled bracteate leaves subtending the umbellate inflorescence; involucre to 6 mm wide or more *E. jamesii*
 — Stems lacking whorled bracteate leaves subtending the capitate inflorescence; involucre to 3 mm wide
 *E. caespitosum*

Key 4.

Plants pulvinate caespitose, mound-forming; inflorescences less than 5 cm tall and leaves less than 1 cm long.

1. Leaf blades oval, almost or quite as broad as long *E. ovalifolium*
 — Leaf blades longer than broad 2
 2(1). Scapes, if present, glabrous; plants of central and south central Utah *E. panguicense*
 — Scapes, if present, tomentose; plants of various distribution 3
 3(2). Flowers glabrous, 2–3 mm long; plants of San Francisco Range *E. soredium*
 — Flowers hairy, mainly 2–4 mm long; distribution various 4
 4(3). Ovaries and achenes pubescent; flowers white or yellow; plants of lower elevations in Great Basin and in eastern Utah *E. shockleyi*
 — Ovaries and achenes glabrous; flowers yellow, white, or pink; plants variously distributed 5
 5(4). Heads 10–15 mm wide, usually evidently pedunculate and definitely bracteate; plants mainly of the Great Basin *E. villiflorum*
 — Heads less than 10 mm wide, usually sessile and not evidently bracteate; plants of eastern and south-central Utah 6
 6(5). Flowers white to rose, 3.5–4 mm long; involucre 6– to 8-lobed; plants of eastern Utah *E. tumulosum*
 — Flowers yellow 1.8–2.5 mm long; involucre 4-lobed; plants of Garfield County *E. aretioides*

Key 5.

Plants herbaceous perennials with leaves more than 1 cm long and with stems or scapes more than 5 cm tall.

1. Caudex branches or root crown 1–2.5 cm thick, clothed with persistent leaf bases, these with persistent, coarse, villous-pilose hairs; plants wandlike, mainly 3–12 dm tall *E. alatum*
 — Caudex branches or root crown less than 1 cm thick, or if thicker, not villous-pilose 2
 2(1). Inflorescence racemose or paniculate, the involucre spaced along elongate, erect branches ... *E. racemosum*
 — Inflorescence cymose, the involucre clustered on short, spreading branches 3
 3(2). Leaf blades all oval to orbicular and about as broad as long; inflorescence branching or capitate but, if the latter, the inflorescence mostly 15–30 mm wide 4
 — Leaf blades, at least some, much longer than broad or, if as above, the inflorescence capitate and 5–14 mm wide 5
 4(3). Involucre capitate; flowers white, pink, or yellow; plants widespread *E. ovalifolium*
 — Involucre borne in open cymes; flowers white or pink; plants of central to western Utah *E. batemanii*

- 5(3). Plants strictly acaulescent above caudex branches 6
 — Plants short-caulescent, the internodes apparent, though short and obscured by dense tomentous or, if acaulescent, the inflorescence branched 7
 6(5). Scapes glabrous; flowers white; plants mainly of southern highlands *E. panguicense*
 — Scapes tomentose; flowers white, pink, cream, or yellow *E. brevicaule*
 7(5). Scapes or peduncles pubescent or, if glabrous (as in some *E. spathulatum*), the plants of Beaver County .. 8
 — Scapes or peduncles glabrous; plants variously distributed 9
 8(7). Involucre capitate; plants of northern Utah *E. brevicaule*
 — Involucre in branching cymes or subcapitate; plants of central and western Utah *E. spathulatum*
 9(7). Flowers yellow; involucre not in capitate clusters; leaves linear to lanceolate or oblanceolate . *E. brevicaule*
 — Flowers white or pink; leaves oblong to elliptic or ovate-lanceolate 10
 10(9). Leaves broadly elliptic to ovate-lanceolate, the blades usually less than 3 times longer than broad . *E. batemanii*
 — Leaves narrowly elliptic, commonly 5–8 times longer than broad *E. lonchophyllum*

Eriogonum alatum Torr. in Sitgr. Winged Buckwheat. [*E. triste* Wats., type from Kane County; *E. alatum* ssp. *triste* (Wats.) Stokes]. Perennial herbs, mainly 3–12 dm tall, from a taproot and thick rootcrown, this 1–3 cm thick or more and clothed with persistent, coarsely villous-pilose leaf bases, the pith chambered; leaves mainly 3–12 (20) cm long, 3–15 mm wide, narrowly oblanceolate to lanceolate, strigose on one or both surfaces; cauline leaves reduced upwards; inflorescence cymose-paniculate; stipes erect, 3–20 mm long; involucre obconic to campanulate, 2–4.5 mm long, pilosulose to glabrous, 5-lobed; perianth yellowish to greenish, 1.5–2.8 mm long, the segments oblong, united to near the middle; achenes 5–9 mm long, 3–6 mm wide, glabrous, 3-winged the entire length; $n = 20$. Sagebrush, mixed desert shrub, pinyon-juniper, and mountain brush communities at 1155 to 2685 m in Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Kane, San Juan, Sevier, Uintah, Wasatch, Washington, and Wayne counties; Wyoming to Nebraska, south to Arizona, New Mexico, Texas, and Mexico; 66 (x).

Eriogonum aretioides Barneby Widtsøe Buckwheat. Pulvinate-caespitose, mound-forming, herbaceous perennials from a pluricipital caudex and woody taproot, the caudex branches mainly 20–50, the taproot clothed with shreddy castaneous to blackish bark; leaves 1–3.5 mm long, 0.8–1.2 mm wide, oblanceolate in outline, revolute, the lower surface obscured, white-pilose, sessile; inflorescence of solitary, sessile involucre, not borne above the rosettes, these campanulate, 2.8–3.2 mm long, 2–4 mm wide, villous, 4-lobed; flowers yellow, 2–2.2 mm long, pilose, the segments lance-ovoid; achenes brown, ca 2 mm long, glabrous. Bristlecone pine, ponderosa pine, Douglas fir, and Rocky Mountain juniper communities, on Pink Limestone Member of the Wasatch Formation, at 2255 to 2655 m in Garfield (type from near Widtsøe) County; endemic; 5 (0).

Eriogonum baileyi Wats. Bailey Buckwheat. Annual herbs, mainly 10–30 cm tall; leaves all basal; blades orbic-

ular or obovate, mainly 5–20 mm long and about as broad, tomentose on one or both sides; petioles 5–30 mm long; inflorescences much-branched, spreading; involucre sessile, subcylindric, 1.5–2.5 mm long, 5–lobed, glabrous, vertically appressed; flowers white to pink, 1.5–2 mm long, glabrous, the outer segments oblong to obovate, slightly constricted near the middle, the inner segments narrower; achenes brown, ca 1 mm long. Sagebrush-rabbitbrush and mountain mahogany communities at 1830 to 2200 m in Beaver County; Oregon and Idaho, south to Nevada and California; 2 (ii).

Eriogonum batemanii Jones Bateman Buckwheat. Perennial herbs, mainly 10–45 cm tall; leaves all basal; blades 1–3.5 cm long, 5–16 mm wide, oval, orbicular, elliptic, or lance-oblong, tomentose on one or both surfaces, flat marginally, obtuse to rounded apically; petioles 8–25 mm long; inflorescences usually glabrous, open, cymose-paniculate, the branches spreading-ascending; involucre sessile, clustered or solitary, narrowly campanulate or obconic, 2–4 mm long, with 5, hyaline, rounded lobes; flowers white, 1.5–2.8 mm long, glabrous, the outer segments obovate, the inner ones slightly narrower; achenes brown, 2.5–3 mm long; n = 20. Three rather weak but geographically correlated varieties occur in Utah.

- 1. Leaf blades mainly 2–3 times longer than broad; plants of eastern Utah *E. batemanii* var. *batemanii*
- Leaf blades about as broad as long; plants of western and central Utah 2
- 2(1). Involucres capitate, mainly 2–5, terminating long naked branches; plants of western Beaver and Millard counties *E. batemanii* var. *eremicum*
- Involucres cymose, mainly 1–5 in branching terminal cymes on rather short branches; plants of Piute and Sevier counties *E. batemanii* var. *ostlundii*

Var. batemanii Mixed desert shrub and pinyon-juniper communities at 1615 to 2515 m in Carbon (type from Price Valley), Duchesne, Emery, Garfield, and Uintah counties; Colorado; a Plateau endemic; 41 (viii). Plants with both capitate and cymose involucre in the branched inflorescences and very short broad leaf blades occur in this entity. Thus, the variation is similar to that represented in the two following varieties, which are distinguished on features not exclusive with them. A specimen from Horn Mt., Emery County (Foster 8257 BRY) simulates *E. lonchophyllum* var. *lonchophyllum*, and suggests a relationship between *E. batemanii* and that taxon.

Var. eremicum (Reveal) Welsh Hermit Buckwheat. [*E. eremicum* Reveal, type from SE of Garrison, Millard County]. Shadscale, desert shrub, and juniper communities at 1555 to 1925 m in Beaver and Millard (type from southeast of Garrison) counties; endemic; 12 (viii). Substrates include limestone and dolomite. Specimens herein assigned to *E. spathulatum* (q.v.), but having glabrous inflorescences, appear to be intermediate towards this variety.

Var. ostlundii (Jones) Welsh Elsinore Buckwheat. [*E. ostlundii* Jones, type from near Elsinore, Sevier County]. *E. spathuliforme* Rydb., type from Piute County]. Shadscale, mixed desert shrub, juniper, and ponderosa pine communities, often on igneous gravels, at 1675 to 1985 m in Piute and Sevier (type from near Elsinore) counties; endemic; 27 (iii).

Eriogonum bicolor Jones Pretty Buckwheat. [*E. microthecum* ssp. *bicolor* (Jones) Stokes]. Mound-forming shrubs, mainly 2–8 cm tall, the horizontal spreading stems mainly 5–20 cm long; leaves caulescent, mostly 5–15 mm long, 1–3 mm wide, clavate, the lower surface more or less obscured by revolute margins, tomentose; current stems white-tomentose; inflorescence umbellate-cymose, on peduncles 3–15 mm long; involucre obconic to broadly campanulate, 2–4 mm long, tomentose to glabrous, with 5 acutish to rounded lobes; flowers white to pink or rose, the midveins often pink to red purple, 2.2–4 mm long, glabrous, the outer segments obovate to orbicular, the inner ones oblanceolate to elliptic; achenes brown, 3–3.5 mm long. Shadscale, mat-atrilex, other salt and mixed desert shrub, and pinyon-juniper communities at 1340 to 1985 m in Carbon, Emery, Garfield, Grand (type from Thompsons Springs), San Juan, Sevier, and Wayne counties; endemic; 54 (vi).

Eriogonum brachypodum T. & G. Parry Buckwheat. [*E. parryi* Gray, type from St. George; *E. deflexum* ssp. *parryi* (Gray) Stokes; *E. deflexum* var. *brachypodum* (T. & G.) Munz; *E. deflexum* ssp. *brachypodum* (T. & G.) Stokes]. Annual herbs, mainly 5–30 cm tall; leaves all basal, the blades 0.8–4 cm long and about as wide or wider, orbicular to reniform, white-tomentose, at least beneath; inflorescences umbellate, the branches glandular; involucre on stipes 3–15 mm long, usually deflexed, glandular; involucre 1–2.5 mm long, obconic to campanulate, usually glandular, with 5 triangular-acute teeth; flowers white or suffused with red, 1.5–2.8 mm long, glabrous, the outer segments ovate-cordate, the inner ones oblanceolate; achenes brown, 1.5–2 mm long; 2n = 40. Creosote bush, other warm desert shrub, and shadscale communities at 760 to 1550 m in Washington County; California, Nevada, and Arizona; 16 (ii).

Eriogonum brevicaulis Nutt. Shortstem Buckwheat. Plants perennial; stems of the year dying to the base, mainly 3–35 cm tall, glabrous or tomentose; leaves all basal or some with obvious short stems, the short internodes obscured by a tomentum, 0.3–10 cm long, 1–9 mm wide, tomentose on one or both surfaces, flat to revolute, entire or undulate, linear to elliptic, oblanceolate, or lanceolate; petioles 1–40 mm long; inflorescences cymose, capitate, or cymose-umbellate; involucre solitary or clustered, obconic to campanulate, 1.5–4.5 mm long, tomentose to glabrous, with 5 acute lobes; flowers yellow to cream, white, or suffused with pink, glabrous, the segments ovate to oblong, lanceolate, oval, or obovate; achenes 1.5–3.5 mm long, brown. The *brevicaulis* complex typifies the problematical nature of interpretation of perennial members of the genus. Floral morphology is sufficiently reduced and uniform as to lack definitive diagnostic criteria in most instances. Inflorescence structure is only somewhat more useful, but is often variable within a population, ranging from capitate to branched. Flower color is useful in a general sense only, often varying from white to yellow or even pink within a population. Pubescence appears, at first, to be of substantial value, but the use of this criterion fails also. The attempt here is to bring together those members of the group as they occur in Utah, meanwhile acknowledging the problems of recognition of all specimens within a constituent entity. Further, an indication of intermedicity, whether phenotypic, due to ecological response, or genotypic, due to hybridization, is presented. Pheno-

typic variation in response to different, often subtle, environmental conditions are apparently great. However, some part of the variation is due to hybridization of phases of this complex among themselves and with phases of the *E. corymbosum*, *E. lonchophyllum*, *E. microthecum*, and possibly other complexes. The following treatment should be regarded as tentative at best.

1. Inflorescences branched from well below the middle of the plant height; plants of the southern Uinta Basin *E. brevicaulis* var. *ephedroides*
- Inflorescence capitate and unbranched or branched from above the middle of the plant height (seldom below in some var. *viridulum* q.v.) 2
- 2(1). Leaves revolute, the lower surface completely obscured by the margin; plants of the northern and western Uinta Basin *E. brevicaulis* var. *viridulum*
- Leaves revolute or flat, the lower surface readily apparent or, if not, the plants of other distribution 3
- 3(2). Leaves both flat and scapes monocephalous; plants of northern Utah 4
- Leaves revolute or, if flat, the plants usually with a branching inflorescence 5
- 4(3). Plants strictly caulescent; plants of western Box Elder County *E. brevicaulis* var. *desertorum*
- Plants short-caulescent, the internodes obscured by a white tomentum; plants of Cache, Morgan, and Rich counties *E. brevicaulis* var. *loganum*
- 5(3). Plants with a definitely woody caudex, this clothed with black, marcescent leaf bases; leaves usually undulately partially revolute; typically growing in crevices or ridge crests *E. brevicaulis* var. *nanum*
- Plants with subligneous caudex, this only sometimes with blackish marcescent leaf bases; leaves various, but sometimes as above; of various habitats 6
- 6(5). Stems glabrous, the inflorescences branching in the upper 1/3–1/4; plants transitional with the following *E. brevicaulis* var. *brevicaule*
- Stems tomentose or, if glabrous, the inflorescence branching in the upper 1/4 7
- 7(6). Flowers white, suffused with pink, or yellow, borne in capitate or branched inflorescences; plants of Minnie Maud Creek and Mt. Bartles vicinity *E. brevicaulis* var. *promiscuum*
- Flowers usually yellow, borne in capitate or branched inflorescences; plants broadly distributed *E. brevicaulis* var. *laxifolium*

Var. *brevicaule* [*E. campanulatum* Nutt.; *E. confertiflorum* var. *stansburyi* Benth. in DC., type from Salt Lake; *E. brevicaulis* var. *aureum* Benth. in DC.; *E. nudicaule* ssp. *garrettii* Stokes, type from near Echo Reservoir; *E. nudicaule* ssp. *parleyense* Stokes, type from Parleys Canyon]. Sagebrush, juniper, mountain brush, pinyon-juniper, aspen, and spruce-fir communities at 1460 to 2745 m in Daggett, Davis, Salt Lake, Summit, and Utah counties; Idaho, Wyoming, and Colorado; 60 (viii). This variety, as interpreted here, includes var. *wasatchense* (Jones) Reveal [*E. wasatchense* Jones, type from American Fork Canyon], a narrow-leaved phase completely transitional with more typical var. *brevicaule* northward. The narrow-leaved phase is also transitional with var. *laxifolium* (q.v.) southward, and both varieties *brevicaule* and *laxifolium* intergrade upwards with the aggregation of forms treated herein as var. *nanum* (q.v.).

Hybrids between var. *brevicaule* and *E. corymbosum* are known from Wyoming.

Var. *desertorum* (Maguire) Welsh Desert Buckwheat. [*E. chrysocephalum* ssp. *desertorum* Maguire in Maguire & Holmgren; *E. desertorum* (Maguire) R. J. Davis]. Sagebrush, bitterbrush, and juniper communities at ca 1585 to 2440 m in Box Elder County; Nevada; 3 (0). This variety simulates the capitate phase of var. *laxifolium*, differing conspicuously only in the flat leaf blades.

Var. *ephedroides* (Reveal) Welsh Ephedra Buckwheat. [*E. ephehdroides* Reveal, type from 10 mi S of Bonanza, Uintah County]. Shadscale, thistle, mixed desert shrub and open pinyon-juniper communities, on Green River Formation, at 1525 to 2075 m in Uintah (type from south of Bonanza) County; endemic; 28 (iii). This most distinctive phase of the *brevicaule* complex forms apparent hybrids with *E. corymbosum* in the eastern part of its range.

Var. *laxifolium* (T. & G.) Reveal Varying Buckwheat. [*E. kingii* var. *laxifolium* T. & G. type from Wasatch Mts.; *E. chrysocephalum* Gray; *E. chrysocephalum* var. *angustum* Jones, type from Johnsons Pass, Tooele County; *E. nudicaule* ssp. *angustum* (Jones) Stokes; *E. brevicaulis* var. *pumilum* Stokes ex Jones, type from between Colton and Kyune, Carbon County; *E. nudicaule* ssp. *pumilum* (Stokes) Stokes; *E. tenellum* ssp. *cottamii* Stokes, type from Utah County; *E. brevicaulis* var. *cottamii* (Stokes) Reveal; *E. medium* Rydb. type from Mt. Nebo]. Mountain brush, sagebrush, pinyon-juniper, ponderosa pine, and aspen communities at 1645 to 3390 m in Duchesne, Emery, Juab, Millard, Salt Lake, Sanpete, Sevier, Tooele, and Utah counties; endemic; 64 (xv). This variety consists of plants with both capitate and open inflorescences, slender to broad leaves, revolute to flat leaves, usually tomentose (but sometimes glabrous) inflorescences, and other diversity. The var. *cottamii* is based on the densely tomentose plants of western ranges, but these are transitional completely at higher elevations with other phases of var. *laxifolium*, and show affinity with *E. spathulatum* (q.v.) downward. Apparent hybrids occur with *E. lonchophyllum* (see var. *promiscuum*).

Var. *loganum* (A. Nels.) Welsh Logan Buckwheat. [*E. loganum* A. Nels., type from Logan; *E. chrysocephalum* ssp. *loganum* (A. Nels.) Stokes]. Sagebrush-bunchgrass communities at 1460 to 2045 m in Cache (type from Logan), Morgan, and Rich counties; endemic; 8 (0). This material differs only superficially from var. *nanum*, a higher elevation phase with similar well-developed woody base.

Var. *nanum* (Reveal) Welsh Dwarf Buckwheat. [*E. nanum* Reveal, type from Willard Peak; *E. grayi* Reveal, type from Lake Blanche, Salt Lake County]. Sagebrush, mountain brush, spruce-fir, and alpine tundra communities, in crevices in limestone or quartzite outcrops, or on windswept ridges or in talus slopes at 2010 to 3510 m in Box Elder, Cache, Juab, Millard, Salt Lake, Tooele, Utah, and Weber counties; endemic; 35 (i). This assemblage consists of crevice plants and other dwarf, high elevation phases that apparently do not have genetic integrity. Their recognition at any taxonomic rank is, therefore, problematical, and they are treated here for convenience only.

Var. *promiscuum* Welsh Green River Shale outcrops in sagebrush, aspen, and spruce-fir communities at 2285 to 3060 m in Carbon (type from Mt. Bartles) County; endemic; 6 (ii). The Mt. Bartles buckwheat is similar in some

respects with var. *nanum*, but seems to have a separate origin. The plants appear to have arisen through hybridization of portions of *E. brevicaulis* var. *laxifolium* with *E. corymbosum* var. *hylophilum*, and with a possible infusion of *E. lonchophyllum* var. *lonchophyllum*. Flowers are predominantly white suffused with pink, and in the upper elevational reaches have capitate inflorescences. Downward the inflorescences are branched and the plants are transitional to *E. corymbosum*. Yellow flowered individuals give evidence of contribution from *E. brevicaulis* var. *laxifolium*; 12 (iii).

Var. *viridulum* (Reveal) Welsh Duchesne Buckwheat. [*E. viridulum* Reveal, type from 8 mi E of Duchesne]. Pinyon-juniper, shadscale, and mixed desert shrub communities at 1555 to 2135 m in Duchesne and Uintah counties; endemic; 58 (v). Hybrids between var. *viridulum* and *E. corymbosum*, which simulate *E. corymbosum* var. *aureum*, are locally common in Duchesne and eastern Utah counties. They have been described as both *E. corymbosum* var. *albogilvum* Reveal (type from Indian Canyon) and *E. x duchesnense* Reveal (type from Indian Canyon); 18 (iii). The var. *viridulum* is closely allied to var. *ephedroides*, standing about midway between that entity and var. *brevicaulis*. There is an admitted close affinity with var. *laxifolium* westward. Some plants from near Split Mt., Uintah County, are apparently transitional with *E. lonchophyllum* var. *saurinum* and *E. microthecum*.

***Eriogonum caespitosum* Nutt.** Mat Buckwheat. Plants perennial, mat-forming, mainly 1–4 dm across, the vegetative stems persistent, with branches woody and usually clothed with gray to black leaves and bases; flowering stems scapose, arising from rosettelike branches, mainly 0.5–10 cm long or lacking; leaves 2–12 mm long, 1.5–5 mm wide, spatulate to oblanceolate, elliptic or oval, tomentose, flat or essentially so, short-petiole; inflorescence capitate, not subtended by bracts; involucre campanulate, with the tubes 2–3.5 mm long and 3–5 mm wide, the lobes oblong, 2–3.5 mm long; flowers yellow or suffused with red, 2.5–10 mm long including the stipitate base, pilose to villous, the segments oblanceolate; achenes 3.5–5 mm long; $n = 20$. Sagebrush, pinyon-juniper, and mountain brush communities at 1525 to 2290 m in Beaver, Box Elder, Iron, Juab, Millard, Rich, Summit, and Washington counties; Oregon to Montana, south to California, Nevada, and Colorado; 21 (iv).

***Eriogonum cernuum* Nutt.** Nodding Buckwheat. [*E. cernuum* var. *tenue* T. & G., type from Weber Valley; *E. cernuum* var. *umbraticum* Eastw., type from McElmo Creek, San Juan County]. Plants annual, becoming umbelliform, mainly 5–45 cm tall; leaves all basal or cauline up to 10 cm above the base, the blades 3–25 mm long and about as wide, ovate to oval or orbicular, tomentose on one or both sides; petioles 3–40 mm long; inflorescence glabrous, open, the branches spreading or ascending; involucre usually stalked (except in var. *vimineum*), often deflexed, obconic to campanulate, 1–2 mm long, glabrous, the 5 teeth acute; flowers white, 1–2.5 mm long, glabrous, the outer segments constricted below the middle, the margins undulate, often more or less saccate basally, the inner ones obovate; achenes 1.5–2 mm long. Shadscale, other salt desert shrub, sagebrush, pinyon-juniper, mountain brush, ponderosa pine, aspen, and spruce-fir communities at 1220 to 2510 m in all Utah counties, except Cache, Morgan, and Summit; Canada

south to California, Arizona, and New Mexico; 142 (xxvii). A phase with sessile involucre and somewhat larger flowers occurs in Beaver and Millard counties; i.e., var. *viminale* (Stokes) Reveal in Munz [*E. cernuum* ssp. *viminale* Stokes]; 5 (0). A few plants from sandy sites in Kane County have inflorescences more paniculiform than usual and more uniformly short-stipitate involucre. Possibly they are of taxonomic significance.

***Eriogonum clavellatum* Small** Comb Wash Buckwheat. Shrubs, mainly 7–20 cm tall, clump-forming; leaves 3–15 mm long, 0.5–2 mm wide, narrowly oblanceolate to oblong, white-tomentose beneath, less densely so above, revolute, often with fasciated secondary ones in at least some axils; petioles very short; inflorescence cymose-umbellate, mainly 1–2.5 cm wide, glabrous; involucre on stipes mainly 1–4 mm long, glabrous, obconic to campanulate, 3.5–4.5 mm long, with 5-acute teeth; flowers white or suffused with pink, glabrous, 3–3.5 mm long, the outer segments obovate to broadly spatulate, the inner ones narrower; achenes 3–3.5 mm long. Shadscale and blackbrush communities at ca 1325 to 1650 m in San Juan (type from Bartons range) County; Colorado; a Plateau endemic. 10 (iv). This taxon might be best treated as variety of *E. fasciculatum*, with which it is closely allied. However, no such combination is proposed herein.

***Eriogonum contortum* Small ex Rydb.** Grand Buckwheat. [*E. effusum* ssp. *contortum* (Small) Stokes]. Shrubs mainly 5–20 cm tall, clump-forming; leaves 5–20 mm long, 1–2 mm wide, linear to narrowly oblanceolate, revolute, tomentose on one or both sides; petioles very short; inflorescence cymose to cymose-umbellate, the involucre not clustered, tomentose to glabrous, involucre 1–2.5 mm long, obconic to campanulate, glabrous, the 5 teeth acutish; flowers yellow, 1.5–2.5 mm long, glabrous, the segments oblong to obovate; achenes 2–2.5 mm long. Shadscale and other salt desert shrub communities at ca 1280 to 1525 m in Grand County; Colorado; 8 (ii). This low shrub is allied to the *brevicaulis* complex.

***Eriogonum corymbosum* Benth.** Corymb Buckwheat. Low to tall shrubs or subshrubs, 0.7–12 dm tall, clump-forming (seldom mat-forming); leaves 0.7–9 cm long, lanceolate to elliptic, orbicular, oblanceolate, spatulate, or linear, tomentose on one or both sides or glabrous, the margins flat to revolute; petioles 2–18 mm long; inflorescences cymose, the branches ascending to spreading or divaricate, glabrous or tomentose; involucre 1.5–4 mm long, obconic or campanulate, glabrous or tomentose, with 5 or 6 acute teeth; flowers white, suffused with pink or red, or yellow, 1.5–4.5 mm long, glabrous, the segments obovate to lanceolate or spatulate; achenes 2–3 mm long; $n = 20$. This is a huge and complex species group, involving numerous morphological variants, some of which are edaphically and geographically correlated. Diagnostic criteria are few, and are often based on vegetative characteristics that form continuous clines. The species is pivotal to *E. thompsonae*, *E. lonchophyllum*, *E. leptocladon*, and *E. brevicaulis*, forming hybrids with all of them. At the margins of ecological tolerance the species undergoes reduction of internode length and concurrent elongation of the inflorescence. Yellow flowers are apparently derived, at least in part, from hybridization with other species having yellow flowers (see *E. x duchesnense*, under *E. brevicaulis*, and both *E. thompsonae* and *E. leptocladon*). The following treatment is preliminary, but allows recognition of the more important phases of the

Eriogonum darrovii Hook. Darrow Buckwheat. Annuals, mainly 3–15 cm tall, usually branched from near the base; leaves mainly cauline, the blades 4–15 mm long, 3–13 mm wide, puberulent to villous-pilose on both sides, obovate to ovate, elliptic or orbicular; inflorescences axillary; involucre sessile, campanulate, 2–2.5 mm long, pilose, with 5 lance-ovate lobes; flowers yellow or pink, 1–2.5 mm long, hairy near the base, the outer segments broadly obovate, hooded, and conspicuously ciliate, the inner ones narrower; achenes ca 1 mm long. Pinyon-juniper community at ca 1860 m in Kane County; Arizona and Nevada; 1 (0).

Eriogonum davidsonii Greene Davidson Buckwheat. [*E. baileyi* var. *davidsonii* (Greene) Jones; *E. molestum* var. *davidsonii* (Greene) Jepson; *E. juncinellum* Gand.; *E. vimineum* ssp. *juncinellum* (Gand.) Stokes]. Annuals, 6–40 cm tall; leaves all basal (rarely some above the base), the blades 6–20 mm long and as wide or wider, orbicular, white-tomentose beneath and above or glabrate above; petioles 3–20 mm long; inflorescences glabrous, the branches erect-ascending; involucre sessile or terminal, narrowly obconic, 2.5–5 mm long, glabrous, the 5 teeth acutish; flowers white to pink, 1.5–2 mm long, glabrous, the segments obovate to oblong; achenes ca 2 mm long; $n = 20$. Creosote bush, Joshua tree, mixed warm desert shrub, and pinyon-juniper communities at 795 to 1680 m in Kane and Washington counties; California, Nevada, Arizona, and Mexico; 7 (0).

Eriogonum deflexum Torr. in Ives Skeletonweed Buckwheat. [*E. deflexum* var. *nevadense* Reveal]. Annuals, 5–40 (50) cm tall; leaves all basal; blades 6–30 (40) mm long and as wide or wider, orbicular to subreniform, rounded to cordate basally, tomentose on one or both sides; petioles 0.3–7 cm long; inflorescences usually spreading and umbrellalike, glabrous; involucre stipitate to subsessile or sessile, glabrous, deflexed, obconic to somewhat campanulate, mainly 1.5–2 mm long, the 5 teeth acutish; flowers white, sometimes pinkish, 1–2 mm long, glabrous, the outer segments cordate, the inner ones narrower; achenes 1.5–2 mm long; $2n = 40$. Creosote bush, Joshua tree, blackbrush, other warm desert shrub, shadscale, and juniper communities at 760 to 1985 m in Garfield, Juab, Kane, Millard, San Juan, Washington, and Wayne counties; Nevada, Arizona, California and Mexico; 39 (xiii). This species is a close ally of *E. hookeri*, *E. brachypodium*, and *E. insigne*, all of which have been included previously within an expanded *E. deflexum*. Some specimens from Washington County have strict branches like *E. insigne*, but are otherwise *E. deflexum*. I follow recent tradition in treating the taxa as separate species. The var. *nevadensis*, in Utah at least, lacks both geographical and morphological continuity. Our material belongs to var. *deflexum*.

Eriogonum divaricatum Hook. Spreading Buckwheat. Annuals, prostrate to decumbent-ascending, the stems 5–22 cm long, dichotomously branched; leaves cauline and basal, the blades 3–30 mm long, 3–20 mm wide, oval to orbicular, puberulent with crinkly hairs; involucre sessile, borne in axils of bracteate leaves on spreading-decurved branches, obconic, 1–2 mm long, pilose, 5-lobed; flowers yellowish or suffused with red, 1–2 mm long, puberulent and glandular, the segments oblong to lanceolate; achenes 1.5–2 mm long. Shadscale, mixed desert shrub, and pinyon-juniper communities at 1155 to 2015 m in Emery, Garfield, Millard, San Juan, Sevier, Uintah,

and Wayne counties; Wyoming, Colorado, New Mexico, and Arizona; 12 (i).

Eriogonum fasciculatum Benth. Mojave Buckwheat. Shrubs, mainly 2–8 dm tall, clump-forming; leaves cauline, often with some fasciated ones in lower axils, 4–18 mm long, 1–5 mm wide, usually more or less revolute, linear to narrowly oblong or oblanceolate, more or less tomentose on one or both sides; inflorescences long-peduncled, divaricately branched or subcapitate, tomentose; involucre obconic to campanulate, 2–3.5 mm long, the 5 obtusish lobes with hyaline margins; flowers white to pink, 2–3 mm long, villous-pilose, the segments obovate; achenes 2–2.5 mm long. Warm desert shrub communities at 730 to 1495 m in Washington County; Nevada, California, Arizona, and Mexico; 25 (i). Our material has been assigned to var. *polifolium* (Benth.) T. & G. [*E. polifolium* Benth. in DC.]. A specimen with provenience of Emery County (Cottam 5224A BRY) is extant, but might be mislabeled.

Eriogonum flexum Jones Bent Buckwheat. [*E. flexum* var. *ferronis* Jones, type from near Ferron; *Stenogonum flexum* (Jones) Reveal & J. T. Howell]. Annuals, 4–35 cm tall; leaves all basal (rarely some whorled at nodes of inflorescence); blades 3–28 mm long and about as wide, orbicular to oval, truncate to subcordate basally, puberulent to glabrous and sometimes glandular on one or both surfaces; petioles 3–40 mm long; involucre stipitate, the filiform stipes commonly abruptly bent below the involucre and often glandular below, campanulate, in 2 whorls, each 3-lobed; flowers yellow, 1.5–4 mm long, puberulent, the segments lanceolate; achenes 2–2.5 mm long; $n = 20$. Shadscale, mat-saltbush, blackbrush, and pinyon-juniper communities, often on fine-textured substrates, at 1430 to 1865 m in Carbon, Emery, Garfield, Kane, San Juan, Uintah, and Wayne counties; Colorado and Arizona; 34 (iii). Although regarded by some workers as belonging, with *E. salsuginosum*, in the segregate genus, *Stenogonum*, because of their peculiar involucre, both species appear to be more nearly allied to species within *Eriogonum* proper than they are to each other.

Eriogonum gordonii Benth. in DC. Gordon Buckwheat. Annuals, mainly 8–60 cm tall; leaves all basal; blades 9–55 mm long, oval to suborbicular, obtuse to truncate or cordate basally, green above, paler beneath, softly spreading-hairy; petioles 0.5–10 cm long or more; inflorescences spreading-ascending, glabrous or hairy; involucre on stipes mainly 3–20 mm long, obconic-campanulate, 0.6–1.3 mm long, glabrous, with 5 obtusish teeth; flowers white, 1–2.5 mm long, glabrous, the segments obovate to oblong or oblanceolate; achenes 1.8–2.5 mm long. Salt desert shrub, shadscale, and juniper or pinyon-juniper communities, on fine-textured saline soils, at 1110 to 2015 m in Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Kane, and Uintah counties; Wyoming to Nebraska, south to Arizona, and New Mexico; 49 (vi).

Eriogonum heermannii Dur. & Hilg. Heermann Buckwheat. Shrubs, mainly 1–6 dm tall, clump-forming, with intricately and divaricately branched inflorescences appearing cushionlike; leaves mainly 3–17 mm long, 2–5 mm wide, the blades elliptic to spatulate, tomentose on one or both sides, more or less revolute; petioles 3–10 mm long; inflorescence cymose, the branches angled or ribbed and sulcate between the ribs; involucre sessile, glabrous, campanulate, 0.6–1.5 mm long, with 5 rounded

teeth; flowers white (yellowish?), 1.5–3 mm long, glabrous, the outer segments obovate, the inner ones narrower; achenes 2–2.5 mm long. Blackbrush, mixed desert shrub, mountain brush, and pinyon-juniper communities (often on rock outcrops) at ca 1220 to 2135 m in Washington County; Nevada, Arizona, and California; 7 (i). All material from Utah examined by me belongs to *var. sulcatum* (Wats.) Munz & Reveal (*E. sulcatum* Wats., type from near St. George). The *var. subracemosum* (Stokes) Reveal [*E. howellii* *var. subracemosum* Stokes] is present in the region also. It differs in having stems less angled and involucre more racemously arranged.

Eriogonum heracleoides Nutt. Whorled Buckwheat. [*E. heracleoides* *var. utahense* Gand., type from Cache County]. Perennial, mat-forming, mainly 2–6 dm across; vegetative stems persistent, the branches woody and more or less clothed with persistent, gray to brown or blackish leaves and bases; flowering stems with whorled leaves near the middle, arising from rosettelike bases, mainly 1.5–5 dm tall; leaves 2–7 cm long, 3–15 mm wide, the blades elliptic to oblong or oblanceolate, tomentose on one or both sides, entire, flat or essentially so; petioles 3–30 mm long; inflorescences umbellate or twice umbellate, rarely capitate, tomentose; involucre sessile or on stipes to 40 mm long, obconic to campanulate, 4–10 cm long, the lobes subequal to the tube or longer; flowers white or cream (or yellow), 4–9 mm long, including the stipitate base, the segments spatulate to elliptic or oblong; achenes 2–5 mm long. Sagebrush, mountain brush, juniper, pinyon-juniper, Douglas fir, and aspen communities at 1310 to 3050 m in Box Elder, Cache, Daggett, Davis, Duchesne, Juab, Millard, Salt Lake, Sanpete, Summit, Tooele, Uintah, Utah, and Wasatch counties; Canada, south to California, Nevada, and Wyoming; 83 (ii). This plant forms putative hybrids with phases of *E. umbellatum*. A specimen with features of *E. heracleoides*, but with yellow flowers (Neese 14148 BRY) might indicate hybridization.

Eriogonum hookeri Wats. Watson Buckwheat. [*E. deflexum* ssp. *hookeri* (Wats.) Stokes; *E. deflexum* ssp. *hookeri* *var. gilvum* Stokes, type from American Fork Canyon]. Annuals, mainly 8–60 mm tall; leaves all basal; blades mainly 10–50 mm long and as broad or broader, orbicular to reniform, tomentose on both sides, obtuse to cordate basally, flat to undulate; inflorescences glabrous, umbrellalike; involucre sessile, deflexed, campanulate to hemispheric, 1–2 mm long, glabrous; flowers yellow, soon suffused with pink to dark red, 1.5–2.7 mm long, glabrous, the outer segments cordate, the inner ones narrower; achenes 2–2.5 mm long; $2n = 40$. Mixed desert shrub, sagebrush, pinyon-juniper, aspen, and spruce-fir communities at 1135 to 3050 m in Beaver, Box Elder, Carbon, Duchesne, Emery, Garfield, Iron, Juab, Millard, Piute, San Juan, Sevier, Tooele, Uintah, Utah (type from American Fork Canyon), and Wayne counties; Wyoming, Colorado, Arizona, Nevada, and California; 70 (xviii).

Eriogonum howellianum Reveal Howell Buckwheat. Annual, 5–30 cm tall, simple or branched from the base; leaves all basal; blades 6–25 (30) mm long and about as wide, oval to suborbicular, pubescent with long, soft, spreading hairs on at least the lower surface, obtuse to subcordate basally; petioles 3–40 mm long; inflorescences divaricately branched, the branches with scat-

tered, stipitate, dark glands; involucre with filiform stipes 3–20 mm long or more, obconic to campanulate, glabrous, 1.3–2 mm long, usually 5-toothed; flowers yellowish or reddish, 1–2 mm long, the segments lanceolate, mostly obscured by spreading-villous hairs; achenes 1.5–2 mm long. Desert shrub, desert almond, and shade-scale communities at 1460 to 1740 m in Juab, Millard (type from southeast of Garrison) and Tooele counties; Nevada; a Great Basin endemic; 8 (i). This taxon is allied to *E. inflatum* and *E. flexum*.

Eriogonum inflatum T. & G. Bottlebrush; Bottlestopper; Desert trumpet. Annual or perennial herbs, mainly 8–100 cm tall; leaves all basal; blades 4–30 mm long and about as wide or wider, orbicular to oblong or reniform, hirtellous on one or both sides, obtuse to cordate basally, entire to undulate-crested; petioles 0.5–6 cm long; peduncles and usually the primary and secondary rays of inflorescence inflated, rarely not; inflorescence umbellate-cymose; involucre borne on glabrous, capillary to filiform stipes 5–45 mm long or more, obconic, 0.7–1.5 mm long, glabrous, the 5 lobes acutish; flowers yellow or reddish, 1–2.5 mm long, densely strigose, the segments lanceolate to ovate; achenes 2–2.5 mm long; $n = 16$. Warm, mixed, and salt desert shrub and pinyon-juniper communities at 760 to 1955 m in Carbon, Duchesne, Emery, Garfield, Grand, Kane, San Juan, Uintah, Washington, and Wayne counties; California, Nevada, Colorado, Arizona, New Mexico, and Mexico; 90 (xvii). Annuals within this species have been regarded as *var. fusiforme* (Small) Reveal [*E. fusiforme* Small], and perennials as *var. inflatum*. The former occurs at the margins of the range of the latter, but is also sympatric. The segregation appears to be moot, owing to the flowering of specimens of both phases during the initial year.

Eriogonum insigne Wats. Unique Buckwheat. [*E. deflexum* *var. insigne* (Wats.) Jones; *E. deflexum* ssp. *insigne* (Wats.) Stokes; *E. exaltatum* Jones; *E. deflexum* ssp. *exaltatum* (Jones) Stokes]. Annuals, mainly 8–100 cm tall; leaves all basal; blades 8–50 mm long (or more) and as wide or wider, orbicular to reniform, obtuse to cordate basally, tomentose on one or both sides; petioles 0.6–10 cm long; peduncles simple or branched from the base, inflorescences open cymose, the branches glabrous, erect to spreading; involucre sessile or with stipes to 6 mm long, obconic to campanulate, 2–3 mm long, glabrous, the 5 teeth obtusish; flowers white or suffused with pink, 1.5–2 mm long, glabrous, the outer segments cordate to oblong-cordate, the inner ones narrower; achenes 2–2.5 mm long; $2n = 40$. Creosote bush, other warm desert shrub, and mixed desert shrub communities at 730 to 1170 m in Iron (type from Red Creek) and Washington counties; California, Nevada, and Arizona; 6 (0).

Eriogonum jamesii Benth. in DC. James Buckwheat. Mat-forming perennials, mainly 1–6 dm wide; vegetative stems persistent, the branches woody, usually clothed with persistent, ashy to dark brown leaf bases; flowering stems subscaiose, arising from rosettelike branches, mainly 6–30 cm long; leaves 1–9 cm long, 4–20 mm wide, the blades elliptic to obovate or ovate, tomentose on one or both sides, entire or undulate, flat or essentially so; petioles 0.5–6 cm long; inflorescences capitate or once or twice umbellate, tomentose, with foliose bracts at the nodes; involucre sessile, campanulate, 3–14 mm long, tomentose, the 5–8 teeth obtusish, erect to spreading; flowers yellow, 4–11 mm long, including the stipitate

base, the segments spatulate to obovate; achenes 4–5 mm long, Sagebrush, mountain brush, pinyon-juniper, and ponderosa pine communities at 1585 to 2685 m in Carbon, Duchesne, Emery, Kane, San Juan, Sevier, Utah, Washington, and Wayne counties; Wyoming to Kansas, south to Arizona, New Mexico, Texas, and Mexico: 40 (viii). This is a remarkably beautiful species, with its bright sulfur yellow flowers. The species varies from population to population and specimens from Utah have been regarded as belonging to two varieties, although more segregation seems possible. Dwarf plants from Washington and adjacent Kane counties have pilose hairs over the tomentum on the upper leaf surfaces; they belong to var. *rupicola* Reveal (type from Zion National Park). The remainder of the Utah specimens are included within var. *flavescens* Wats., but that taxon consists of variants of about equal rank to var. *rupicola*. Specimens from San Juan County have capitate inflorescences, and material from western Emery County has huge involucre.

Eriogonum leptocladon T. & G. Sand Buckwheat. Shrubs, mainly 2–10 dm tall or more, clump-forming; leaves often deciduous at anthesis, mainly 10–45 mm long, 2–10 mm wide, linear to narrowly lanceolate or oblanceolate, more or less revolute to flat, tomentose on one or both sides; petioles 1–6 mm long; inflorescences tomentose or glabrous, much longer than the vegetative stems; involucre cymose-racemose, sessile or nearly so, obovate to campanulate, 1.5–3 mm long, glabrous or tomentose, the 5 teeth acute to rounded; flowers yellow, yellowish, or white and often suffused with pink, 2–3.5 mm long, glabrous, the segments obovate; achenes 2.5–3.5 mm long; $n = 20$. Three rather weak varieties are present.

- 1. Flowers yellow; plants of the central Canyonlands vicinity *E. leptocladon* var. *leptocladon*
- Flowers white; plants sometimes distributed as above, or otherwise 2
- 2(1). Branches of inflorescence yellowish green, glabrous or rarely tomentose; plants of Garfield and Kane counties *E. leptocladon* var. *papiliunculum*
- Branches of inflorescence green to gray green, tomentose or glabrous; plants of broad or other distribution *E. leptocladon* var. *ramosissimum*

Var. *leptocladon* [*E. microthecum* var. *leptocladon* (T. & G.) T. & G.; *E. effusum* ssp. *leptocladon* (T. & G.) Stokes; *E. effusum* ssp. *pallidum* var. *shandsii* Stokes, type from Indian Creek, San Juan County]. Purple-sage, ephedra, sand sagebrush, blackbrush, saltbush, and pinyon-juniper communities, usually in sand or on stabilized dunes, at 1340 to 1895 m in Emery, Garfield, Grand (type from Green River), San Juan, Sevier, and Wayne counties; endemic; 39 (x). This phase forms putative hybrids with *E. corymbosum* var. *corymbosum* (Neese 6529 - 6833 BRY). The apparent backcrosses to *corymbosum* have broad leaves and yellowish flowers or are broad leaved and have white or pinkish flowers. The latter plants simulate var. *ramosissimum* and suggest at least one possible origin for that entity.

Var. *papiliunculum* Reveal Little-butterfly Buckwheat. Ephedra-Vanelevea, sand sagebrush, other sand desert shrub, and juniper communities at 1400 to 1830 m in Garfield, Kane, San Juan, and Wayne counties; Arizona (?); 10 (ii). These plants have broader leaves than in var. *leptocladon* and yellowish green inflorescences.

They are intermediate in most respects between var. *ramosissimum* and *E. corymbosum*, with possibly both var. *corymbosum* and var. *aurcum* as contributors. Specimens transitional to both var. *ramosissimum* and *E. corymbosum* var. *aurcum* are known.

Var. *ramosissimum* (Eastw.) Reveal Eastwood Buckwheat. [*E. ramosissimum* Eastw., type from near Butler Wash, San Juan County]. Vanelevea, yucca, purple-sage, sand sagebrush, blackbrush, and juniper communities at 1310 to 1770 m in Garfield, Kane, San Juan, and Wayne counties; Arizona, Colorado, and New Mexico; 14 (ii). This plant appears to be closely allied to *E. wrightii*, q.v.

Eriogonum leptophyllum (Torr.) Woot. & Standl. Slenderleaf Buckwheat. [*E. effusum* var. *leptophyllum* Torr. in Sitgr.; *E. microthecum* var. *leptophyllum* (Torr.) T. & G.]. Shrubs, mainly 1.5–5 (6) dm tall; vegetative branches with leaves separated by short internodes; leaves (1.5) 2–6 cm long, 1–3 mm wide, linear, tomentose on the almost obscured lower surfaces, tightly revolute; petioles 0.4–1 mm long; peduncles and inflorescences glabrous, cymose, dense and tufted with numerous glabrous branches; involucre obovate, 2–3 mm long, glabrous, 5-lobed; flowers white to pink, 2–4 mm long, glabrous, the segments subequal; achenes 3.5–4 mm long. Desert shrub community at ca 1700 m in San Juan County (Heil & Porter sn BRY); Colorado, Arizona, and New Mexico; 1 (0).

Eriogonum lonchophyllum T. & G. Longleaf Buckwheat. Subshrubs or shrubs, mainly 8–80 cm tall; vegetative branches with leaves all at base of current growth or with leaves separated by elongated internodes; leaves mainly 2–11 cm long, 2–12 mm wide, linear to elliptic, lanceolate, or oblanceolate, tomentose on one or both sides, margins entire to crenate, plane to revolute; petioles 3–20 mm long; peduncles and inflorescences glabrous or tomentose, cymose-corymbose to cymose-capitate; involucre usually sessile, obovate to campanulate, 2–4 mm long, glabrous, 5-lobed; flowers white, cream, or suffused with pink, 2–4 mm long, glabrous, the segments subequal; achenes 2.5–3.5 mm long. As is typical of other species complexes in the perennial versus shrubby species in *Eriogonum*, the *E. lonchophyllum* phases demonstrate genetic compatibility with members of other complexes. And, these likewise tend to precipitate out more or less uniform phases on distinctive soils or geologic substrates. Problems of interpretation of the distinctive groupings, their origins, and relationships are not made easier by the linear systems of classification and nomenclature usual in plant taxonomy. Instead of taxa (both ecotypes and microspecies) being related by descent from a common ancestor, they might have resulted from a reticulate relationship involving two or more parental taxa. There are two more or less distinctive taxa in Utah that fall within the circumscription of *E. lonchophyllum*, as described above. In species of genera in other families these would be regarded as belonging to the same taxon, in a broad sense, but here they might have had separate origins. The following treatment is, therefore, tentative.

- 1. Plants acaulescent or essentially so, the internodes of vegetative stems very short, growing on ridge crests along the Tavaputs divide and elsewhere *E. lonchophyllum* var. *lonchophyllum*

— Plants definitely caulescent, the internodes of vegetative stems readily apparent, growing on Mowry Shale and closely adjacent strata in northern Uintah County
 *E. lonchophyllum* var. *saurinum*

Var. *lonchophyllum* [*E. intermontanum* Reveal, type from the Roan Cliffs, Grand County]. Sagebrush, mountain brush, and Douglas fir communities, mainly on Green River and other calcareous formations at 2285 to 2745 m in Emery, Grand, and Uintah counties; Colorado and New Mexico; 11 (ii). This variety forms intermediates with *E. corymbosum* down slope in Uintah County (the Rainbow phase); 21 (0). The apparent hybrids are transitional from one extreme to the other, with individuals simulating not only var. *saurinum* but also the *E. lancifolium* and *E. corymbosum* var. *davidsei* phases of *E. corymbosum* var. *corymbosum* (q.v.). The similarity of this taxon to both *E. batemanii* var. *batemanii* and *E. spathulatum* is great. It also approaches *E. brevicaule* through the var. *promiscuum*.

Var. *saurinum* (Reveal) Welsh Dinosaur or Mowry Buckwheat. [*E. saurinum* Reveal, type from 10 mi E of Vernal]. Eriogonum, juniper, serviceberry, pinyon-juniper, and ponderosa pine, mainly on Wasatch, Mowry, Curtis, Entrada, Carmel, and Moenkopi formations, at 1585 to 1895 m in northern Uintah County; endemic; 33 (vi). Much of var. *saurinum* grows on the siliceous, acidic Mowry Shale Formation. That material, though variable, is the most uniform phase of the variety. Evidence exists that even the Mowry Shale phase is partially, at least, a product of introgression with *E. corymbosum*. On other formations adjacent to the Mowry Shale the plants vary from the type; e.g., in the Steinaker Reservoir area (Curtis, Entrada, and Carmel formations) the inflorescences are suggestive of those of *E. brevicaule* var. *viridulum* on the one hand and *E. microthecum* on the other; in the Asphalt Ridge (Wasatch Formation) vicinity the plants bear features of *E. corymbosum*; and, in the Bourdette Draw vicinity (Moenkopi Formation), south of Blue Mountain, the plants again share features of *E. brevicaule*, in a broad sense. Though trends exist that indicate direct relationship with *E. lonchophyllum*, this variety might represent mainly recombinants of various *E. brevicaule* and *E. corymbosum* introgressants. More work is indicated.

Eriogonum maculatum Heller Spotted Buckwheat. [*E. angulosum* var. *maculatum* (Heller) Jepson; *E. angulosum* ssp. *maculatum* (Heller) Stokes]. Annuals, mainly 8–37 cm tall or more; leaves basal and cauline (foliose bracteate); basal leaf blades 5–25 mm long, 3–15 mm wide, oval to obovate or elliptic, tomentose on one or both sides; petioles 3–15 mm long; bracteate leaves reduced and becoming sessile upwards; inflorescences tri- or dichotomous, tomentose; involucre on filiform stipes 5–30 mm long or more, broadly campanulate, 1–2.5 mm long, glandular-puberulent, with 5 broad teeth; flowers white to yellowish or pink, 1.5–2.8 mm long, glandular-puberulent, the outer segments ovate and cupulate, shorter than the slender inner ones; achenes 1–1.5 mm long. Creosote bush, Joshua tree, blackbrush, pinyon-juniper, live oak, and mixed desert shrub communities, at 730 to 1830 m in Box Elder, Juab, Millard, Tooele, and Washington counties; Washington and Idaho, south to California, Nevada, and Arizona; 25 (iv).

Eriogonum microthecum Nutt. Slender Buckwheat. Shrubs, mainly 4–100 cm tall, clump-forming; leaves

4–35 mm long, 1–7 mm wide, elliptic to linear or oblanceolate, tomentose on one or both sides, the margins flat or revolute; petioles 1–5 mm long; inflorescences cymose, the branches ascending to spreading, glabrous or tomentose; involucre sessile to short-stipitate, obconic, 2–3.5 mm long, tomentose or glabrous, with 5 obtusish to rounded teeth; flowers white or suffused with pink, 2–3.2 mm long, glabrous, the segments obovate; achenes 2–3 mm long. Salt and mixed desert shrub, sagebrush, pinyon-juniper, ponderosa pine, mountain brush, and white fir communities at 1125 to 2900 m in all Utah counties except Davis, Duchesne, Morgan, Salt Lake, Sanpete, Wasatch, and Weber; Washington to Montana, south to California, Nevada, Arizona, and New Mexico; 166 (xxxvi). There are two intergrading phases of this species in Utah, distinguished only by leaves being flat or revolute. The former have been designated as var. *laxiflorum* Hook. [*E. tenellum* var. *grandiflorum* Gand., type from Utah], and the latter as var. *foliosum* (T. & G.) Reveal [*E. effusum* var. *foliosum* T. & G.; *E. simpsonii* Benth. in DC.; *E. friscanum* Jones, type from Frisco; *E. nelsonii* L. O. Williams, type from Geyser Basin, San Juan County]. Specimens that are intermediate between *E. microthecum* and *E. brevicaule* are known (Neese 14531 a-c BRY), and likewise with *E. lonchophyllum* var. *saurinum* (Neese 8495 BRY). Despite its tendency to form intermediates with other taxa the slender buckwheat is not known to hybridize with *E. corymbosum*, with which it is typically contrasted in keys.

Eriogonum nidularium Cov. Birdnest Buckwheat. Annuals, mainly 5–20 cm tall, usually with erect-ascending branches from near the base; leaves all basal, 3–20 mm long and as wide, orbicular, tomentose on one or both sides; petioles 4–30 mm long; inflorescences densely branched, tomentose; involucre sessile, obconic, 0.6–1 mm long, appressed-erect, 5-toothed; flowers yellowish or reddish, 1.5–3 mm long, glabrous, the outer segments broadly obovate to flabellate, the inner ones narrower; achenes ca 1 mm long. Mixed desert shrub at ca 1065 to 1220 m in Washington County; Oregon to Idaho, south to California and Arizona; 3 (0).

Eriogonum nummularie Jones Coin Buckwheat. Shrubs or subshrubs, sprawling to erect, mainly 1–8 dm tall, clump-forming; leaves 4–30 mm long, 4–17 mm wide, orbicular to elliptic, lanceolate, or obovate, tomentose on both surfaces, plane or undulate; petioles 1–15 mm long; inflorescences cymose or cymose-racemose, tomentose or glabrous, the branches erect-ascending or spreading; involucre sessile or on stipes 1–2 mm long, obconic, 1.5–3.5 mm long, tomentose or glabrous, 5-toothed; flowers white or suffused with pink, 1.5–3 mm long, the segments obovate to oblong; achenes 1.5–3.5 mm long; n = 40. Two varieties occur in Utah.

1. Inflorescences glabrous; involucre narrowly obconic, glabrous; plants uncommon
 *E. nummularie* var. *ammophilum*
- Inflorescences tomentose; involucre broadly obconic, tomentose; plants locally common
 *E. nummularie* var. *nummularie*

Var. *ammophilum* (Reveal) Welsh Ibex Buckwheat. [*E. ammophilum* Reveal, type from Ibex Warm Point, Millard County]. Shadscale, horsebrush, winterfat, rabbitbrush, ephedra, and pinyon-juniper communities at 1460 to 1830 m in Millard (type from Ibex Warm Point)

County; endemic; 8 (v). These plants are intermediate between *E. nummulari*, in a strict sense, and *E. batemanii* var. *cremicum*. They share the caulescent habit of the former with the glabrous inflorescences and involucre of the latter. The distribution is intermediate between the two.

Var. *nummulari* [*E. kearneyi* Tidestr., type from w of Tooele; *E. dudleyanum* Stokes, type from Skull Valley]. Fourwing saltbush, rabbitbrush, sagebrush, salt desert shrub, and juniper communities at 1095 to 1985 m in Juab, Kane, Millard, Tooele (type from Dutch Mountain), and Washington counties; California, Nevada, and Arizona; 30 (v). Specimens from sandy areas of eastern Tooele County south to Kane and Washington counties (i.e., *E. kearneyi* sens. str.) have leaves proportionally longer than broad, but the variation is continuous westward with more typical material.

Eriogonum nutans T. & G. Dugway Buckwheat. [*E. deflexum* ssp. *ultrum* Stokes, type from Beaver Valley; *E. rubiflorum* Jones, type from Dugway, Tooele County]. Annuals, mainly 5–30 cm tall; leaves all basal; blades 5–25 mm long and as wide or wider, orbicular to reniform, obtuse to cordate basally, tomentose on one or both sides; petioles 5–28 mm long; inflorescences more or less trichotomously branched, glabrous or more or less stipitate-glandular; involucre with slender stipes mainly 3–12 mm long, finally decurved, broadly campanulate, 2–3 mm long, more or less glandular, the 5 teeth with hyaline margins; flowers white or suffused with pink or red, glabrous, 2–3 mm long, the outer segments oblong-obovate, the inner ones narrower; achenes 1.5–2 mm long. Shadscale and sagebrush communities at ca 1525 to 1830 m in Beaver, Carbon, Millard, Sanpete, Sevier, and Tooele counties; Oregon and Nevada; 6 (ii).

Eriogonum ovalifolium Nutt. Cushion Buckwheat. Pulvinate-caespitose, often mound-forming perennials, mainly 0.5–4 dm across; vegetative branches clothed with persistent, ashy to black leaf bases, terminated by rosettes of leaves; fertile stems scapose, 1–30 cm tall; leaf blades 2–6 cm long, 1–15 mm wide, tomentose on both surfaces, orbicular to elliptic, oblanceolate, or spatulate; petioles 1–50 mm long or more; inflorescences capitate, tomentose; involucre solitary or few to several, obconic to campanulate, 2–5.6 mm long, tomentose, with 5 teeth; flowers white, cream, yellow, or suffused with pink, red, or purple, 3–7 mm long, glabrous, the outer segments oval to orbicular, the inner ones narrower; achenes 2–3 mm long; $n = 20$. Shadscale, bullgrass, winterfat, Grayia, sagebrush, pinyon-juniper, fringed sagebrush, and alpine meadow communities at 1370 to 3420 m in all Utah counties, except Davis, Morgan, Summit, and Wasatch; Canada, south to California, Arizona, and New Mexico; 202 (xxv). This species has been treated as having three varieties in Utah; var. *ovalifolium* [*E. ovalifolium* var. *utahense* Gand., type from Cache County?], with white or whitish flowers that ultimately turn pink, red, or purple; var. *multiscapum* Gand., with yellow flowers; and var. *nivale* (Canby) Jones [*E. nivale* Canby], a dwarf, small-flowered plant of high elevations. The segregation has not proven to be more than arbitrary, with diagnostic features segregating specimens, not taxa.

Eriogonum palmerianum Reveal in Munz Palmer Buckwheat. [*E. plumatella* var. *palmeri* T. & G.; *E. baileyi* var. *tomentosum* Wats.]. Annuals, mainly 6–25 (30) cm tall; leaves all basal (rarely some cauline); blades

4–23 mm long and as wide or wider, orbicular to subreniform, obtuse to cordate basally, tomentose on one or both sides; petioles 3–40 mm long; inflorescences branched from near the base, tomentose, the branches often divaricate; involucre sessile, appressed, obconic, 1.2–2 mm long, tomentose, with 5 acute teeth; flowers white or pink, 1.5–2.4 mm long, glabrous, the outer segments broadly oblanceolate or obovate, the inner ones narrower; rowers; achenes 1.5–2 mm long; $n = 20$. Blackbrush, shadscale, cheatgrass, rabbitbrush, desert almond, sagebrush, and pinyon-juniper communities at 1155 to 1985 m in Beaver, Box Elder, Garfield, Grand, Iron, Juab, Kane, Millard, San Juan, Sevier, Tooele, and Washington counties; Nevada to Colorado, California, Arizona, and New Mexico; 44 (x).

Eriogonum panguicense (Jones) Reveal Panguitch Buckwheat. [*E. pauciflorum* var. *panguicense* Jones, type from Panguitch; *E. spathulatum* var. *panguicense* (Jones) Stokes; *E. chrysocepalum* var. *alpestre* Stokes, type from Cedar Breaks; *E. panguicense* var. *alpestre* (Stokes) Reveal]. Pulvinate to caespitose perennial herbs, mainly 5–20 cm across; vegetative stems abbreviated, more or less clothed with ashy to black leaf bases and terminated by clustered leaves; flowering stems scapose, 2–30 cm long, glabrous; leaves 4–70 mm long, 2–8 (10) mm wide, linear to elliptic, oblanceolate, lanceolate, ovate, or obovate, obtuse to cuneate basally, plane or somewhat revolute; petioles 1–12 mm long; inflorescences glabrous, capitate or rarely branched; involucre sessile, several, obconic to campanulate, 2–3.7 mm long, the 5 teeth acute to obtuse; flowers white, often suffused with red, 2–3 mm long, glabrous, the segments oblong to lance-oblong; achenes 3–4 mm long. Pinyon-juniper, sagebrush, ponderosa pine, pygmy sagebrush, bristlecone pine, and spruce-fir communities, usually on limestone, at 1675 to 3355 m in Garfield, Iron, Kane, Millard, Sanpete, Sevier, and Washington counties; endemic; 48 (xi). This attractive buckwheat is closely allied to both *E. batemanii* and *E. spathulatum*, with whom it is partially sympatric. The species differs from both, however, in the usually unbranched inflorescences and smaller stature. It consists of a series of more or less disjunct populations growing on peculiar calcareous strata. Each population differs in subtle ways from all others, and if one is chosen for varietal status, the remainder require similar recognition. The overall status, as a mosaic of variation, seems to dictate against recognition of infraspecific categories.

Eriogonum pharnaceoides Torr. in Sitgr. Wirestem Buckwheat. Annuals, mainly 6–30 cm long; leaves basal and cauline (foliose bracteate); blades 8–35 mm long, 1–6.5 mm wide, linear to narrowly oblanceolate, tomentose on one or both sides; petioles 1–5 mm long or lacking; inflorescences cymose, tomentulose; involucre on filiform stipes mostly 8–50 mm long, these often curved, campanulate, usually pilose, 3–4 mm long, with 5 oblong teeth; flowers yellow, 2–3 mm long, glabrous, the outer segments cordate and more or less cupulate, the inner ones narrower and surpassing the outer; achenes 1.5–2 mm long. Pinyon-juniper, oakbrush, and ponderosa pine communities at ca 1830 to 2640 m in Iron and Washington counties; Nevada, Arizona, and New Mexico; 5 (0). Our material belongs to var. *cervinum* Reveal (type from Pine Valley Mts.).

Eriogonum plumatella Dur. & Hilg. Obscure Buckwheat. [*E. palmeri* Wats., type from Washington County]. Low, rounded shrubs, mainly 3–6 dm tall;

stems leafy in the lower portion, white-tomentose, branched above; leaves 8–15 mm long, oblanceolate to elliptic, oblong, or oblong-lanceolate, more or less revolute, acute, tomentose, with short, slender petioles; branches of inflorescence divaricate, green; involucre borne on widely spreading branches, these terminating in branches with shortened internodes, the involucre solitary or crowded, glabrous, sessile, obconic to subcylindric, ca 2.5 mm long; perianth segments glabrous, white, 1.5–2.5 mm long, the outer segments ovate, the inner narrower; filaments pilose below; achenes narrow, subangular. Creosote bush community at ca 1035 m in the Beaverdam Mts., Washington County; Arizona, Nevada, and California; 3 (i).

Eriogonum polycladon Benth. in DC. Leafy Buckwheat. [*E. vimineum* ssp. *polycladon* (Benth.) Stokes]. Annuals, mainly 15–60 cm tall, the leafy stems erect; leaves basal and cauline; blades 6–18 mm long, 4–13 mm wide, obovate to elliptic, ovate, or suborbicular, tomentose on one or both sides; petioles 2–15 mm long; inflorescences tomentose, the branches erect-ascending; involucre sessile, appressed-erect, 1.5–2.5 mm long, glabrous or tomentose, with 5 obtuse teeth; flowers white or suffused with pink, 1.5–2.5 mm long, glabrous, the outer segments broadly obovate, the inner somewhat narrower; achenes 1–1.5 mm long. Sagebrush and pinyon-juniper communities at ca 1675 to 1830 m in Kane County; Arizona, New Mexico, Texas, and Mexico; 6 (ii).

Eriogonum puberulum Wats. Red Creek Buckwheat. Annuals, mainly 4–30 cm tall; leaves basal and cauline (leafy bracteate); blades 2–15 mm long and about as wide, obovate to orbicular, puberulent to pilosulose on one or both sides; petioles 1–15 mm long; inflorescences puberulent, more or less dichotomously branched; involucre obconic, 0.6–1.5 mm long, mainly obscured by cupulate, long-lobed, nodal bracts, with 5 obtuse lobes; flowers white or suffused with red, 1.5–2.2 mm long, glabrous or scabrous, the segments oblong, sometimes somewhat cordate basally; achenes ca 1 mm long. Blackbrush, pinyon-juniper, mountain brush, and ponderosa pine communities at 1050 to 2745 m in Beaver, Iron (type from Red Creek), Millard, and Washington counties; Nevada; 7 (0).

Eriogonum pusillum T. & G. Low Buckwheat. [*E. reniforme* ssp. *pusillum* (T. & G.) Stokes]. Annuals, 5–30 cm tall; leaves all basal; blades 3–20 mm long and about as wide, obovate to oval, tomentose on one or both sides; petioles 6–30 mm long; inflorescences more or less trichotomous, glabrous or the bracts glandular; involucre on slender, glabrous stipes 3–40 mm long, campanulate, 1–1.7 mm long, glandular-puberulent, the 5 lobes acute to obtuse; flowers yellow, 2–2.5 mm long, glandular-scaberrulous, the segments oblong; achenes ca 1 mm long. Creosote bush and Joshua tree communities at ca 760 m in Washington County; Oregon and Idaho, south to California and Arizona; 2 (i).

Eriogonum racemosum Nutt. Redroot Buckwheat. Perennial, scapose or subscapose herbs, 1.6–10 dm tall, from a simple or branched caudex; leaves all basal or some foliose-bracteate ones at nodes of inflorescence; blades 1–10 cm long, 6–38 mm wide, elliptic, oblong, oval, or ovate, tomentose on one or both sides, obtuse to truncate or cordate basally; petioles 0.6–10 cm long or more; inflorescences often swollen below the nodes, simple or branched, the branches erect-ascending, tomentose or

glabrous; involucre sessile, racemously arranged, obconic to campanulate, 2–6 mm long, tomentose or glabrous, with 5 acute teeth; flowers white or suffused with pink, rose, or scarlet, 2.5–5.5 mm long, glabrous, the segments oblong or oblanceolate; achenes 3–4.5 mm long; n = 18. Two varieties occur in Utah.

1. Flowering stems usually definitely swollen below the first branches of the inflorescence and often upward as well, glabrous or sometimes tomentose; plants of Kane and Washington counties *E. racemosum* var. *zionis*
- Flowering stems not at all or only occasionally somewhat swollen, tomentose or occasionally glabrous; plants widespread *E. racemosum* var. *racemosum*

Var. *racemosum* Sagebrush, pinyon-juniper, mountain brush, ponderosa pine, aspen, and spruce-fir communities at 1525 to 2745 m in Beaver, Cache, Davis, Duchesne, Emery, Garfield, Grand, Iron, Juab, Kane, Millard, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Utah, Washington, and Wayne counties; Nevada, Colorado, Arizona, and New Mexico; 108 (xiv).

Var. *zionis* (J. T. Howell) Welsh Zion Buckwheat. [*E. zionis* J. T. Howell, type from Zion National Park]. Mountain brush, juniper-manzanita, and ponderosa pine communities at 1340 to 1830 m in Kane and Washington counties; Arizona; 9 (v). Specimens are known that grade morphologically with var. *racemosum*; i.e., plants with glabrous stems are essentially non-fistulose and some with fistulose stems are tomentose throughout. The phase with scarlet flowers from nearby in Arizona are very similar to specimens of var. *racemosum* with deep rose colored flowers. The variety might ultimately be discovered in Utah. It is regarded as *E. racemosum* var. *coccineum* (J. T. Howell) Welsh [*E. zionis* var. *coccineum* J. T. Howell].

Eriogonum salsuginosum (Nutt.) Hook. Smooth Buckwheat. [*Stenogonum salsuginosum* Nutt.]. Annuals, mainly 3–26 cm tall, clump-forming, 3–40 cm wide; leaves basal and cauline (foliose bracteate); blades 2–20 mm long, 2–12 mm wide, spatulate to oblanceolate, obovate, or linear, tapering to broad petioles 2–20 mm long or sessile, glabrous on both sides; inflorescence more or less dichotomous, glabrous or minutely glandular; involucre sessile or on stipes to 4 cm long, these curved-ascending, broadly campanulate, in 2 whorls, each 3-lobed; flowers yellow, 1.5–3 mm long, puberulent, the segments lanceolate; achenes 2–2.5 mm long. Shadscale, mat-atrilex, and pinyon-juniper communities at 1370 to 2760 m in Carbon, Daggett, Duchesne, Emery, Garfield, San Juan, and Uintah counties; Wyoming, Colorado, Nevada, Arizona, and New Mexico; 48 (viii).

Eriogonum scabrellum Reveal Westwater Buckwheat. Annuals, mainly 20–60 cm tall; leaves all basal, usually persistent at anthesis and beyond; blades 1–6 cm long and about as wide, orbicular to suborbicular, cordate basally, the margin strongly undulate-crested, tomentose on one or both sides; petioles 8–50 mm long; inflorescences spreading-ascending to umbrellalike, tomentose and glandular; involucre sessile, erect or deurved, on usually deurved branchlets, obconic, 1.5–2.5 mm long, with 5 acute teeth; flowers white or suffused with pink or red, 1.5–2.2 mm long, the outer segments obovate, the inner ones narrower; achenes 1.8–2.2 mm long. Salt desert shrub communities at ca 1220 to 1740 m in Garfield,

Grand (type from Westwater), Kane, and San Juan counties; Colorado and New Mexico; 7 (i).

Eriogonum shockleyi Wats. Shockley Buckwheat. [*E. pulvinatum* Small, type from Milford; *E. longilobum* Jones, type from near Price]. Pulvinate-caespitose, scapose, mound-forming perennials, mainly 2–5 cm tall, 5–40 cm across or more, from a woody, pluricapital caudex, the branches clothed with marcescent leaf bases and terminated by rosettes; leaf blades 2–12 mm long, 1–6 mm wide, obovate, oblanceolate, elliptic, or spatulate, tomentose on one or both sides; petioles 1–10 mm long, or lacking; inflorescences capitate; involucre sessile, campanulate, 2–6 mm long, tomentose, with 5 (or more) ovate to lanceolate lobes; flowers white, cream, yellow, or suffused with red, 2.5–4.5 mm long, pilose, the segments oblong to obovate; achenes 2.5–3 mm long. Blackbrush, shadscale, mixed desert shrub, sagebrush, and pinyon-juniper communities, often on fine-textured substrates, at 1280 to 1955 m in Beaver, Box Elder, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Kane, Millard, San Juan, Sevier, Tooele, Uintah, and Wayne counties; Idaho to Colorado, south to California, Arizona, and New Mexico; 107 (xv). Specimens from Utah have been treated in two varieties; i.e., var. *longilobum* (Jones) Reveal, with larger, more deeply cut involucre, occupying eastern Utah, and var. *shockleyi*, with shorter, less deeply cut involucre, occupying western Utah. Some of the plants from eastern Utah do have large involucre, but many do not. A large number of plants from western Utah have yellow flowers, but only very few from eastern Utah bear yellow flowers. A conservative interpretation is indicated.

Eriogonum soredium Reveal Frisco Buckwheat. Densely matted, pulvinate-caespitose, scapose, mound-forming perennials, mainly 2–4 cm tall, 10–50 cm across, from a pluricapital caudex, the branches clothed with marcescent leaf bases and terminated by rosettes; leaves 2–5 mm long, 0.7–2 mm wide, elliptic to oblong, white-tomentose on both surfaces, revolute; petioles 0.6–3 mm long; inflorescences capitate, tomentose; involucre sessile, obconic, 1.5–2.5 mm long, obscured by a dense tomentum, with 4 or 5 teeth; flowers white or suffused with pink, 2–3 mm long, glabrous, the outer segments obovate, the inner ones narrower; achenes 2–2.5 mm long. Sagebrush and juniper communities, on white limestone outcrops, at 2010 to 2230 m in Beaver (type from Frisco) County; endemic; 5 (ii).

Eriogonum spathulatum Gray Sevier Buckwheat. Perennial herbs, 10–40 cm tall, from a branching caudex; leaves subbasal, at least some internodes apparent, but obscured by a dense tomentum; blades 1–8 cm long, 3–15 mm wide, obovate to spatulate, elliptic, or linear, usually 1.5–5 times longer than wide or more, tomentose on one or both sides, acute to cuneate basally; petioles 3–30 mm long; inflorescences tomentose or glabrous, more or less trichotomous, the branches ascending; involucre sessile, clustered at branch ends, obconic, 2–4 mm long, tomentose or glabrous, with 5 acute teeth; flowers white or yellow, 2–3.5 mm long, glabrous, the segments oblong; achenes 2–3.5 mm long. Two more or less geographically correlated varieties are present.

1. Flowers yellow; leaf blades mainly less than twice as long as broad *E. spathulatum* var. *natum*

— Flowers white, or rarely yellow; leaf blades usually more than twice longer than broad *E. spathulatum* var. *spathulatum*

Var. *natum* (Reveal) Welsh Son Buckwheat. [*E. natum* Reveal, type from 43 mi SW of Delta]. Shadscale community on ancient marly playa remnants at 1440 to 1500 m in Millard County; endemic; 10 (ii).

Var. *spathulatum* [*E. nudicaule* ssp. *ochroflorum* Stokes, type from Clear Creek Canyon, Sevier County]. Greasewood, shadscale, rabbitbrush, cphedra, and pinyon-juniper communities at 1405 to 2135 m in Beaver, Millard, Sanpete, Sevier (type from Sevier River Valley), and Wayne counties; endemic; 47 (xiv). Both this and var. *natum* show affinities with *E. brevicaulis* var. *laxifolium* (q.v.), especially through the densely hairy, low elevation *cottamii* phase, whose distribution is immediately adjacent to the north. The relationship is also through the *laxifolium* phase proper northeastward in Sanpete County. Plants with glabrous inflorescences and involucre from the vicinity of Frisco and the Shauntie Hills in Beaver County have about the same integrity as does var. *ammophilum* of the *E. nummularis* complex. Probably they have similar hybrid origin, with one parent represented by *E. batemanii* var. *eremicum*, but the other putative parent is different. These glabrous plants are similar to phases of *E. panguicense*, but the inflorescences are consistently branched.

Eriogonum subreniforme Wats. Stokes Buckwheat. [*E. filicale* Stokes, type from Springdale]. Annuals, mainly 5–40 cm tall; leaves all basal; blades 4–30 mm long and about as broad or broader, orbicular to reniform, tomentose on one or both sides, truncate to cordate basally; petioles 6–60 mm long; inflorescence more or less trichotomous, glabrous, the branches ascending to spreading; involucre on filiform stipes mostly 3–25 mm long, glabrous, obconic, mostly 0.5–1 mm long, with 5 acute teeth; flowers white to rose, 1–2 mm long, glabrous or distinctly puberulent, the segments elliptic to lance-elliptic or spatulate; achenes 1.5–2 mm long. Creosote bush, shadscale, eriogonum, sagebrush, and pinyon-juniper communities at 850 to 1985 m in Garfield, Kane, and Washington (type from St. George) counties; Arizona and New Mexico; 17 (ii). Specimens from Garfield and Kane counties have glabrous flowers.

Eriogonum thomasii Torr. Thomas Buckwheat. [*E. minutiflorum* Wats.]. Annuals, mainly 5–30 cm tall; leaves all basal; blades 4–20 mm long and about as wide, orbicular to subreniform, tomentose on one or both sides, obtuse to subcordate basally; petioles 3–30 mm long; inflorescences more or less polychotomous, glabrous, the branches spreading to ascending; involucre on stipes mainly 3–30 mm long, glabrous, obconic to campanulate, 0.6–1.2 mm long, the 5 teeth obtuse; flowers yellow, 0.8–2 mm long, hispidulous near the base, the outer segments becoming saccate at maturity, the inner ones narrow and not saccate; achenes ca 1 mm long; $n = 20$. Creosote bush community at ca 850 to 915 m in Washington County; California, Nevada, Arizona, and Mexico; 6 (i).

Eriogonum thompsonae Wats. Ellen Buckwheat. [*E. corymbosum* var. *matthewsiacae* Reveal, type from Springdale]. Perennial subshrubs or shrubs, mainly 2–8 dm tall, clump-forming; leaves subbasal or definitely cauline; blades 10–60 mm long, 8–28 mm wide, oblong to elliptic, lanceolate or ovate, tomentose on one or both sides, the

margins entire, flat or undulate and sometimes crisped; petioles 1.5–10 cm long; inflorescences more or less trichotomous, glabrous or less commonly tomentose, the branches spreading to ascending; involucre sessile, narrowly obconic, 2.5–3.8 mm long, glabrous or tomentose, the teeth rounded and more or less hyaline; flowers yellow or white, 2.5–4 mm long, glabrous, the segments oblong or obovate; achenes 2–3 mm long. Blackbrush, salt desert shrub, and pinyon-juniper communities, mainly on Chinle and Moenkopi formations, at 1125 to 1830 m in Kane and Washington counties; Arizona, a Mohave Strip endemic; 32 (iii). The *thompsonae* complex consists of a series of morphological subunits, each more or less distinctive, but only arbitrarily separable. They are based on application of the 2ⁿ formula, where "n" equals the number of characters contrasted; i.e., yellow or white flowers with subscape or caulescent habit. Plants with yellow flowers and subscape habit are var. *thompsonae* (type from near Kanab); those with white flowers and subscape habit are var. *albiflorum* Reveal [type from W of Virgin; *E. corymbosum* var. *mattheusiae*, in part]; those with yellow flowers and caulescent habit are *E. corymbosum* var. *aureum*, in part (Shivwits phase); and those with white flowers and caulescent habit are *E. corymbosum* var. *mattheusiae* (Springdale phase), at least in part. Some plants of the Shivwits phase often have yellow flowers, but they display all shades from sulphur yellow to cream and white, and the yellow flowers seem to have been secondarily derived from *E. corymbosum* var. *aureum* (*E. aureum* Jones, in a strict sense). Occasional specimens of the varicolored materials have loosely tomentose inflorescences and the involucre are shortly obconic as in var. *aureum*. In other specimens of the Shivwits phase the narrowly obconic involucre are essentially like those of var. *albiflorum*. The recognition of any of these phases at taxonomic rank is problematical because of intermediates connecting most if not all of them.

Eriogonum trichopes Torr. Slender-stipe Buckwheat. [*E. trichopodum* Torr. in DC.; *E. trichopodum* var. *minus* Benth. in DC.]. Annuals, 8–45 cm tall; leaves all basal; blades mainly 5–30 mm long, 4–25 mm wide, oval to orbicular, hirtellous on one or both sides, obtuse to cordate basally, entire to undulate-crisped; petioles 3–40 mm long or more; peduncles and primary rays of inflorescence inflated or not; inflorescence polychotomous; involucre borne on capillary stipes 3–18 mm long, obconic to campanulate, 0.4–1 mm long, glabrous, 4-lobed; flowers yellowish, 1–2 mm long, strigulose, the segments lance-ovate; achenes 1.5–2 mm long; n = 16. Warm desert shrub communities at 760 to 980 m in Washington County; Nevada and California to New Mexico, south to Mexico; 10 (i). This species simulates the annual phase of *E. inflatum* in having inflated stems in some plants. The usually more numerous branches from the lowest node of the inflorescence, and flowers and involucre that average smaller, are diagnostic.

Eriogonum tumulosum (Barneby) Reveal Woodside Buckwheat. [*E. villiflorum* var. *tumulosum* Barneby, type from SW of Woodside]. Pulvinate-caespitose, mound-forming, herbaceous perennials from a pluricipital caudex and woolly taproot, the caudex branches clothed with persistent leaves and bases, the roots with shaggy castaneous to blackish bark; leaves 3–7 mm long, 0.7–1.5 mm wide, oblanceolate to elliptic, tomentose to

pilose on both surfaces, revolute; petioles very short; scapes to ca 1 cm long or lacking; inflorescences capitate; involucre campanulate, 2–4 mm long, villous, 7- to 10-lobed; flowers white or suffused with pink, 3–4 mm long, pilose, the segments oblong to oblanceolate; achenes ca 2 mm long. Mixed desert shrub and pinyon-juniper communities at 1525 to 2170 m in Duchesne, Emery, and Uintah counties; Colorado; a Colorado Plateau endemic; 16 (ii).

Eriogonum umbellatum Torr. Sulfur Buckwheat. Perennial herbs or subshrubs, mat-forming, mainly 1–10 dm across; vegetative stems persistent, the branches woody and usually more or less clothed with persistent ashy, castaneous, or blackish leaves and bases; flowering stems scape, arising from rosettelike stem apices, mainly 10–60 cm tall; leaf blades 4–30 mm long, 2–20 mm wide, ovate to oval, elliptic, lanceolate, or oblanceolate, tomentose or glabrous on one or both sides, flat or nearly so; petioles 2–15 mm long; inflorescence umbellate (or compound) or capitate, often immediately subtended by foliose bracts; involucre terminating rays or sessile, obconic to campanulate, the tube 2–6 mm long and 1.5–10 mm wide, the lobes 1–6 mm long; flowers creamy white to yellow and often suffused with red or purple, 2.5–10 mm long (including the stipitate base), the segments spatulate to ovate; achenes 2–5 mm long; n = 40. This species is a portion of a huge assemblage occupying much of the western U. S. There are four more or less geographically correlated varieties present.

1. Flowers creamy white *E. umbellatum* var. *majus*
- Flowers yellow 2
- 2(1). Inflorescences of compound umbels, at least some; plants mainly of middle to lower elevations in the southern 2/3 of Utah *E. umbellatum* var. *subaridum*
- Inflorescences merely umbellate or capitate 3
- 3(2). Inflorescences capitate or rarely some branched; leaves glabrous on both sides; plants of high elevations *E. umbellatum* var. *porteri*
- Inflorescences umbellate; leaves variously pubescent, sometimes as above; plants of moderate to high elevations *E. umbellatum* var. *umbellatum*

Var. *majus* Hook. Cream Buckwheat. [*E. subalpinum* Greene; *E. umbellatum* var. *subalpinum* (Greene) Jones; *E. umbellatum* ssp. *subalpinum* (Greene) Stokes; *E. heracleoides* var. *subalpinum* (Greene) R. J. Davis; *E. umbellatum* ssp. *majus* (Hook.) Piper; *E. aridum* Greene; *E. umbellatum* ssp. *aridum* (Greene) Stokes; *E. umbellatum* var. *aridum* (Greene) C. L. Hitchc.; *E. umbellatum* var. *dicrocephalum* Gand.; *E. umbellatum* var. *desereticum* Reveal, type from Mt. Timpanogos]. Sagebrush, mountain brush, pinyon-juniper, Douglas fir-white fir, aspen, lodgepole pine, and spruce-fir communities at 1495 to 3420 m in Beaver, Box Elder, Cache, Carbon, Daggett, Davis, Duchesne, Garfield, Juab, Millard, Rich, Salt Lake, Sanpete, Sevier, Summit, Tooele, Wayne, and Weber counties; Canada, south to California and Nevada; 73 (vi). This plant forms apparent hybrids (Neese 14620 A-E BRY) with *E. heracleoides*. It is also identical, except for flower color, with var. *umbellatum*, and has a similar sequence of pubescence forms.

Var. *porteri* (Small) Stokes Porter Buckwheat. [*E. porteri* Small, type from Bear River Canyon, Summit County]. Ponderosa pine, aspen, spruce-fir, lodgepole

pine, and alpine meadow and talus communities at 2500 to 3700 m in Beaver, Duchesne, Iron, Sanpete, Sevier, Summit, and Uintah counties; Nevada and Colorado; 41 (xi).

Var. *subaridum* Stokes Arid Buckwheat. [*E. umbellatum* ssp. *subaridum* (Stokes) Munz; *E. biumbellatum* Rydb., type from Fish Lake; *E. ferrissii* A. Nels.; *E. umbellatum* ssp. *ferrissii* (A. Nels.) Stokes]. Sagebrush, mountain brush, pinyon-juniper, and Douglas fir communities at 1370 to 2745 m in Beaver, Emery, Garfield, Iron, Juab, Kane, Millard, San Juan, Sanpete, Sevier, Summit, Tooele, Washington, and Wayne counties; Colorado, Arizona, Nevada, and California; 79 (xvi). Occasional specimens share features, especially simple inflorescences and pubescence phases, with other varieties of the species.

Var. *umbellatum* [*E. luteum* Small ex Rydb.; *E. rydbergii* Greene; *E. cupreum* Gand.; *E. glaberrimum* var. *aureum* Gand.; *E. umbellatum* var. *aureum* (Gand.) Reveal; *E. neglectum* Greene; *E. azaleastrum* Greene; *E. umbelliferum* Small; *E. umbellatum* var. *umbelliferum* (Small) Stokes; *E. marginale* Gand.; *E. umbellatum* var. *intectum* A. Nels.; *E. umbellatum* var. *glabratum* Stokes, type from Huntington Canyon]. Sagebrush, mountain brush, pinyon-juniper, ponderosa pine, white fir, aspen, spruce-fir, and alpine meadow communities at 1765 to 3450 m in Beaver, Box Elder, Carbon, Daggett, Duchesne, Emery, Grand, Juab, Millard, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, Washington, and Wayne counties; Washington to Montana, south to California, Nevada, and Colorado; 111 (xv).

Eriogonum villiflorum Gray Gray Buckwheat. Plicate-caespitose, mound-forming, herbaceous perennials from a pluricipital caudex and woody taproot, the caudex branches clothed with persistent ashy to castaneous or blackish leaf bases and with shaggy blackish bark; leaves 4–15 mm long, 0.7–2 mm wide, oblanceolate to elliptic, villous-pilose on both sides, more or less revolute; petioles very short; scapes mainly 1–5 cm long; inflorescences subcapitate to shortly umbellate; involucre sessile or short-stipitate, campanulate, 3–5 mm long, villous-pilose, with 6–10 lobes; flowers white or suffused with pink, 3–4 mm long, pilose, the segments oblong; achenes 2–3 mm long. Sagebrush, pygmy sagebrush, mixed desert shrub, and pinyon-juniper communities at 1555 to 2350 m in Beaver, Iron, Juab, Millard, and Sanpete counties; Nevada; a Great Basin endemic; 17 (iii).

Eriogonum wetherillii Eastw. Wetherill Buckwheat. [*E. sessile* Stokes ex Jones; *E. filiforme* L. O. Williams, type from near Hanksville]. Annuals, 5–30 cm high, ultimately forming cushionlike, intricately branched clumps, mainly 8–40 cm wide; leaves all basal; blades 4–40 mm long and about as wide, orbicular to oval, tomentose on one or both sides, obtuse to subcordate basally; petioles 5–50 mm long; inflorescences intricately branched, glabrous, ultimately gray to red purple; involucre on filiform stipes, mainly 3–16 mm long or sessile, obconic, glabrous, 0.5–1 mm long, with 4 teeth; involucre yellow, soon suffused with red, 0.6–1.5 mm long, glabrous, the segments elliptic to obovate; achenes 0.6–1 mm long. Blackbrush, shadscale, mixed desert shrub, and pinyon-juniper communities (and often along roadsides) at 1125 to 2135 m in Emery, Garfield, Grand, Kane, San Juan (type from along the San Juan River), Sevier, and Wayne counties; Colorado, New Mexico, and Arizona; 68 (xii).

Eriogonum wrightii Torr. in DC. Wright Buckwheat. Shrubs, mainly 2–5 dm tall; leaves caulescent, mainly 5–25 mm long and 3–10 mm wide, elliptic to oblanceolate, tomentose on both sides, plane or more or less revolute; petioles 1–6 mm long; inflorescence erect-ascending, tomentose, more or less racemose; involucre sessile, obconic, tomentose, 2–4 mm long, with 5 teeth; flowers white or suffused with pink, 3–4 mm long, glabrous, the segments obovate; achenes 2–3 mm long. Pinyon-juniper and mountain brush communities at ca 1190 m in Washington County (upper Beaverdam and Manganese washes); California to Texas, south to Mexico; 4 (ii).

Oxyria Hill

Perennial, subrhizomatous herbs, from long taproots; leaves simple, alternate or mostly basal; stipules sheathing; flowers numerous, borne in panicles, not subtended by an involucre; perianth of 4 sepaloid segments, glabrous; stamens 6; pistil 2-carpeled, the ovary 1-loculed, 1-ovuled; styles 2, short, the stigmas fringed; fruit a flattened, wing-margined achene.

Oxyria digyna (L.) Hill Mountain Sorrel. [*Rumex digynus* L.]. Plants mainly 5–35 cm tall, the herbage often reddish tinged; stems usually simple, the juice acid; leaves mostly basal; petioles 1–15 cm long; blades 5–50 mm long and as wide or wider, reniform to orbicular, cordate basally; panicles 2–20 cm long; perianth 1–2.5 mm long, the 2 segments at achene edges more slender than those on the flat sides; achenes flattened, 3–6 mm broad, prominently winged; $2n = 14, 42$. Lodgepole pine, spruce-fir, and alpine meadow communities, often in talus, at 2560 to 3965 m in Beaver, Box Elder, Cache, Daggett, Duchesne, Grand, Juab, Piute, Salt Lake, San Juan, Sanpete, Summit, Uintah, Utah, Wasatch, and Weber counties; Alaska and Yukon, east to Labrador, south to California, Arizona, and New Mexico; circum-boreal; 38 (ix).

Oxytheca Nutt.

Annuals; stems dichotomously branched; leaves basal; bracts connate, in 3's, foliaceous; involucre few-flowered, stipitate, more or less campanulate, 4-lobed, the lobes awn-tipped; flowers pedicellate; perianth 6-parted; stamens 9; achenes ovoid.

Oxytheca perfoliata T. & G. [*Eriogonum perfoliatum* (T. & G.) Stokes]. Plants 6–20 cm tall or more, erect or spreading-ascending; leaves basal and cauline (leafy bracteate), the basal ones 1–4 cm long, spatulate to oblanceolate, sparingly hirsute to glabrous, ciliate; inflorescences short-pedunculate, then dichotomous or trichotomous, with each node bearing a connate-perfoliate, foliaceous, 3-lobed bract ca 1–2 cm wide, the lobes spinose-tipped; internodes of inflorescence more or less stipitate-glandular; involucre solitary, obconic, 3–6 mm long, including spines, 4-lobed, each lobe spinose-tipped; flowers several, cream to whitish, ca 1.5 mm long, coarsely strigose, the segments lanceolate; achenes ca 2 mm long; $n = 20$. Warm desert shrub communities at ca 950 m in Washington County; Arizona, Nevada, and California; 6 (i).

Polygonum L.

Plants annual, biennial, or perennial herbs from taproots or rhizomes; leaves alternate, cauline or basal; stip-

ules sheathing; flowers solitary or clustered in leaf axils or in axillary or terminal spikelike racemes or panicles, not subtended by a regular involucre; perianth of 5 petaloid (or sepaloid) segments; stamens 8 (5 and 3) or lacking; pistils usually 3-carpeled, the ovary 1-loculed, 1-ovuled; styles 2 or 3, often very short; achenes lens-shaped or 3-angled.

1. Leaves with subcordate, cordate, or hastate bases; flowers in axillary racemes or panicles; plants cultivated ornamentals, escaping and persisting, or occurring as weeds 2
- Leaves various but not cordate or hastate basally; flowers variously arranged but not as above; plants indigenous or adventive, weedy or not 4
- 2(1). Stems not twining; leaves broadly obovate, obtuse to subcordate basally; plants clump-forming, cultivated ornamentals, escaping and persisting ... *P. cuspidatum*
- Stems twining; leaves cordate to hastate; plants sprawling or twining on other plants or structures 3
- 3(2). Plants perennial; flowers showy, whitish; fruit broadly winged; cultivated ornamentals, escaping and persisting *P. aubertii*
- Plants annual; flowers not showy, greenish; fruit not winged; adventive weedy species *P. convolvulus*
- 4(1). Stems erect, from an expanded to somewhat bulbous caudex; leaves mostly basal; flowers in terminal spike-like racemes; plants mostly of higher elevations 5
- Stems of various habit, but not from a caudex or, if so, the plants otherwise different from above; flowers axillary or in axillary and terminal spikelike racemes or panicles 6
- 5(4). Racemes slender, mainly 4–6 mm thick, the lower flowers at least replaced by bulblets *P. viviparum*
- Racemes mainly 10–25 mm thick, the flowers not replaced by bulblets *P. bistortoides*
- 6(4). Leaves not jointed at the base; flowers in terminal and (or) axillary spikes or racemes 7
- Leaves with a hingelike joint at the point of attachment of leaf base with sheath; flowers in small, axillary clusters or solitary 11
- 7(6). Inflorescences all terminal, usually solitary; plants perennial, aquatic or semiaquatic to terrestrial; flowers bright pink *P. amphibium*
- Inflorescences not all terminal, at least some axillary; plants mostly annual, seldom aquatic (but sometimes so); flowers pink, green, or white 8
- 8(7). Stipular sheaths lacking marginal bristles (or merely short-ciliate); veins of the outer pair of perianth segments branched and recurved at the tip *P. lapathifolium*
- Stipular sheaths usually with well-developed marginal bristles; veins of the outer pair of perianth segments not branched and recurved at the tip 9
- 9(8). Plants perennial from rhizomes, growing in or near water; spikes slender, mostly less than 5 mm broad, often paired; not definitely known from Utah, but to be expected *P. hydropteroides* Michx.
- Plants annual from taproots, growing in moist sites, but not aquatic; spikes slender to thick, not or seldom paired 10
- 10(9). Mature perianth glandular-punctate, greenish to white (or pinkish); spikes slender, arching, interrupted near the base *P. hydropter*

- Mature perianth not glandular-punctate, pink to purplish; spikes dense, erect or nearly so, not or rarely interrupted *P. persicaria*
- 11(6). Flowers in terminal, leafy-bracteate spikes; plants mainly less than 10 cm tall *P. kelloggii*
- Flowers in axillary clusters or solitary, or in terminal spikes with bracts much reduced; plant height various 12
- 12(11). Leaves ovate to broadly elliptic, scarcely reduced upward; plants mainly less than 10 cm tall . . . *P. minimum*
- Leaves linear to narrowly elliptic, lanceolate, or oblanceolate, more or less reduced upward; plant height various 13
- 13(12). Flowers borne in elongate, spikelike racemes; leaves much reduced and bractlike upwards; plants usually erect and with branches erect-ascending *P. ramosissimum*
- Flowers borne in axils of foliage leaves, these sometimes reduced but not especially bracteate upward; plants of various habit 14
- 14(13). Plants mainly prostrate; leaves mostly flat and with prominent lateral veins, often deciduous in fruit ... *P. aciculare*
- Plants mainly erect or ascending; leaves flat to revolute, the veins inconspicuous, usually persistent ... *P. douglasii*

***Polygonum amphibium* L.** Water Smartweed. [*P. coccineum* Muhl. in Willd.]. Perennial aquatic or terrestrial, rhizomatous or stoloniferous herbs, the herbage coarsely strigose to glabrous or stipitate-glandular; stems prostrate (often floating) or erect; leaf blades mainly 3–18 cm long, 1–6 cm wide, lanceolate to oblong or elliptic, acute to alternate or rounded apically, obtuse to truncate basally; petioles 0.5–7 cm long; stipules cylindric, 0.5–3 cm long, glabrous to coarsely strigose; panicles 1 or 2, spikelike, 1–8 cm long, the peduncles glabrous, glandular, or strigose and also more or less glandular; pedicels 1–2 mm long; flowers bright pink, 4–5 mm long, the segments oblong, subequal; stamens 8, exerted; style 2–4 mm long; achenes lenticular 2–3 mm long, brown, shining or dull; $2n = 88$. Springs, streams, ponds, lakes, reservoirs, and irrigation canals at 1340 to 2865 m in Beaver, Box Elder, Cache, Daggett, Duchesne, Garfield, Millard, Piute, Rich, Salt Lake, Sanpete, Sevier, Summit, Uintah, Utah, Wasatch, Wayne, and Weber counties; widely distributed in North America; cosmopolitan (except Australia?); 47 (v). Traditional separation of this taxon into two species on the basis of pubescence and panicle differences is not supported by the cline of variation connecting the distinctive extremes.

***Polygonum aubertii* L.** Henry Silver Lace-vine. Perennial, twining herbs; stems mainly 2–7 m long or more; herbage glabrous or scabrous; ocrea soon deciduous, the margin not ciliate; leaf blades 1–8 cm long and 1–6 cm wide, cordate-ovate, cordate basally, attenuate to acuminate apically; petioles 0.5–5 cm long; panicles open, axillary or terminal, 5–15 cm long or more; flowers usually white, 7–10 mm long, including the attenuate winged base, fragrant; fruit lenticular (?), seldom formed. Cultivated ornamental, escaping and persisting in Utah County; introduced from China; 2 (0).

***Polygonum aciculare* L.** Knotweed; Chivalry-grass; Dishwater-grass. Annuals, prostrate to ascending or erect, the stems striate, terete or angled, mostly 1–10 dm long; leaves usually not crowded, 5–40 mm long and 2–10

mm wide, oblong to elliptic or oblanceolate, smaller on the branchlets than on the main stem, acute to obtuse or rounded, the blade sessile or short-petiolate above the basal joint; stipules shredded, 3–6 mm long; flowers 1–5, axillary; pedicels included or shortly exserted; perianth 2–3 mm long, united ca 1/3 the length, 5–lobed, the lobes greenish with white or pink edges, the outer lobes only slightly broader than the inner; styles 3; achenes 3–angled, brown; $2n = 22, 40, 60$. Weedy species of open sites at 760 to 3085 m in probably all Utah counties; widespread in most continents; 59 (vii). The plants tolerate trampling and similar abuse that forces other plants to yield way to this vigorous species.

Polygonum bistortoides Pursh American Bistort. [*P. bistorta* var. *oblongifolium* Meissner in DC.; *P. bistorta* var. *linearifolium* Wats.]. Perennials, erect, from thickened bulblike bases and rhizomes, the stems mainly 1–8 dm tall; basal leaves well developed, mainly 5–30 cm long, the blades 2–20 cm long and 0.3–3.5 cm wide, lanceolate to elliptic or linear, attenuate to obtuse or rounded apically, cuneate to obtuse basally; petioles usually well developed, not jointed; stipules mainly 1.5–8 cm long, sometimes flaring apically; cauline leaf blades reduced upward; flowers numerous, borne in terminal spikelike racemes, 1–7 cm long; perianth 4–6 mm long; connate only near the base, white or sometimes pinkish, the segments subequal; stamens 8, exserted; styles 3, exserted; achenes brown, shining, ca 4 mm long. Aspen, lodgepole pine, and spruce-fir communities, usually in moist meadows, at 2070 to 3510 m in all Utah counties, except Davis and Salt Lake; British Columbia to Montana, south to California, Arizona, and New Mexico; 68 (x). This species differs in degree only from *P. bistorta* L. of the Old World and Alaska-Yukon-Mackenzie. The synonyms indicate the views of some previous workers in this genus. Additional work might indicate a more conservative view than that followed here.

Polygonum convolvulus L. Black Bindweed. Annuals, erect (when young) or soon prostrate or twining, the stems 1–15 dm long or more; leaves with long petioles not jointed basally, the blades 1–8 cm long (from sinus to apex), 0.7–5 cm wide, sagittate-ovate, acuminate; stipules 2–5 mm long, shredded and soon deciduous; flowers few to many, borne in axillary or terminal racemes; perianth 3–4.5 mm long, greenish, 5–lobed, the outer lobes keeled; styles 3–cleft; achenes 3–angled, black, usually shining; $2n = 40$. Weedy species of gardens, fields, and other open habitats at 850 to 1680 m in Beaver, Cache, Juab, Salt Lake, Sevier, Utah, and Washington counties; widespread in North America; adventive from Europe; 11 (0).

Polygonum cuspidatum Sieb. & Zucc. Fleece-flower. [*P. zuccarinii* Small]. Perennial, dioecious, erect or ascending herbs, mainly 8–15 dm tall; leaves petiolate, the blades mostly 5–15 cm long and 3–10 (12) cm wide, ovate, cuneate to truncate or subcordate basally, abruptly acuminate apically; stipules 4–8 mm long, soon deciduous; flowers 4–5 mm long or more, including the winged, stipelike base, cream to greenish, functionally imperfect, enlarging in fruit; styles 3; achenes 3–angled, black, smooth, shining, ca 3 mm long; $2n = 88$. Cultivated ornamentals, escaping and persisting, at 1220 to 1830 m in Duchesne, Salt Lake, and Utah counties; widely grown in the U. S.; introduced from Asia; 5 (0).

Polygonum douglasii Greene Douglas Knotweed. Annuals, mainly 3–45 cm tall or more, erect or ascending,

leaves 6–50 mm long, 1–8 mm wide, linear to oblong, lanceolate or oblanceolate, gradually reduced upward, jointed at the base; stipules lacerate, 3–12 mm long; flowers axillary, usually 1–4 per node, the pedicels erect or reflexed, 1–4 mm long; perianth 2–4.3 mm long, the segments green with white or pink to reddish margins, or white to pink overall, united only near the base; achenes 3–angled, black, smooth and shining, 2.5–3.5 mm long. Two rather well-defined but largely sympatric varieties are present in Utah.

1. Flowers deflexed, stipitate above a joint at pedicel apex, the stipe 0.1–0.2 mm long and persistent on the flower base *P. douglasii* var. *douglasii*
- Flowers erect, not stipitate, the base sessile on the joint, dehiscing without a peglike stipe at the base *P. douglasii* var. *johnstonii*

Var. *douglasii* Sagebrush, mountain brush, pinyon-juniper, ponderosa pine, Douglas fir-white fir, aspen, lodgepole pine, and spruce-fir communities at 1705 to 3145 m in Cache, Carbon, Daggett, Duchesne, Garfield, Grand, Juab, Kane, Millard, Salt Lake, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, and Weber counties; widely distributed in North America; 56 (v).

Var. *johnstonii* Munz Sawatch Knotweed. [*P. sawatchense* Small; *P. utahense* Brenckle & Cottam, type from 6 mi N of Escalante]. Pinyon-juniper, mountain brush, sagebrush, and spruce-fir communities at 1675 to 2625 m in Beaver, Carbon, Daggett, Duchesne, Garfield, Grand, Iron, Juab, Kane, Millard, Piute, Rich, San Juan, Sevier, Summit, Tooele, Uintah, Utah, and Washington counties; Washington to North Dakota, south to California, Arizona, and Colorado; 44 (viii). A phase with flowers almost completely white or pink, that tend to open wide (apparently *P. utahense*, sens. str.), occurs in sandy soils in the ponderosa pine and adjacent plant communities in eastern Washington and western Kane and Garfield counties. Possibly these plants are worthy of taxonomic recognition. More work is indicated, but similar plants occur elsewhere within the range of var. *johnstonii*.

Polygonum hydropiper L. Water-pepper. Plants annual (sometimes perennial?), the stems occasionally rooting at the nodes, mainly 3–8 dm tall; leaves with short petioles or else subsessile, not jointed at the base, the blades 3–10 cm long, 0.5–3 cm broad, lanceolate to elliptic, acute to acuminate apically, acute to cuneate basally, sparsely strigose to glabrous, ciliate; stipules 8–15 mm long, not shredded, strigose to glabrous, ciliate with long bristles; flowers several to many, borne in terminal and usually also in lateral, spikelike, interrupted racemes 2–8 cm long; perianth 2.5–4 mm long, glandular-dotted, united ca 1/3 the length, usually 4–lobed, the lobes greenish with white or pink margins; styles 2 or 3, distinct; achenes lens shaped or 3–angled, brown; $2n = 20, 22, 24$. Irrigation ditches, roadsides, and bottomlands at ca 1340 to 1375 m in Cache, Salt Lake, and Utah counties; widespread in North America; adventive from Europe; 3 (0). The herbage has a peppery flavor.

Polygonum kelloggii Greene Kellogg Knotweed. Annuals, erect or ascending, 1–9 cm tall, the stems angled, simple or branched; leaves 3–20 (25) mm long, 0.5–2 mm wide, usually crowded and bracteated upwards (surpassing the flowers), and sometimes white margined, sessile or nearly so, jointed at the base; stipules lacerate, 2–7 mm long; pedicels mostly included; perianth 1.5–2.5 mm

long, connate in lower 1/3, the 5 lobes subequal or the outer ones largest, green with white or pink margins; stamens 8, the 5 outer ones with linear filaments and usually abortive anthers; stigmas 3; achenes 3-angled, 1.5-2 mm long, yellow to brownish, shining and smooth or brown and dull. Mountain brush, sagebrush, ponderosa pine, meadows, lodgepole pine, aspen, and spruce-fir communities at 1830 to 3235 m in Cache, Daggett, Duchesne, Emery, Garfield, Morgan, Rich, Salt Lake, San Juan, Sevier, Summit, Uintah, Wasatch, and Washington counties; British Columbia to Montana, south to California, Arizona, and Colorado; 29 (iii).

Polygonum lapathifolium L. Willow-weed. [*P. nodosum* Pers.; *P. scabrum* Moench; *P. pennsylvanicum* authors, not L.]. Plants annual, erect or prostrate (rarely rooting at the nodes), 1-9 dm long; leaves petiolate to subsessile, not jointed at the base; blades 2-20 cm long, 0.6-7 cm wide, lanceolate to oblong or elliptic, acuminate to acute (abruptly rounded) apically, acute to cuneate basally, glabrous or pubescent, ciliate or glabrous marginally; stipules 5-20 mm long, not shredded, glabrous to pubescent, sparsely short-ciliate to glabrous apically; flowers several to many, borne in spike-like racemes, often aggregated in panicles, the peduncles often stipitate (or sessile) glandular; perianth 2-3 mm long, not (or sometimes) glandular-dotted, united only near the base, 4- to 5-lobed, the lobes greenish, white, or pink, finally strongly veined, the veins branched apically and the ends recurved; styles 2 or 3; achenes lens-shaped or 3-angled, brown, lustrous; $2n = 22$. Bogs, marshes, sand bars, stream and river margins at 790 to 2135 m in Box Elder, Cache, Daggett, Davis, Garfield, Grand, Millard, Piute, Rich, Salt Lake, San Juan, Uintah, Utah, Washington, Wayne, and Weber counties; widely scattered in North America; adventive (or indigenous in part?) from Eurasia; 43 (vi).

Polygonum minimum Wats. Broadleaf Knotweed. Annuals, ascending to erect, the stems not conspicuously striate, terete or triangular, 5-10 (25) cm long; leaves crowded only near the stem tips, 5-15 mm long, 2-8 mm wide, elliptic, ovate, or obovate, somewhat smaller above, acute to mucronate apically, acute basally, the blades sessile at the basal joint; stipules shredded, 2-4 mm long; flowers 1-4 axillary; pedicels included; perianth 1.5-2 mm long, united ca 1/3 the length, 5-lobed, the lobes greenish with white or pink edges, subequal; stigmas 3; achenes 3-angled, black, lustrous. Spruce-fir and alpine communities, often in rockstripes or talus, at ca 2745 to 3390 m in Cache, Salt Lake, and Summit (type from the Uinta Mts.) counties; Alaska south to California, Nevada, and Colorado; 3 (0).

Polygonum persicaria L. Ladythumb. Annuals, erect to ascending, mainly 1.5-10 dm tall; leaves petiolate to subsessile, not jointed at the base; blades 1.5-15 cm long, 0.4-4 cm wide, lanceolate to elliptic or oblong, acuminate to attenuate apically, acute to cuneate basally, with a purplish spot near the center, usually glabrous, ciliate; stipules 5-15 mm long, not shredded, usually pubescent, long-ciliate apically; flowers several to numerous, borne in terminal and usually axillary racemes; perianth 1.5-3 mm long, not glandular-dotted, united only near the base, 5-lobed, the lobes pinkish or whitish, not strongly veined and with vein ends not recurved; styles 2 or 3; achenes lens shaped or 3-angled, black, lustrous; $2n = 22, 40, 44$. Fence lines, canal banks, marshes, pond mar-

gins, fields, gardens, and pastures at 915 to 2135 m in Box Elder, Cache, Duchesne, Garfield, Rich, Salt Lake, Sevier, Uintah, Utah, Wasatch, Washington, and Weber counties; widespread in North America; Eurasia; 24 (0).

Polygonum ramosissimum Michx. Bushy Knotweed. Annuals, ascending or erect, the stems striate and somewhat angled, 1-10 dm tall; leaves not crowded, 10-50 mm long, 2-6 mm wide, linear-oblong to lance-elliptic, usually acute, gradually reduced upward, short-petiolate above the joint; stipules shredded, 5-10 mm long; pedicels exerted; perianth 2.4-4.4 mm long, united ca 1/3 the length, 5-lobed, green or with pink, white, or yellow margins, the outer ones broader than the inner; stigmas 3; achenes 3-angled, brown to black, lustrous. Open sites and (mainly) in saline meadows at 1340 to 1770 m in Box Elder, Cache, Davis, Duchesne, Juab, Millard, Salt Lake, Sevier, Uintah, Utah, Wayne, and Weber counties; widespread in North America; Europe; 23 (0). The closely allied, but hardly differentiated and possibly identical, *P. argyrocoleon* Steudel, has been identified from Utah. The material grades continuously with *P. ramosissimum*, and the older name is applied. That taxon might be valid beyond Utah.

Polygonum viviparum L. Alpine Bistort. Perennials, erect from short, expanded bases; stems 7-40 (55) cm tall; basal leaves well developed, 3-25 cm long, the blades 1.5-13 cm long, 3-25 mm wide, oblong to elliptic, lanceolate, or oval, attenuate to acute apically, cuneate to subcordate basally; petioles well developed, not jointed; cauline leaves reduced upward; stipules 1-6 cm long, not shredded, often flaring and brownish apically, the upper ones seldom bladeless; flowers several to numerous, borne in terminal, spike-like racemes 2-12 cm long, at least the lower (sometimes all) replaced by bulblets; perianth 2-3.5 mm long, the lobes connate only near the base, 5-lobed, greenish with white (cream) to pink margins, subequal; stamens often vestigial; styles 3, exerted; achenes 3-angled, brownish, lustrous, seldom developing; $2n = 66, 80, 88, 98+$. Sedge-grass meadows and alder-birch-willow streamside habitats, mainly in lodgepole pine and spruce-fir communities, at 2470 to 3570 m in Cache, Daggett, Duchesne, Emery, Garfield, Iron, Salt Lake, San Juan, Sevier, Summit, and Uintah counties; Alaska east to Newfoundland, south to Oregon, Nevada, New Mexico, Minnesota, and Maine; 21 (vi).

Pterostegia Fisch. & Mey.

Annuals, with diffuse, dichotomous, slender stems; leaves opposite, the blades broadly elliptic to ovate, entire or 2-lobed; bracts foliaceous, each subtending a solitary flower, 2-lobed, enlarging and becoming scarious and reticulate in fruit, enclosing the achene, with 2 pouches on the back; calyx 6-lobed, the lobes narrowly lanceolate; stamens 3 or 6; style 3-cleft; achenes 3-angled, glabrous.

Pterostegia drymarioides Fisch. & Mey. Plants prostrate-spreading, mainly 10-30 cm long; leaves petiolate, the blades 3-20 mm long, 3-25 mm wide, entire or bilobed, sparingly long-hairy; bracts 1-3 mm long in fruit, the margin subtentive to lacerate; perianth ca 1 mm long, the segments white (or reddish); achenes ca 1 mm long. Rock crevices at ca 850 m in Washington County; Oregon to California, Nevada, and Arizona; 4 (i).

Rheum L.

Perennials from stout tuberous roots; leaves alternate, cauline or basal; stipules sheathing, prominent; flowers numerous, borne in terminal or axillary panicles, not subtended by regular involucre; perianth of 6 petaloid segments, open and spreading; stamens mostly 9 (rarely 6); pistils 3-carpellate, the ovary 1-loculed, 1-ovuled; styles 3; fruit a strongly winged achene.

Rheum rhabarbarum L. Rhubarb; Pie-plant. [*R. rhaponticum* L., misapplied]. Plants erect, the stems striate, fistulose, 3-20 dm tall or more, glabrous or nearly so; leaves mostly basal, the edible petioles thick; blades cordate-ovate to orbicular or reniform, entire but undulate; stipules long-sheathing; flowers numerous in branching panicles; perianth greenish white; achenes 6-12 mm long, winged. Cultivated fruit substitute and extender in all Utah counties; persisting but not escaping; introduced from Eurasia; 3 (0). This plant is used alone and in mixtures with other fruits to make delicious pies, jams, jellies, and beverages.

Rumex L.

Annual, biennial, or perennial herbs from stout taproots or rhizomes; leaves alternate, basal or mostly cauline, gradually reduced upward; stipules sheathing; flowers borne in panicles, not subtended by a regular involucre; perianth of 6 (rarely 4), petaloid or sepeloid segments, the inner 3 segments enlarging in fruit and forming the "wings" or "valves" enclosing the fruit, the midveins of the valves sometimes thickened and forming grainlike tuberosities on the segments; stamens usually 6; pistil 3-carpelled, the ovary 1-loculed, 1-ovuled; styles 3; fruit a 3-angled achene.

Rechinger, K. H. Jr. 1937. The North American species of *Rumex*. Field Museum Publ. Bot. 17:1-151.

- 1. Flowers mostly or entirely imperfect; plants usually dioecious; leaves hastate or elliptic to oblanceolate . . . 2
- Flowers all or mostly perfect; leaves various 3
- 2(1). Leaves all or some of them hastate; plants rhizomatous, sod-forming, weedy *R. acetosella*
- Leaves elliptic, tapering at both ends; plants from thick taproots, not sod-forming, not weedy *R. paucifolius*
- 3(1). Plants rhizomatous, the rhizomes black, spreading, valves of fruit mainly 1-20 mm wide *R. venosus*
- Plants from taproots (sometimes tuberous); valves of fruit less than 10 mm wide, or if wider (as in *R. hymenosepalus*, from deeply set tuberous roots 4
- 4(3). Plants from deeply set tuberous roots; valves of fruit usually 10-20 mm wide when mature; habitats in sand dunes and other sandy sites *R. hymenosepalus*
- Plants from a superficial taproot; valves of fruit less than 10 mm wide at maturity; habitats various, but seldom if ever as above 5
- 5(4). Valves toothed along the margins, the teeth at least 1 mm long at maturity 6
- Valves entire or toothed but, if toothed, the teeth less than 1 mm long 9
- 6(5). Tuberosities lacking or forming on only 1 or 2 of the valves; basal leaves mainly 5-10 cm wide or more *R. obtusifolius*
- Tuberosities usually forming on all valves; leaves mostly less than 4 cm wide (wider in *R. occidentalis*) . . 7

- 7(6). Plants perennial; inflorescences paniculate, not especially verticillate in lower nodes *R. stenophyllum*
- Plants annual; inflorescences of verticillate panicles, the verticils apparent in lower nodes and sometimes throughout 8
- 8(7). Valves 4-6 mm long at maturity; teeth subulate; tuberosities more than 0.5 mm wide; leaves not papillose *R. dentatus*
- Valves 2-3 mm long, teeth bristlelike; tuberosities less than 0.5 mm wide; leaves papillose, at least some *R. maritimus*
- 9(5). Stems with axillary branches at some or all nodes below the inflorescence, usually decumbent-ascending *R. salicifolius*
- Stems seldom with axillary branches below the inflorescence (except in some *R. occidentalis*, erect or essentially so 10
- 10(9). Valves without tuberosities, even in fruit *R. occidentalis*
- Valves with tuberosities on 1 or more of them 11
- 11(10). Valves cordate, 5-9 mm long; basal and lower leaves typically rounded to truncate or cordate, the margins not especially crisped *R. patentia*
- Valves triangular-ovate, mostly 3-5 mm long; basal and lower leaves rounded to acute basally, the margins strongly crisped *R. crispus*

Rumex acetosella L. Sheep Sorrel. Perennial, dioecious, erect herbs from slender rhizomes; stems 1-6 dm tall, usually unbranched below the inflorescence; basal leaves long-petiolate; cauline leaves becoming short-petiolate to subsessile; blades 1-8 cm long, 2-25 mm wide, oblong to ovate, linear, lanceolate, or elliptic, hastately lobed basally, attenuate, acute or obtuse apically; flowers numerous, imperfect, borne in leafless panicles, often purplish tinged; fruiting pedicels jointed at flower base; perianth segments 0.5-1.8 mm long in flower, the outer ones not relexed, the inner ones enlarging and investing the achene, 1-2 mm long, ovate, entire, lacking tuberosities; achenes 1-2 mm long, yellowish brown, lustrous, sometimes adherent to the valves; 2n = 14, 28, 38, 42+. Roadsides, meadows, and other open sites at 1370 to 2745 m in Beaver, Cache, Carbon, Davis, Duchesne, Emery, Grand, Piute, Salt Lake, Sanpete, Summit, Uintah, Washington, and Weber counties; widespread in North America; adventive from Eurasia; 25 (vi).

Rumex crispus L. Curled Dock. Perennial erect herbs from taproots; stems 3-10 dm tall or more; basal leaves long-petiolate; blades 8-40 cm long, 1.2-6 cm wide, oblong-lanceolate to elliptic, acute to rounded basally, acuminate to acute apically, undulate-crisped (the margin appearing irregularly lobed due to numerous overlapping folds in pressed specimens; cauline leaves somewhat smaller upward, short-petiolate; flowers numerous, perfect, borne in panicles with large leafy bracts to midlength or above, usually greenish; fruiting pedicels jointed above the base; perianth 1.5-2 mm long, the outer segments not reflexed; inner segments much enlarged in fruit, 3-5 mm long, cordate to deltoid or ovate, denticulate to entire, usually each (sometimes only 1 or 2) bearing a reticulately patterned tuberosity almost half as long as the segment; achenes 2-3 mm long, brown, lustrous; 2n = 60. Weedy plants of open sites at 760 to 2440 m in probably all Utah counties; widespread in North America; adventive from Eurasia; 72 (v).

Rumex dentatus L. Annual or biennial herbs, erect, from tap or fibrous roots; stems mainly 2–7 dm tall; leaves cauline or essentially so, the lower ones long-petiolate; blades 1–6 cm long, oblong, rounded to subcorate basally, rounded to acute apically; flowers mainly perfect, borne in verticillate panicles; pedicels thickened apically, jointed below midlength; valves in fruit triangular, 4–6 mm long, toothed marginally, the teeth 1.5–2 mm long, usually all with a pronounced tuberosity; $2n = 40$. Moist, open sites at ca 1340 m in Salt Lake County (Arnou 5263 UT); adventive from Asia; 1 (0).

Rumex hymenosepalus Torr. Canaigre. Perennial herbs, from deeply seated, tuberous roots; stems mainly 2–10 dm tall; lower leaves long-petiolate; blades mainly 8–25 cm long, 2–12 cm wide, elliptic to lanceolate or oblanceolate, cuneate basally, acute to acuminate apically, more or less fleshy; cauline leaves reduced and short-petiolate upward; stipular sheaths 1–4 cm long; panicles compact, 10–35 (40) cm long, usually pinkish; pedicels 4–12 mm long, jointed near the middle; perianth 2–4 mm long at anthesis, the valves 8–18 mm long in fruit, cordate-ovate to suborbicular, reticulate, rounded apically; $2n = 40$. Blackbrush, Vanleavea, ephedra, and other sandy desert shrub communities at 760 to 1680 m in Daggett, Garfield, Grand, Kane, San Juan, Uintah, and Washington counties; California, Nevada, Arizona, New Mexico, Texas, Colorado, and Wyoming; Mexico; 49 (vi).

Rumex maritimus L. Golden Dock. [*R. maritimus* var. *athrix* St. John, type from Vermillion]. Annual (or biennial?) herbs, erect from taproots; stems 0.5–8 dm tall; basal leaves usually reduced; cauline leaves well developed, but reduced in size upward, short-petiolate; blades 2–15 cm long, 1–4 cm wide, oblong to lanceolate, rounded to surcordate or acute basally, acute to acuminate or obtuse apically, undulate to plane; flowers numerous, borne in compact axillary clusters, the inflorescence leafy throughout or nearly so, often half the total plant height, greenish; pedicels jointed near or at the base; perianth 1–2 mm long in flower, the outer ones not reflexed; inner segments 3–7 mm long (including the acuminate apex) in fruit, ovate, with 2–4 slender teeth per segment, each tooth 1.5–5 mm long, the valves each usually with a well-developed tuberosity ca 1/2 as long as the segment; achenes 1.5–2 mm long, brown, lustrous; $2n = 40$. Lake shores, stream margins, pond and seep margins, and other moist sites at 1220 to 2565 m in Beaver, Box Elder, Cache, Carbon, Daggett, Davis, Duchesne, Emery, Garfield, Juab, Kane, Piute, Rich, Salt Lake, Sanpete, Sevier, Summit, Uintah, and Wayne counties; widespread in North and South America; Europe; 40 (ii). Our specimens belong to var. *fuegineus* (Phil.) Dusen [*R. fuegineus* Phil.; *R. maritimus* ssp. *fuegineus* (Phil.) Hulten].

Rumex obtusifolius L. Bitter Dock. Perennial, erect herbs from taproots; stems 4–12 dm tall (or more), usually unbranched below the inflorescence; basal leaves long-petioled; blades 10–40 cm long, 4–15 cm wide, ovate to oblong or lanceolate, cordate to truncate basally, obtuse to acute or acuminate apically, undulate; cauline leaves like the basal ones, somewhat smaller and with shorter petioles upward; flowers numerous, perfect, borne in panicles with leafy bracts to the middle or above, usually greenish; perianth segments 2–3 mm long, the outer ones not reflexed; inner segments 3.5–5 mm long in fruit, ovate, with 4–6 teeth per segment, each tooth 0.5–2 mm

long, at least some valves with a prominent tuberosity; achenes 1.5–2 mm long, brown, lustrous; $2n = 20$, 40. Ruderal weeds, mainly on canal and stream banks, at 1370 to 2290 m Cache, Davis, Duchesne, Salt Lake, Tooele, and Utah counties; widespread in North America; adventive from Eurasia; 13 (i).

Rumex occidentalis Wats. Western Dock. [*R. subalpinus* Jones, type from near Marysvale]. Perennial, erect herbs from taproots; stems 5–20 dm tall, usually unbranched below the inflorescence, often reddish tinged; basal leaves long-petioled; blades 0.6–4 dm long, 3–15 cm wide, oblong to ovate or oblong-lanceolate, cordate to truncate or obtuse basally, rounded to obtuse or acute apically, usually more or less undulate-crested; cauline leaves reduced upward; flowers numerous, perfect, borne in panicles with leafy bracts only near the base, greenish; fruiting pedicels obscurely jointed near or below the middle; perianth segments 2–4 mm long, the outer ones not reflexed, the inner ones 4–10 mm long in fruit, ovate to oval (mostly longer than broad), denticulate to entire, lacking tuberosities; achenes 3–4 mm long, brown, lustrous; $2n = 160$. Meadows, aspen, and spruce-fir communities at 1830 to 3175 m in Beaver, Daggett, Duchesne, Garfield, Salt Lake, Sanpete, Sevier, Summit, Uintah, and Wasatch counties; Alaska to Quebec, south to California, Nevada, New Mexico, and South Dakota; 13 (0).

Rumex patens L. Perennial, erect herbs from a taproot; stems mainly 6–15 dm tall, unbranched below the inflorescence; basal leaves long-petiolate; blades mainly 10–30 cm long and 6–15 cm wide, ovate-oblong to lanceolate or oblong, subcordate to truncate or acute basally, acute to acuminate apically; panicles dense, 2–5 dm long, leafy bracteate to the middle; pedicels jointed at or below the middle; flowers perfect, the outer segments 1.5–2 mm long, finally reflexed, the inner ones 5–9 mm long in fruit, ovate to suborbicular and cordate basally, entire to denticulate, 1 valve (only) with a tuberosity; achenes 3–3.5 mm long; $2n = 60$. Weedy species of open sites at 1340 to 2440 m in Cache, Davis, Salt Lake, and Utah counties; widely distributed in North America; introduced from Eurasia; 6 (i). This species is not clearly differentiated from *R. occidentalis*, q.v., and evidently forms intermediates with both *R. crispus* and *R. obtusifolius*.

Rumex paucifolius Nutt. Alpine Sorrel. Perennial, dioecious herbs from a taproot and thick root-crown; stems mainly 1–7 dm tall, unbranched below the inflorescence; basal leaves well developed, petiolate; blades 2–13 cm long, elliptic, acute to attenuate at both ends, much reduced upward; inflorescence essentially ebracteate, often as much as half the plant height; flowers imperfect, commonly red; pedicels jointed near the middle; outer perianth segments not reflexed; valves 3–4 mm long, cordate to suborbicular, lacking tuberosities; achenes smooth, ca 1.5 mm long; $2n = 14$, 28. Meadows in aspen and spruce-fir communities at 2095 to 3050 m in Beaver, Cache, Davis, Rich, Salt Lake, Summit, and Wasatch counties; British Columbia and Alberta, south to California and Colorado; 23 (i).

Rumex salicifolius Weim. Beach Dock. Perennial, decumbent to ascending (or erect) herbs from taproots, mainly 2–6 dm tall, branching from the lower nodes; leaves mostly cauline, short-petiolate, not much reduced upward; blades 3–20 cm long, 3–30 mm wide, narrowly

lanceolate to oblong or linear, acute to rounded basally, acute apically, plane to undulate, not crisped; flowers numerous, perfect, borne in panicles, these more or less leafy-bracteate, usually greenish; fruiting pedicels jointed near the base; perianth segments 1–2 mm long, the outer ones not reflexed, the inner 2–4 mm long in fruit, ovate to deltoid, entire to denticulate, with tuberosities on all valves or lacking on all valves; achenes 1.5–2.5 mm long, brown, lustrous. Salt grass, salt desert shrub, sagebrush, pinyon-juniper, mountain brush, aspen-tall forb, Douglas fir, and spruce-fir communities at 1340 to 3205 m in most if not all Utah counties; Alaska to Quebec, south to California, Texas, and New York; 79 (viii). Our material has been treated within two varieties; *var. montigenitus* Jepson, with tuberosities lacking on the valves, and *var. mexicanus* (Meissner) C. L. Hitchc. [*R. mexicanus* Meissner; *R. utahensis* Rech. f., type from Kyune, Carbon County] with tuberosities on the valves. Transitional specimens connect the varieties, which are not geographically correlated. Both of the varieties are regarded as phases within *ssp. triangulivalvis* Danser.

Rumex stenophyllus Ledeb. Perennial, erect herbs from taproots, mainly 3–9 dm tall; leaves basal and cauline, petiolate; blades 4–20 cm long, 1–5 cm wide, lanceolate to lance-oblong or elliptic, obtuse to acute basally, acute to attenuate apically; panicles loose to dense, mainly 2–4 dm long; pedicels jointed below the middle; outer perianth segments 1–2 mm long, the valves with tuberosities; achenes 2–2.5 mm long, lustrous. Palustrine, riparian, and lacustrine habitats at ca 1400 to 1590 m in Duchesne and Uintah counties; Wyoming; adventive from Eurasia (?); 5 (0). These plants are more or less intermediate between *R. obtusifolius* and *R. crispus*, neither of which is known from the locality where this species occurs.

Rumex venosus Pursh Perennial herbs from creeping rhizomes; stems erect, 1–5 dm tall, usually branched; stipules conspicuous, 1–5 cm long; leaves cauline, the lowermost lacking blades; blades mostly 2–14 cm long, 1–6 cm wide, ovate to elliptic or oblong, leathery, obtuse to acute basally; flowers numerous, in more or less leafy bracteate panicles; pedicels jointed near the middle; perianth segments 4–5 mm long, the valves 15–35 mm long, usually suffused with red, orbicular to subreniform, cordate basally, rounded apically, reticulate, lacking tuberosities; achenes 5–6 mm long, smooth; 2n = 40. Sand dunes and other sandy habitats at 1370 to 2230 m in Cache, Davis, Emery, Grand, Juab, Kane, Millard, Salt Lake, Tooele, Uintah, Utah, Washington, and Weber counties; British Columbia to Saskatchewan, south to California, New Mexico, and Nebraska; 15 (iii).

PORTULACAEAE A. L. Juss.

Purslane Family

Annual or perennial, often succulent herbs; leaves simple, entire, alternate, opposite, or mostly basal; flowers perfect, regular or nearly so; sepals 2, rarely more; petals mostly 4 or 5, or in *Lewisia* more numerous; stamens few to many, opposite the petals; style 2- to 8-cleft or -divided, the branches stigmatic on the inner side; pistil 1, the ovary superior or partly inferior, 1-loculed, dehiscent by 2 or 3 valves or circumscissile; styles 1–3 or more; seeds 1 to many; x = 4–42+.

- 1. Capsule circumscissile 2
- Capsule 2- or 3-valved, dehiscent from the apex 3
- 2(1). Calyx 2-lobed, the tube adherent to the ovary; capsule circumscissile near the middle, the calyx deciduous with the top of the capsule; stems leafy *Portulaca*
- Calyx of distinct sepals, free from the ovary; capsule circumscissile near the base and splitting longitudinally upward; leaves mostly basal *Lewisia*
- 3(1). Sepals deciduous; plants perennial *Talinum*
- Sepals persistent; plants annual or perennial 4
- 4(3). Stigmas and valves of capsule 2; plants annual *Calyptridium*
- Stigmas and valves of capsule 3; plants annual or perennial 5
- 5(4). Plants perennial, with large corms or tuberous roots; cauline leaves in one pair; ovules 6 *Claytonia*
- Plants annual or, if perennial, with stolons terminating in bulblets; cauline leaves in several pairs or, if only 1 pair, connate-perfoliate; ovules 3 *Montia*

Calyptridium Nutt. in T. & G.

Annual or perennial herbs; leaves alternate or basal, spatulate; inflorescence of scorpioid spikes or the spikes umbellate, capitate, or paniculate; flowers perfect; sepals 2, persistent, scarious or scarious-margined; petals 2 or 4, withering and enclosing the style or summit of the capsule (hence *Calyptridium*); stamens 1–3; style simple, short- or long-filiform, with 2 stigmas; capsule membranous, 2-valved, with few to many seeds.

Hinton, W. F. 1975. Systematics of the *Calyptridium umbellatum* complex (Portulacaceae). *Brittonia* 25: 197–208.

- 1. Inflorescence in headlike clusters; style long-filiform; petals in age twisting about the style; stamens exerted; sepals wholly scarious; plants alpine *C. umbellatum*
- Inflorescence not headlike; style short; petals ultimately enclosing the capsule; stamens included; sepals merely with scarious margins; plants seldom if ever alpine 2
- 2(1). Capsule 2–4 times as long as the sepals; sepals 1–2 mm long *C. monandrum*
- Capsule less than twice as long as the sepals and often obscured by them; sepals 2–3.5 mm long *C. parryi*

Calyptridium monandrum Nutt. in T. & G. Prostrate to ascending annual herbs; stems branched from the base, 5–18 cm long; leaves mostly in a basal rosette, 2–6 cm long, linear-spatulate, the cauline ones scattered, somewhat reduced; flowers subsessile in short spikes aggregated in a terminal panicle, the branchlets scorpioid, secund; sepals ovate to deltoid, scarious-margined, 1–2 mm long; petals commonly 3, white, ovate, ca 1 mm long; capsule compressed, linear-oblong, curved, many veined, 4–8 mm long; seeds 5–10, black, shining. Creosote bush, blackbrush, Joshua tree, and pinyon-juniper communities at 800 to 1750 m in Washington County; Nevada, Arizona, California, and Mexico; 5 (ii).

Calyptridium parryi Gray Prostrate to ascending annual herbs; stems branched from the base, 5–20 cm long; leaves mostly 1–6 cm long, 3–10 mm wide, oblanceolate, the cauline ones somewhat reduced; flowers subsessile or the lower ones short-pedicellate; sepals 2–3.5 mm long; petals usually 4, shorter than the sepals; capsule 1–2 times longer than the sepals or wholly obscured by them; seeds dull, mucicate, 0.6–0.7 mm long. Ponderosa pine

community at ca 2625 m in Sevier County (Albee 4850 BRY); Nevada and California; 1 (0).

Calyptridium umbellatum (Torr.) Greene [*Spraguea umbellata* Torr.]. Glabrous, annual or perennial herbs; stems 5–25 cm long; leaves mainly basal, 1.5–7 cm long, the blades spatulate to obovate, petioled; cauline leaves reduced or lacking; inflorescence umbellate-cymose, appearing capitate; flowers pink or white, closely crowded; bracts scarious; sepals pink or white, orbicular-reniform, 4.5–8 mm long, scarious, except for the greenish center, accrescent; petals 4, 3–6 mm long, oblong or ovate; stamens usually 3, mostly exerted; pistil 5–6 mm long, exerted, the stigma 2-lobed; capsule ovate, 3–4 mm long, 2- to 10-seeded; $2n = 22$. Mainly in spruce-fir and alpine tundra communities at 2775 to 3355 m in Beaver, Box Elder, Davis, Duchesne, Piute, and Summit counties; British Columbia to Montana, south to California, Nevada, and Wyoming; 7 (i). Our material is referable to var. *caudicifera* Gray, which has a caudex and glomerate-capitate inflorescence.

Claytonia L.

Glabrous, perennial herbs from deep-seated corms or fleshy roots; basal leaves 1 to many; cauline leaves 2, opposite or nearly so; inflorescence terminal, racemose; bracts present only at raceme base; flowers perfect, regular; sepals 2, herbaceous, persistent; petals usually 5, rose to white or yellowish; stamens 5, adnate to the petals; styles 3, united at the base; capsule ovate, 3-valved, the valve margins involute in age; seeds 2–6, dark, shining.

1. Plants with fleshy, purplish red roots; basal leaves numerous, the petioles winged; petals 5–10 mm long, white to pink, clawed; plants of high elevations *C. megarrhiza*
- Plants from globose to ellipsoid corms; basal leaves few or none; petals 7–12 mm long, white to pink; plants of various elevations *C. lanceolata*

Claytonia lanceolata Pursh Spring-beauty. [*C. multicaulis* A. Nels.; *C. multiscapa* Rydb.; *C. rosea* Rydb.]. Prevernal perennials from ellipsoid to globose corms 1–2 cm in diameter; stems solitary or more commonly 2 to several from each corm, mostly 5–20 cm tall (above ground); basal leaves present or lacking, 5–10 cm long, petioled, oblanceolate to oblong or ovate; cauline leaves 2–6 cm long or more, linear to oblong-lanceolate, sessile, with 1–5 veins; sepals 4–7 mm long, ovate to oval; petals 7–12 mm long, white to pink, rounded to emarginate apically; capsule subequal to or shorter than the sepals; seeds ca 2 mm long; $n = 8, 12, 16$. Pinyon-juniper, mountain brush, aspen, fir, lodgepole pine, and spruce-fir communities at 1585 to 3400 m in nearly all counties in Utah; British Columbia and Alberta south to California, Arizona, and New Mexico; 78 (viii). This is a beautiful plant, with its fresh pink to white flowers and second reflexed pedicels. Its flowering marks the upward advance of springtime from foothills to mountain summits.

Claytonia megarhiza (Gray) Parry in Wats. [*C. arctica* var. *megarhiza* Gray]. Perennial herbs from thick, purplish red taproots and a thick, often monocephalous caudex, this marked by horizontal leaf scars; stems mostly 5–15 cm tall, several per caudex crown; basal leaves 1–15 cm long, the blades oblanceolate to nearly orbicular; cauline leaves 1–3 cm long, opposite or alternate, linear to spatulate; inflorescence subequal to the leaves or

shorter; sepals 4–7 mm long, ovate, acute; petals 5–10 mm long, white to pink, clawed; capsule 4–6 mm long; seeds 2–2.4 mm long. Crevices and talus slopes in alpine tundra at 3080 to 4120 m in Duchesne, Grand, San Juan, Summit, and Uintah counties; Washington to Alberta, south to Nevada and Colorado; 10 (0).

Lewisia Pursh

Perennial, somewhat fleshy herbs from fleshy roots or corms; stems scapose, erect; leaves mostly basal, narrow, linear to oblanceolate; flowers solitary or borne in panicles, usually showy, the petals soon withering; sepals 2–9, persistent; petals 4–18; stamens 5 to many; styles 3–8; ovary superior; capsule circumscissile at the base, then splitting upward; seeds usually many.

1. Sepals 4–9, petaloid; bracts 3–7; pedicels jointed to the peduncles *L. rediviva*
- Sepals 2; bracts 1 or 2; pedicels not jointed to the peduncles 2
- 2(1). Basal leaves lacking or solitary, but with 2–5 linear cauline leaves subtending the inflorescence; plants from subglobose corms, known from Salt Lake and Summit counties *L. triphylla*
- Basal leaves numerous; plants from tuberous roots, of various distribution 3
- 3(2). Floral bracts similar to sepals and subtending them; sepals entire; plants mainly of Washington County; flowers large and showy *L. brachycalyx*
- Floral bracts dissimilar to the sepals and separated from them; sepals denticulate; plants of broad distribution *L. pygmaea*

Lewisia brachycalyx Engelm. ex Gray [*Oreobroma brachycalyx* (Engelm.) Howell; *L. brachycarpa* Wats.]. Caudex short, thick; stems many, 2–6 cm long; leaves many, fleshy, 3–6 cm long, oblanceolate; flowers usually solitary, sessile, subtended by sepaloid bracts; sepals 6–8 mm long, ovate, acute, entire; petals 12–18 (25) mm long, white; capsule 8–9 mm long; seeds many, ca 1.5 mm long, black, shining. Meadows and wash bottoms in mountain brush, pinyon-juniper, and ponderosa pine communities at 1530 to 2600 m in Washington County; New Mexico, Arizona, Nevada, and California; 9 (vi).

Lewisia pygmaea (Gray) Robins. [*Talinum pygmaeum* Gray; *Calandrina pygmaea* (Gray) Gray; *C. grayi* Britt.; *Claytonia grayana* Kuntze; *Oreobroma pygmaea* (Gray) Howell; *Calandrina nevadensis* Gray; *L. pygmaea* var. *nevadensis* (Gray) Fosberg]. Acaulescent to subcaulescent perennials from thickened roots and usually monocephalous caudices, the caudex marked with leaf scars and more or less persistent leaf bases; stems several to many, 2–6 cm long, partly buried; leaves basal, 2–8 cm long, 1–6 mm wide, numerous, linear to narrowly oblanceolate; scapes 1.5–5 cm long, bracteate at or below the middle; bracts hyaline, lanceolate, 6–10 mm long, opposite; sepals 2, ovate to orbicular, acute to rounded or truncate, entire to dentate apically with glandular teeth; petals 6–8, pink or white, 8–16 mm long; stamens 5–8; stigmas 3–5; capsule 4–6 mm long; seeds 1–1.3 mm long. Sagebrush, mountain brush, aspen, lodgepole pine, spruce-fir, and alpine tundra at 2285 to 3920 m in Beaver, Box Elder, Cache, Daggett, Duchesne, Garfield, Grand, Iron, Juab, Millard, Piute, San Juan, Sanpete, Sevier,

Summit, Tooele, Uintah, Utah, Wasatch, Washington, and Wayne counties; Washington to Montana, south to California, Arizona, and New Mexico; 73 (xiv). There is tremendous variation in plant height, leaf shape and size, and in other features, but it does not seem practical to segregate infraspecific taxa.

Lewisia rediviva Pursh Bitterroot. Plants with thick, fleshy roots and short caudices; stems many, 1–3 cm long, 1-flowered; leaves densely clustered at the caudex crown, 2–5 cm long, linear to clavate, obtuse, fleshy; bracts 5–8, whorled, scarious; pedicels easily disjointed in age; sepals 4–8, rose to white, 1.5–2.5 cm long; petals 12–18, 2–2.5 cm long, rose or sometimes white; stamens 35–50; styles 5–8; capsule 5–6 mm long; seeds dark, shining, 2–2.5 mm long; $2n = 26$. Sagebrush, pinyon-juniper, mountain brush, Douglas fir, and aspen communities at 1460 to 3150 m in Beaver, Box Elder, Daggett, Davis, Iron, Juab, Millard, Piute, Salt Lake, San Juan, Sanpete, Tooele, Utah, and Washington counties; British Columbia to Montana, south to California, Nevada, and Colorado; 24 (iv). The roots were eaten in springtime by Indians in the western U. S. The plant bears its scientific name because the specimens taken by Lewis (of the Lewis and Clark expedition) continued to grow at the herbarium of the Philadelphia Academy of Sciences.

Lewisia triphylla (Wats.) Robins. in Gray [*Claytonia triphylla* Wats.]. Plants from deep seated, subglobose corms 5–8 mm thick; stems 1–5, slender, 3–10 cm long; basal leaves solitary or lacking; cauline leaves 2–5, whorled, linear, 1–5 cm long, 1–2.5 mm wide; inflorescence subumbellate or paniculate, bracteate, 2– to 15-flowered; sepals 2, oval, entire, 2.5–4 mm long; petals 5–8, white or pink, 4–5 mm long; seeds black, shining, ca 1 mm long. Meadows in sedge-forb and spruce-fir communities at 2745 to 3235 m in Cache, Duchesne, Morgan, Rich, Salt Lake, and Summit counties; Washington to Montana, south to California, Nevada, and Colorado; 6 (0). This is an obscure, poorly collected entity that should be expected beyond the range of the few specimens examined.

Montia L.

Annual or perennial, somewhat succulent herbs from fibrous roots, or with rhizomes or stolons; cauline leaves 2 and opposite or 2 to several and opposite or alternate; basal leaves well developed and petiolate or lacking; flowers showy or inconspicuous, usually several in axillary or terminal racemes; sepals 2, persistent; petals usually 5 (2–6), distinct or basally united; stamens 2–5, opposite the petals and usually adnate to them at the base; styles deeply 3-cleft; capsules 3-valved; seeds 1–3, smooth or tuberculate, often shining.

- 1. Cauline leaves alternate, linear; plants perennial *M. linearis*
- Cauline leaves opposite, not linear; plants annual or perennial 2
- 2(1). Stems with 2 to several pairs of leaves; plants rhizomatous perennials *M. chamissoi*
- Stems with a single pair of leaves; plants annual or perennial, but if the latter, not strongly rhizomatous . . . 3
- 3(2). Plants perennial, the cauline leaves not connate-perfoliate; petals 9–12 mm long *M. cordifolia*
- Plants annual, with a single pair of connate-perfoliate leaves; petals 2–7 mm long *M. perfoliata*

Montia chamissoi (Ledeb.) Robins. & Fern. Toad-lily. [*Claytonia chamissoi* Ledeb.]. Plants perennial, 5–25 cm tall, from slender rhizomes and stolons (which produce bulbletlike offsets); flowering stems often branched; basal leaves reduced or lacking; cauline leaves opposite, 4 to several, 1–5 cm long, 2–18 mm wide, oblanceolate to elliptic, tapering to the petiole; inflorescence erect, racemose, terminal and axillary; flowers few to several, nodding in bud, a single bract at the base of the lowest pedicel; sepals 2, 2–3 mm long; petals 5, white (or pinkish), 5–8 mm long; stamens commonly 5; capsules 2–3 mm long; seeds 1–3; $n = 11$. Moist meadows, stream banks, seeps, and springs at 1890 to 3520 m in Box Elder, Cache, Davis, Emery, Garfield, Kane, Sevier, Summit, Utah, Wasatch, Washington, and Wayne counties; Alaska to Manitoba, south to California, New Mexico, and Iowa; 13 (i).

Montia cordifolia (Wats.) Pax & K. Hoffm. in Engler & Prantl [*Claytonia cordifolia* Wats.]. Perennial herbs with short rhizomes; stems 1 to few, 1–3 (5) dm tall; basal leaves round-reniform to ovate, the blades 2–5 cm long and wide, the petioles 5–15 cm long; stem leaves 2, opposite, sessile, 1.5–3 cm long; racemes bractless, 4– to 9-flowered; pedicels 1–2 cm long; sepals suborbicular, 3–4.5 mm long; petals white, obovate, 6–12 mm long; capsule ca 4 mm long; seeds black, roundish, shining; $2n = 10$. Moist sites with willow, birch, aspen, and fir at 1650 to 2330 m in Cache, Salt Lake, and Weber counties; British Columbia to Montana, south to California; 4 (0).

Montia linearis (Dougl.) Greene [*Claytonia linearis* Dougl. ex Hook.]. Annual, erect, branching herbs; stems slender, 5–20 cm tall; leaves alternate, linear, 2–3.5 cm long, the petioles with enlarged, scarious bases; racemes terminal, secund, lax, 2– to 10-flowered; pedicels 6–15 mm long, spreading or recurved; sepals rounded, ca 4 mm long, white-margined; petals unequal, obovate, white, ca 5 mm long; capsule ovoid, ca 4 mm long; seeds 3, lens-shaped, muricate marginally, 1.5–2 mm long. Meadows in sagebrush, mountain brush, mixed conifer, and riparian communities at ca 2000 m in Morgan and Weber counties; British Columbia to Montana, south to California and Idaho; 2 (0).

Montia perfoliata (Donn) Howell Miners-lettuce. [*Claytonia perfoliata* Donn]. Annual herbs from slender taproots; flowering stems few to several from the root crown, 5–20 cm tall; basal leaves 2–15 cm long, somewhat sheathing basally, the blades linear to spatulate or broader; cauline leaves 2, opposite, usually connate-perfoliate and forming a discoid structure 0.8–3 cm broad; inflorescence racemose, terminal and sometimes also axillary; flowers mostly 3–8; pedicels 2–10 mm long or longer, nodding, only the lowermost subtended by a bract; sepals 2, 1.5–3 mm long, rounded; petals 5, white or pinkish, 3–5 mm long; stamens 5; capsule 2–4 mm long; seeds usually 3, black, lustrous; $2n = 12, 24, 32, 36, 48, 60$. Creosote bush, blackbrush, sagebrush, pinyon-juniper, mountain brush, riparian, and spruce-fir communities at 800 to 3300 m in Beaver, Box Elder, Cache, Davis, Duchesne, Juab, Millard, Morgan, Salt Lake, Sanpete, Summit, Tooele, Utah, Washington, and Weber counties; British Columbia to Montana, south to California and Nevada; 56 (xiv). Plants with linear basal leaves have been segregated as var. **utahensis** (Rydb.) Munz [*Limnia utahensis* Rydb., type from St. George]. There

appears to be some geographic correlation with the linear leaf type, i.e., the plants occur in Washington County. The broad-leaved material is referable to var. *perfoliata*, and is widely distributed, including Washington County.

Portulaca L.

Annual or perennial, succulent herbs; leaves opposite or alternate, flat or terete; stipules scarious, reduced to hair tufts, or lacking; flowers perfect, solitary or crowded at the stem and branch ends, opening only in full light; sepals 2, united below and adnate to the ovary; petals 5 or rarely many, inserted on the calyx; stamens 8 to many; style deeply 3- to 9-parted; ovary partly to wholly inferior; capsule 1-loculed, circumscissile, many-seeded; seeds round-reniform.

1. Leaves terete, linear or narrowly oblanceolate; plants with long hairs in the inflorescence and leaf axils 2
- Leaves broad and flat, thick and fleshy; plants glabrous 3
- 2(1). Plants cultivated; flowers variously colored; leaf axils with long, thin hairs, but not woolly *P. grandiflora* Hook.
- Plants indigenous; flowers yellow, orange, or bronze; axils of leaves with long, white, woolly hairs *P. parvula*
- 3(1). Seeds conspicuously and sharply granulate or echinate, 0.9-1 mm wide; leaves often retuse or emarginate apically; style lobes mostly 3 or 4; plants not definitely known from Utah, but to be expected in the southern counties *P. retusa* Engelm.
- Seeds minutely rounded tuberculate, less than 0.8 mm wide; leaves rounded or truncate apically; style lobes 5 or 6; plants widespread *P. oleracea*

Portulaca oleracea L. Purslane; Pusley; Mother-of-millions. Glabrous, fleshy, prostrate annuals; stems 5-50 cm long or more; leaves alternate, 6-30 mm long, 2-13 mm wide, the blades obovate-cuneate to spatulate, rounded to truncate apically; flowers clustered or solitary, sessile, the bracts subtending them inconspicuous or lacking; sepals broadly ovate to orbicular, 2.8-4.5 mm long, 2.3-3.8 mm wide, keeled, acutish; petals yellowish, 3-4.6 mm long, 1.8-3 mm wide; stamens 6-10; style lobes 5 or 6; capsules 6-9 mm long, circumscissile; seeds black, 0.4-0.6 mm long, minutely punctate; $2n = 36, 54$. Weedy species of gardens and fields, but widespread in disturbed sites in indigenous plant communities at 830 to 2440 m in all Utah counties; widely distributed in North America; cosmopolitan; 17 (vii). This is a persistent weed of gardens, yielding abundant work for gardeners, who harvest it in large quantities, only to find that it continues to flower and mature seed when pulled and left to dry. The plant is edible, and serves as feed for poultry, for those hapless gardeners who have both poultry and purslane.

Portulaca parvula Gray Dwarf Purslane. Plants with stems prostrate to ascending, annual; stems mainly 5-15 cm long, usually branched from the base; leaves 4-13 mm long, 1-2 mm thick, succulent, somewhat compressed; leaf axils with tufts of white hair 3-7 mm long; inflorescence apical, capitate, with 2-10 flowers; bracts subtending inflorescence 3-8 mm long; sepals ca 2-2.5 mm long; petals yellow, orange, or bronze, 2-2.5 mm long; capsule 1.5-2 mm thick, the persistent basal part campanulate, short-stipitate; seeds ca 0.5 mm wide, black, stellate-tuberculate. Sandy sites in mixed warm desert shrub and pinyon-juniper communities at 1220 to 1895 m in Kane

and San Juan counties; Arizona to Oklahoma and Texas, south to Mexico; 5 (iii). Previous reports of *P. mundula* Gray belong here.

Talinum Adanson

Perennial herbs, often with thickened roots; stems often short; leaves fleshy, alternate to subopposite or mainly basal, entire, flat or terete; flowers often showy, borne on long or short peduncled cymes, or sometimes only 1 to several in leaf axils; sepals 2, deciduous; petals 5 or more, soon withering; stamens few to numerous; filaments filiform; ovary superior; styles 3, more or less connate; capsule 1-loculed, 3-valved; seeds flattened.

1. Flowers solitary or few in axillary cymes; caudex branches spreading, forming mats of rosettes; leaves 4-9 mm long *T. brevifolium*
- Flowers in terminal cymes; caudex branches erect-ascending, not forming mats; leaves mainly 15-50 mm long 2
- 2(1). Stamens 4-8; stems and peduncles erect or ascending, often more than 6 cm tall *T. parviflorum*
- Stamens 10; stems and peduncles more or less spreading, less than 6 cm tall *T. thompsonii*

Talinum brevifolium Torr. Mat-forming, fleshy herbs, with spreading caudex or superficial branches and stout roots; vegetative and flowering stems short, seldom to 5 cm long; leaves arranged in rosettelike clusters or the internodes very short, subterete, narrowly spatulate to clavate or linear, 4-9 mm long, 1-1.8 mm wide, obtuse apically; flowers solitary in the axils of upper leaves, borne on pedicels 3-3.5 mm long; sepals 3-3.7 mm long, 3.8-4.4 mm wide, oval to orbicular; petals mostly 8-10 mm long, 4-5 mm wide, obovate, rose or white; stamens ca 20-25; style as long as the ovary, 3-cleft; capsule subglobose to ovoid or ellipsoid, 3.5-3.7 mm long; seeds almost smooth. Sandstone depressions and crevices in Navajo and Cedar Mesa formations (and probably others) at 1555 to 2130 m in Emery, Garfield, San Juan, Washington, and Wayne counties; Arizona to Texas; 15 (viii). Flowers in most materials examined in the field are rose colored and 10-12 mm across, but plants from near Fish Canyon on Cedar Mesa bear white flowers, some of them dimorphic. The small flowers average about 5 mm broad and the large ones about 10 mm broad. A plant from the Comb Reef, west of Bluff, had pink flowers 25 mm broad. More work is required to evaluate the importance of this diversity.

Talinum parviflorum Nutt. Low, clump-forming, perennial herbs, mainly 5-19 cm tall, with fleshy roots; stems short, much surpassed by the peduncle and inflorescence; leaves 15-50 mm long, 0.8-2.5 mm wide, linear, terete or nearly so, broadened at the base; inflorescence cymose, bracteate at the forks; peduncles slender, 3-15 cm long; pedicels slender, 1-4 mm long; sepals 2.7-4 mm long, 1.5-3.2 mm wide, ovate to oval-ovate, deciduous; petals 5.5-7 mm long, 2.2-2.6 mm wide, pink to pink purple, obovate or elliptic; stamens 4-8, the anthers oblong; style longer than the stamens; stigma subcapitate; capsule 3.5-4.5 mm long, ellipsoid; seeds smooth, 0.8-0.9 mm wide. Usually on rock outcrops (sandstone or igneous) in black sagebrush, pinyon-juniper, and ponderosa pine communities at 1525 to 2685 m in Emery, Garfield, Iron, and Kane counties; North Dakota and Minnesota, south to Texas and west to Arizona; 7 (ii).

Talinum thompsonii Atwood & Welsh [*T. validulum* authors, not Greene]. Low, clump-forming, perennial herbs to 10 cm wide, from a fusiform or cylindrical, reddish, tuberous root and short rooterown bearing branches of the season; stems spreading, rosettelike; leaves 8–32 mm long, fleshy, cylindrical, mainly 2–3 mm thick (when pressed), with an auriculate, clasping base; flowers (1) 3–6 in open cymes, ca 1 cm across; petals pink; sepals 4.3–4.8 mm long, ovate, reticulately veined, greenish or brownish, with scarious margins, abruptly acuminate apically, tardily deciduous; stamens 10; capsules 6–6.5 mm long, 3.2–3.8 mm wide, keeled along the sutures apically; seeds grayish-black, 1.2–1.3 mm long. Silicious conglomeratic gravels in pinyon-juniper and ponderosa pine communities at ca 2290 m in Emery (type from Cedar Mt.) County; endemic; 3 (ii).

PRIMULACEAE Vent.

Primrose Family

Annual or perennial herbs; leaves simple, alternate, opposite, or whorled; flowers perfect, regular, variously arranged, terminal or axillary; sepals commonly 5, more or less united; petals 5, united or lacking (in *Glaux*); stamens 5, opposite the corolla lobes, sometimes alternating with 5 staminodia; pistil 1, the ovary superior to partly inferior, 1-loculed, 5-carpeled; style 1, the stigma capitate; fruit a capsule; $x = 5, 8-15, 17, 19, 22$.

- 1. Leaves all basal; flowers borne in umbels 2
- Leaves cauline; flowers axillary, solitary or few to many, or in terminal racemes or panicles 4
- 2(1). Corolla lobes distinctly reflexed; flowers nodding *Dodecatheon*
- Corolla lobes spreading to erect or, if reflexed, the flowers ca 3 mm long, flowers erect or spreading 3
- 3(2). Flowers white, mostly less than 6 mm long or broad; corolla tube usually shorter than the calyx *Androsace*
- Flowers pink to rose or red purple, rarely white, commonly more than 6 mm long and broad; corolla tube longer than the calyx *Primula*
- 4(1). Corolla lacking, plants often of saline meadows *Glaux*
- Corolla present; plants of various habitats 5
- 5(4). Inflorescence terminal, of numerous flowers in racemes or panicles *Samolus*
- Inflorescence lateral, the flowers solitary or in dense axillary clusters 6
- 6(5). Plants indigenous, perennial; flowers sulfur yellow, borne singly, in pairs, or in dense axillary clusters *Lysimachia*
- Plants adventive, annual; flowers salmon, borne singly on axillary pedicels *Anagallis*

Anagallis L.

Annual herbs from taproots; stems branched from the base; leaves cauline, opposite or whorled; flowers borne singly in leaf axils, pedicellate; calyx deeply 5-cleft; corolla 5-lobed, rotate; capsule circumscissile.

Anagallis arvensis L. Scarlet Pimpernel; Poor-mans Weatherglass. Stems prostrate or ascending, mainly 10–25 (40) cm long, glabrous; leaves 5–15 mm long, ovate, entire, sessile, more or less clasping basally; pedicels 10–30 mm long, filiform, usually recurved in

fruit; sepals 2–4 mm long, narrowly lanceolate, acuminate, almost distinct; corolla 5–8 mm broad, salmon, ciliate; staminal filaments hairy; capsule globose, 3–5 mm wide. Weedy species of cultivated sites in Salt Lake County; widely distributed in the western U. S.; adventive from Europe; 1 (0).

Androsace L.

Annual or perennial, scapose herbs; leaves in basal rosettes, simple, usually persistent; herbage pubescent with stellate, forked, or simple hairs, or glabrous; flowers in umbels of 2–20 or more, rarely solitary, borne on peduncles that arise from the basal rosette; calyx 5-lobed, the tube nearly equaling the lobes; corolla tubular, contracted and sometimes with 5 crests at the throat, 5-lobed; stamens 5, the filaments adnate to the corolla; capsules subglobose.

Robbins, G. T. 1944. North American species of *Androsace*. Amer. Midl. Naturalist 32: 137–163.

- 1. Plants mat-forming perennials; herbage with long, moniliform hairs; corollas 5–6 mm wide; known from the La Sal Mts. *A. chamaejasme*
- Plants annual or biennial (?); herbage glabrous or puberulent; corollas 2–3 mm wide; distribution various . . . 2
- 2(1). Leaf blades abruptly narrowed to a petiole; calyx not keeled, the lobes 3-veined; corolla lobes reflexed *A. filiformis*
- Leaf blades tapering to the base; calyx keeled, the lobes 1-veined; corolla lobes spreading to erect 3
- 3(2). Bracts subtending umbel commonly more than 3 times longer than broad, attenuate apically; calyx lobes not incurved; plants common *A. septentrionalis*
- Bracts subtending umbel less than 3 times longer than broad, abruptly acute apically; calyx lobes ultimately incurved; plants uncommon *A. occidentalis*

Androsace chamaejasme Host Plants mat-forming perennials, with a caudex and prostrate stems, each with a terminal rosette, the flowering stems 1.2–5 cm tall; leaves several to many, 2–8 mm long, glabrous above, pilose beneath, ciliate with moniliform hairs; peduncles 1 per rosette, pubescent with moniliform hairs; flowers 2 to several, on pedicels 1–3 mm long, the umbels subtended by few to several saccate bracts; calyx 2–3 mm long, with teeth subequal to or shorter than the tube; corolla white to cream (fading pinkish), with a yellow center, the tube subequal to the calyx, the lobes 1.5–3 mm long; capsules 2–3 mm long. Alpine tundra at 3050 to 3845 m in Grand (?) and San Juan counties; Alaska to Mackenzie, south to Colorado; Eurasia; 5 (0). Our material is assignable to var. *carinata* (Torr.) Knuth [A. *carinata* Torr.; A. *chamaejasme* ssp. *carinata* (Torr.) Hulten]. The few specimens available for study do not appear to differ in any real way from those of interior Alaska, and they might best be treated within ssp. *lehmanniana* (Sprengel) Hulten [A. *lehmanniana* Sprengel], but nomenclatural combination is not intended or implied herein.

Androsace filiformis Retz. [A. *capillaris* Greene]. Annual herbs; leaves in a basal rosette, 6–20 (30) mm long, the blades ovate to deltoid, toothed, abruptly narrowed to broad petioles; scapes few to numerous, 0–8 (12) cm tall, glabrous or sparingly glandular or puberulent above; bracts several, 1–4 mm long; pedicels capillary, 1–4 cm long, glabrous or puberulent; calyx hemispheric, 1.4–2.1

mm long, the lobes triangular, 3-veined; corolla tube subequal to the sepals, the lobes 0.8-1.2 mm long; capsules surpassing the calyx, translucent; seeds brownish, 0.2-0.3 mm long. Meadows at 2135 to 2595 m in Cache, Duchesne, Emery, and Salt Lake counties; Washington to Montana, south to Oregon and Colorado; 5 (0).

Androsace occidentalis Pursh [*A. simplex* Rydb.]. Annual herbs; leaves in a basal rosette, 6-20 (30) mm long, lanceolate to oblanceolate or spatulate, not differentiated into blade and petiole, entire or toothed, puberulent with simple hairs; scapes 1 to many, 2-10 cm tall, puberulent with forked hairs; bracts lanceolate to elliptic, pubescent with forked hairs; umbels 3- to 10-flowered; pedicels slender, 3-20 (30) mm long; calyx turbinate-campanulate, 3.8-5 mm long, puberulent, keeled below each lobe, the lobes subequal to the tube; corolla white, included in the calyx; capsule globose, subequal to the calyx tube, opaque; seeds brown, ca 1 mm long. Mountain brush and pinyon-juniper communities at ca 1280 to 2135 m in Beaver, Davis, Kane, Salt Lake, and Utah counties; British Columbia to California and New Mexico; 5 (0).

Androsace septentrionalis L. Annual (or biennial?) herbs; leaves in a dense basal rosette, 5-60 mm long, oblanceolate to spatulate, usually with 5 or more apical teeth, sparsely to densely puberulent with simple or forked hairs, not differentiated into blade and petiole; scapes 1 to many, 1-20 cm tall or more, puberulent; umbels with several to many flowers; bracts lanceolate to oblong or lance-linear; pedicels 3-40 mm long or more; calyx turbinate-campanulate, 2.5-4 mm long, keeled below the lobes, those shorter than the tube; corolla white, subequal to the calyx, the lobes 0.5-1 mm long; capsules 2-4 mm long; 2n = 20. Pinyon-juniper, sagebrush, mountain brush, ponderosa pine, Douglas fir-white fir, aspen, lodgepole pine, grass-forb, spruce-fir, and alpine tundra communities at 1950 to 2965 m in most, if not all, Utah counties; Alaska to Labrador, south to California, Arizona, and New Mexico; circumboreal; 175 (xxiii).

Dodecatheon L.

Perennial, subrhizomatous, scapose herbs; leaves all basal, petiolate, the blades broad; herbage glabrous or glandular-pubescent; flowers (1) 2 to many, borne in terminal umbels, nodding at anthesis, erect in fruit; calyx cup-shaped, 4- or 5-lobed; corolla 4- or 5-lobed, the lobes much longer than the tube, reflexed; stamens 4 or 5, the filaments short, distinct or connate, adnate to the corolla tube; anthers connivent around the style; anther sacs with a prominent connective that is dilated at the base; capsules elongate.

- 1. Corolla and sepal lobes 4; stigma prominently dilated *D. alpinum*
- Corolla and sepal lobes 5; stigma various 2
- 2(1). Leaves abruptly contracted to petioles, the blades ovate to subcordate, sinuate-dentate; plants rare . . . *D. dentatum*
- Leaves tapering to the petioles, the blades mostly spatulate to oblanceolate or elliptic, entire or variously toothed 3
- 3(2). Staminal filaments mostly 1-3.5 mm long, united into a yellow or black tube; stigmas not especially enlarged; our most common species *D. pulchellum*
- Staminal filaments less than 1 mm long, distinct; stigmas noticeably enlarged; plants rare in western Utah *D. redolens*

Dodecatheon alpinum (Gray) Greene Alpine Shooting-star. [*D. meadia* var. *alpinum* Gray; *D. jeffreyi* var. *alpinum* (Gray) Gray; *D. alpinum* ssp. *majus* H. J. Thompson]. Plants 8-38 cm tall, the roots yellowish; leaves 1.5-17 cm long, 3-17 mm wide, spatulate to oblanceolate, entire or irregularly sinuate; scapes 6-33 cm long, glabrous or sparingly glandular-pubescent; umbels 2- to 6-flowered, the pedicels 2-45 mm long; calyx tube 3-4 mm long, the teeth 2.5-3.5 mm long; corolla magenta to lavender, 8-20 mm long; staminal filaments 0.5-1 mm long, distinct or narrowly connate, black; anthers 5-8.5 mm long, purplish black, the connective black, roughened; stigma conspicuously enlarged; capsules 5-8 mm long, oblong-ovoid. Alpine meadows in lodgepole pine, spruce-fir and tundra communities at 2195 to 3510 m in Beaver, Duchesne, Garfield, Iron, Juab, Salt Lake, Summit, Utah, Wasatch, and Washington counties; Oregon, Nevada, and California; 25 (iii).

Dodecatheon dentatum Hook. Plants 12-40 cm tall, the roots yellowish; leaves 2-15 cm long, 8-40 (60) mm wide, the blades ovate to elliptic or subcordate, abruptly contracted to a broad petiole, sinuate-dentate; scapes 10-35 cm long, glabrous or sparsely glandular-pubescent; umbels 2- to 12-flowered, the pedicels 0.8-7 cm long; calyx tube 1.5-2.5 mm long, the lobes 2-3 mm long, triangular; corolla creamy white (fading lavender), the lobes 12-20 mm long, the tube yellowish; staminal filaments less than 1 mm long, distinct, purple; anthers 6-7 mm long, deep red (or purple?); stigma not conspicuously enlarged; capsule 6-10 mm long, cylindrical-ovoid. Crevices at ca 2375 to 2440 m in Salt Lake County; British Columbia to Oregon and Idaho; 2 (0).

Dodecatheon pulchellum (Raf.) Merr. Pretty Shooting-star. Plants (6) 12-65 cm tall, the roots pale; leaves 3-30 (35) cm long, 0.4-6 (7.5) cm wide, oblanceolate to elliptic, tapering to the petiole, usually entire; scapes 7-50 cm long; umbels (1) 3- to 20-flowered; pedicels 1-7 cm long; calyx tube 2-3.5 mm long, the lobes 2.5-6 mm long; corolla magenta to lavender (or white), 9-21 mm long; staminal filaments 0.5-3.5 mm long, united into a distinctive yellow or black tube; anthers 3-8 mm long, the connective maroon to black or yellow, smooth; stigma not conspicuously enlarged; capsules 7-17 mm long, cylindrical to ovoid. This is a highly variable species, treated herein as separable into two intergrading phases at taxonomic rank.

- 1. Leaves mainly 10-35 cm long and 3-7.5 cm wide; petals mostly over 12 mm long; plants of hanging gardens and seeps, mainly below 1220 m in Kane and Washington counties *D. pulchellum* var. *zionense*
- Leaves mainly less than 10 cm long and less than 3 cm wide; petals typically less than 12 mm long; plants typically of moist sites above 1220 m, widely distributed *D. pulchellum* var. *pulchellum*

Var. *pulchellum* [*Eximia pulchella* Raf.; *D. meadia* var. *pauciflorum* Dur.; *D. pauciflorum* (Dur.) Greene; *D. radicum* Greene]. n = 22, 44. Moist sites in meadows, seeps (sometimes markedly saline), and springs from 1370 to 3355 m in all Utah counties (except perhaps Grand and San Juan); Alaska and Yukon, south to Mexico, and disjunctly in the eastern U. S.; 85 (xi). Plants with black staminal tube have been designated as var. *monanthum* (Greene) C. L. Hitchc. [*D. pauciflorum* var. *monanthum* Greene], but there does not appear to be geographical

correlation. The plants with yellow staminal tube belong to var. *pulchellum*. This plant often stains huge areas in wet meadows with the pink of its masses of flowers. Specimens from low elevation saline seeps and springs in the western counties have thick coriaceous leaves and tend to have very short pedicels. Perhaps they will prove to be worthy of taxonomic recognition.

Var. *zionense* (Eastw.) Welsh [*D. zionense* Eastw., type from Zion Canyon]. Seeps and hanging gardens at 1125 to 1285 m in Kane, San Juan (?), and Washington counties; endemic; 14 (v). This is a showy phase of the species simulating, but unmatched by, races from elsewhere within the huge distribution of the complex. The plants tend to maintain their characteristics even where growing in open sunny sites such as occasionally in seeps along Lake Powell; the features are thus not merely ecologically induced.

***Dodecatheon redolens* (Hall) H. J. Thompson** [*D. jeffreyi* var. *redolens* Hall]. Plants 20–60 cm tall, the roots pale; leaves 8–40 cm long, 2–6 cm wide, oblanceolate, entire, tapering to a broad petiole; scapes 25–60 cm tall; umbel 5- to 10-flowered; pedicels 1–5 cm long or more; calyx tube 3–4 mm long, the lobes 5–8 mm long, lanceolate; corolla magenta to lavender, 15–25 mm long; staminal filaments less than 1 mm long, distinct, black; anthers 7–11 mm long, the connective rough, maroon to black; stigmas conspicuously enlarged; capsules 8–14 mm long. Streambanks at ca 2867 m in the Deep Creek Mts., Juab County; Nevada and California; 1 (0). This plant is questionably segregated from *D. jeffreyi* Van Houtte.

***Glax* L.**

Succulent, perennial herbs from short rhizomes and fibrous or tuberous roots; leaves opposite below, subopposite to alternate above, entire, sessile; herbage glabrous; flowers solitary, sessile or subsessile in the axils near the middle of the stem; calyx cupshaped, the 5 petaloid lobes equaling or surpassing the tube; corolla lacking; stamens 5, alternate with the calyx lobes; capsule subglobose, few-seeded.

***Glax maritima* L.** Sea Milkwort. Plants 3–25 (30) cm tall; leaves 3–20 (25) mm long, oval to narrowly oblong, jointed to the stem; calyx 3–5 mm long, the lobes white or pinkish; stamens subequal to the calyx lobes, inserted at the base of the ovary; capsules 2–3 mm long; 2n = 30. Seeps, springs, streambanks, and moist meadows, often where saline, at 1280 to 2200 m in Box Elder, Cache, Daggett, Duchesne, Garfield, Grand, Juab, Millard, Piute, Rich, Salt Lake, Sanpete, Sevier, Tooele, Utah, and Wayne counties; widely distributed in North America; circumboreal; 43 (v).

***Lysimachia* L.**

Perennial, rhizomatous herbs; leaves opposite or whorled, large, minutely spotted with red, sessile or petiolate; flowers solitary or 2 to many, borne in middle to upper axils; calyx of usually 5 more or less united sepals; corolla usually of 5 petals more or less united at the base; stamens usually 5, attached to the ovary base; capsules subglobose.

Ray, J. D. Jr. 1956. The genus *Lysimachia* in the New World. Illinois Biol. Monographs 24(3–4): 1–160.

- 1. Flowers small, numerous, borne in dense, pedunculate racemes; leaves sessile *L. thyrsoflora*
- Flowers large, solitary or in pairs; leaves petiolate *L. ciliata*

***Lysimachia ciliata* L.** Fringed Loosestripe. [*Steironema ciliatum* (L.) Raf.]. Stems erect, 2.5–10 (13) dm tall, simple or branched above, glabrous; leaves cauline, the lower withered by anthesis, the petioles 3–20 mm long, coarsely ciliate, the blades 3.5–15 cm long, 0.9–6.5 cm wide, ovate to lanceolate, rounded to subcordate basally, obtuse to acuminate-attenuate apically, ciliate; flowers solitary or in pairs; pedicels 1–8 cm long; calyx 3.5–8 mm long, 5-lobed, the lobes lance-acuminate; corolla bright yellow (fading whitish), rotate, the lobes 7–12 mm long, glandular within; stamens 5, alternating with 5 narrow staminodia; capsule shorter than the calyx; seeds 10–20; 2n = 34, 92, 96, 98, 100, 108, 112. Stream and river banks and bogs at 1340 to 1405 m in Cache, Davis, Salt Lake, Utah, and Weber counties; Canada south to Oregon, New Mexico, and Georgia; 6 (i).

***Lysimachia thyrsoflora* L.** Tufted Loosestripe. Plants 2–8 dm tall; stems erect, simple; leaves scalelike below, enlarged above, but the lower often withered at anthesis, 3–16 cm long, 0.5–6 cm wide, oblong to lanceolate, elliptic, or oblanceolate, sessile; flowers in dense, pedunculate racemes; pedicels 1–4 mm long; calyx glandular-spotted, 5 (7)-lobed, the lobes 1.8–3.5 mm long; corolla yellow, spotted with purple, 5 (7)-lobed, the lobes 3–7 mm long; ovary dark, glandular; style 4–6 mm long; capsule ca 2.5 mm wide, few-seeded; 2n = 40, 42. Marshes at 1340 to 1405 m in Cache, Utah, and Weber counties; widespread in North America; Eurasia; 3 (0).

***Primula* L.**

Perennial, scapose herbs; leaves all basal, simple, neither conspicuously imbricate nor persistent; herbage glabrous, glandular, or mealy; flowers 1 to many in involucrate umbels; calyx tubular, 5-lobed; corolla tubular, not conspicuously contracted, the crests absent or reduced, 5-lobed, the lobes usually emarginate; stamens 5, the filaments adnate to the corolla; capsule cylindrical to ovoid.

- 1. Involucres, calyces, and leaves (at least beneath) conspicuously white-mealy; bracts swollen at the base 2
- Involucres, calyces, and leaves (even beneath) not (or only somewhat) mealy, either glabrous or glandular; bracts not swollen at the base 3
- 2(1). Corollas 6–10 mm wide; calyx teeth parallel, the margins touching; plants of calcareous bogs at middle elevations *P. incana*
- Corollas 10–16 mm wide; calyx teeth diverging, the margins well separated; plants of hanging gardens at lower elevations *P. specuicola*
- 3(1). Calyx conspicuously glandular, 7–16 mm long; leaves mainly 15–25 cm long and 1.5–4 cm wide; plants of high elevation, montane sites *P. parryi*
- Calyx glabrous or sparingly mealy, 5.5–12 mm long; leaves 1.5–11 cm long and 0.4–2.2 cm wide; plants of limestone crevices and slopes at middle elevations 4
- 4(3). Calyx 5.5–7.5 mm long (to 9 mm long in fruit); corolla lobes 4–5 mm wide, obovate; plants of Logan Canyon *P. maguirei*
- Calyx 8–10 mm long (to 12 mm long in fruit); corolla lobes 4–12 mm wide, broadly obovate; plants of the House Range *P. domensis*

***Primula domensis* Kass & Welsh** House Range Primrose. Plants 7–15 cm tall; leaves 2–8 (11) cm long, 5–22

mm wide, oblanceolate to spatulate, dentate or subentire, tapering to a broad petiole, green and more or less glandular on both sides; bracts usually 3, 1.5–10 mm long, lanceolate, not swollen at the base, glabrous or mealy; peduncle apex glabrous or somewhat mealy; umbels 1– to 5–flowered, the pedicels 5–22 mm long; calyx 8–12 mm long, mealy or glabrous, the teeth shorter than the tube; corolla rose to lavender, the tube surpassing the calyx, but less than twice as long, the limb 12–25 mm wide, the lobes shorter than the tube, 4–12 mm wide; capsule to 8 mm long, not surpassing the calyx. Crevices in limestone at 2590 to 2745 m in the House Range (type locality), Millard County; endemic; 3 (0). This primrose is nearer geographically to the *P. nevadensis* N. Holmgren, of eastern Nevada, than it is to *P. maguirei* of Logan Canyon. In *P. nevadensis* the cuneate, markedly dentate leaves commonly overtopping the inflorescence are diagnostic. Although grossly similar to *P. maguirei*, the House Range primrose has much larger calyces, on the average and in the extreme, more consistently toothed leaves, and corolla tubes shorter in proportion to the calyx length. All belong to the *P. cusickiana* Gray complex, and might be best treated within that entity at infraspecific rank; a proposal beyond the scope of this work, and neither intended nor implied herein.

Primula incana Jones Silvery Primrose. Plants 5–40 cm tall; leaves 1.5–8 cm long, 0.5–1.7 cm wide, oblanceolate to spatulate, shallowly denticulate, tapering to broad petioles, usually white-mealy below, green above; bracts lanceolate to linear, 3–10 mm long, swollen at the base, more or less mealy; peduncle apex often white-mealy; umbels 2– to 15–flowered, the pedicels 2–15 (25) mm long; calyx 5.5–10 mm long, mealy, the teeth shorter than the tube, erect, the margins touching or slightly diverging; corolla lilac, the tube surpassing the calyx, the limb 6–10 mm wide, the lobes shorter than the tube; capsule only slightly exceeding the calyx; seeds roughened. Wet meadows and calcareous, often quaking, bogs at 2012 to 2655 m in Daggett and Garfield (type from the vicinity of Tropic) counties; Alaska and Yukon to Hudson Bay, south to Colorado; 4 (0).

Primula maguirei L. O. Williams Maguire Primrose. Plants 4–15 cm tall; leaves 1.5–7 cm long, 4–15 (25) mm wide, oblanceolate to spatulate, subentire or irregularly toothed, tapering to slender petioles, green and more or less glandular on both sides; bracts 1–7 mm long, lanceolate to elliptic, not swollen at the base, glabrous or mealy; peduncle apex glabrous or sparingly mealy; umbels 1– to 3–flowered, the pedicels 2–15 mm long; calyx 5.5–7.5 mm long, mealy or glabrous, the teeth shorter than the tube, erect, the margins diverging; corolla rose to lavender, the tube surpassing the calyx (ca twice as long), the limb 10–15 (25) mm wide, the lobes shorter than the tube, 4–5 mm wide; capsule surpassing the calyx. Limestone crevices and slopes at ca 1550 to 1680 m in Cache (type from Logan Canyon) County; endemic; 3 (0). The Maguire primrose is a delicate beauty on limestone in mesic sites in Logan Canyon.

Primula parryi Gray Parry Primrose. Plants 7–55 cm tall, ill-scented, from thick rhizomatous caudex branches, these clothed with brown marcescent leaf bases; leaves 8–50 cm long, 1–9 cm wide, spatulate to oblanceolate or elliptic, entire to sinuate, glandular and green on both sides; bracts numerous, not saccate at the base, 2–10 mm long, oblong to lance-attenuate; peduncle apex merely

glandular; umbels 3– to 20–flowered, the pedicels 0.3–12 cm long; calyx 7–16 mm long, the lobes shorter than or subequal to the tube; corolla reddish purple (or white) with a yellow center, the limb 12–28 mm wide, the lobes shorter than the tube, 6–12 mm wide or more; capsules ovoid, subequal to the calyx; $2n = 44$. Meadows, talus slopes, and stream banks in spruce-fir and alpine tundra communities at 2470 to 3965 m in Beaver, Box Elder, Cache, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, and Wayne counties; Idaho and Montana to Arizona and New Mexico; 64 (vii).

Primula specuicola Rydb. Cave Primrose; Easter-flower. Plants 6–28 cm tall, from short, rhizomatous caudex branches, these more or less clothed with marcescent leaf bases; leaves 2–20 cm long, 3–33 mm wide, spatulate to oblanceolate or elliptic, crenate-serrate to serrate-dentate, strongly to slightly white-mealy beneath, green above; bracts 4–8 mm long, lance-attenuate, numerous, swollen at the base, more or less mealy; umbels 5– to 40–flowered, sometimes a second one superposed, the pedicels 8–34 mm long; calyx 5–8.5 mm long, often mealy, the lobes 2–4 mm long (longer to shorter than the tube), diverging; corolla lavender to rose, pink, or white, the tube ca twice as long as the calyx, the limb 10–16 mm wide, the lobes shorter than the tube, rarely double; capsules shorter than the calyx; seeds roughened. Hanging gardens and their margins at 1125 to 1680 m in Garfield, Grand, Kane, San Juan (type from near Bluff), and Wayne counties; Arizona; 38 (xv). This beautiful primrose is an endemic of the canyons of the Colorado. The plants produce flower buds as early as January and complete flowering in early May. Its beauty hardly diminishes following flowering due to the bead-like, glistening, mealy surface and bicolored leaves. It often clings to vertical, wet cliff faces, where its roots are anchored in an algal mat, within the surface of platy exfoliating sandstone, or in sandy detritus. The coincidence of flowering time with Easter, in most years, accounts for the common name applied in southeastern Utah.

Samolus L.

Glabrous, perennial herbs; leaves simple, alternate, entire; flowers small, white, in terminal racemes or panicles; calyx tube adnate to the ovary below, 5-lobed; corolla campanulate, perigynous, 5-lobed; stamens 5, inserted on the corolla tube opposite the lobes, alternating with 5 staminodia; ovary more than half inferior; capsule subglobose, 5-valved; seeds numerous.

Samolus parviflorus Raf. Water-pimpernell; Brookweed. Plants 1.5–4.5 dm tall or more; stems simple or branched; leaves mainly 1–15 cm long, 0.5–4 cm wide, obovate to spatulate, oblanceolate, ovate, or oval, sessile or petiolate, rounded to obtuse; racemes (or panicles) sessile or nearly so, the slender axis flexuous; pedicels filiform, mainly 5–20 mm long, bracteate (above to below the middle); calyx lobes triangular to ovate; corolla white, 2–3 mm wide, the lobes oblong, longer than the tube; capsules 2–3 mm wide. Canal banks, seeps and springs, and in riparian communities at 850 to 1345 m in Salt Lake and Washington counties; widespread in the U. S. and southern Canada; Mexico; 8 (ii).

PUNICACEAE Horan.

Pomegranate Family

Small trees or shrubs; branches thorn-tipped; leaves opposite, estipulate; flowers epigynous, perfect; calyx lobes 5-7, persistent; petals 5-7, alternate with the sepals; stamens numerous, the filaments slender; pistil 1, the ovary inferior, 3- to 7 (or more) -loculed, the ovules numerous on all the placentae; style and stigma 1; fruit a thick-skinned, depressed globose berry, the seeds surrounded by juicy pulp; x = 8, 9.

Punica L.

Plants glabrous; leaves leathery; flowers 1-5 on tips of axillary branches; receptacle or hypanthium campanulate or tubular, leathery, topped by the persistent sepals; corolla lobes alternate with the sepals and inserted on the hypanthium, wrinkled; stamens obscuring the inside of the receptacle.

Punica granatum L. Pomegranate. Plants deciduous; stems to 7 m tall; leaves short-petioled, oblong or oval-lanceolate, 2.5-6 cm long, obtuse, glabrous, shiny; flowers orange red, 2.5-4 cm broad; fruit to 10 cm in diameter, brownish to orange red; seeds numerous, the fleshy coat red or pink; 2n = 16, 18. Cultivated for its sweet fleshy seeds, long persisting, and rarely escaping at 720 to 1270 m in Washington County (and previously at Hite, San Juan County, prior to Glen Canyon Dam); introduced from Asia, now widely grown in warm areas of the world; 5 (ii). There are many named varieties, with single or double flowers. Many produce no fruit and are grown for aesthetic value only.

PYROLACEAE Dumort.

Wintergreen Family

Suffrutescent or herbaceous perennials; leaves simple, alternate, opposite, or appearing whorled, evergreen or much reduced and lacking chlorophyll; flowers usually perfect, regular or irregular; calyx with 4 or more or less distinct sepals; corolla with 4 or 5 more or less distinct petals (united in Pterospora); stamens twice as many as the petals, the anthers pendulous, opening by apparently terminal pores or by slits, or the anthers erect, awnless or 2-awned; pistil 1, the ovary superior, 4- or 5-loculed; style 1; fruit a capsule; x = 8, 11, 13, 16, 19, 23.

Welsh, S. L. 1980. Pyrolaceae. pp. 53-55. In: Utah flora: Miscellaneous families. Great Basin Nat. 40: 38-58.

- 1. Plants lacking chlorophyll; leaves reduced and scale-like, reddish, brownish, purple, or yellowish when fresh, often drying dark Pterospora
— Plants with chlorophyll (rarely without); leaves not reduced to scales, except rarely, commonly evergreen ... 2
2(1). Flowers solitary, the petals rotate or nearly so ... Moneses
— Flowers few to several, the petals concave 3
3(2). Stems leafy, though short, the leaves apparently whorled; flowers corymbose; staminal filaments dilated near the base; styles very short or lacking. Chimaphila
— Stems leafy at base only; flowers in elongate racemes; filaments not especially dilated at the base; styles in most species over 2 mm long Pyrola

Chimaphila Pursh

Low shrubs from creeping rhizomes, the stems erect or ascending; leaves evergreen, leathery, apparently whorled or some alternate; flowers regular, (1) 2 to several, borne in pedunculate, umbellate corymbs; sepals usually 5, distinct nearly to the base, persistent; petals usually 5, distinct, rotate-campanulate; stamens usually 10, the filaments dilated and ciliate near the base; anthers awnless, opening by falsely terminal pores on short tubes; ovary superior, 5-lobed and 5-loculed; fruit a loculicidally dehiscent capsule.

- 1. Leaves lance-ovate to ovate; flowers 1-3, white; plants rare in Washington County C. menziesii
— Leaves oblanceolate; flowers 3-7, pink; plants uncommon, widely distributed C. umbellata

Chimaphila menziesii (R. Br.) Sprengel [Pyrola menziesii R. Br. ex D. Don]. Plants erect, mainly 1-1.5 dm tall, simple or sparingly branched; leaves alternate or indistinctly whorled, lance-ovate to ovate, 15-30 (35) mm long, serrulate, dark green above, pale beneath, sometimes mottled; peduncles mostly 3.5-5 cm long; bracts obovate, persistent; sepals 4-5 mm long, rounded, erose; petals white, 5-6 mm long; capsules 5-6 mm thick; 2n = 18, 26. Juniper and mountain brush community at ca 1585 m in Washington (Zion National Park) County; British Columbia and Idaho south to California; 1 (0).

Chimaphila umbellata (L.) Barton Pipsisewa; Prince's Pine. [Pyrola umbellata L.; C. occidentalis Rydb.; C. umbellata ssp. occidentalis (Rydb.) Hulten]. Plants (1) 1.5-2.5 (3) dm tall, the stems glabrous, only somewhat woody; leaves 1.5-4.5 (6) long, 0.5-1.5 (2) cm wide, elliptic to oblanceolate, cuneate basally, sharply serrate, shining above, pale beneath, glabrous; peduncles 4-7 (10) cm long, glabrous or minutely glandular-puberulent, often suffused with red purple; pedicels glandular-puberulent or merely puberulent; flowers 1-6 or more, umbellate-corymbose; sepals erose-ciliate; petals 5-7 mm long, pink; stamens with expanded bases ciliate; capsules 5-7 mm broad. Ponderosa pine, white fir-Douglas fir, aspen, lodgepole pine, and spruce-fir communities at 2195 to 2900 m in Daggett, Duchesne, Garfield, Juab, Millard, Piute, Salt Lake, Summit, Uintah, Utah, and Washington counties; Alaska south to California and Mexico, east to New Mexico and Colorado, and in the eastern U. S.; Eurasia; 14 (0). Our materials are referable to var. occidentalis (Rydb.) Blake.

Moneses Salisb.

Rhizomatous herbs; leaves with chlorophyll, leathery, persistent, mainly basal, but sometimes opposite or in whorls; flowers solitary, nodding, borne on a long peduncle; sepals usually 5, persistent; petals usually 5, distinct, spreading; stamens usually 10, the filaments tapering to the apex, the anthers awnless, nodding, opening by means of apparently terminal pores; ovary superior, 5-loculed, the stigma borne on an elongate, glabrous style; fruit a loculicidal capsule.

Moneses uniflora L. Single Delight; Wax Flower. [M. reticulata Nutt.; M. uniflora var. reticulata (Nutt.) Blake]. Plants 0.4-1.7 dm tall; leaves (including petioles) 0.8-4 cm long, 0.6-2 cm broad, serrate to crenate-serrate; peduncles 3-15 cm long usually with 1 or 2 bracts along its length; flowers 1.3-2.5 cm broad, white to

cream; sepals 1.5–2.5 cm long, ciliate; petals 7–11 mm long, spreading; style 2–4 mm long; capsule 5–8 mm broad; 2n = 24, 26. Moist sites in spruce-fir communities at 2450 to 3355 m in Beaver, Carbon, Duchesne, Emery, Garfield, Grand, Iron, Juab, Salt Lake, San Juan, Uintah, Utah, and Wasatch counties; widely distributed in North America; Eurasia; 19 (ii).

Pterospora Nutt.

Plants herbaceous saprophytes, devoid of chlorophyll, tall, reddish or purplish brown, the stems arising from the bulbous clusters of coralloid roots; leaves alternate, simple, scalelike, colored like the stems; flowers numerous, borne in an elongate raceme, nodding; calyx 5-lobed; corolla urn-shaped, the tube much longer than the lobes; stamens 10, the filaments flattened, tapering to the apex, glabrous, the anthers with 2 recurved awns, dehiscent almost throughout; ovary superior, 5-loculed, the stigma borne on a short thick style; fruit a loculicidal capsule. Note: This genus is often included within the Monotropaceae.

Pterospora andromeda Nutt. Pinedrops. Plants erect, the stems simple, 2–8.5 (10) dm tall, reddish brown, succulent, arising from a cluster of roots to 5 cm in diameter, glandular-hairy, leafy only near the base; racemes 3–35 cm long or more; flowers 5–8 mm long, nodding, axillary; pedicels 5–15 mm long, recurved; sepals oblong, glandular; corolla pale yellow, depressed urn-shaped; capsule 8–12 (14) mm broad, 5-lobed, depressed globose. Pinyon-juniper, ponderosa pine, mountain brush, aspen, and lodgepole pine communities at 1980 to 3355 m in Beaver, Daggett, Duchesne, Garfield, Grand, San Juan, Summit, Uintah, and Washington counties; widely distributed in North America; 21 (iii).

Pyrola L.

Rhizomatous herbs; leaves with chlorophyll, leathery, persistent, all basal or apparently so, or rarely lacking and the plants then partially or completely saprophytic; flowers regular to irregular, borne in terminal racemes; sepals 5, united at the base; petals 5, distinct, usually concave, deciduous; stamens 10, the filaments tapering to the apex, the anthers unawned, pendulous, opening by means of apparently terminal pores; ovary superior, 4-loculed, the stigma borne on a straight or curved style; fruit a loculicidal capsule.

Copeland, H. F. 1947. Observations on structure and classification of the Pyroleae. *Madrono* 9: 65–102.

- 1. Style straight or nearly so; pores of the anthers sessile; stigma usually much broader than the style 2
- Style bent or curved; pores of anthers usually borne on short tubes; stigmas only slightly broader than the styles 3
- 2(1). Style 2 mm long or less, not (or seldom) exerted from the flower; flowers not secund; petals pinkish to cream *P. minor*
- Style over 2 mm long, exerted from the flower; flowers secund; petals greenish white *P. secunda*
- 3(1). Flowers pink to purplish; sepals longer than broad *P. asarifolia*
- Flowers pale, greenish yellow; sepals broader than long 4

4(3). Leaves marked with white or silvery gray along the veins; plants known from Washington County *P. picta*

— Leaves uniformly green throughout; plants of broad distribution, including Washington County *P. cirens*

Pyrola asarifolia Michx. Liver-leaf Wintergreen. [*P. rotundifolia* var. *bracteata* (Hook.) Gray; *P. asarifolia* var. *bracteata* (Hook.) Jepson; *P. rotundifolia* var. *purpurea* Bunge; *P. asarifolia* var. *purpurea* (Bunge) Fern.; *P. incarnata* Fisch. in DC.; *P. asarifolia* var. *ovata* Farw.; *P. uliginosa* T. & G. ex Torr.; *P. rotundifolia* var. *uliginosa* (T. & G.) Gray; *P. asarifolia* var. *uliginosa* (T. & G.) Farw.; *P. elata* Nutt.; *P. bracteata* var. *hilli* J. K. Henry]. Plants 1.3–4 dm tall; leaves basal or essentially so, the blades 1.3–7.5 cm long, 1.1–7.3 cm wide, oval, rotund, elliptic, or acute basally, rounded to obtuse or emarginate apically, entire to serrulate; petioles 1–9 cm long; racemes mostly 2–12-flowered; pedicels 3–8 mm long; sepals longer than broad, 1.5–4 mm long; petals pink to purplish, 5–7 mm long; anthers pink, the pores on short tubes; style curved, with a flaring collar below the stigma. Mountain brush, aspen, lodgepole pine, spruce-fir, and bristlecone pine communities at 1675 to 3205 m in Cache, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Millard, Piute, Rich, Salt Lake, Sanpete, Summit, Uintah, Utah, Washington, and Weber counties; Alaska east to Newfoundland, south to California, New Mexico, South Dakota, and New England; Asia; 50 (iv). Varietal status of Utah material is not clear.

Pyrola minor L. Lesser Wintergreen. [*Amelia minor* (L.) Alef.; *Erxlebenia minor* (L.) Rydb.; *P. minor* var. *conferta* C. & S.; *P. conferta* (C. & S.) Fisch. ex Ledeb.]. Plants 0.8–2.4 dm tall; leaves basal, the blades (0.4) 1.1–3.3 cm long, (0.6) 0.9–2.5 cm broad, oval, elliptic, or ovate, obtuse to rounded apically, crenate to subentire; petioles 0.2–3 cm long; racemes mostly 5– to 13-flowered; pedicels 2–3 mm long sepals 1–1.5 mm long, erose to subentire; petals pale pink to cream, 3.5–4.5 mm long; anthers with pores sessile; style straight, very short, not exerted from the corolla, with a more or less distinctive collar below the stigma; 2n = 46. Aspen, white fir, lodgepole pine, and spruce-fir communities at 2255 to 3420 m in Beaver, Box Elder, Daggett, Duchesne, Garfield, Juab, Piute, Salt Lake, San Juan, Sevier, Uintah, and Washington counties; Alaska and Yukon, east to Greenland and south to California and Colorado; circumboreal; 19 (ii).

Pyrola picta J. E. Sm. Pictureleaf Wintergreen. Plants mainly 1–2 dm tall; leaves basal, the blades 2–7 cm long, 1–3.5 cm wide, lance-ovate to elliptic, white along the veins, obtuse to rounded apically; petioles 0.3–3.5 cm long; racemes mostly 2– to 7-flowered; pedicels 3–8 mm long; sepals 1.8–2 mm long; petals greenish to cream, 7–8 mm long; anthers yellowish, the pores on elongate tubes; style curved, with a flaring collar below the stigma. Ponderosa pine, fir, and aspen communities at ca 2530 to 2900 m in Washington (Pine Valley Mts.) County; British Columbia to Montana, south to California and Wyoming; 2 (0).

Pyrola secunda L. Secund Wintergreen. [*Ramischia secunda* (L.) Garecke; *Actinocyclus secundus* (L.) Klotzsch; *P. secunda* var. *obtusata* Turcz.; *Orthilia secunda* var. *obtusata* (Turcz.) House; *P. secunda* var. *pumila* Paine; *P. secunda* f. *eucycla* Fern.]. Plants 0.6–1.8 (2.1) dm tall; leaves basal or rarely some cauline,

or sometimes with a naked stem below the leaves, the blades 1.3–4 (5) cm long, 1–3 cm wide, ovate, oval, elliptic, or orbicular, obtuse or rounded basally, acute to obtuse or rounded apically, crenate-serrate; petioles 0.6–2 cm long; racemes mostly 4– to 15–flowered, the flowers secund; pedicels 2–5 mm long sepals 0.5–1.5 mm long; petals greenish white, 4–6 mm long; anthers with pores sessile; style straight, exerted from the corolla, lacking a collar; 2n = 46. Mountain brush, ponderosa pine, Douglas fir, aspen, lodgepole pine, and spruce-fir communities at ca 2010 to 3420 m in Box Elder, Cache, Carbon, Daggett, Duchesne, Garfield, Juab, Kane, Millard, Piute, Rich, Salt Lake, San Juan, Sanpete, Summit, Uintah, Utah, Wasatch, and Washington counties, broadly distributed in North America; Eurasia; 57 (ix). Segregation of our materials into the various proposed infraspecific categories seems unwarranted.

Pyrola virens Schweigger in Schweigg. & Koerte Greenish Wintergreen. [*P. chlorantha* Swartz; *P. chlorantha* var. *saximontana* Fern.; *P. virens* f. *paucifolia* (Fern.) Fern.; *P. chlorantha* f. *paucifolia* (Fern.) Camp]. Plants 0.9–2.5 dm tall; leaves basal, the blades 0.6–3.5 cm long, 0.5–3 cm broad, elliptic, oval, or obovate, obtuse to rounded basally, rounded to obtuse apically, crenate-serrate to subentire; petioles 0.8–6 cm long; racemes mostly 2– to 9–flowered; pedicels 3–8 mm long; sepals 0.5–1.5 mm long; petals greenish yellow, 5–7 mm long; anthers yellowish, the pores on elongate tubes; style curved, with a flaring collar below the stigma. Ponderosa pine, aspen, lodgepole pine, and spruce-fir communities at 2225 to 3050 m in Daggett, Duchesne, Juab, Piute, Salt Lake, San Juan, Summit, Uintah, and Washington counties; widely distributed in North America; Eurasia; 17 (ii).

- 6(5). Leaves simple, the blades reniform, cordate; perianth white, large, showy; plants of wet meadows at higher elevations *Caltha*
- Leaves deeply lobed or compound; perianth showy or not; plants of various habitats, and occasionally as above 7
- 7(6). Leaves alternate; flowers greenish, inconspicuous . . . 8
- Leaves opposite or whorled; flowers often showy 9
- 8(7). Leaves simple, palmately lobed or parted; flowers perfect; anthers oval or ovate, 1 mm long or less *Trautvetteria*
- Leaves compound; flowers perfect or imperfect; anthers mostly more than 1 cm long *Thalictrum*
- 9(7). Stems with sessile or short-petioled, whorled leaves; flowers erect *Anemone*
- Stems with petiolate, opposite leaves; flowers nodding or erect *Clematis*
- 10(5). Flowers inconspicuous, numerous, in dense, terminal racemes; pistils 1 per flower; fruit a red or white fleshy berry *Actaea*
- Flowers solitary or few in cymes; pistils several to numerous; fruit an achene or a follicle 11
- 11(10). Plants annual; leaves dissected, the ultimate segments 0.5–1.5 mm wide; petals white to red *Adonis*
- Plants perennial, or if annual, not otherwise as above 12
- 12(11). Petals linear, narrower than the white to cream petaloid sepals; fruit a several-seeded follicle; plants montane *Trollius*
- Petals mostly as broad as or broader than the usually green sepals, or lacking; fruit usually a 1-seeded achene *Ranunculus*

Aconitum L.

Perennial herbs from tuberous roots; stems simple, erect; leaves alternate, palmately divided; flowers perfect, irregular, large and showy, borne in terminal racemes or panicles; sepals 5, petaloid, the upper one large, helmetlike, the lateral ones oval, broader than the lower 2; petals 2, enclosed within the helmetlike hood, highly modified (with a slender filamentous claw, a pendulous blade, and a saclike or curved spur), sometimes 3 additional scalelike petals present; stamens numerous, the filaments flattened; pistils 3–5, distinct; fruit a follicle.

Aconitum columbianum Nutt. in T. & G. Monkshood. [*A. bakeri* Greene; *A. insigne* Greene; *A. divaricatum* Rydb., type from City Creek Canyon; *A. glaberrimum* Rydb., type from southern Utah?]. Plants mainly 5–15 dm tall, the stems glabrous below, pubescent above, with at least some spreading hairs and often glandular, usually contracted at or below ground level; leaves mostly cauline, 5–25 cm long, the blades 3– to 5-lobed, the sinuses lateral to the terminal lobe extending almost to the base, the terminal lobe 2.5–10 cm long or more; sepals mostly a deep bluish purple, rarely white, yellowish, or greenish; hood 14–25 mm high, only the upper 2 petals usually present, the spur commonly coiled; follicles commonly 3, glabrous or glandular, 10–20 mm long; 2n = 16, 18. Often along streams in mountain brush, sagebrush, aspen, hairgrass-sedge, lodgepole pine, and spruce-fir communities at 1950 to 3355 m in all Utah counties, except Wayne; British Columbia to Montana, south to California, Arizona, and New Mexico; 124 (xvi). Our specimens belong to var. *columbianum*.

RANUNCULACEAE A. L. Juss.

Buttercup Family

Annual or perennial herbs or trailing vines; leaves alternate, opposite, or basal, simple, deeply divided or variously compound; flowers hypogynous, perfect or rarely imperfect, regular or irregular, lacking a hypanthium; sepals 3 to many, often petaloid; petals 3 to many or lacking; stamens several to many; pistils 1 to many, superior; fruit an achene, follicle, or berry; x = 6–10, 13.

- 1. Flowers markedly irregular, mostly dark blue or purple 2
- Flowers regular, seldom dark blue or purple 3
- 2(1). Upper sepal spurred at the base; petals usually 4 *Delphinium*
- Upper sepal not spurred, hooded at apex; petals usually 2 *Aconitum*
- 3(1). Flowers with sepals or petals spurred anteriorly 4
- Flowers not spurred 5
- 4(3). Leaves simple, linear to narrowly spatulate; plants diminutive annuals *Myosurus*
- Leaves ternately once to thrice compound; plants perennial *Aquilegia*
- 5(3). Perianth consisting of a single whorl, arbitrarily called sepals, but often petaloid in texture and color . . 6
- Perianth of sepals and petals, but the sepals sometimes deciduous and leaving scars below the petals . . 10

Actaea L.

Perennial, rhizomatous herbs, the stems simple or more usually branched, erect; leaves all cauline, alternate, twice ternately or twice ternate-pinnately compound; flowers perfect, regular, small, borne in terminal racemes; sepals 3–5, caducous; petals 5–10 (rarely lacking); stamens numerous; pistil 1; fruit a red or white berry.

Actaea rubra (Ait.) Willd. Baneberry. [*A. spicata* var. *rubra* Ait.; *A. arguta* Nutt. ex T. & G.; *A. rubra* ssp. *arguta* (Nutt.) Hulten]. Plants 3–10 dm tall; stems glabrous or glabrate; leaves all cauline, the segments broad, ovate to lanceolate, oblong, or obovate, 2–10 cm long, sharply toothed and often lobed; sepals 2–3 mm long, whitish (rarely purplish); stamens much surpassing the petals; berries 5–10 mm long, white or red; $2n = 16$. Mountain brush, willow-birch, aspen, Douglas fir, limber pine, fir, and spruce-fir communities at 1980 to 3050 m in probably all Utah counties; Alaska and Yukon east to the Atlantic, south to California, Arizona, and New Mexico; 61 (vi). This plant is considered to be poisonous, especially the berries.

Adonis L.

Annual herbs; leaves alternate, bipinnatifid, the ultimate segments linear to subulate; flowers showy, regular, complete, solitary, borne on axillary or terminal pedicels; sepals 5, membranous or chartaceous; petals 5–20, white or red orange, sometimes suffused with dark blue or black basally, lacking a glandular basal scale; stamens numerous; pistils numerous; fruit a crested, sculptured achene.

Adonis aestivalis L. Pheasant-eye. Plants glabrous; stems simple or branched, 2–6 dm tall; leaves 2–6 cm long, dissected into narrow segments; sepals gibbous basally, greenish, straw colored, or reddish; petals 5–12.5 mm long, white or red orange, blue to black basally, narrowly oblong-oblancoate; stamens blue or brown; achenes hardened, crested, 5–6 mm long (including the beak); $2n = 16, 32$. Disturbed sites in fields and in sagebrush, aspen, and spruce-fir communities at 1370 to 2400 m in Cache, Garfield, Salt Lake, and Utah counties; widespread in the U. S.; introduced from Eurasia; 4 (0).

Anemone L.

Perennial herbs from rhizomes or caudices; stems with usually a single whorl of leaves below the inflorescence; basal leaves long-petioled, the blades simple and palmately lobed or ternately compound and often deeply dissected; flowers perfect, regular, showy, borne 1 per peduncle, the peduncles solitary or 2 to several in umbellate cymes; sepals 4–10, petaloid, variously colored; petals lacking; stamens numerous; fruit an achene.

1. Sepals 2–5 cm long, blue to purplish (rarely white); styles plumose, 2–4 cm long in fruit *A. patens*
 - Sepals 0.5–2 cm long, white, yellow, purplish, or bicolored; styles not plumose, mainly less than 5 mm long in fruit 2
- 2(1). Plants from tubers; stems constricted below ground level, growing in xeric habitats in southern and western Utah *A. tuberosa*
 - Plants from a caudex or slender rhizome, not or rarely constricted below ground level, growing in mesic habitats, usually at higher elevations, the distribution various 3

- 3(2). Cauline whorl of leaves with slender petioles 1–4 cm long, ca 1 mm wide, compound; achenes short-pubescent *A. quinquefolia*
 - Cauline whorl of leaves sessile or with broadly winged petioles, simple or compound, achenes pilose or woolly hairy 4
- 4(3). Leaflets of basal leaves merely crenate or cleft to near the middle and with rounded lobes; sepals white within, usually bluish dorsally; flowers solitary *A. parviflora*
 - Leaflets of basal leaves dissected into narrowly oblong, elliptic, or lanceolate, acute lobes; sepals purplish, maroon, yellow, or white; flowers 1 to several *A. multifida*

Anemone multifida Poir. Cutleaf Anemone. [*A. multifida* var. *globosa* T. & G.; *A. globosa* (T. & G.) Nutt.]. Plants from caudices, 0.4–5 dm tall, the herbage pubescent with long, spreading or ascending hairs; basal leaves 3–22 cm long, 3–foliolate, the leaflets dissected to below the middle into narrowly oblong, elliptic, or lanceolate, acute lobes, the terminal leaflet 1–6 cm long; cauline leaves 1.5–6.5 cm long, in 1 or 2 whorls, silky-hairy to glabrate; peduncles 1–3, 3–15 cm long or more; flowers often showy; sepals purple, maroon, reddish, yellow, or white (often bicolored) 6–12 mm long, silky-hairy without; cluster of achenes ovoid to globose or short-cylindric, mainly 1–2 cm long; achenes 3–4 mm long, silky-hairy, the styles 0.7–1.2 mm long; $2n = 16, 32$. Mountain brush, ponderosa pine, sagebrush, aspen, Douglas fir, lodgepole pine, spruce-fir, and alpine tundra communities at 2225 to 3390 m in Cache, Carbon, Dagget, Duchesne, Emery, Garfield, Iron, Juab, Kane, Piute, Rich, Salt Lake, San Juan, Sevier, Summit, Uintah, Utah, Wasatch, Washington, and Weber counties; Alaska and Yukon to Newfoundland, south to California, New Mexico, and New York; 84 (viii). Our materials apparently belong, at least in large part, to var. *tetonensis* (T. C. Porter) C. L. Hitchc. [*A. tetonensis* T. C. Porter; *A. stylosa* A. Nels., type from Fish Lake, Sevier County]. Possibly recognition of this taxon is inconsequential, since the specimens pass by degree into var. *multifida*. Reports of *A. cylindrica* Gray probably belong here.

Anemone parviflora Michx. Northern Anemone. Plants from elongate rhizomes, mainly 4–15 cm tall (or more), the herbage spreading-villous to glabrous; basal leaves 1.5–10 (17) cm long, 3–foliolate, the leaflets merely lobed or incised to near the middle, the segments or teeth rounded, the terminal leaflet 3–25 (28) mm long; cauline leaves 7–28 mm long, in 1 whorl, silky-hairy to glabrous; peduncles 1 per inflorescence, 2–10 (26) cm long; flowers solitary, large and showy; sepals white to cream, often tinged bluish dorsally; cluster of achenes ovoid, 0.8–1.3 cm long; achenes 2–3 mm long, woolly hairy, the styles 1.2–2 mm long; $2n = 16, 32$. Spruce-fir community at 3050 m in Duchesne and Salt Lake counties; Alaska and Yukon, east to the Atlantic, south to Oregon and Colorado; 2 (0).

Anemone patens L. Pasque-flower; Wild Crocus. [*Pulsatilla patens* ssp. *multifida* (Pritz.) Zam.]. Plants from caudices, 1–5.5 dm tall, the herbage more or less grayish villous; basal leaves 8–30 cm long, 3–foliolate, the leaflets dissected into narrowly oblong or lanceolate segments, the terminal leaflet 2.5–6 cm long; cauline leaves 3–6 cm long, in 1 whorl, silky hairy; peduncles 1 per inflorescence; flowers solitary, large and showy; sepals 2–4.5 cm long, blue to purplish (or white), silky hairy dorsally; achenes 4–6 mm long, silky-hairy, the elongate plumed

style 2–3.5 cm long; 2n = 16. Aspen, sagebrush, lodgepole pine, and alpine tundra communities at 2560 to 3510 m in Daggett, Duchesne, and Summit counties; Alaska, Yukon, and Mackenzie, south to Washington, Colorado, Texas, and Illinois; 4 (0). Our plants apparently belong to var. *multifida* Pritz.

Anemone quinquefolia L. American Wood-anemone. [*A. oregona* Gray; *A. quinquefolia* var. *oregana* (Gray) Robins.]. Plants from slender scaly rhizomes, mainly 1–2 (3) dm tall, the herbage short-hairy to glabrous; basal leaves 6–20 cm long, 3– to 5–foliolate, the leaflets finely to coarsely serrate or dentate and shallowly cleft, the terminal leaflet 2–4.5 cm long; cauline leaves 3–12 cm long, in 1 whorl, sparingly pilose to subglabrous, ciliate; peduncles 1 per inflorescence; flowers large, showy; sepals 8–22 mm long, white, sometimes tinged bluish or purplish without, glabrous; achenes 3–4 mm long, short-hairy, the cluster subglobose; style ca 1 mm long. Spruce-fir community at 3050 m in Salt Lake County (Cottam et al. s.n. BRY); widespread in the U. S.; 1 (0). Our material belongs to var. *lyallii* (Britt.) Robins. [*A. lyallii* Britt.].

Anemone tuberosa Rydb. Desert Anemone. Plants from fusiform, tubers (tuberous rhizomes), mainly 8–50 cm tall, the herbage sparingly silky-hairy to glabrous; basal leaves 6–16 cm long, 3–foliolate, the leaflets deeply cleft or parted, the ultimate segments obovate to cuneate, the terminal leaflet (including petiolule) 1.3–5.5 cm long; cauline leaves 15–70 mm long, in 1 whorl (rarely 2), sparingly pilose to glabrous; peduncles 1–5 per inflorescence; flowers showy; sepals 9–18 mm long, rose-pink; achenes 3.5–4.5 mm long, woolly-hairy; styles 0.8–1.8 mm long. Blackbrush, creosote bush, hopsage (other warm desert shrub), mixed desert shrub and juniper-cliff-rose communities at 800 to 1650 m in Beaver, Juab, Kane, San Juan, Tooele, and Washington counties; Nevada, California, Arizona, and New Mexico; 27 (iv). This is a remarkably pretty plant, with its apparent northern distribution on Stansbury Island in Great Salt Lake, where it occurs with *Astragalus nuttallianus*, far north of its more usual range.

Aquilegia L.

Perennial herbs from caudices and taproots; stems simple or branched above, erect; leaves alternate or mainly basal, the cauline ones much reduced, ternate to triternately compound; flowers regular, showy, solitary or 2 to several in bracteate, long-pedicellate, terminal racemes; sepals 5, petaloid, not spurred; petals 5, the lower part closed and forming a spur with a bulbous, glandular tip; stamens numerous, the inner ones often sterile (staminodia); pistils mostly 5, distinct; fruit a follicle.

Munz, P. A. 1946. *Aquilegia*. The cultivated and wild columbines. *Gentes Herb.* 7: 1–150.
Payson, E. B. 1918. The North American species of *Aquilegia*. *Contr. U. S. Nat. Herb.* 20: 133–157.

- 1. Herbage conspicuously glandular-pubescent; stems mainly 3–7 dm tall, flowers white or suffused with blue or pink; plants of alcoves in southeastern Utah *A. micrantha*
- Herbage glabrous, glaucous, or glandular-pubescent (especially in the inflorescence and throughout in some *A. flavescens* and *A. formosa*); stems of various height; flowers variously colored, plants of various distribution, but not, if ever, of hanging gardens (except in Zion Canyon)

- 2(1). Sepals and spurs scarlet, sometimes fading yellowish; flowers nodding 3
- Sepals and spurs white, blue, yellow, or pinkish, but never truly scarlet; flowers erect to spreading 4
- 3(2). Flowers much longer than wide, appearing subconic; sepals erect-ascending; spurs 3–5 times longer than petal blades *A. elegantula*
- Flowers as wide as long or wider; sepals horizontally spreading; spurs mainly 5–8 times longer than petal blades *A. formosa*
- 4(2). Sepals and spurs uniformly yellow (or merely suffused with pink); plants of Zion Canyon or of central to northern Utah 5
- Sepals and spurs bicolored, blue and white, red and yellow, or other, or monochrome, but not yellow; plants variously distributed 6
- 5(4). Spurs subequal in length to the sepals; flowers mainly 2.5–4 cm long; plants of central and northern Utah .. *A. flavescens*
- Spurs much longer than the sepals; flowers mainly 5–7 cm long; plants of Zion Canyon *A. chrysantha*
- 6(4). Sepals and spurs pinkish; stamens exceeding the petal blades by 6–13 mm; herbage glaucous; plants of shale outcrops in Uinta Basin *A. barnebyi*
- Sepals and spurs white or blue; stamens shorter than petal blades or exceeding them by 2–6 mm; plants glaucous or not but, if so, not of the Uinta Basin 7
- 7(6). Ultimate leaf segments overlapping, often thickened and glaucous; plants mainly 0.6–4.5 dm tall; sepals and spurs commonly blue *A. scopulorum*
- Ultimate leaf segments not overlapping, not thickened, seldom glaucous except below; plants mainly 2–10 dm tall; sepals and spurs white or sometimes blue

Aquilegia barnebyi Munz Shale Columbine. Plants mainly 3–8 dm tall; stems glabrous below, glandular pubescent above; leaves mainly basal, 0.5–2.7 dm long, triternate, glaucous, glabrous, not especially bicolored; flowers 1 to several, erect or spreading; sepals horizontally spreading, 12–20 mm long, pink, ovate-lanceolate to elliptic; petals with spurs colored like the sepals, the blades yellowish to cream, 6–10 mm long; spurs 13–27 mm long, the blades ca 1/4 as long, rounded; staminodia ca 8 mm long; stamens exceeding the blades by 6–13 mm; follicles 20–25 mm long, glandular-puberulent. Shale outcrops of the Douglas Creek and Parachute Creek (Mahogany beds) of the Green River and Uinta formations in mixed desert shrub, Salina wildrye, pinyon-juniper, and Douglas fir communities at ca 1675 to 2255 m in Duchesne and Uintah counties; Colorado (a Uinta Basin endemic); 22 (i). This singular columbine is distinguished from *A. flavescens* by the sepals being shorter than the spurs and by the shorter, glaucous tuft of basal leaves.

Aquilegia caerulea James Colorado Columbine. Plants mainly 1.5–10 dm tall; stems glabrous or sparsely puberulent below, glandular-pubescent or hirtellous above; leaves mainly basal, 0.5–4 dm long, biternate or rarely triternate, the blades glabrous or puberulent beneath, often paler beneath; flowers 1 to several, erect; sepals horizontally spreading, 2–4 cm long, pale blue to blue (purplish) or white, oblong-lanceolate to elliptic; petals colored like the sepals, but the blades often paler or white; spurs 3–7.3 cm long, the blades 12–23 mm long, truncate; stamens shorter than or slightly surpassing the

blades; follicles 5–10, erect, glandular-puberulent, 2–3 cm long; $2n = 14$. Sagebrush, pinyon-juniper, mountain brush, aspen, Douglas fir-white fir, aspen-tall forb, spruce-fir, and alpine tundra communities at 1675 to 3660 m in probably all Utah counties; Idaho and Montana, south to Arizona and New Mexico; 167 (xxvii). The common, strikingly beautiful pale-flowered phase of this species in Utah can be called var. *ochroleuca* Hook. [*A. leptocera* Nutt.; *A. caerulea* var. *albiflora* Gray]. The less common plants of higher elevations belong to var. *caerulea* [*A. pinetorum* Tidestr.; *A. caerulea* var. *pinetorum* (Tidestr.) Payson ex Kearney & Peebles; *A. caerulea* ssp. *pinetorum* (Tidestr.) Payson]. Alpine plants are commonly dwarfed. They approach and pass by degree into *A. scopulorum* within its range. This beautiful columbine is the state flower of Colorado.

Aquilegia chrysantha Gray Golden Columbine. Plants mainly 4–12 dm tall; stems glabrous or glandular-puberulent, forming huge clumps; basal leaves 10–60 cm long or more, mostly triternate, glabrous above and glabrous or finely puberulent and glaucous beneath; cauline leaves well developed; pedicels mostly 3–10 cm long; flowers 1 to several, erect, longer than broad; sepals horizontally spreading, 12–25 mm long, clear golden yellow, lanceolate to lanceolate; petals with spurs colored like the sepals, the blades golden yellow, 8–16 mm long; spurs 4–7 cm long; stamens exceeding blades by 8–10 mm; follicles 5–7, 2–3 cm long. Hanging gardens, stream and seep margins, and other moist sites at ca 1340 m in Zion Canyon, Washington County; Arizona, Colorado, New Mexico, and Mexico; 3 (iii). This pretty yellow columbine hybridizes with *A. formosa*, resulting in varicolored hybrid swarms in some of the hanging gardens.

Aquilegia elegantula Greene Elegant Columbine. Plants mainly 1–4 dm tall; stems glabrous or glandular to glandular-puberulent; leaves mainly basal, 4–15 (25) cm long, biternate, glabrous or glandular, glaucous at least beneath; flowers 1 to few, nodding, cone-shaped, much longer than wide; sepals ascending, 7–11 (15) mm long, usually scarlet, ovate to lanceolate; petals with spurs colored like the sepals, the blades yellow, 6–11 mm long; spurs 15–35 mm long; stamens exceeding the blades by 6–10 mm; follicles 5, 15–20 mm long. Moist woods or in riparian sites in aspen, Douglas fir, and spruce-fir communities at 1735 to 2745 m in Carbon, Emery, Garfield, Grand, Kane, San Juan, and Washington counties; Colorado; 7 (iii).

Aquilegia flavescens Wats. Yellow Columbine. [*A. chrysantha* authors, not Gray; *A. depauperata* Jones, type from Provo Canyon; *A. flavescens* f. *minor* Tidestr., type from Wasatch Plateau]. Plants mainly 1.5–8 dm tall; stems glabrous or glandular-puberulent; leaves mainly basal, 4–40 cm long, biternate (or almost or quite triternate in some), glabrous or finely puberulent or glandular, glaucous beneath; flowers 1 to several, erect, as broad as long or broader; sepals horizontally spreading, 10–25 mm long, yellow or pinkish, ovate to lanceolate or oblong-elliptic; petals with spurs colored like the sepals, the blades yellow (or pink), 5–13 mm long; spurs 10–22 mm long; stamens exceeding blades by 5–11 mm; follicles 5–7, 20–27 mm long. Two more or less distinctive varieties are present.

- I. Leaves, stem, and inflorescence glandular hairy; flowers pink with cream or white petal blades; plants of the east margin of the Wasatch Plateau
 *A. flavescens* var. *rubicunda*

- Leaves and stem glabrous and glaucous, or the stem puberulent to glandular above; flowers clear yellow or as above; plants variously distributed
 *A. flavescens* var. *flavescens*

Var. *flavescens* Moist woods or riparian sites in mountain brush, aspen, spruce-fir, and mixed montane communities at 1370 to 3265 m in Box Elder, Cache, Davis, Duchesne, Emery, Juab, Millard, San Juan, Salt Lake, Sevier, Summit, Tooele, Utah, and Weber counties; British Columbia and Alberta, south to Oregon and Colorado; 40 (vi). The type is from the Wasatch Mts. The yellowish, less commonly pink, proportionately short flowers, and moderately exerted stamens, are diagnostic. Specimens intermediate with *A. caerulea* are known.

Var. *rubicunda* (Tidestr.) Welsh [*A. rubicunda* Tidestr., type from "Link Trail," west of Emery in Sevier County]. Ponderosa pine, aspen, and spruce-fir communities at 2255 to 2505 m in Emery and Sevier counties; endemic; 4 (i). This phase of *A. flavescens* has long passed as a synonym under *A. micrantha*, primarily because of the smallish flowers and glandular vesture. It is allopatric with that taxon, but is contiguous to (if not sympatric with) *A. flavescens*.

Aquilegia formosa Fisch. in D.C. Western Columbine. Plants 1.5–10.5 dm tall; stems glabrous or glandular-hirtellous above; leaves mainly basal, 4–38 cm long, biternate, glabrous or villous or glandular, green above, paler beneath; flowers usually 2–4, nodding, as broad as long or broader; sepals horizontally spreading, 14–27 mm long, red, reddish, or rarely yellowish; petals with spurs colored like the sepals, the blades yellow, 2–7 (9) mm long; spurs 15–20 (30) mm long; stamens exceeding the blades by 12–17 mm; follicles usually 5, pubescent, 15–25 mm long; $2n = 14$. Commonly in riparian or palustrine habitats in sagebrush, mountain brush, pinyon-juniper, ponderosa pine, aspen, and white fir communities at 1370 to 2685 m in Beaver, Box Elder, Iron, Juab, Kane, Millard, Sanpete, Tooele, Uintah (?), and Washington counties; Alaska and Yukon, south to Baja California, Nevada, and Montana; 41 (xi). The truly scarlet perianth parts (except for the petal blades), short, broad, nodding flowers, short petal blades, and long-exserted stamens are diagnostic for this species. An unusual plant, represented by three collections, is present in eastern Washington County; spurs and blades are longer than usual (the measurements in parentheses in the description), leaf segments are more dissected, and the herbage is glandular-pubescent overall. This later material is designated as var. *fosteri* Welsh (type from Zion Canyon).

Aquilegia micrantha Eastw. Alcove Columbine. [*A. ecalcarata* Eastw., not Maxim. (or Hort.) ex Steudel; *A. pallens* Payson, type from La Sal Creek]. Plants 2–7.5 dm tall (or more); stems glandular pubescent throughout, or rarely glabrous below, or sometimes long-pilose; leaves mainly basal, 10–30 cm long, bi- or triternate, commonly glandular-pubescent on one or both surfaces and sometimes sparingly to densely long-pilose beneath; flowers 1 to several, erect or somewhat nodding, about as broad as long; sepals horizontally spreading, 7–20 mm long, white to cream or pale blue (rarely pink?); petals with spurs colored like the sepals, the blades white or cream, 5–13 mm long; spurs 15–35 mm long; stamens subequal to the blades or exceeding them by 4 or 5 mm; follicles usually 5, glandular-hairy, ca 15–20 mm long. Moist alcoves in hanging garden communities and less commonly in seeps

and springs not in alcoves at 1125 to 1895 m in Emery, Garfield, Grand, Kane, San Juan (type from Bluff), and Wayne counties; Colorado and Arizona; 45 (xii). The usually glandular herbage, short sepal to spur length ratio, and small flowers appear to be diagnostic. The stamens are less exerted than in *A. flavescens*.

Aquilegia scopulorum Tidestr. Roek Columbine. [*A. caerulea* var. *calcarea* Jones, type from above Cannonville]. Plants 0.6–4.5 dm tall; stems villous to hispidulous throughout or glabrous below; leaves mainly basal, 2–11 (22) cm long, ternate to biternate, the segments distinctly overlapping and crowded, commonly glabrous, glaucous, and thickened, but sometimes green and thin; flowers 1 to several, erect, somewhat longer than broad; sepals horizontally spreading, 13–27 mm long, blue; petals with spurs colored like the sepals, the blades blue to pale blue or white, 8–15 mm long; spurs 21–42 mm long; stamens subequal to the blades or surpassing them by 1–4 mm; follicles usually 5, glandular-hairy, 12–22 mm long. Pinyon-juniper, ponderosa pine, bristlecone pine, spruce-fir, and alpine tundra communities at 2135 to 3420 m in limestone or on igneous scree slopes, in Garfield, Juab, Kane, Piute, Sanpete (type from Wasatch Peak), and Sevier counties; Nevada; 20 (v). The overlapping leaf segments and usually blue flowers appear to be diagnostic for most specimens, but plants from the Tushar Mts., growing on igneous scree slopes have green leaves and are completely transitional with *A. caerulea*. Possibly the best status for this attractive taxon would be to regard it as *A. caerulea* var. *calcarea*.

Caltha L.

Perennial subrhizomatous herbs with fibrous roots; stems short, erect; leaves basal or alternate, petiolate, the blades simple, cordate to oval-cordate or ovate; flowers perfect, regular, showy, solitary or 2 or 3; sepals 5–12, petaloid; petals lacking; stamens numerous, rarely petaloid and resulting in "double flowers;" pistils 5 to many; fruit of subsessile follicles.

Caltha leptosepala DC. Marsh-marigold. Plants erect, 0.5–5 dm tall; basal leaves 4–30 cm long, the petioles 2–22 cm long, the blades 1.5–8 cm long (from sinus to apex), 1.3–4.5 cm wide, oval- to oblong-cordate, crenate to subentire; stems usually with a single leaf; peduncles 1 or 2, 4–33 cm long, 1-flowered; sepals white, tinged bluish or purplish externally, 2–27 mm long; follicles subsessile, 12–15 mm long; 2n = 48, 96. Wet meadows, streambanks, and around seeps and springs in aspen, lodgepole pine, spruce-fir and alpine tundra communities at 2315 to 3600 m in Beaver, Box Elder, Cache, Daggett, Duchesne, Emery, Garfield, Iron, San Juan, Salt Lake, Sanpete, Sevier, Summit, Uintah, Utah, Wasatch, and Wayne counties; Alaska and Yukon, south to Oregon, Nevada, and Colorado; 67 (xiv). Our material belongs to var. *leptosepala*. The broad-leaved *C. biflora* DC. is reported for Utah (Pacific N. W. Flora 2: 336, 1964), and is approached by some specimens, especially those taken by Lewis (7402; 7603 BRY) from Sanpete County. Specimens transitional to those occur among our herbarium materials and no segregation appears possible. Beyond Utah the species are distinct.

Clematis L.

Perennial herbs or woody vines; stems erect or clam-bering; leaves opposite, pinnately to ternately com-

pound, some petioles often twining or clasping; flowers small to large, solitary, or few to many in compound cymes, perfect or imperfect (the plants then dioecious or polygamous); sepals 4 or 5, valvate in bud; petals lacking; stamens many, the outer sometimes broadened and petaloid; pistils many, 1-ovuled, forming 1-seeded, long-tailed achenes.

Pringle, J.S. 1971. Taxonomy and distribution of *Clematis*; Sect. *Atragene* (Ranunculaceae), in North America. *Brittonia* 23: 361–393.

- 1. Flowers few to many in cymose clusters; sepals white, 5–8 mm long; plants widespread at lower elevations *C. ligusticifolia*
- Flowers solitary; sepals yellow to blue or purple; plants of various distribution 2
- 2(1). Stems erect, not at all vinelike; leaves pinnately compound; sepals commonly densely hairy dorsally, thickened *C. hirsutissima*
- Stems commonly viney; leaves ternate to biternate; sepals glabrous or sparingly hairy dorsally, thin 3
- 3(2). Sepals yellow; plants of lower elevations, commonly along roadsides, introduced *C. orientalis*
- Sepals blue to purple or rarely white; plants of middle to higher elevations, indigenous 4
- 4(3). Leaves bi- or tritermately compound, the ultimate segments usually sharply toothed; plants widespread *C. columbiana*
- Leaves merely ternate, the leaflets bluntly toothed; plants of northern Utah *C. occidentalis*

Clematis columbiana (Nutt.) T. & G. [*Atragene columbiana* Nutt.; *C. pseudoatragene* (ssp.) *pseudoalpina* Kuntze; *C. pseudoalpina* (Kuntze) A. Nels. in Coult. & Nels.; *C. pseudoatragene* (ssp.) *wenderothoides* Kuntze, type from Kane County; *C. alpina* (ssp.) *occidentalis* 2. *repens* Kuntze, type from American Fork Canyon; *C. alpina* var. *occidentalis* subvar. *tenuiloba* Gray in Newton & Jenney; *C. tenuiloba* (Gray) C. L. Hitchc.; *C. columbiana* var. *tenuiloba* (Gray) Pringle]. Plants perennial; stems woody, trailing or sometimes short; herbage glabrous to long-hairy; leaves petiolate, bi- or tritermately, the ultimate segments usually lobed or toothed; peduncles 3–19 cm long, recurved near the apex; flowers solitary, bell shaped, nodding; sepals 4, violet blue to lilac, fading red purple, lanceolate to ovate, 12–60 mm long, commonly hairy dorsally; staminal filaments petaloid; achenes ca 5 mm long; plumose styles 20–55 mm long; 2n = 16. Sagebrush, mountain brush, ponderosa pine, Douglas fir-white fir, aspen, and spruce-fir communities at 1830 to 3295 m in Cache, Carbon, Duchesne, Emery, Garfield, Grand, Iron, Kane, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Utah, Wasatch, Washington, Wayne, and Weber counties; Montana to North Dakota, south to Arizona and New Mexico; 78 (xv). Our material long passed under the name of *C. pseudoalpina* until problems of typification were resolved by Pringle (1971), who points to the similarity of North American plants to those of Old World *C. alpina* (L.) Miller, accounting in part for the occurrence of that name among the synonyms. Segregation of specimens into two varieties on the basis of much dissected leaves and short aerial stems (var. *tenuiloba*) versus not much dissected leaves and developed aerial stems (var. *columbiana*) seems arbitrarily possible only and does not seem to be geographically correlated.

Clematis hirsutissima Pursh Lions-beard. [*Virona hirsutissima* (Pursh) Heller; *C. wyethii* Nutt.; *C. douglasii* ssp. *jonesii* Kuntze, type from American Fork Canyon, Utah County]. Perennial, erect herbs from a branched caudex; stems 2–7 dm tall, simple or branched above; herbage usually long-hairy; leaves usually 2–6 pair, the lowermost bladeless and sheathing, pinnately compound, the primary divisions again once or twice dissected into narrowly elliptic, oblong, or linear segments; peduncles 2–15 cm long, recurved apically in flower, erect in fruit; flowers solitary (seldom more on axillary upper branches), perfect; sepals 4, thickened, urceolate-campanulate, brownish purple to purple, grayish villous-lanate dorsally, purple within, 2–5 cm long, connate basally, the tips free and recurved; stamens included, the filaments villous; styles plumose, 20–50 mm long. Sagebrush, mountain brush, ponderosa pine, aspen, aspen-tall forb, and spruce-fir communities at 1860 to 3175 m in Cache, Carbon, Daggett, Duchesne, Emery, Grand, Salt Lake, San Juan, Sanpete, Sevier, Summit, Uintah, Utah, and Wasatch counties; British Columbia to Montana, south to Oregon and Colorado; 58 (vii).

Clematis ligusticifolia Nutt. White Virgins-bower. Vigorous, dioecious, woody vines to 10 m long or more; herbage glabrous to strigose or villous; leaves pinnately compound with 3–7 leaflets 2–8 cm long, these lanceolate to ovate, coarsely few-toothed and often lobed or entire; flowers few to many in bracteate cymes; sepals white to cream, 6–11 mm long, elliptic to oblanceolate; staminate flowers lacking pistils; pistillate flowers with sterile stamens; achenes villous; styles 2–4.2 cm long; 2n = 16. Commonly in riparian communities at 1125 to 2380 m in all Utah counties except Davis, Morgan, Salt Lake, Summit, and Wasatch; British Columbia to North Dakota, south to California, Arizona, and New Mexico; 79 (xiii). This plant festoons willows, cottonwoods, and other trees and shrubs in riverbottom communities, but curiously it is missing from the central Wasatch Front.

Clematis occidentalis (Hornem.) DC. Purple Virgins-bower. [*Atragene occidentalis* Hornem.; *C. columbiana* authors, not (Nutt.) T. & G., q.v.]. Plants woody, sprawling or clambering vines, mainly 1–30 dm long; herbage pilose, finally glabrate; leaves ternate, the 3 leaflets lanceolate to ovate or orbicular, 2–11 cm long, entire to crenate, occasionally lobed; peduncles 2.5–15 cm long, recurved near the apex in flower, erect in fruit; flowers solitary, more or less campanulate; sepals 4, blue to violet or lilac, rarely white, lanceolate to elliptic or ovate, 2.5–6 cm long, ciliate and sometimes hairy externally; stamens with petaloid filaments; achenes ca 5 mm long; styles plumose 30–70 mm long. Moist woods and riparian habitats in mountain brush, aspen, and spruce-fir communities at 2010 to 2715 m in Cache, Daggett, Duchesne, Salt Lake, Summit, Uintah, and Utah counties; British Columbia to Montana, south to Oregon and Colorado; 28 (0).

Clematis orientalis L. Oriental Clematis. [*C. aurea* Nels. & Macbr.?]. Vigorous clambering vines to 30 dm long or more; herbage sparingly villous to glabrous; leaves ternate or pinnate-ternate, the segments ovate to lanceolate or elliptic, 1–5 cm long, coarsely toothed to lobed or entire; peduncles 6–12 cm long; flowers solitary, nodding to erect; sepals 4, yellow (or tinged reddish), oblong to lanceolate, 15–25 mm long, pubescent, ultimately spreading; stamens with petaloid, pubescent filaments; achenes 3–5 mm long; styles plumose, 3–10 cm long; 2n

= 16, 32. Sagebrush, mountain brush, and ruderal habitats at 1370 to 2290 m in Cache, Juab, Millard, Salt Lake, Tooele, Uintah, and Utah counties; sporadic in the U. S.; introduced from Asia; 18 (0). This plant is now well established in Utah.

Delphinium L.

Annual or perennial herbs from slender or tuberous roots; stems simple (rarely branched), erect; leaves alternate or mostly basal, the blades palmately divided; flowers perfect, irregular, large and showy, borne in terminal racemes or panicles, subtended by a pair of bracts; sepals 5, petaloid, the upper one produced into a prominent spur, the lateral ones often shorter than the lower 2; petals 4, in 2 pair, the upper ones spurred and clawless, the lower ones clawed and with expanded blades; stamens numerous; pistils 3–5; fruit a follicle.

Ewan, J. 1945. A synopsis of the North American species of *Delphinium*. Univ. Colorado Stud. Ser. D. 2: 55–244.

1. Plants annual or short-lived perennial; lowermost leaves often deciduous at anthesis; adventive weedy or cultivated plants *A. ajacis*
- Plants perennial; leaves mainly basal and persistent at anthesis or mainly cauline and with broadly cuneate lobes; indigenous 2
- 2(1). Leaves mainly cauline, the lowermost often withered at anthesis; leaf segments cuneate, often more than 1 cm broad; plants often over 1 m tall, of montane habitats *D. occidentale*
- Leaves mainly basal, much reduced upwards, the lowermost often persistent at anthesis; leaf segments variably shaped, but less than 1 cm wide; plants less than 1 m tall, of xeric to montane habitats 3
- 3(2). Stems conspicuously narrowed below ground level, easily separable from the fusiform tuberous roots; plants ubiquitous, common *D. nuttallianum*
- Stems not especially narrowed below the ground level or easily separable from the caudex; roots slender, elongate, not tuberous or fusiform 4
- 4(3). Herbage puberulent with curved or crinkly hairs; pedicels spreading-ascending, much longer than the spurs; plants of northeastern Utah *D. geyeri*
- Herbage glabrous or essentially so; pedicels erect-ascending, longer to shorter than the spurs; plants of southeastern, southern, and western Utah. *D. andersonii*

Delphinium ajacis L. Rocket Larkspur. Plants annual; stems 1.5–7 dm tall or more, glabrous or puberulent above, simple or branched above; basal leaves often withered at anthesis, the blade divided into 3 sections and these again divided into numerous linear segments; pedicels curved ascending, 1–6 cm long, subtended by a subulate bract and with another pair near the middle; flowers blue to violet, rose, pink, or white, the spurs 10–20 mm long; pistils mainly solitary; follicles usually solitary, pubescent, 12–25 mm long; 2n = 16. Cultivated ornamental, escaped and persistent in Cache, Juab, Millard, Salt Lake, Sevier, and Utah counties; widely grown in the U. S.; introduced from Europe; 11 (0).

Delphinium andersonii Gray Anderson Larkspur. Perennial herbs from fibrous coarse roots and caudices, mainly 10–60 cm tall; stems simple, glabrous or sparingly long hairy in the inflorescence; leaves mainly basal or on lower portion of the stem, usually at least some persistent at anthesis, much reduced upwards; blades mainly 1–6

cm wide, thickened, usually thrice dissected, the ultimate segments to 4 mm wide; inflorescence a raceme or panicle, the main raceme with 1-15 flowers, lower pedicels shorter than or to 4 times longer than the spur or longer, ascending to erect; sepals blue (pale or purplish), 9-15 mm long; follicles 12-25 mm long, erect, glabrous or puberulent. Two morphologically similar geographic races are present in Utah.

- 1. Plants subscapose, the cauline leaves often reduced to mere rudiments upward; flowers pale blue or sometimes dark blue; distribution in southeastern and southern Utah *D. andersonii* var. *scaposum*
- Plants not especially subscapose, the cauline leaves reduced upwards, but not especially rudimentary; flowers usually dark blue; distribution in the Great Basin *D. andersonii* var. *andersonii*

Var. *andersonii* [*D. cognatum* Greene; *D. andersonii* ssp. *cognatum* (Greene) Ewan; *D. leonardii* Rydb., type from Garfield, Salt Lake County]. Pinyon-juniper, sagebrush, mixed desert shrub, and mountain brush communities in Beaver, Box Elder, Juab, Millard, Piute, Sanpete, Sevier, Tooele, and Utah counties; Oregon to Montana, south to California and Nevada; 40 (v). Plants of this and the next variety have long been confused. In their extremes they are easily separable, but when dark flowered plants occur within the range of the usually pale flowered variety their identification beyond specific rank is dubious; hence, the presentation herein. In the monograph by Ewan three largely sympatric taxa were recognized, but our material seems better segregated on geographic and morphological basis into two very similar taxa.

Var. *scaposum* (Greene) Welsh [*D. scaposum* Greene; *D. coelestinum* Rydb., type from Washington County; *D. amabile* Tidestr.]. Joshua tree-cresote bush, blackbrush, shadscale, Vanclvea-ephedra, and pinyon-juniper communities in Emery, Garfield, Grand, Kane, San Juan, Washington, and Wayne counties; Colorado, New Mexico, Arizona, and Nevada; 74 (xii).

Delphinium geyeri Greene Geyer Larkspur. Plants 1.5-9 dm tall, from a woody caudex and stout fibrous roots; stems not or seldom fistulous, simple, crisp-puberulent with curved hairs; leaves mainly basal or lower cauline, 4-25 cm long, the blades divided into linear to oblong segments, mainly 2-4 mm wide; inflorescence simple or paniculate, the main axis 7-32 cm long, the ascending to erect pedicels longer or shorter than the spurs; calyx spreading hairy or with curved subappressed hairs, blue, blue purple, or white; lateral sepals 11-19 mm long, elliptic to oblanceolate, obtuse; spurs 11-19 mm long; blade of upper sepal spreading-ascending; follicles hirtellous, 12-15 mm long; 2n = 16, 32. Salt desert shrub, sagebrush, pinyon-juniper, mountain brush, and aspen communities at 1585 to 2745 m in Daggett, Summit, and Uintah counties; Wyoming, Nebraska, and Colorado; 18 (ii).

Delphinium nuttallianum Pritz. Nelson Larkspur. [*D. nelsonii* Greene; *D. menziesii* authors, not DC.; *D. menziesii* var. *utahense* Wats., type from Wasatch Mts.; *D. nelsonii* ssp. *utahense* (Wats.) Ewan; *D. pinetorum* Tidestr.; *D. nelsonii* f. *pinetorum* (Tidestr.) Ewan]. Plants 0.9-9.2 dm tall, from clustered tuberos roots; stems not fistulous (or rarely so), simple, glabrous to crisp puberulent or hirtellous; leaves mainly lower cauline, 2-15 cm

long, the blades divided into linear oblong to elliptic lobes mainly 2-5 mm wide; inflorescence simple or paniculate, the main axis 2-35 cm long, the ascending to erect-ascending pedicels longer than to shorter than the spurs; calyx hirtellous, blue purple (rarely pale blue or white); lateral sepals 9-17 mm long, oblong-elliptic to oblanceolate, obtuse to rounded; spurs 12-19 mm long; blade of upper sepal spreading-ascending; follicles hirtellous, puberulent, or glabrous, 9-19 mm long (including the beak); 2n = 16. Blackbrush, mixed desert shrub, pinyon-juniper, mountain brush, sagebrush, ponderosa pine, aspen, grass-forb, Douglas fir, spruce-fir, and meadow communities at 1125 to 3175 m in probably all Utah counties; British Columbia to Alberta, south to California, Arizona, New Mexico, and Nebraska; 203 (xxvii). This is our most common and most ubiquitous larkspur species. Despite its commonness and ubiquity this species has been known under three specific epithets—*menziesii*, *nelsonii*, and *nuttallianum*, and, even now, the nomenclatural problem is not readily resolved. Should our plants be treated as conspecific with *D. menziesii*, with which they are reported to intergrade (Vascular Plants Pacific N. W. 2: 357. 1964), that name (having priority) must be used. In an attempt at a stable nomenclature the name *nuttallianum* is used herein. Recognition of infraspecific categories among our specimens seems unwarranted.

Delphinium occidentale (Wats.) Wats. Western Larkspur. [*D. elatum* var. *occidentale* Wats., type from the Wasatch Mountains; *D. cuculatum* A. Nels.; *D. occidentale* ssp. *cuculatum* (A. Nels) Ewan; *D. occidentale* var. *cuculatum* (A. Nels.) R. J. Davis; *D. abietorum* Tidestr., type from Wasatch Plateau]. Plants perennial, 6-20 dm tall or more; stems often fistulose, simple, often glaucous, glabrous or crisp puberulent below and crisp puberulent to glandular hirtellous above; leaves mostly cauline, the lower ones usually withered at anthesis; blades 3-20 cm wide, cleft to the base into 3 main lobes, the lateral ones again cleft (not as deeply) into 2 main, cuneate, lobed, cleft, or toothed broad segments; inflorescence simple or paniculate, the main axis 10-35 cm long, the pedicels shorter to somewhat longer than the spurs; calyx crisp puberulent to glandular hirtellous or glandular long-hairy, blue purple to rose or white; lateral sepals variably shaped, 7-20 mm long, rounded-acute to acute or attenuate; spurs 10-17 mm long; blade of upper sepal erect to ascending or spreading-ascending; follicles glabrous to puberulent, or glandular-hirtellous; 2n = 16. Two varieties are recognized.

- 1. Axis of racemes and pedicels with lustrous, long spreading glandular hairs; lateral sepals lanceolate to lance-oblong, 13-20 mm long, acute to acuminate; follicles mostly glabrous *D. occidentale* var. *barbeyi*
- Axis of racemes and pedicels with crisp puberulent curved or crinkly hairs or sparingly short glandular hairs; lateral sepals ovate, oblong, or lance-elliptic, 7-15 mm long, rounded-acute; follicles puberulent to glandular hirtellous *D. occidentale* var. *occidentale*

Var. *barbeyi* (Huth) Welsh [*D. exaltatum* var. *barbeyi* Huth; *D. barbeyi* (Huth) Huth; *D. scopulorum* var. *attenuatum* Jones, type from Bullion Creek; *D. barbeyi* f. *subroseum* (Cockerell) Ewan]. Mountain brush, ponderosa pine, aspen, spruce-fir, alpine meadow, and alpine tundra communities at 2590 to 3450 m in Beaver,

Garfield, Iron, Kane, Piute, San Juan, Sanpete, and Sevier counties; Colorado, New Mexico, and Arizona; 44 (x). Similarity of this attractive poisonous plant to *D. occidentale* has long resulted in confusion as to taxonomic limits of both. They are partially sympatric, overlapping in Sanpete County. Presence of glandular hairs in both taxa compounds the difficulty. The glandular hair in var. *barbeyi* is long, yellowish, lustrous, and usually copious; in var. *occidentale* with glandular pubescence the hairs are short, lustrous or not, yellowish or whitish, and usually sparse. Plants with hairs long and copious or with long spreading sepals or spreading-ascending blades of upper sepals occur beyond the range of var. *barbeyi* as strictly interpreted. Because of these problems *barbeyi* is treated at varietal rank.

Var. occidentale Western Larkspur. Mountain brush, sagebrush, Douglas fir-white fir, aspen, grass-tall forb, and spruce-fir communities at 2135 to 3115 m in Box Elder, Cache, Carbon, Daggett, Duchesne, Emery, Juab, Millard, Rich, Salt Lake, Sanpete, Tooele, Uintah, Utah, Wasatch, and Weber counties; Oregon to Montana, south to Nevada and Colorado; 58 (iv). The western larkspur has been regarded as *D. scopulorum* ssp. *occidentale* (Wats.) Abrams, indicating a portion of a broader problem than can be solved on the basis of Utah plants alone.

Myosurus L.

Diminutive tufted, scapose herbs; leaves basal, entire or toothed, linear to narrowly spatulate; flowers minute, greenish or purplish to whitish, solitary; sepals 5 (6 or 7), spurred at the base; petals lacking or 6 or 7; stamens 5 to many; pistils many on a slender tapering axis, this elongate in fruit; achenes apiculate or aristate.

Campbell, C. R. 1952. The genus *Myosurus* in North America. *El Aliso* 2: 389-403.

- 1. Achenes cupulate dorsally, the beak arising from the horseshoe-shaped cup *M. cupulatus*
- Achenes ridged dorsally, the beak a continuation of the ridge 2
- 2(1). Achene beak 0.8-2 mm long, usually more or less spreading *M. apetalus*
- Achene beak 0.2-0.5 mm long, straight *M. minimus*

Myosurus apetalus C. Gay Mousetail. [*M. aristatus* Benth. ex Hook.; *M. minimus* ssp. *montanus* G. R. Campbell]. Plants slender, 1-6 (10) cm tall; leaves 1-4 (7) cm long, 0.5-1.5 mm wide, linear to narrowly spatulate, entire or toothed; scapes 1 to several; flowers solitary; sepals 5, greenish or purplish, narrowly oblong, 1-3 mm long, spurred basally, the spur 1-3 mm long; petals 5 or lacking, whitish, ca 1-1.5 mm long, caducous; stamens usually 5; achenes 20-50 or more, borne on a receptacle mainly 0.4-2 cm long, ca 2 mm wide; dorsal keel of achene projecting beyond the body as a usually spreading-ascending beak 0.7-2 mm long. Lake and pond margins and along drainages at 2075 to 2950 m in Box Elder, Cache, Daggett, Duchesne, Juab, San Juan, Salt Lake, Sanpete, Sevier, Uintah, Utah, and Weber counties; British Columbia to Montana, south to California and Wyoming; South America; 15 (0).

Myosurus cupulatus Wats. Horseshoe Mousetail. Plants slender, 2-15 cm tall; leaves 0.7-7 cm tall, 0.5-1.5 mm wide, linear to narrowly spatulate, entire; scapes 3 to

many; flowers solitary; sepals 5, whitish to greenish or brownish, 1.5-3 mm long, spurred basally, the spur 1-2 mm long; petals 5, ca 2-2.5 mm long, caducous; stamens ca 5; achenes 20-50 or many more; borne on a receptacle 7-40 mm long, ca 2.5-4 mm wide; beak of achene arising from a depression surrounded by a spongy thickened margin, the beak, ca 0.5-0.8 mm long. Mixed desert shrub, mountain brush, and sagebrush communities at 850 to 2135 m in Beaver, Iron, Millard, Tooele, and Washington counties; Arizona and California 9 (i). Note: the closely related *M. nitidus* Eastw. is known from the Kaibab Plateau and from Montezuma County, Colorado. It might occur in Utah adjacent to those regions. It has fewer than 4 scapes per plant and longer (ca 1 mm) slender achene beak from a less pronounced or non-cupulate achene.

Myosurus minimus L. Tiny Moustail. Plants slender, mainly 3-10 cm tall or more; leaves 2-5 mm long, 0.5-1.5 mm wide, narrowly spatulate to linear, entire; scapes 1 to numerous; flowers solitary; sepals 5, whitish to greenish, 2-3 mm long, the spur 1-3 mm long; petals 5, linear, caducous; stamens usually 10; achenes 30-100 or more, borne on a receptacle projecting beyond the body as a beak 0.3-0.5 mm long; 2n = 16. Pond margins, drainage bottoms, and other moist sites at ca 1735 to 2380 m in Cache, Daggett, Salt Lake, San Juan, and Summit counties; widely distributed in North America; circumboreal; 4 (0). This species is sometimes delimited to include *M. apetalus* (*M. aristatus*) at infraspecific level, but that solves no problem, rather, the problem is then reduced to separation of subspecies or varieties. There do not seem to be any real problems with our Utah materials once ssp. *montanus* G. R. Campbell is placed in synonymy with *M. apetalus*.

Ranunculus L.

Perennial, biennial, or annual aquatic or terrestrial herbs with fibrous to tuberous roots; stems erect, ascending or sometimes prostrate and stoloniferous; leaves basal or cauline and alternate, simple or compound; flowers perfect, regular, solitary or few to several in cymes; sepals 3-5, herbaceous or petaloid, usually deciduous; petals 5-16, rarely more; stamens 5 to numerous, sometimes the outer ones petaloid; pistils 5 to many; fruit an achene.

Benson, L. 1948. A treatise on the North American Ranunculi. *Amer. Midl. Nat.* 40: 1-264.

Padmore, P. A. 1957. The varieties of *Ranunculus flammula* L. and the status of *R. scoticus* E. S. Marshall and *R. reptans* L. *Watsonia* 4: 19-27. 1957.

Palmieri, M. D. 1976. A revision of the genus *Ranunculus* (Ranunculaceae) for the state of Utah. Unpublished M. S. thesis, Brigham Young University. 141 pp.

- 1. Plants aquatic; petals white; submersed leaves divided into linear-filiform segments *R. aquatilis*
- Plants terrestrial or aquatic; petals yellow or red; leaves variable, but not with linear-filiform segments .. 2
- 2(1). Plants tomentose annuals; stamens commonly 5-7; fruit 3-loculed, the lateral locules empty *R. testiculatus*
- Plants perennial or, if annual, not as above; stamens commonly 10 or more; fruit 1-loculed 3
- 3(2). Petals and sepals red purple or lined with red purple; leaves dissected; plants of lower elevation habitats in desert ranges *R. andersonii*

- Petals yellow, the sepals often greenish or brownish; leaves various; distribution various, but seldom in lower elevation desert sites 4
- 4(3). Leaves all entire or merely crenate, not lobed or dissected or, if 3- to 5-lobed, the lobes rounded 5
- Leaves, leaflets, or bracts dissected or lobed (the lower sometimes merely crenate) 10
- 5(4). Plants stoloniferous, rooting at the nodes, growing in palustrine or riparian habitats 6
- Plants not stoloniferous, of various habitats, sometimes as above 7
- 6(5). Leaf blades entire, elliptic, several times longer than broad, plants of high elevations *R. flammula*
- Leaf blades crenate, cordate-oval, the length subequal to the width; plants seldom of high elevations *R. cymbalaria*
- 7(5). Leaf blades with 3-5 broadly rounded teeth or lobes, usually broader than long, plants aquatic or semiaquatic 8
- Leaf blades entire or essentially so, much longer than broad; plants not aquatic or semiaquatic 9
- 8(7). Leaf blades mostly 3-8 mm long, achenes 10-20, receptacle mainly 1.5-3 mm long *R. hyperboreus*
- Leaf blades mostly 4-15 mm long; achenes 20-60; receptacles 3-5 mm long *R. nutans*
- 9(7). Petals 5-7 mm broad or more; achenes ca 50-100 in an ovoid cluster 10-12 mm long, 9-10 mm thick; achenes 3-3.2 mm long; plants of Kane and San Juan counties *R. oreogenes*
- Petals 2-5 mm broad; achenes 10-50 in a hemispherical to subglobose cluster 4-7 mm long, 6.5-8.5 mm thick; achenes 1.5-2.5 mm long *R. alismifolius*
- 10(4). Plants aquatic or semiaquatic; leaves often dimorphic, at least some finely dissected; stems prostrate and rooting at the nodes or erect and fistulous; achenes glabrous, beakless or essentially so 11
- Plants neither aquatic nor semiaquatic and with finely dissected leaves, but sometimes growing in wet places; stems mostly erect, seldom rooting at the nodes; achenes either hairy or with a beak more than 0.5 mm long 13
- 11(10). Plants annual, erect, the stems fistulous; achenes beakless or essentially so *R. scleratus*
- Plants perennial, the stems usually prostrate and rooting, not fistulous; achenes with a beak 0.3-0.5 mm long 12
- 12(11). Leaf blades 2-5 cm long or more; petals 7-12 mm long; achenes 1.8-2 mm long, prominently keeled; beak 1-2 mm long *R. flabellaris*
- Leaf blades 1-2 cm long; petals 3-7 mm long; achenes 1-1.5 mm long; not prominently keeled; beak usually less than 1 mm long *R. gmelinii*
- 13(10). Plants annual, achenes 5-8 in a globose cluster, compressed, 4-7.5 mm long (including beaks), armed with stout spines; adventive *R. arvensis*
- Plants perennial; achenes commonly more than 10 and less than 4 mm long, unarmed 14
- 14(13). Roots tuberous, clavate, 2-5 mm thick; plants low (mainly 2-12 cm tall), flowering in early springtime in sagebrush-mountain brush habitats *R. jovis*
- Roots not especially thickened, tapering or linear, mainly less than 2 mm thick; plants of various height, flowering in springtime or summer, of various habitats 15
- 15(14). Basal leaf blades entire or merely crenately toothed or lobed, or doubly so 16
- Basal leaf blades divided, parted, or cleft, the divisions one-half or more to the base 18
- 16(15). Blades of basal leaves mainly 2-4 times as long as wide, entire or shallowly 3-lobed *R. glaberrimus*
- Blades of basal leaves about as broad as long, crenate to crenate-serrate 17
- 17(16). Cauline leaf segments 3-10 mm broad or more; petals mostly 5-7 mm long *R. inamoenus*
- Cauline leaf segments 1-3 mm wide; petals 8-10 mm long or lacking *R. cardiophyllus*
- 18(15). Plants mainly 5-20 cm tall, leaf blades commonly 1-3 cm long; habitats at high elevations 19
- Plants commonly 20-60 cm tall; leaf blades mainly 2-8 cm long; habitats various, but sometimes at high elevations 22
- 19(18). Basal leaves with 3 main lobes, the lateral lobes again merely toothed or lobed *R. eschscholtzii*
- Basal leaves with 3 main lobes but the lateral lobes again deeply divided or parted into linear or oblong segments 20
- 20(19). Stems abruptly horizontally spreading, curved from near the middle; leaf blades 0.5-1 cm long, the ultimate segments oblong; petals 4-6 mm long *R. gelidus*
- Stems erect; leaf blades various, the ultimate segments linear to narrowly oblong, petals various 21
- 21(20). Leaf blades 1-4 cm long, the ultimate segments linear to narrowly oblong; petals 6-12 mm long; plants locally common and more widespread *R. adoneus*
- Leaf blades 0.8-1.2 cm long; petals 4-6 mm long; plants evidently rare in the Uinta Mts. *R. pedatifidus*
- 22(18). Leaves compound, the primary divisions petiolulate; herbage glabrous *R. ranunculinus*
- Leaves palmatifid or, if compound, the primary divisions sessile; (stalked in *R. repens*); herbage variously hairy 23
- 23(22). Basal leaves apparently pinnately 5- to 7-lobed; achene beaks 2-4 mm long *R. orthrorhynchus*
- Basal leaves pinnately ternate, palmatifid, or palmately 3-lobed (the lobes often again lobed); achene beaks mainly 0.3-2 mm long, often hooked or recurved 24
- 24(23). Petals not much if at all surpassing the sepals, mostly less than 7 mm long *R. macounii*
- Petals much surpassing the sepals, mostly 7-12 mm long or more 25
- 25(24). Basal leaves with stalked primary divisions, compound; stems rooting at lower nodes, often prostrate or decumbent; flowers single or double *R. repens*
- Basal leaves palmatifid or palmately compound with sessile primary segments; stems not rooting at lower nodes and not prostrate to decumbent 26
- 26(25). Basal leaves pentagonal in outline, the blades incised into short acute teeth or lobes; achene body 2-2.5 (3) mm long, the beaks 0.5-0.6 mm long, curved; sepals spreading to reflexed *R. acris*
- Basal leaves not especially pentagonal in outline, the blades incised into broad blunt to acute segments; achene body 2.5-3.5 mm long, the beaks 0.2-0.6 mm long, abruptly curved; sepals reflexed *R. acriformis*

Ranunculus acriformis Gray Sharp Buttercup. Terrestrial perennials, mainly 2.5-6 dm tall; stems spreading-

hirsutulous, 2–2.5 mm wide, erect (the base sometimes decumbent), not rooting at the nodes; basal leaf blades simple, ternate, twice divided, some segments again lobed or parted, the ultimate segments linear-lanceolate, acute or abruptly obtuse, 2–5 mm wide, reniform in outline and often more or less folded when pressed, 3–5 cm wide, 1–5 cm long; petioles 5–10 cm long; cauline leaves alternate, similar to the lower; bracts linear or with 3 linear lobes; pedicels 5–10 cm long, sparingly long-hairy; sepals 5, yellowish green, 4–5 mm long, dorsally pilose, reflexed, deciduous, petals 5, yellow, 7–11 mm long; achenes 20–40 in a hemispheric cluster 5–7 mm high and 6–8 mm wide, the bodies 3–3.4 mm long, with beaks 0.2–0.6 mm long, abruptly curved; receptacle glabrous. Wet meadows adjacent to cold bogs and springs at 1950 to 2595 m in Carbon, Emery, Sanpete, and Wasatch counties; Idaho and Montana, south to Wyoming and Colorado; 7 (0). Materials from Emery and Wasatch counties apparently are more nearly related to the body of the species to the north and east.

Ranunculus acris L. Tall Buttercup. Terrestrial perennials mostly 2–5 dm tall; stems spreading long-hairy below, the hairs appressed upwards, 1.5–3 mm wide, erect, not rooting at the nodes; basal leaf blades simple, 3-parted, the 3 main segments again lobed or toothed, pentagonal in outline, the ultimate segments mostly 1–7 mm wide; petioles 3–15 cm long; cauline leaves sinuilar but more shortly petiolate; bracts with 1–3 linear segments, sessile; pedicels 2–20 cm long or more; sepals 5, greenish, or marginally yellowish, 4–5.5 mm long, pilosulous, spreading deciduous; petals 5, yellow, 8–10 mm long, obovate; achenes glabrous, 2.6–3 mm long, ca 50, in a subglobose cluster, 5.5–6 mm high and 6–7.5 mm wide; beaks ca 0.5–0.6 mm long; receptacle hirtellous; $n = 14, 28$. Two varieties, one indigenous and the other introduced are present in Utah.

1. Leaf segments narrowly cuneate, the ultimate segments mainly 1–4 mm wide; plants of Garfield County *R. acris* var. *aestivalis*
- Leaf segments broadly cuneate to obtuse basally, the ultimate segments more than 4 mm wide; plants of northern Utah *R. acris* var. *acris*

Var. *acris* Riparian habitats at 1460 to 2170 m in Box Elder, Cache, and Rich counties; naturalized widely in North America; adventive from the Old World; 3 (0).

Var. *aestivalis* (L. Benson) Welsh [*R. acriformis* var. *aestivalis* L. Benson, type from north of Panguitch]. Sedge-grass meadow at ca 1964 m in Garfield County; endemic; 4 (0). The similarity of this taxon to *R. acris*, sens. lat., seems to override considerations of close relationship to *R. acriformis*, with which it shares similar achene characteristics. However, the achene features of both *acris* and *acriformis* are hardly convincing as diagnostic characters. The *acris* complex includes various taxa, often recognized at specific rank in North America, including *R. acriformis*, and it is hardly surprising that a phase of the species should occur in the western U. S., at the southern margin of the species complex proper. The *R. acris* complex should be treated monographically, an attempt far beyond the scope of this work.

Ranunculus adoneus Gray Alpine Buttercup. Terrestrial perennials, mostly 0.5–3.2 dm tall; stems glabrous, 0.5–4 mm wide, ascending to erect; basal leaf blades simple, several times divided into usually linear segments

0.7–3 mm wide, the whole 1–5 cm long and about as broad; petals 1–9 mm long; cauline leaves similar to the basal but with progressively shorter petioles; bracts short-petioled to subsessile commonly 5 to many lobed; pedicels 0.5–14 cm long, glabrous; sepals 5, green or brownish to lavender, 3.5–10 mm long, pilose or glabrous, deciduous, spreading; petals 5–12, yellow, 5–15 mm long; achenes glabrous, 2.5–4 mm long, 40–70 in an ovoid cluster 5–10 mm long and 3–9 mm thick; beaks 1.4–1.9 mm long, straight or curved; receptacle glabrous. Moist sites near melting snow in open meadows, talus slopes, and in spruce-fir communities at 2400 to 3660 m in Cache, Daggett, Duchesne, Juab, Salt Lake, Sanpete, Summit, Uintah and Utah counties; Idaho; Wyoming, Nevada, and Colorado; 46 (0). Our material is assignable to var. *alpinus* (Wats.) L. Benson [*R. orthrorhynchus* var. *alpinus* Wats., type from Wasatch Mts.], but is probably not significantly different from var. *alpinus*, from which it has been segregated by its narrow leaf segments and straight beaks. The species has been treated at infraspecific rank as *R. eschscholtzii* var. *alpinus* (Wats.) C. L. Hitchc.

Ranunculus alismifolius Geyer Plantain Buttercup. Terrestrial perennials, 0.5–4.6 dm tall, glabrous; stems 1.5–6 mm wide, erect, not rooting at the nodes; basal leaf blades simple, entire or merely dentate, 2–10 cm long, 0.5–3.5 cm wide, lanceolate to ovate-lanceolate; petioles 2–17 cm long; cauline leaves sessile or short-petiolate, alternate or opposite; bracts like the leaves only narrower; pedicels 2–14 cm long glabrous or pubescent; sepals 5, yellowish or greenish, or suffused with lavender, 4.5–7.5 mm long, glabrous, spreading, deciduous; petals 3–10, yellow, 4–14 mm long; achenes glabrous, 1.6–3.2 mm long, 15–45 in a subglobose cluster 4–7 mm long and 6.5–8.5 mm wide; beaks 0.4–1.2 mm long; receptacle glabrous; $2n = 16$. Wet meadows, pond margins, and stream banks in sagebrush, sedge-hairgrass, aspen, fir, and spruce-fir communities at 1830 to 3355 m in Beaver, Box Elder, Cache, Davis, Duchesne, Emery, Garfield, Grand, Iron, Salt Lake, San Juan, Sanpete, Sevier, Summit, Utah and Wasatch counties; widespread in the western U. S. and Canada; 47 (v). Specimens in Utah are referable to var. *montanus* Wats. (type from upper Provo River, Uinta Mts.). The variety is distinguished from phases of the species beyond Utah in its more numerous petals (9 or 10, not 5). This species is distinguished from *R. oreogenes* by its glabrous achenes and receptacle, and from *R. glaberrimus* by its narrow fruiting head (less than 9 mm) and usually entire cauline leaves.

Ranunculus andersonii Gray Violet Buttercup. [*R. andersonii* var. *tenellus* Wats., type from Pilot Rock Point, Great Salt Lake]. Terrestrial perennials, 0.5–3 dm tall, glabrous; stems scapose, 1.5–4 m thick, not rooting at the nodes; blades of basal leaves compound, 1–5 cm long, 1.5–5.5 cm wide, triterately 2–3 times divided, the ultimate segments 0.5–4 mm wide, acute; petioles 1–12 cm long; cauline leaves lacking, or a single bracteate leaf subtending a second pedicel; sepals 5, reddish or purple, 6–15 mm long, glabrous, spreading, persistent; petals 5, red purple, 12–17 mm long, orbicular; achenes 4.5–6.5 mm long, 30–60 in a hemispheric cluster ca 10 mm long and 9–15 mm wide; beaks 0.2–1 mm long; receptacle glabrous. Shadscale, horsebrush, sagebrush, juniper, pinyon-juniper, and ponderosa pine communities at 1095 to 2410 m in Beaver, Box Elder, Juab, Kane, Millard,

Tooele, and Washington counties; Oregon and Idaho, south to California, Nevada, and Arizona; 33 (ii). Our materials have long been regarded at species level as *R. juniperinus* Jones, based mainly on size of the achenes - 4-6 mm versus 9-14 mm for *R. andersonii*. But a cline in size of fruit exists east and west. The *juniperinus* phase was further substantiated by the presence of a second flower subtended by a leafy cauline bract in some specimens. Plants with two flowers occur in Washington County uniformly and less commonly north to Millard County. These are designated as var. *juniperinus* (Jones) Welsh [*R. juniperinus* Jones, type from Washington County; *Beckwithia juniperina* (Jones) Heller]. The remainder of the Utah material belongs to var. *andersonii*.

Ranunculus aquatilis L. Water Crowfoot. Aquatic perennials, mainly 2-8 dm long, glabrous; stems 1-2.5 mm wide, submersed or floating, rooting at the nodes; leaves all cauline, alternate, submersed ones dissected into filiform segments, the blades 1-3 cm long on petioles 3-18 mm long, the floating ones simple but deeply 3-parted and 1-2.5 cm broad (1-1.5 cm long) on petioles 1-3 cm long; pedicels 1-6 cm long, finally recurved but usually not from the base, glabrous; sepals 5, green or purplish, 3-5 mm long, glabrous, spreading or reflexed, deciduous; petals 5, white, 1.6-2 mm long, 15-30 in a subglobose cluster; 4-6.5 mm high, 4-6 mm wide; beaks 0.2-0.4 mm long or lacking; pericarp transversely ridged; receptacle hairy; 2n = 16, 32, 48. Four closely allied, and possibly taxonomically insignificant, phases are known.

- 1. Leaves petiolate, the petiole arising from the summit of the stipular enlargement, commonly collapsing when withdrawn from water 2
- Leaves sessile, the first divisions arising from the summit of the stipular enlargement, often not collapsing when withdrawn from water 3
- 2(1) Leaves dimorphic, the submersed segments capillary, the floating broadly lobed . . . *R. aquatilis* var. *hispidulus*
- Leaves all alike, all submersed and with capillary segments *R. aquatilis* var. *capillaceus*
- 3(2) Pedicels recurved basally in front; petals 2-4 mm wide; stamens 5-10; achenes 30-50, the beak 0.2-0.5 mm long *R. aquatilis* var. *subrigidus*
- Pedicels not recurved in front; petals 2.5-6 mm wide; stamens 10-20; achenes 7-25, the beak 0.7-1.1 mm long, slender *R. aquatilis* var. *longirostris*

Var. *capillaceus* (Thuill.) DC. [*R. capillaceus* Thuill.; *Batrachium aquatile* var. *capillaceum* (Thuill.) Garrett]. Streams, lakes, ponds, and irrigation canals at 1320 to 3050 m in Box Elder, Cache, Daggett, Duchesne, Garfield, Iron, Salt Lake, Sevier, Uintah, Utah, Wasatch, Washington; and Weber counties; widely distributed in North America; circumboreal (as to the species); 34 (ii). Specimens on mud in drying pond margins have leaves less dissected—with shorter and proportionally (if not actually) broader segments. Possibly these account for the report (Vascular Plants Pacific N. W. 2: 378. 1964) of var. *porteri* Benson for Utah.

Var. *hispidulus* E. Drew Ponds and lakes at 1675 to 2745 m in Beaver, Cache, Salt Lake, and San Juan counties; widespread in western north America; 2 (i).

Var. *longirostris* (Codron) Lawson [*R. longirostris* Codron]. Ponds, reservoirs, lakes, streams, springs, and irrigation canals at 1370 to 1800 m in Cache, Davis, Duchesne, Grand, Salt Lake, Rich, Summit, and

Wasatch counties; Saskatchewan to Quebec, south to Nevada, Colorado, New Mexico, Arkansas, Alabama, and Delaware; 8 (0). This is a close ally of both var. *subrigidus* and var. *capillaceus*, with intermediates representing a grading series and with no one feature being useful in segregation of all specimens.

Var. *subrigidus* (E. Drew) Breitung [*R. circinatus* var. *subrigidus* (E. Drew) L. Benson]. Ponds, lakes, and streams at 1065 to 2745 in Cache, Daggett, Garfield, Rich, Salt Lake, Sanpete, Sevier, Summit, Utah, Washington, and Wayne counties; widespread in North America; Europe; 8 (i). This plant is closely allied to both *R. aquatilis* var. *capillaceus* and to *R. aquatilis* var. *longirostris*. The (usually) sessile leaves and short beaked achenes are considered as diagnostic, but these are tenuous characters at best.

Ranunculus arvensis L. Field Buttercup. Terrestrial annuals, mainly 0.7-6 dm tall; stem glabrous to pilosulous, ca 1-2 mm wide, erect, not rooting at the nodes; basal leaf blades simple, cuneate to obovate, apically toothed or 3-parted; petioles 1.5-3.5 cm long; cauline leaves alternate, numerous, deeply divided into 2-5 oblanceolate segments, with petioles progressively shorter upwards; bracts sessile or petiolate, toothed or lobed; pedicels 1-5 cm long, strigose; sepals 5, green to yellow, 3-5.5 mm long, long-hairy dorsally, spreading, finally deciduous; petals 5, yellow, 4-6.5 mm long, obovate; achenes 6.5-8.5 mm long, commonly 8 or fewer in a whorl, this 9-16 mm wide, the beaks stout, 1.8-3 mm long, the surfaces with straight spines ca 1-3 mm long; receptacles pubescent; 2n = 32. Weedy species of fields and other open habitats at 1370 to 1680 m in Cache, Salt Lake, Utah, and Weber counties; widely naturalized in the U. S.; adventive from Europe; 4 (0).

Ranunculus cardophyllus Hook. Showy Buttercup. Terrestrial perennials, mainly 1.3-5 dm tall; stems 1-3 mm wide, with long, spreading hairs, erect, not rooting at the nodes; basal leaf blades simple, with crenate to lobed margins, the apical lobe sometimes free 1/2 the blade length, truncate to cordate basally, 2-3.5 cm long, 1.8-3.5 cm wide, oval to orbicular; cauline leaves sessile or essentially so, 3- to 7-parted, the segments 1-5 mm wide; bracts sessile, the lobes 1-3 mm wide; pedicels 2-17 cm long; sepals 5, green or diffused with purple dorsally, 4-5.5 mm long, villous dorsally, spreading, deciduous; petals 5 (or lacking), yellow, 8-15 mm long, obovate; achenes short-hairy, 1.6-3 mm long, 50-100 or more, in a cylindrical cluster, 6-10 mm long and 4.5-7.5 mm wide; beaks 0.6-1 mm long; receptacle hirsute; 2n = 32, 64. Meadows and tall forb communities in aspen, ponderosa pine, lodgepole pine, and spruce-fir woodlands at 2315 to 3600 m in Beaver, Daggett, Duchesne, Garfield, Iron, Piute, and Uintah counties; British Columbia to Saskatchewan, south to Washington, Arizona, and New Mexico; 9 (ii). This is a poorly understood taxon in Utah. Its gross morphology closely simulates the common *R. inamoenus* (q.v.), but differs in its larger flowers and usually narrower upper bracts segments.

Ranunculus cymbalaria Pursh Marsh Buttercup. [*R. cymbalaria* var. *saximontana* Fern.]. Palustrine or riparian perennials; vegetative stems 0.5-1.5 mm wide, produced into strawberrylike stolons, rooting at the nodes, glabrous to pubescent; flowering stems 0.2-3 dm tall; basal leaves simple, the petioles 1-15 cm long, the blades 0.5-4 mm long, cordate, ovate, or uniform, crenate;

pedicels 2–10 cm long; sepals 5, 2.5–7.5 mm long, glabrous, deciduous; petals 5 or more, yellow, 2.5–8 mm long; achenes ca 1.1–1.5 mm long, 25–200 in a cylindrical cluster, glabrous, straight, the beak to ca 0.3 mm long, straight; $2n = 16$. Muddy sites along streams, near pools or lakes, or in marshlands, at 850 to 2745 m in all Utah counties; widely distributed in North America; South America and Eurasia; 143 (xiii). This most common of our buttercup species has been interpreted as belonging to two varieties, but such status does not seem to be warranted.

Ranunculus eschscholtzii Schlecht. Eschscholtz Buttercup. Terrestrial perennials, 0.4–2.6 dm tall, glabrous or sometimes pilose; stems 1.5–3.5 mm wide, erect, not rooting at the nodes; basal leaf blades simple, cleft into 3 main lobes, the midsegment entire or 3-toothed, the lateral segments lobed or toothed, truncate to cordate or obtuse basally, 0.9–5 cm wide, 0.7–2.5 cm long; cauline leaves sessile or subsessile, alternate; bracts sessile, usually 3-lobed; pedicels 0.5–9 cm long; sepals 5, green or purplish, 4–6 mm long, pilose dorsally, reflexed, deciduous; petals 5, yellow, 6–10 mm long, obovate; achenes glabrous or hairy, 1.3–1.8 mm long, 20–50 or more in an elongate cluster 6–12 mm long and 6–7.5 mm wide; beak 0.7–1 mm long; receptacle glabrous or hairy; $2n = 32, 40, 48$. Spruce-fir and alpine meadow communities at 2745 to 3205 m in Daggett, Duchesne, Piute, Salt Lake, San Juan, Sanpete, and Summit counties; Alaska and Yukon, south to California, Nevada, and Colorado; 21 (iii). Our material has been segregated into the common var. *eschscholtzii*, with broad lobes and rounded teeth and var. *trisectus* (Eastw.) L. Benson [*R. trisectus* Eastw. in Robins.] with slender more acute lobes. Importance of the distinction is unclear. Specimens from the La Sal Mts. have been designated as var. *eximius* (Greene) L. Benson [*R. eximius* Greene] on the basis of more sharply lobed lower leaves.

Ranunculus flabellaris Raf. Yellow Water-crowfoot. [*R. delphinifolius* Torr. in A. A. Eaton, not H. B. K.]. Aquatic or palustrine perennials 3–8 dm long or more, submersed or on mud, rooting at the nodes; stems 2–8 mm wide; leaves all cauline, alternate, ternately compound, the main segments further divided into linear segments, these 0.3–2 mm wide, the blades 1–6 cm long; petioles 2–12 cm long or more, the aerial leaves simple, 3-parted to -divided and again lobed, with petioles to 20 cm long; pedicels 1–8 cm long; sepals 5, greenish, 6–7.5 mm long, glabrous, spreading, deciduous; petals 5, yellow, 7–10 mm long, obovate to orbicular; achenes not ridged, ca 4 mm long, 40–100 or more in a subglobose cluster 6–10 mm long and 7–11 mm wide; beaks 1.3–2 mm long; receptacles hairy; $n = 16$. Ponds, marshes, and other wet sites at 1310 to 2685 m in Cache, Duchesne, Salt Lake, and Summit counties; widespread in North America; 1 (0).

Ranunculus flammula L. Creeping Spearwort. [*R. repens* L.]. Palustrine perennials, with vegetative stems produced into strawberrylike stolons, often rooting at the nodes, glabrous or nearly so; flowering stems 1–10 cm tall; leaves simple, alternate (appearing basal), the petioles 2–13 mm long, the blades 0.5–7.5 cm long, 1–8 mm wide, linear to narrowly elliptic, lanceolate or oblanceolate, acute at both ends, entire; pedicels 2–10 cm long; sepals 5, 2–5 mm long, glabrous or pubescent, greenish, deciduous; petals 5, yellow, 2–8 mm long; achenes 1.2–1.8 mm long, 5–30 in a subglobose cluster, glabrous;

beak 0.1–0.7 mm long; receptacle glabrous; $2n = 32$. Margins of ponds, lakes, streams and other moist muddy or gravelly sites in aspen, alder, lodgepole pine, spruce-fir, and meadow communities at 2315 to 3355 m in Daggett, Duchesne, Garfield, Iron, Kane, Salt Lake, Sevier, Summit, Uintah, Utah, and Wayne counties; widespread in North America; circumboreal; 26 (ix). Segregation of infraspecific taxa seems to be unnecessary.

Ranunculus gelidus Kar. & Kir. Tundra Buttercup. Terrestrial perennials, from a subterranean root crown and long-sheathing marcescent leaf base; stems abruptly curved above or below the floral bracts, 0.2–1 dm tall, not rooting at the nodes, glabrous or sparsely hairy; basal leaves simple, the petioles 1.5–6 cm long, the blades 0.5–1 (2) cm long, cordate to uniform in outline, 3-parted and again cleft or parted; cauline leaves alternate, sessile or subsessile; pedicels 1.5–6.5 cm long; sepals 5, 2.5–4.5 mm long, spreading or reflexed, pubescent with pale hairs, deciduous; petals 5, 3.5–5 mm long; achenes 2–2.5 mm long, 30–80 in a subglobose to elongate cluster, glabrous; beak 0.4–0.7 mm long; receptacles glabrous; $2n = 16$. Smelowskia-sedge community in alpine tundra at 3415 to 3800 m in Duchesne and Summit counties; Alaska and Yukon, south to Colorado; 2 (i). The sheathing marcescent bases, abruptly curved, horizontally spreading stems, and dissected short lower leaf blades are diagnostic for this species, which is disjunct from the arctic.

Ranunculus glaberrimus Hook. Sagebrush Buttercup. Terrestrial perennials, mainly 5–19 cm tall, glabrous; stems 1–2 mm thick, erect, not rooting at the nodes; basal leaves simple, the blades entire or apically 3-lobed, 1–5.2 cm long 0.5–2 cm wide, orbicular to ovate, elliptic, or oblanceolate, rounded to acute or obtuse at both ends; petioles 2–7 cm long; cauline leaves simple or dissected into 2 or 3 linear or lanceolate lobes, bracteate; pedicels 1–8.5 cm long; sepals usually 5, green or suffused with purple, 4.5–7 mm long, pubescent, spreading, deciduous; petals 5, yellow, 6.5–11 mm long, mostly 5–10 mm wide; achenes hairy, 1.3–3.5 mm long, 60–180 in a globose cluster 8–11 mm thick; beaks 0.5–0.7 mm long; receptacle glabrous; $2n = 64, 80$. Sagebrush, meadow, ponderosa pine, Douglas fir, aspen, and lodgepole pine communities at 1460 to 3050 m in Beaver, Box Elder, Cache, Carbon, Daggett, Juab, Salt Lake, San Juan, Sevier, Summit, Tooele, and Uintah counties; British Columbia to the Dakotas, south to California and New Mexico; 22 (j). Our material has been recognized as belonging to two varieties; var. *glaberrimus*, with orbicular usually lobed basal leaves and var. *ellipticus* Greene, with narrow unlobed basal leaves. The differences do not seem to represent taxonomic entities.

Ranunculus gmelinii DC. Gmelin Buttercup. [*R. multifidus* var. *repens* Hook., in Wats., type from Weber Valley, Summit County]. Palustrine or aquatic perennials, mainly 2–5 dm long, glabrous or pubescent; stems 1.5–3 mm thick, prostrate or floating, rooting at the nodes; leaf blades simple, 3-parted or divided, the primary lobes again lobed or forked, seldom some dissected into linear segments, cordate basally, orbicular to uniform in outline; pedicels 1–5 cm long; sepals 5, greenish, 2.5–6 mm long, glabrous or pubescent, deciduous; petals 5, yellow, 4–8 mm long; achenes 1–1.5 mm long, 50–70 in an ovoid cluster, glabrous; beak 0.6–0.8 mm long; receptacle hairy. Pond margins and wet places often exposed as water dries, at 1705 to 2930 m in Duchesne, Morgan, Rich, Sanpete, Sevier, Summit, and Weber

counties; widely distributed in North America; Asia; 2 (0). *R. gmelinii* is a near congener of *R. flabellaris*, from which it is distinguished mainly by its usually smaller parts, but with which it would probably best be combined at some infraspecific status. Both were published in 1818, and would be difficult to decide priority should they be combined. Recognition of infraspecific taxa within our portion of the species seems unnecessary.

Ranunculus hyperboreus Rottb. Arctic Buttercup. Aquatic (sometimes palustrine) perennials; stems prostrate to erect (sometimes floating), 1–5 dm long, rooting at the nodes, glabrous; leaves mostly cauline, alternate, the petioles 1.5–5 cm long; blades simple, 3–8 (10) mm long, with 3–5 entire, rounded lobes, truncate to rounded or cordate basally; pedicels 0.5–4 cm long; sepals 5, greenish, 2–3 mm long, glabrous, deciduous; petals 5, yellow, 2–4 mm long; achenes 0.6–0.8 mm long, 10–20 in a globose cluster, glabrous; beaks ca 0.1 mm long; receptacle glabrous; $2n = 16, 24, 32, 64$. Bogs and wet meadow at 2590 to 2900 m in Daggett, Rich, and Summit counties; widespread in northern North America; circumpolar; 6 (0). This is a near ally of *R. natans*, q. v., and our materials might be more nearly allied to that taxon. More specimens must be examined to determine the exact affinities.

Ranunculus inamoenus Greene Drab Buttercup. [*R. alepeophilus* A. Nels.; *R. utahensis* Rydb., type from Alta; *R. inamoenus* var. *alepeophilus* (A. Nels.) L. Benson]. Terrestrial perennials, mainly 0.5–4.4 dm tall, hairy or glabrous; stems 1.5–3 mm thick, erect, not rooting at the nodes; basal leaf blades simple, erenate or 3-lobed, truncate to obtuse or acute basally, 1–5.5 cm long, 1–4.5 cm wide; petioles 1.5–15 cm long; cauline leaves sessile or shortly petiole, deeply lobed or divided; bracts sessile usually 3- to 5-lobed, the lobes mainly 3–10 mm wide or more; pedicels 0.5–7 cm long; sepals 5, green or suffused with purple, 4–7 mm long, obovate; petals 5, yellow, mostly 5–7 mm long, elliptic to obovate; achenes hairy or glabrous, 1.6–2.5 mm long, 16–200 in an elongate cluster 7.5–17 mm long and 5.5–8.5 mm thick; beaks 0.2–0.8 mm long, straight or curved; receptacle hairy or glabrous. Sagebrush, ponderosa pine, mountain brush, Douglas fir, aspen, spruce-fir communities, often in meadows, at 1370 to 3540 m in all Utah counties, except Morgan and Rich; British Columbia and Alberta, south to Nevada, Arizona, and New Mexico; 98 (xii). Recognition of infraspecific taxa seems to be inadvisable.

Ranunculus jovis A. Nels. Jupiter Buttercup. [*R. digitatus* Hook., not Gilib.]. Terrestrial perennials, glabrous, 2–11 cm tall; roots tuberous, clustered, clavate, 2–5 mm thick; stems 1–4 mm wide, erect, not rooting at the nodes; basal leaf blades simple but divided into 2–5 lance-oblong to oblanceolate segments 0.8–4 cm long and 2–10 cm wide; petioles 1–8 cm long; cauline leaves sessile, commonly 2 or 3-lobed; pedicels 0.5–6 cm long, abruptly curved-spreading in fruit; sepals 5, green or suffused with purple, 2–7.5 mm long, glabrous, reflexed, deciduous; petals 5, yellow, 4–15 mm long; achenes glabrous or pubescent, 1–2.3 mm long, 50–70 in a globose to elongate cluster 4–6.5 mm long and 4.5–6 mm wide; beaks 0.2–1 mm long; receptacle glabrous. Sagebrush, mountain brush, aspen, and spruce-fir communities at 1525 to 2745 m in Box Elder, Cache, Juab, Morgan, Salt Lake, Summit, Utah, and Wasatch counties; Wyoming, Idaho, and Nevada; 24 (iii). This is a remarkable

plant, flowering at edges of snowbanks from low to high elevations.

Ranunculus macounii Britt. Macoun Buttercup. [*R. hispidus* Hook.]. Terrestrial perennials; stems 2–10 dm tall, erect to decumbent, sometimes rooting at the lower nodes, pubescent with long spreading hairs, 3–12 mm in diameter; basal leaves simple or pinnately (subpalmately) 3- to 5-foliolate (rarely double the compound); petioles 5–20 cm long, the blades 3–9 cm long, on petiioles 0.1–2.3 cm long; cauline leaves alternate, similar to the basal; pedicel 0.3–11.5 cm long; sepals 5, often suffused with purple, 3.5–8.5 mm long, reflexed, long-hairy, deciduous; petals 5, yellow, 3–8 mm long; achene 2–3 mm long (excluding beaks), 20–60 in a subglobose cluster 7–14 mm long and 7–15 mm wide; beaks 0.8–1.5 mm long; receptacle glabrous; $2n = 48$. Stream margins and moist meadows at 1370 to 2960 m in Box Elder, Cache, Davis, Daggett, Duchesne, Garfield, Grand, Kane, Morgan, Piute, Rich, Salt Lake, San Juan, Sanpete, Sevier, Summit, Uintah, Utah, Washington, and Weber counties; widely distributed in North America; 48 (vii). The short petals proportional to sepal length, and moderately long, straight achene beaks, are diagnostic characteristics allowing segregation of *R. macounii* from other tall buttercup species. Occasional specimens have creeping stems rooting at the nodes as in *R. repens*, the apparent nearest ally. However, that species has very showy flowers and usually curved achene beaks.

Ranunculus natans C. A. Mey. in Ledeb. Floating Buttercup. [*R. hyperboreus* var. *natans* Regel]. Aquatic or palustrine perennials, mainly 0.5–5 dm long; stems prostrate or floating, rooting at the nodes; leaves all cauline, alternate, the petioles 1–6 cm long, the blade 5–15 cm long and usually broader, rounded to cordate basally, 3- to 5-lobed, the lobes broadly rounded; pedicels 2–8 cm long; sepals 5, greenish, 2–4.5 mm long, spreading, deciduous; petals 5, yellow, 3–4.5 mm long; achenes 1–1.2 mm long, glabrous, 25–70 in an ovoid cluster; style beak 0.1–0.3 mm long. Ponds, bogs, and wet meadows at 1920 to 2745 m in Daggett and Rich counties; Alberta to Colorado; Eurasia; 3 (0).

Ranunculus oreogenes Greene Mountain Buttercup. [*R. collomae* L. Benson]. Terrestrial perennial, 5–10.5 cm tall, glabrous; stems 1–2 mm thick, erect but abruptly bent, soon spreading, not rooting at the nodes; blades of basal leaves simple, linear to elliptical, entire, 1.5–5 cm long, 0.2–1.3 cm wide, the petioles 2–3.2 cm long; cauline leaves and bracts simple, not lobed; pedicels 2.5–6 cm long; sepals 5, greenish or suffused with purple, ca 5 mm long, pilose, spreading, deciduous; petals 5, yellow, 7–12 mm long; achenes hairy, 3–3.2 mm long, 50–100 in an ovoid cluster 10–12 mm long and 9–10 mm wide; beaks ca 1 mm long, curved; receptacle pubescent. Pinyon-juniper and ponderosa pine communities at ca 1830 to 2440 m in Kane (Benson 1948) and San Juan counties; Arizona, Colorado, and New Mexico; 3 (0). A specimen from the north side of Navajo Mt. (Atwood 4186 BRY) is peculiar in having slender involute leaves and more or less persistent sepals. This species is identical with *R. glaberrimus* in general aspect, differing in no discernable way except for the entire cauline leaves and bracts. Possibly it would best be treated at varietal level within that taxon, a fact not intended or implied herein.

Ranunculus orthorhynchus Hook. Straight-beaked Buttercup. [*R. orthorhynchus* var. *platyphyllus* Gray,

based on *R. macranthus* Wats., type from Wasatch Mts.]. Terrestrial perennials 2.5–8 dm tall, spreading long-hairy; stems 2.5–8 mm thick, erect, not rooting at the nodes; basal leaves mostly pinnately trifoliate, the terminal division long-petiolulate and deeply lobed or again compound, the lateral leaflets more shortly petiolulate but sometimes again compound, the blade 4–13 cm long and 4–11 cm wide; petioles 6–31 cm long; cauline leaves similar to the basal, gradually reduced upward to the sessile or short petiolate bracts, these 3-parted with broad, toothed segments; pedicels 2–16 cm long; sepals 5, greenish and suffused with purple, 6.5–12.5 mm long, sparingly long-pilose, reflexed, tardily deciduous; petals 5, yellow, 8.5–14 mm long; achenes 5–7.5 mm long, 25–65 in a globose cluster 8.5–17 mm high and 10–19 mm thick; beaks 2.5–4 mm long; receptacle hirsute; $n = 16$. Pinyon-juniper, mountain brush, sagebrush-grass, aspen, tall forb, and spruce-fir communities, often in meadows, at 2195 to 3115 m in Cache, Carbon, Daggett, Duchesne, Emery, Grand, Iron, Salt Lake, Sanpete, Sevier, Summit, Utah, and Wasatch counties; British Columbia to Montana, south to California; Nevada, and Wyoming; 30 (ii). Our material is assignable to *var. platyphyllus* Gray. The large flowers, large achenes with long beaks, and definitely pinnately compound main lower leaves are diagnostic.

Ranunculus pedatifidus J. E. Sm. ex Rees Northern Buttercup. Terrestrial perennials; stems erect, mainly 0.6–2 dm tall (rarely taller), puberulent to glabrous, not rooting at the nodes; basal leaves simple, the petioles 1–4 cm long or more, the blades 0.8–1.2 (3) cm long, usually divided into numerous linear to narrowly oblanceolate lobes; cauline leaves alternate; bracts divided into 3–7 linear lobes, sessile; pedicels 1–10 cm long or more; sepals 5, greenish, 4–6 mm long, spreading, pubescent, deciduous; petals 5, yellow, 4–6 (10) mm long; achenes ca 2 mm long, 25–70 in an elongate cluster, glabrous, the beak 0.6–1 mm long. Alpine tundra at ca 3415 m in Summit County (Ostler 640, 1977 BRY); widespread in Northwestern America; 1 (0). This attractive dwarf plant shares features with both *R. gelidus* (size of petals and leaves) and *R. adoneus* (narrow leaf segments). More collections are necessary to determine the nature of this plant in Utah.

Ranunculus ranunculinus (Nutt.) Rydb. Little Buttercup. [*Cyrtorhyncha ranunculina* Nutt. ex T. & G.]. Terrestrial perennials 1.5–2.5 dm tall, glabrous; stems 0.8–2.5 mm wide, erect, not rooting at the nodes; blades of basal leaves 4–6 cm wide, 3–5.5 cm long, pinnately ternate, the leaflets again lobed or parted into segments 1–4 mm wide; petioles 7–11 cm long; cauline leaves and bracts similar to the basal leaves or reduced and becoming sessile; pedicels 1–7 cm long; sepals 5, yellowish, 2–4 mm long, glabrous, spreading, deciduous; petals 5, yellow, 3–6 mm long; achene 2.4–2.8 mm long, 10–30 in a hemispheric cluster ca 5 mm long and 5–7 mm wide; beaks 0.6–1.2 mm long; receptacle glabrous; $2n = 32$. Aspen and spruce fir or mountain brush communities, often in crevices in limestone cliffs at ca 2135 to 2595 m in Cache county; Wyoming, Colorado, and New Mexico; 3 (0).

Ranunculus repens L. Creeping Buttercup. Terrestrial perennials, mainly 1–8 dm tall, densely to sparingly spreading hairy; stems 0.8–8 mm thick, prostrate-decumbent to erect often rooting at the nodes; blades of

basal leaves trifoliate (rarely 5-foliate) but pinnately compound, the petiole of the central leaflet longer than those of lateral ones, 1–11 cm long and about as broad, the leaflets again lobed or toothed, rarely again compound; petioles 3–28 cm long; cauline leaves similar to the basal ones, reduced upwards and transitional to sessile or subsessile bracts; pedicels 1–15 cm long; sepals 5, greenish or suffused with purple, 5–8.5 mm long, hairy, spreading, deciduous; petals 5 to numerous, yellow, 3.5–15 mm long; achenes 2.4–4 mm long, 20–40 in a subglobose cluster 6.5–9.5 mm long and 7–10 mm wide; beaks 0.5–1 mm long, the margins prominent; receptacle hairy. Lawns, gardens, banks of streams, and irrigation canals at 1310 to 1895 m in Cache, Davis, Duchesne, Garfield, Salt Lake, Sevier, Summit, Uintah, and Utah counties; widely established in North America; adventive from Eurasia; 21 (i). Two phases are present; a many-petaled one with buttonlike flowers (*var. pleniflorus* Fern.), and a single flowered one with usually 5 large petals (*var. repens*). They sometimes grow intermixed. Plants with usually 5-petaled flowers are distinguished from the similar *R. macounii* by the proportionately greater petal-sepal ratio and usually curved achene beaks.

Ranunculus sceleratus L. Blister Buttercup. Palustrine or semiaquatic annuals, glabrous or nearly so; stems 2–15 mm thick, fistulose, thin-walled and often succulent, erect, not rooting at the nodes; blades of basal leaves simple, 3-lobed or parted, 0.5–4.5 cm long, 0.5–6 cm wide, the main lobes again lobed, parted, or toothed; cauline leaves similar to the basal ones, alternate, petiolate; petioles 1.5–30 cm long; bracts sessile or shortly petiolate variously narrowly lobed or entire; sepals 5; greenish, 2–5.5 mm long, hairy spreading, deciduous; petals 5, yellow, 0.5–5 mm long; achenes glabrous, 0.8–1.3 mm long, mostly 90–200 or more in a cylindrical to subglobose cluster 4–11 mm long and 2.5–8 mm wide; beaks to 0.2 mm long; receptacle sparsely hairy; $2n = 32, 64$. Pond, lake, stream, and spring margins and banks, or in other wet places, at 1495 to 2535 m in probably all Utah counties; Alaska and Yukon; 41 (v). Our material is assignable to *var. multifidus* Nutt. in T. & G. This is the only annual buttercup of wetlands in Utah.

Ranunculus testiculatus Crantz Bur Buttercup. [*Ceratocephalus testiculatus* (Crantz) Roth]. Terrestrial annuals, 1.5–10 cm tall, tomentose; stems scapose, 0.5–1.5 mm thick erect or decumbent, not rooting at the nodes; leaves all basal, simple, 0.3–4 cm long, 0.3–3 cm broad, deeply 3-parted, the lateral segments again lobed into linear segments; petioles 0.5–3 cm long, broadly winged; sepals 5, green, 2.5–8.5 mm long, tomentose, spreading, persistent; petals 2–5, yellow, 3.5–8 mm long; achenes tomentose, 3-loculed, the 2 lateral locules empty, 5–80; in an elongate cluster 7–23 mm long; receptacle tomentose; $2n = 14$. Weedy species in most dry land community types at 1155 to 3050 m in probably all Utah counties; introduced from Eurasia, now widely established in Western U. S.; 54 (vi). This species is one of our earliest flowering plants, often opening the first flowers before the scape elongates. It has long been regarded as belonging to the genus *Ceratocephalus* by European workers.

Thalictrum L.

Perennial, glabrous, rhizomatous herbs, the stems simple or branched above, erect; leaves alternate or basal, bi- or tritermately compound; flowers perfect or imperfect,

regular, inconspicuous, borne in racemes or panicles; sepals 4 or 5, green, whitish, or purplish, caducous; petals lacking; stamens 8 to many; pistils 2 to many; fruit a sessile or stipitate, beaked achene.

Boivin, B. 1944. American *Thalictrum* and their Old World Allies. *Rhodora* 46: 337-77; 391-445; 453-57.

1. Plants dioecious, the flowers imperfect; peduncles straight below the achene cluster; achenes spreading in all directions; anthers 2.5-3.5 mm long, borne on filiform, usually contorted stamens; plants common
 *T. fendleri*
- Plants with perfect flowers or, if imperfect, the ultimate leaf segments less than 6 mm long (see *T. heliophilum*) 2
- 2(1). Plants dioecious, the flowers imperfect; ultimate leaf segments less than 6 mm long; known from western Colorado, and to be sought on the shales of eastern Utah *T. heliophilum* Wilkins
- Plants with flowers perfect, ultimate leaf segments various in size, seldom if ever of shales in eastern Utah 3
- 3(2). Leaves all basal, except for a single small leaf below the stem middle; flowers in racemes; staminal filaments linear; stems mainly less than 2.5 dm tall; plants rare in alpine sites *T. alpinum*
- Leaves mainly cauline; flowers in panicles; staminal filaments dilated upwards; stems commonly over 3 dm tall; plants uncommon in montane sites . . . *T. sparsiflorum*

Thalictrum alpinum L. Arctic Meadowrue. [*T. duriusculum* Greene, type from near Fish Lake]. Plants 0.3-2.5 (3) dm tall; leaves all basal or with a single leaf near the base, 2-8 (13) cm long, biternate, the segments 3-8 mm long; racemes elongate; pedicels recurved in fruit; flowers perfect; sepals purplish tinged; stamens 8-15, the filaments linear or slightly expanded apically; anthers 1.5-3 mm long; achenes 2-3.5 mm long, subsessile. Wet meadows and cold (often calcareous) bogs in willow-sedge, lodgepole pine, and spruce-fir communities at ca 2440 to 2900 m in Daggett, Duchesne, Emery, Juab, Sevier, Summit, and Wayne counties; Alaska and Yukon, east to the Atlantic, south to California, Nevada, and New Mexico; circumboreal; 9 (i).

Thalictrum fendleri Engelm. ex Gray Fendler Meadowrue. Plants dioecious, perennial; stems mainly 2-8 (10) cm tall, often purplish, commonly branching above; leaves mainly cauline (but larger towards the base), usually biternate, the ultimate segments (5) 8-20 mm long, ovate to obovate or orbicular, thin, dark green above, pale and often glandular beneath; panicles small to large, leafy bracteate; pedicels straight, not abruptly bent below the flowers in fruit; sepals whitish or greenish, 2-4 mm long; stamens 18-25, the anthers apiculate, 2.5-3 mm long, shorter than the usually contorted, filiform (often purplish) filaments; achenes 5-11 mm long, sessile or nearly so, spreading (often appearing as a round cluster when pressed), the body 4-7 mm long, strongly flattened, glabrous or glandular, obliquely elliptic-obovate in outline; styles 2-4 mm long, stigmatic almost the entire length; $2n = 28$. Willow, birch, mountain brush, sagebrush-snowberry, boxelder-cottonwood, alder, ponderosa pine, lodgepole pine, aspen-tall forb, and spruce-fir communities at 1370 to 3355 m in probably all Utah counties; Oregon to Wyoming, south to California, Arizona, New Mexico, and Texas; northern Mexico; 136 (xxi). This is our common meadowrue, being practically omnipresent in the aspen zone in Utah. Reports of *T. occi-*

dentale Gray probably belong here. That species has the achenes spreading to reflexed, usually more than twice longer than wide, stigmas often purplish, with the style 3-4 mm long. None of our numerous specimens approaches that species.

Thalictrum sparsiflorum Turcz. ex Fisch. & Mey. Montane Meadowrue. Plants 2.5-10 dm tall, simple or branched above; leaves mainly cauline, usually triternate, the ultimate segments 5-20 mm long, green above, pale and often glandular beneath, obovate to orbicular; inflorescence simple or branched, leafy, with bracts subtending pedicels leafletlike; pedicels abruptly recurved below the flowers in fruit; flowers perfect; sepals whitish or greenish, 2-3.5 mm long; stamens 12-20, the filaments whitish, somewhat dilated upwards, 3-4.5 mm long; anthers 0.5-0.8 mm long; achenes shortly stipitate, 3-4.5 mm long, strongly flattened, glandular, obliquely obovate in outline; styles 1-1.5 mm long, the stigmatic portion ca 1 mm long; $2n = 14, 42$. Alder, willow, aspen, lodgepole pine, and spruce-fir communities at 1860 to 3355 m in Beaver, Carbon, Duchesne, Piute, Sevier, Summit, Uintah, and Utah counties; Alaska and Yukon, south to California and Colorado; 13 (iv).

Trautvetteria Fisch. & Mey.

Perennial, rhizomatous herbs; stems erect; leaves basal and cauline, alternate, deeply palmately lobed; flowers in more or less dichotomously branched corymbose panicles, perfect; perianth white or greenish, in 1 series, of 3-7 caducous, concave segments; stamens and pistils numerous; achenes sharply angular, not ribbed, with a hooked, persistent style.

Trautvetteria carolinensis (Walter) Vail [*Hydrastis carolinensis* Walter; *T. grandis* Nutt.; *T. media* Greene]. Plants rhizomatous, the stems solitary or few to several, erect, 2.5-10 dm tall, usually glabrous below but puberulent above; leaves mainly basal, long-petiolate, the blades 1-3 dm broad, 5- to 11-lobed, the lobes variously again lobed and serrate-dentate, glabrous above, commonly pubescent and paler beneath; cauline leaves 1 or 2, alternate, short-petiolate; sepals 3-6 mm long, ovate; staminal filaments 5-7 mm long; achenes 3-4 mm long, strongly veined on the angles. Boggy stream-sides at ca 2745 to 3000 m in the Abajo Mts., San Juan County; British Columbia south to California and New Mexico; 2 (0).

Trollius L.

Perennial, rhizomatous herbs; stems erect; leaves basal and cauline, alternate, palmately lobed to compound; flowers perfect, regular, solitary or few; sepals 5 to several, petaloid; petals 5-10, linear, glandular (sometimes regarded as staminodia); stamens numerous; pistils few to numerous; fruit of few- to several-seeded follicles.

Trollius laxus Salisb. [*T. americanus* DC.; *T. laxus* var. *albiflorus* Gray; *T. albiflorus* (Gray) Rydb.]. Terrestrial perennials, usually tufted from a caudex and fibrous roots; stems erect, 1 to several, 1-7.5 dm tall; basal leaves with petioles 2-30 cm long, the blade palmately cleft and usually 5-lobed, the lobes again lobed or toothed; cauline leaves usually 2-4, becoming sessile upwards; flowers solitary on pedicels 2-20 cm long; sepals 5-9, 10-20 mm long, white to cream; petals 2-5 mm long; follicles 8-12 mm long, drying blackish. Bogs, wet meadows, and other moist sites in aspen, spruce-fir, and lodgepole pine com-

munities at 2745 to 3300 m in Duchesne, Summit, Uintah, and Wasatch counties; British Columbia east to the eastern U. S., south to Oregon and Colorado; 20 (iii). This is a very attractive large-flowered plant that is often associated with *Caltha leptosepala* in cold wet sites at higher elevations.

RESEDACEAE S. F. Gray

Mignonette Family

Annual or perennial herbs with watery sap; leaves alternate, simple, or pinnately to subpalmately divided; flowers perfect, irregular, borne in terminal racemes; sepals (4) 5–6 (8), distinct; petals (4) 5–6 (8), unequal in size, the upper one the largest, appendaged; stamens 8 or more, borne on the upper side of a rounded disk, the anthers 2-loculed; pistil 1, the ovary superior, with usually 3 (2–6) carpels; style lacking; fruit a capsule, usually open at maturity; $x = 6-15$.

Reseda L.

Erect or ascending annual or perennial herbs from a taproot; leaves alternate; flowers greenish yellow; sepals subequal; petals unequal; pistils 1, the carpels usually 3, open toward the apex.

Reseda lutea L. Yellow Mignonette. Plants simple or much branched, glabrous; leaves pinnatifid or subpalmately divided; flowers greenish yellow, numerous, borne in elongate racemes; petals usually 6, each commonly with 3 connate or distinct appendages; ovary and capsule usually with 3 apical lobes; $2n = 24, 48$. Cultivated ornamental; rarely escaping Utah; introduced from the Old World; 1 (0).

RHAMNACEAE A. L. Juss.

Buckthorn Family

Shrubs or small trees; leaves simple, alternate or opposite, pinnately or palmately veined; stipules small; flowers perigynous, perfect or polygamous, regular or nearly so; sepals 4 or 5, lined with a disk; petals 4 or 5, distinct, or absent; hypanthium present; stamens equaling the petals in number and opposite them; pistil 1, the ovary free or coalescent with the fleshy disk, 2- or 3-loculed, each locule with 1 ovule; style 1, commonly cleft; fruit a capsule or a berry; $x = 9-13, 23$.

1. Fruit dry, capsular; flowers showy, borne in terminal or axillary clusters *Ceanothus*
- Fruit fleshy, drupe-like; flowers small, inconspicuous, borne axillary or in axillary clusters 2
- 2(1). Leaves palmately 3-veined from the base *Ziziphus*
- Leaves pinnately several- to many-veined *Rhamnus*

Ceanothus L.

Shrubs; leaves alternate or opposite, deciduous or persistent, commonly with 3 main veins from the base; flowers small, but showy, white to cream, borne in terminal or lateral, corymbose cymes; sepals 5, somewhat petaloid, united below with the urn shaped receptacle (this filled with a glandular disk surrounding the ovary); petals 5, distinct, clawed; stamens 5, opposite the petals; ovary 3-loculed, 3-lobed; style 3-cleft; fruit a capsule; seeds smooth.

1. Leaves opposite, pinnately veined, with several broad veins; stipules thick, commonly persistent (at least the lower part) *C. greggii*
- Leaves alternate, palmately 3-veined from the base; stipules thin, usually deciduous except for a thickened basal scar 2
- 2(1). Branches thorny; leaves both entire and permanently pubescent beneath *C. fendleri*
- Branches unarmed; leaves toothed or entire, but not permanently pubescent beneath 3
- 3(2). Leaves deciduous, mainly 0.5–2.5 cm long, entire near the base; plants inodorous *C. martinii*
- Leaves persistent, leathery, mainly 2.5–6 cm long or more, serrulate throughout; plants with odor of cinnamon *C. velutinus*

Ceanothus fendleri Gray Fendler Mountain-lilac. [*C. fendleri* var. *viridis* Jones, type from Elk Ranch, Kane (?) County]. Low, rounded to spreading, thorny (rarely unarmed) shrubs, mainly 2–8 dm tall; leaves alternate, deciduous, short-petiolate, the blades 3–24 mm long, 2–11 (14) mm wide, elliptic to oblong, ovate, acute or acutish, entire or serrulate, pale and persistently short-hairy beneath; inflorescence more or less corymbose; sepals ca 0.3–0.5 mm long; petals hooded, ca 1.5–1.8 mm long, white; fruit 4–5 mm thick, 3-lobed; seeds shiny, brown, 2.5–3 mm long. Ponderosa pine-manzanita, and less commonly in pinyon-juniper, aspen, and spruce communities at 1950 to 2840 m in Beaver, Daggett, Duchesne, Garfield, Iron, Kane, Piute, San Juan, Sevier, Uintah, and Wayne counties; Wyoming to South Dakota, south to Arizona, New Mexico, and Texas; 36 (iii).

Ceanothus greggii Gray Desert Mountain-lilac. Shrubs, mainly 0.2–2 m tall, erect or low and rounded, unarmed, the branchlets tomentose; leaves opposite, more or less persistent, 5–16 mm long, 3–8 mm wide, elliptic to obovate, thick and leathery, entire or toothed, more or less hairy on one or both sides, pinnately veined; inflorescence more or less corymbose; sepals white ca 1–1.5 mm long; petals white or purple, hooded, ca 1.5–3 mm long; fruit 4–5 mm thick; seeds brown, shiny, ca 4 mm long. Mixed desert shrub, pinyon-juniper, and mountain brush communities at 1220 to 2870 m in Grand, Iron, San Juan, Washington, and Wayne counties; Nevada, California, Arizona, New Mexico; Texas, and Mexico; 29 (iii). Specimens from San Juan County are mainly rimrock plants at the margin of pinyon-juniper communities, and form low-rounded bushes mainly 2–5 dm tall, typical of the material in the Colorado Drainage. Plants from Washington County are typically much taller (1–2 m).

Ceanothus martinii Jones Utah Mountain-lilac. [*C. utahensis* Eastw., type from Soldier Summit, Wasatch County]. Low, rounded to spreading, unarmed shrubs, mainly 2–8 dm tall; leaves alternate, deciduous, short-petiolate, the blades 7–30 mm long, 4–22 mm wide, elliptic to oval, ovate or obovate, entire or serrulate except at the base, green on both sides, variously strigose, but especially so on veins beneath; inflorescence more or less corymbose; sepals 0.5–1.2 mm long, petals hooded 1.8–2.4 mm long, white; fruit 4–5 mm thick, 3-lobed; seeds shiny brown, ca 3 mm long. Pinyon-juniper, mountain brush, sagebrush, ponderosa pine, Douglas fir, aspen, and bristlecone pine communities at 1830 to 2930 m in Beaver, Box Elder, Carbon, Davis, Duchesne, Emery,

Garfield, Juab, Kane, Millard, Piute, Salt Lake, Sanpete (type from Manti Canyon), Sevier, Tooele, Utah and Washington counties; Nevada, Arizona, Colorado, and Wyoming; 50 (viii).

Ceanothus velutinus Dougl. Deer-brush. Rounded to spreading unarmed shrubs, mainly 0.5–1.5 m tall; leaves alternate, persistent with petioles 0.6–2.4 cm long, the blades 18–85 mm long, 12–55 mm wide, broadly elliptic to oval or oblong, strongly 3–veined from the base, serrulate throughout, green and shiny above, pale and velvety beneath; inflorescence more or less corymbose; sepals 0.9–1.4 mm long, white; petals hooded, 2–2.5 mm long, white; fruit 3–4 mm thick, 3-lobed; seeds tan, shiny, 2–2.5 mm long; 2n = 24. Ponderosa pine, sagebrush, mountain brush, aspen, and lodgepole pine communities at 1890 to 2900 m in Box Elder, Cache, Daggett, Davis, Duchesne, Millard, Morgan, Salt Lake, Sanpete, Summit, Tooele, Utah, and Weber counties; British Columbia to South Dakota, south to California, Nevada, and Colorado; 45 (iii). The plants have a pervasive odor of cinnamon that is especially noticeable when one tramples the plant.

Rhamnus L.

Shrubs or small trees; leaves alternate, pinnately veined, deciduous; flowers small, perfect or imperfect, in axillary clusters; calyx with 4 or 5 lobes, circumscissally deciduous following anthesis; petals 4 or 5 or lacking; stamens 4 or 5, with short filaments; pistils 1, the ovary free of the disk, 2- to 4-lobed; fruit a berrylike drupe.

Wolf, C. B. 1938. The North American species of *Rhamnus*. Rancho Santa Ana Bot. Gard Monogr. Bot. Ser. 1.

- 1. Leaves mainly with 10–12 lateral veins along each side; plants of the Colorado River Canyon and tributaries *R. betulifolia*
- Leaves with fewer lateral veins on each side (2–7); plants of different distribution 2
- 2(1). Main lateral veins of leaves 2–4 on each side; flowers 4-merous, the petals usually present; style 4-lobed *R. cathartica*
- Main lateral veins of leaves 5–9; flowers 5-merous, the petals lacking; styles 3-lobed 3
- 3(2). Main lateral veins of leaves 5–7, uncommonly cultivated shrubs, but known to escape and persist *R. alnifolia*
- Main lateral veins of leaves 8–9, uncommonly cultivated ornamental, not known to escape or persist *R. frangula* L.

Rhamnus alnifolia L'Her. Alder Buckthorn. Shrubs, mainly 1–1.5 m tall; leaves 1–8 cm long, elliptic to ovate, serrulate, glabrous or puberulent on one or both sides; umbels with 1–3 flowers, appearing before the leaves; flowers imperfect, mostly 5-merous; pedicels 2–6 mm long; calyx ca 3 mm long; petals lacking; fruit black, 6–8 mm long, subglobose, 3-seeded. Aspen-fir community at ca 2196 m in Davis and Salt Lake counties; British Columbia to Newfoundland, south to California and Wyoming; 1 (0).

Rhamnus betulifolia Greene Birchleaf Buckthorn. Shrubs, mainly 1–2.5 m tall; leaves alternate, with petioles 0.3–1.8 cm long, the blades 2.5–15 cm long, 1.6–8.5 cm wide, elliptic to obovate, or oblong, obtuse to abruptly short attenuate apically, hirtellous on one or both sides, at

least when young, the main lateral veins 7–12 on each side; inflorescence axillary, corymbose; flowers perfect, 5-merous; hypanthium, pedicels, and branches of the inflorescence puberulent; sepals 1.5–2.5 mm long, triangular; petals brownish, ca 1 mm long; style ca 1 mm long; ovary 3-lobed; fruits 7–10 mm long, with 3 seeds. Rock crevices, defiles, monolith bases, and hanging gardens at 1125 to 1895 m in Emery, Garfield, Grand, Kane, San Juan, Washington, and Wayne counties; Arizona, New Mexico, Texas, and Nevada; 52 (xvii).

Rhamnus cathartica L. Common Buckthorn. Shrubs or small trees, mainly 2–5 m tall, often armed with blunt thorns; leaves opposite or subopposite, the petioles mainly 5–25 mm long, the blades mostly 1.5–6 cm long, 1.2–3.5 cm wide, elliptic to obovate, oval or obovate, erenulate, rounded to abruptly short-attenuate, with 2–4 main lateral veins on each side; flowers 1–3, axillary, 4-merous; sepals 1.5–3 mm long; petals brownish, 1–1.3 mm long or shorter; style 4-lobed; fruit black, 5–7 mm thick, often with 4 seeds; 2n = 24. Cultivated, escaping, and persisting in Salt Lake and Utah counties; introduced from Eurasia; 1(0).

Ziziphus Miller

Shrubs or small trees; leaves alternate, petiolate, markedly 3-veined from the base; flowers in axillary cymes, the hypanthium filled with a massive disk surrounding the pistil but not adherent; petals present, caducous; ovary 2-lobed; fruit drupaceous, with a solitary 2-lobed stone.

Ziziphus jujuba Miller Jujube. Glabrous shrubs or small trees, mainly 3–8 m tall, spiny or unarmed; branchlets often clustered, simulating pinnate leaves often with 2 spines at each node; leaves glossy, commonly 2–6 cm long, ovate to lanceolate, serrate, obtuse to marginate; drupes dark red or brown. Uncommonly cultivated fruit plant, escaping and persisting mainly in Washington County; introduced from Eurasia; 5 (0). The fruit is edible, either dried or preserved, and resembles a small date.

ROSACEAE A. L. Juss.

Rose Family

Annual, biennial, or perennial herbs, shrubs, or trees; leaves alternate or basal (and still alternate) or less commonly opposite, simple or pinnately to palmately compound, mostly deciduous, stipulate or rarely exstipulate; flowers perfect or imperfect, regular, complete or incomplete, perigynous to epigynous, borne singly or in racemose, corymbose, umbellate or cymose clusters; sepals usually 5 (more in some), often bearing bracteoles alternate with the lobes, borne with petals and stamens on margin of a hypanthium; petals usually 5 (lacking or more in some), commonly showy; stamens 5 to numerous; pistils 1 to many, of 1 carpel, or of 5 connate or distinct carpels enclosed in the hypanthium; fruit an achene, follicle, drupe, pome, aggregate, hip, or accessory; x = 7–9, 17+. Note: The rose family is both large and complex. The diversity of fruit type reflects the many morphological differences in structure of the gynoecium. Suggestions by some workers that the group should be segregated into more than one family is not without merit. It is held together by the presence of the hypan-

thium on which the perianth and stamens are displayed. This is a complex structure, with several possible origins, and might fail ultimately as a diagnostic character.

- Plants trees, shrubs, or subshrubs Key 2

Key 1.

Plants herbaceous.

- 1. Petals lacking; flowers numerous, borne in dense spikes; leaves pinnately compound *Sanguisorba*
- Petals present; flowers not both numerous and borne in spikes 2
- 2(1). Leaves bi- or triternately dissected into linear segments; petals white; plants of Piute, Beaver, and Sevier counties *Chamaerhodos*
- Leaves various, but not bi- or triternately dissected into linear segments; petals white, yellow, or pink 3
- 3(2). Flowers solitary on scapose peduncles; leaves simple, crenate; fruit of plumose achenes; sepals and petals 8-10 each *Dryas*
- Flowers usually more than 1; leaves compound or lobed, rarely simple; fruit not of plumose achenes; sepals and petals usually 5 each 4
- 4(3). Bractlets lacking between the sepals; flowers with a stalked receptacle; hypanthium funnellform; plants of Washington County *Purpusia*
- Bractlets present, alternating with the sepals; flowers with sessile receptacle; hypanthium not funnellform 5
- 5(4). Leaflets tridentate apically, entire along the sides; stamens 5; plants prostrate or mat-forming, of high elevations *Sibbaldia*
- Leaflets variously toothed or lobed, but not regularly tridentate apically; stamens 5, 10, or more; plants of various habit and habitat 6
- 6(5). Leaves trifoliolate; plants with well-developed stolons; flowers white; receptacle ripening into an accessory fruit *Fragaria*
- Leaves mostly with more than 3 leaflets but, if trifoliolate, the lacking stolons; flowers typically yellow (less commonly purple or white); receptacle not ripening 7
- 7(6). Leaflets very numerous, mostly less than 6 mm long; petals usually clawed *Ivestia*
- Leaflets 3-15 (rarely more), commonly much more than 6 mm long; petals sessile 8
- 8(7). Leaves palmately or pinnately lobed or compound, not lyrate pinnatifid; styles at maturity not elongate and conspicuous *Potentilla*
- Leaves pinnately lobed or compound or more usually lyrate-pinnatifid; styles at maturity elongate and conspicuous *Geum*

Key 2.

Plants woody.

- 1. Leaves compound 2
- Leaves simple 7
- 2(1). Stems and/or leaves armed with prickles or spines 3
- Stems and leaves lacking prickles or spines 4
- 3(2). Pistils several, enclosed within a fleshy hypanthium; fruit a hip; petals very showy *Rosa*
- Pistils several to many, on an elongate receptacle; fruit an aggregate; petals not especially showy *Rubus*

- 4(2). Leaves bipinnately compound, the ultimate segments 0.5-1.5 mm long; herbage glandular-stellate, aromatic *Chamaebatiaria*
- Leaves once pinnately compound, the leaflets much longer than 1.5 mm; herbage not glandular-stellate 5
- 5(4). Leaflets 3-7; leaves 1.5-3.5 cm long; flowers yellow; low shrub *Potentilla*
- Leaflets 7-15 or more; leaves 5-20 cm long or more; flowers white to cream; moderate shrubs to small trees 6
- 6(5). Ovary superior; stamens 20 or more; leaflets 13-23; cultivated shrubs *Sorbaria*
- Ovary inferior; stamens 15-20; leaflets 9-15; indigenous shrubs or cultivated trees *Sorbus*
- 7(1). Leaves opposite; petals lacking, intricately branched, low desert shrubs of southern and southeastern Utah *Coleogyne*
- Leaves alternate; petals present (lacking in *Cercocarpus*); plants of various habits and habitats 8
- 8(7). Shrubs low, mat-forming; flowers solitary or in dense spikes on leafless or merely bracteate scapes 9
- Shrubs or small trees, never mat-forming; flowers various, but neither scapose nor subscapose 10
- 9(8). Flowers solitary, the sepals and petals mostly 8-10 each; leaves crenate; plants of alpine tundra *Dryas*
- Flowers in dense spikes, the sepals and petals commonly 5 each; leaves entire; plants of rock surfaces at low to moderate elevations *Petrophytum*
- 10(8). Pistils superior, the 1 to several ovaries separate or partially connate, not adnate to the hypanthium; fruit a drupe, aggregate, achene, follicle, or capsule 11
- Pistils inferior, the 3- to 5-carpellate ovaries adnate to the hypanthium; fruit a pome 20
- 11(10). Flowers inconspicuous; petals lacking; leaves entire and evergreen (except in *C. montanus*) *Cercocarpus*
- Flowers showy, though small in some; petals present; leaves mainly toothed or lobed, often deciduous 12
- 12(11). Pistil 1; fruit a drupe; leaves commonly with glands at base of blade or on petiole *Prunus*
- Pistils 1 to many; fruit not a drupe; leaves not gland-bearing 13
- 13(12). Leaves pinnately veined, the lobes, if any, pinnate 14
- Leaves palmately veined, the lobes palmately arranged or flabellate 16
- 14(13). Flowers yellow, solitary, terminating branches of the current year *Kerria*
- Flowers white to pink or lavender, borne in corymbs, panicles or racemes 15
- 15(14). Flowers borne in racemes, 1.5 cm wide or more; petals 6-12 mm long *Exochorda*
- Flowers borne in corymbs or panicles, less than 1 cm wide; petals 6-15 mm long *Spiraea*
- 16(13). Flowers large, 2 cm broad or more, in few-flowered cymes; fruit an aggregate *Rubus*
- Flowers commonly less than 2 cm broad, solitary or in corymbs or panicles 17
- 17(16). Flowers numerous, borne in panicles *Holodiscus*
- Flowers borne singly or in few- to many-flowered corymbs 18
- 18(17). Flowers borne in umbellate corymbs; leaves broad and thin, commonly 1-6 cm wide or more *Physocarpus*

- Flowers borne singly or in corymbose racemes; leaves thickish, seldom to 1 cm wide 19
- 19(18). Pistils numerous; petals white; leaf lobes tightly revolute; plants of low elevations in southern Utah . *Fallugia*
- Pistils 1–5 (rarely more); petals white to cream or pale yellowish; leaf lobes not tightly revolute; plants of broad distribution *Purshia*
- 20(10). Stems armed with thorns or spines 21
- Stems unarmed 23
- 21(20). Leaves evergreen, crenate-serrate; pomes commonly orange; petals white, less than 4 mm long . *Pyracantha*
- Leaves deciduous, serrate or doubly serrate; pomes variously colored, rarely orange; petals more than 5 mm long 22
- 22(21). Shrubs to 2 m tall (generally less); flowers 20–45 mm broad; fruit over 2 cm thick *Chaenomeles*
- Shrubs or small trees to 5 m tall or more; flowers 9–18 mm broad; fruit less than 1.5 cm thick *Crataegus*
- 23(20). Leaves entire or essentially so 24
- Leaves serrate to doubly serrate (see also *Peraphyllum*) 26
- 24(23). Leaves ovate to cordate ovate, 1.5–5 cm wide or more; pomes clothed with a villous tomentum *Cydonia*
- Leaves variously shaped, less than 1.5 cm wide; pomes glabrous 25
- 25(24). Shrubs to 1.5 m tall or more, indigenous; leaves narrowly elliptic; fruit an acrid pome *Peraphyllum*
- Shrubs of various height, cultivated; leaves ovate to obovate or oblanceolate; pomes mealy, non-acrid *Cotoneaster*
- 26(23). Flowers white, in racemes; plants indigenous, rarely cultivated; leaves prominently toothed towards the apex *Amelanchier*
- Flowers white or otherwise, in corymbs; plants cultivated, sometimes escaping; leaves toothed or lobed throughout 27
- 27(26). Leaves deeply or at least prominently lobed ... *Sorbus*
- Leaves moderately if at all lobed 28
- 28(27). Shrubs to 2 m tall (generally less); flower solitary or sessile in corymbose clusters *Chaenomeles*
- Shrubs or trees to 7 m tall or more; flowers pedicellate in corymbose or umbellate clusters 29
- 29(28). Flowers in umbels; styles connate at the base; fruit with few if any stone cells, apple-shaped *Malus*
- Flowers in corymbs; styles free; fruit with stone-cells, mostly pear-shaped *Pyrus*

Amelanchier Medicus

Shrubs or small trees with unarmed branches; leaves alternate, simple, not lobed; stipules linear, caducous; flowers perfect, regular, borne in racemes; hypanthium short, with a glandular disk on the inner surface; sepals 5, persistent; petals 5, white; stamens usually 10 or more; pistil 1, the ovary inferior, usually 5–loculed (appearing as 10); styles 2–5, the stigmas capitate; fruit a reddish to purplish, often glaucous, pome.

Jones, C. N. 1946. American species of *Amelanchier*. Ill. Biol. Monogr. 20: 1–126.

- 1. Leaves mainly over 2.5 cm long; petals mostly 9–15 mm long; styles commonly 5 *A. alnifolia*

- Leaves mainly less than 2.5 cm long; petals 5–10 mm long; styles 2–4 (rarely 5) *A. utahensis*

Amelanchier alnifolia (Nutt.) Nutt. Serviceberry, Shadbush, Saskatoon. [*Aronia alnifolia* Nutt.; *Amelanchier canadensis* var. *pumila* Nutt. in T. & G.; *A. pumila* (Nutt.) Roemer; *A. alnifolia* var. *eusickii* (Fern.) C. L. Hitchc.]. Low shrubs to small trees, mostly 2–5 m tall; leaves petiolate, mainly 20–50 mm long, 15–40 mm broad, oval to oblong, acute to rounded or subcordate basally, rounded to truncate apically, serrate near the apex, glabrous or hairy on one or both sides; flowers in short racemes; sepals 2.8–4.6 mm long; petals 9–15 mm long, 3.3–5.8 mm wide, spatulate-ob lanceolate, white to pinkish; styles 5 (or 4); fruit purplish to black purple, glaucous, subglobose, 6–14 mm long, palatable; 2n = 34. Streamsides, meadows, and mountain slopes at 1500 to 2900 m in sagebrush, mountain brush, aspen, and mixed conifer communities at 1220 to 2900 m in all Utah counties; Alaska and Yukon east to Hudson Bay and south to California, Arizona, New Mexico, and Nebraska; 112 (iii). Attempts to segregate the various proposed infraspecific taxa among our Utah materials are fraught with difficulties not easily overcome, even by application of mechanical and arbitrary keys. Pubescence or its absence and the position of that pubescence form the basis of the main proposed segregates. The feature of pubescence seems to be so variable, not only within *A. alnifolia*, but within *A. utahensis* (q.v.), that it might indicate a response to ecological conditions rather than genetic affinities. More work is indicated.

Amelanchier utahensis Koehne Utah Serviceberry. [*A. bakeri* Greene; *A. oreophila* A. Nels.; *A. utahensis* ssp. *oreophila* (A. Nels.) Clokey; *A. florida* var. *oreophila* (A. Nels.) R. J. Davis; *A. utahensis* var. *cinerea* Goodding, type from Washington County]. Low to large shrubs, mostly 0.5–4 m tall, intricately branched, often in dense clumps; leaves petiolate, mainly 10–27 mm long, 6–27 mm wide, oval to ovate, oblong, or elliptic, acute to rounded or subcordate basally, rounded to truncate or less commonly acute apically, serrate near the apex, hairy on one or both sides, rarely glabrous; sepals 1–3 mm long; petals 5.2–10 mm long, 1.8–4.2 mm wide, spatulate-ob lanceolate to elliptic, white, cream or pinkish; styles 2–4 (5); fruit purplish or pinkish, 5–12 mm long, palatable or dry and hardly edible. Streamsides, dry slopes, or thickets in sagebrush, grassland, mountain mahogany, mountain brush, pinyon-juniper, aspen, and ponderosa pine communities at 900 to 2800 m in all counties in Utah (type from Leeds, Washington County); Washington to Montana and south to Baja California, Arizona, New Mexico, and Texas; 268 (xxxi). Segregation of all specimens in the *alnifolia-utahensis* complex is difficult if not impossible. Diagnostic features show overlap, and while trends are apparent in the vast amount of material available, the best of characteristics fail singly and often in combination as well. Because of the trends indicated by leaf and petal size, and other features, it seems best to treat *A. utahensis* apart from the tangled morphology of *A. alnifolia*. Additionally, variation within the *utahensis* assemblage is as great as (or greater) than that known to occur in the *alnifolia* materials. Both taxa are hosts to a cedar-apple rust.

Cercocarpus H.B.K.

Shrubs or small trees with unarmed branches and very dense wood; leaves alternate, simple, entire or toothed; stipules small, adnate to petiole; flowers perfect, regular, borne solitary or in small clusters, terminal or axillary; hypanthium trumpetlike, with a deciduous apical portion; sepals 5; petals lacking; stamens 10 or more, borne in 2 or 3 whorls; pistil 1, of 1 carpel; style terminal; fruit an achene, with the elongate plumose style persisting.

Martin, F. L. 1950. A revision of *Cercocarpus*. Brittonia 7: 91-111.

- 1. Leaves deciduous, toothed, not especially revolute *C. montanus*
- Leaves evergreen, entire or toothed, decidedly revolute 2
- 2(1). Leaves (at least some) toothed; a hybrid *C. montanus* x *C. ledifolius*
- Leaves entire 3
- 3(2). Leaves elliptic, commonly 12-30 mm long or more; shrubs or small trees, mostly of middle and higher elevations *C. ledifolius*
- Leaves linear to narrowly oblong, usually less than 12 mm long; low intricately branched shrubs of lower middle and lower elevations *C. intricatus*

Cercocarpus intricatus Wats. Dwarf Mountain Mahogany. [*C. ledifolius* var. *intricatus* (Wats.) Jones; *C. intricatus* var. *villosus* Schneider, type from Deep Creek, Juab (?) County; *C. arizonicus* Jones]. Shrubs mostly 0.5-2 m tall, intricately branched; leaves 3-18 mm long, 0.8-1.4 mm wide, oblong to linear (rarely elliptic), tightly revolute, glabrous, strigose-pilose, or villous, coriaceous and persistent; flowers 3.2-8.7 mm long; sepals 0.6-1.2 mm long; stamens 10-20; tails of achenes 1-3 cm long. Rimrock, cliffs, and slopes in desert shrub, pinyon-juniper and mountain brush communities at 1370 to 2400 m in Beaver, Box Elder, Cache, Daggett, Emery, Garfield, Grand, Juab, Kane, Millard, San Juan, Sanpete, Sevier, Uintah, Utah (type from American Fork Canyon), Washington, and Wayne counties; Nevada, California, and Arizona; 53 (xiii). Pubescence of leaves varies from strigose-pilose to crinkly-hairy, or it is lacking. Plants with pilose leaves form the basis of var. *villosus*, but the feature does not seem to be correlated with any other. Leaves are heavily cutinized in plants from Kane and Washington counties.

Cercocarpus ledifolius Nutt. in T. & G. Curl-leaf Mountain Mahogany. [*C. ledifolius* var. *intercedens* Schneider; *C. ledifolius* var. *intercedens* f. *subglaber* Schneider, type from Slate Canyon, Utah County; and f. *hirsutus* Schneider, type from Odgen]. Shrubs or small trees, mainly 2-5 m tall; leaves 10-42 mm long, 2-14 mm wide, elliptic to oblong, the margin only revolute, pubescent to glabrous, coriaceous, persistent; flowers 7-10 mm long; sepals 1.2-2.1 mm long; stamens 20-30; tails of achenes 4.5-8 cm long. Mountain brush, pinyon-juniper, aspen, and spruce-fir communities, often in stands, at 1400 to 3000 m in all Utah counties; Washington to Montana and south to California, Arizona, and Colorado; 89 (xi). Hybrids are known between *C. ledifolius* and *C. montanus*. They are easily discerned by the coriaceous persistent toothed leaves. They occur as scattered individuals in places of contact between the parental types. Similarly, putative hybrids involving *C. ledifolius*

and *C. intricatus* are known. Longer very narrow and markedly revolute leaves mark those apparent hybrids.

Cercocarpus montanus Raf. Alder-leaf Mountain Mahogany. [*C. betuloides* Nutt. in T. & G.; *C. betulifolius* Nutt. ex Hook.; *C. parviflorus* var. *glaber* Wats.; *C. parviflorus* var. *betuloides* (Nutt.) Sarg.; *C. montanus* var. *glaber* (Wats.) Martin; *C. parvifolius* var. *minimus* Schneider, type from Utah?; *C. flabellifolius* Rydb., type from Glenwood, Sevier County]. Shrubs, or less commonly, small trees commonly 1.2-4 m tall; leaves short-petiolate, the blade obovate to oblanceolate or orbicular, 6-44 mm long, 5-23 mm wide, crenate-serrate, glabrous above, pubescent beneath (sometimes glabrous), deciduous; flowers 9.5-17.5 mm long; sepals 0.9-1.7 mm long; stamens 25-40, the anthers hairy; tails of achenes 3-10 cm long. Mountain brush, sagebrush, grassland, pinyon-juniper, aspen, and mixed conifer communities at 1400 to 2800 m throughout Utah, except in Box Elder and Weber counties; Oregon to Wyoming and south to Mexico; 91 (xiv). This and other species of *Cercocarpus* are valuable browse plants for wildlife and domestic livestock. They are components of wild seed mixtures in reclamation attempts.

Chaenomeles Lindl.

Shrubs, usually armed with thorns; leaves alternate, simple, serrate; stipules large, deciduous; flowers perfect, regular, solitary or 2-5 or more in sessile clusters; hypanthium short; sepals not persistent; petals 5 (sometimes more), variously colored; stamens 20 or more; pistil 1, the ovary inferior, usually 5-loculed; styles 5, joined at the base; the stigmas capitate; fruit a pome of moderate size.

- 1. Branchlets with verrucose small scars left by deciduous short hairs; flowers orange scarlet, ca 2.5 cm wide; plants mostly less than 1 m tall *C. japonica*
- Branchlets smooth, lacking hair scars; flowers variously colored, over 2.5 cm wide; plants commonly more than 1 m tall *C. speciosa*

Chaenomeles japonica (Thunb.) Lindl. ex Spach Japanese Quince. [*Pyrus japonica* Thunb.; *Cydonia japonica* (Thunb.) Pers.; *Cydonia lagenaria* Lois.; *Cydonia japonica* var. *lagenaria* (Lois.) Makino; *Chaenomeles lagenaria* (Lois.) Koidz.]. Shrubs to 1 m tall (rarely more); the short branchlets often modified as thorns, the young branchlets with deciduous short hairs leaving verrucose scars on falling; leaves obovate, 20-50 mm long, 8-35 cm wide, obtusely serrate, obtuse to subacute apically; flowers orange-scarlet, ca 2.5 cm wide; fruit subglobose, ca 3 cm thick. Cultivated ornamental in Carbon, Salt Lake, and Utah counties; introduced from Japan; 4 (i).

Chaenomeles speciosa (Sweet) Nakai Flowering Quince. [*Cydonia speciosa* Sweet; *C. lagenaria* Koidz, not (Lois.) Koidz.]. Shrubs to 2 m tall, the short branchlets often modified as spines, glabrous or with short deciduous hairs leaving no scars on falling; leaves oblong to ovate or lanceolate, 22-65 mm long, 12-35 mm wide, sharply serrate, acute to subacute apically; flowers scarlet to white or red, 2.5-3.5 cm wide; fruit subglobose to pyriform, 2-5 cm thick. Cultivated ornamental in Juab, Salt Lake, and Utah counties; introduced from China; 3 (i).

Chamaebatiaria (T. C. Porter) Maxim.

Aromatic shrubs, unarmed; leaves alternate, bi- or tri-pinnately compound, the herbage stellate-pubescent; stipules herbaceous, more or less persistent; flowers perfect, regular, showy, borne in terminal panicles; hypanthium turbinate; petals 5, persistent; petals 5, white; stamens many; pistils 5, more or less connate below, the ovary superior; styles 5; fruit of follicles.

Chamaebatiaria millefolium (Torr.) Maxim. Fern Bush, Desert Sweet. [*Spiraea millefolium* Torr.]. Shrub 8–20 dm tall (rarely more), the stems and herbage glandular and stellate-pubescent when young; leaves 0.9–6.7 cm long, 0.4–1.8 cm wide, oblong to lanceolate in outline, with 8–24 pairs of pinnac, these again pinnate, the tertiary segments again pinnatifid; panicles 3–15 cm long; flowers 0.8–1.5 cm wide; sepals ovate to lanceolate, 3–5 mm long, green; petals white, 2.5–5 mm long and about as broad; follicles 4–6 mm long, few-seeded; n = 9. Sagebrush, mountain brush, aspen, limber pine, and spruce-fir communities at 1495 to 2900 m in Beaver, Box Elder, Garfield, Iron, Juab, Kane, Millard, Piute, Tooele, Washington, and Wayne counties; Oregon, Idaho, Wyoming, and south to California and Arizona; 34 (vii).

Chamaerhodos Bunge

Plants biennial or short-lived perennial herbs; leaves alternate and in a basal rosette, bi- or tritermately divided, the segments narrow; stipules foliose, narrowly oblong, simple or divided, persistent; flowers perfect, regular, borne in bracteate, corymbose cymes; hypanthium cup-shaped, long-hairy within; sepals 5; petals 5; stamens 5, borne at the base of the petals; pistils 5 (rarely fewer), distinct, the ovaries superior, each 1-loculed; style 1 per pistil, the stigma capitate; fruit an achene.

Chamaerhodos erecta Bunge in Ledeb. American *Chamaerhodos*. [*C. erecta* var. *nuttallii* T. & G.; *C. erecta* ssp. *nuttallii* (T. & G.) Hulten; *C. nuttallii* (T. & G.) Rydb.]. Plants erect, mostly 7–28 (30) cm tall, from a taproot and a basal rosette, the stems freely branched above the base; leaves mostly 7–40 mm long, the ultimate segments linear to oblong, sparingly long-hairy; cymes equaling 1/4–1/2 the plant height; flowers short-pedicellate, inconspicuous; sepals 1.2–2.5 mm long, triangular, sparsely hirsute; petals white, equaling or slightly longer than the sepals; achenes 1.2–1.5 mm long, glabrous, grayish; 2n = 14. Igneous gravel and sandy loam in sagebrush, grassland, and alpine tundra at 2745 to 3355 m in Piute, Sevier, and Wayne (?) counties; Alaska and Yukon east to Michigan and south to Colorado and North Dakota; Asia. Our materials are assignable to var. *parviflora* (Nutt.) C. L. Hitchc. [*Sibbaldia erecta* var. *parviflora* Nutt.]; 8 (iv).

Coleogyne Torr.

Shrubs, the stems intricately branched, spinescent; leaves opposite, fasciculate on spur branchlets, entire, coriaceous, persistent; flowers perfect, regular, solitary and terminal on spur branchlets, subtended by paired, trifid bracts; hypanthium cup-shaped, coriaceous, persistent; sepals valvate, 4, persistent; petals 0 or rarely 4 and yellow; stamens 20–40, basally inserted on outside of tubular sheath enclosing ovary; pistil 1, with a lateral, twisted, exerted, persistent style pubescent at base; fruit a glabrous achene.

Coleogyne ramosissima Torr. Blackbrush. Rounded shrubs, 3–12 dm or more tall, with divaricate branches; leaves 3–12 mm long, mainly 0.8–1.5 mm wide, narrowly oblanceolate, obtusish and commonly mucronate apically, strigose with malpighian hairs; sepals 4.5–6.5 (8) mm long, ovate to lanceolate, malpighian hairy and red brown dorsally, glabrous and yellowish ventrally, the margin scarios; petals typically lacking, or rarely 4, yellow, 6–10 mm long; hypanthium membranous, tapering to 5-toothed apex, silky-hairy within, glabrous without; achene ovate, curved, glabrous, 5–8 mm long. Shallow sandy to clay soils in blackbrush and warm desert shrub communities at 760 to 1830 m in Emery, Garfield, Grand, Kane, San Juan, Washington, and Wayne counties; Nevada and Colorado south to California and Arizona; 35 (v). Specimens with petals occur sporadically in the range of the species. The plants are eaten by deer in winter.

Cotoneaster Medicus

Shrubs, unarmed, erect to arcuate or horizontal, deciduous or evergreen; leaves alternate, simple, entire; stipules linear, deciduous; flowers perfect, regular, solitary or in cymes terminating lateral branches; hypanthium short, persistent; sepals 5; petals 5, white or pink; stamens 10–20; pistil 1, the ovary inferior, 2- to 5-loculed, the styles 2–5; fruit a pome. Note: Members of this genus are cultivated widely in Utah as ornamentals. They have potential for use in reclamation and stabilization projects and will probably be maintained as a portion of our introduced flora. The genus has some 50 species distributed in Eurasia, and many more are in cultivation than are treated herein. The species keyed below are merely representative.

- 1. Leaves mainly 5–12 mm long; flowers usually solitary . . . 2
- Leaves mainly 1.5–10 cm long or more; flowers commonly several to many 3
- 2(1). Petals spreading, white; shrubs spreading, leaves evergreen *C. microphylla* Lindl.
- Petals erect, pink; plants depressed-horizontal, leaves semi-evergreen *C. horizontalis* Decne.
- 3(1). Petals erect, obovate, pinkish or white; fruit red or black 4
- Petals spreading, suborbicular, white; fruit red 5
- 4(3). Fruit black; at least some leaves more than 2.5 cm long *C. acutifolia* Turcz.
- Fruit red; leaves less than 2.5 cm long *C. dielsiana* Pritz.
- 5(3). Leaves glabrate at maturity *C. multiflora* Bunge
- Leaves persistently, white to rusty tomentose beneath . . 6
- 6(5). Leaves white-tomentose beneath, commonly 1–3 cm long *C. pannosa* Franch.
- Leaves rusty-tomentose beneath, or finally glabrate, often at least some over 3 cm long *C. salicifolia* Franch.

Note: *Cotoneaster* species are not described due to lack of adequate specimens in herbaria. Much work on cultivated plants is needed.

Crataegus L.

Small, deciduous trees or shrubs, commonly armed with thorns; leaves alternate, simple, serrate to doubly serrate, lobed in some; stipules small, adnate to the petiole, glandular-serrate, deciduous; flowers perfect, regu-

lar, in corymbose cymes terminating short lateral branchlets; hypanthium short, free above the ovary; sepals 5, tardily deciduous; petals 5, white or pink; stamens (5) 10–25 or more, the filaments filiform; pistil 1, the ovary inferior, 1- to 5-loculed, the styles 1–5; fruit a pome. Only one taxon is widespread in Utah, growing as a portion of the indigenous flora. The following key contains other native and widely cultivated or escaping taxa. Others are present in cultivation but are excluded.

1. Leaves deeply 3- to 7-lobed; styles 1–3; fruits with 1 or 2 seeds; plants ornamental, cultivated and escaping *C. monogyna*
- Leaves serrate to doubly serrate or somewhat lobed; styles 2–5; plants indigenous 2
- 2(1). Leaves mostly more than twice long as broad; plants common and widespread; fruit black *C. douglasii*
- Leaves mostly less than twice as long as broad, plants rare; fruit red, yellow, or orange 3
- 3(2). Petioles, at least some, with stalked red glands; teeth of leaves conspicuously tipped with reddish glands; plants known from Cache County *C. chrysoarpa*
- Petioles lacking stalked red glands; teeth of leaves not conspicuously red-tipped; plants known from Provo Canyon *C. succulenta*

Crataegus chrysoarpa Ashe Yellow Hawthorn. (*C. rotundifolia* Moench, not Lam.; *C. doddsii* Ramaley). Shrub or small tree with rounded crown, 2–4 m tall or more, with thorns 1–5 cm long or more; leaf blades 1.8–7 cm long, 1–7.2 cm wide, orbicular to obovate, acute apically, acute to broadly obtuse basally, the margins sharply doubly serrate (the serrations red-tipped) and commonly lobed as well; petioles often glandular (at least some); inflorescence more or less villous at anthesis; sepals lance-attenuate to triangular, serrate; petals white, 6–8.5 mm long and about as broad; stamens 5–10; styles 2–4; fruit red to yellow orange; “seeds” not pitted or deeply concave ventrally. Streamsides at ca 1617 m in Blacksmiths Fork, Cache County; Alberta and Manitoba south to Colorado and Nebraska; 1 (0).

Crataegus douglasii Lindl. River Hawthorn. Shrubs or small trees, with rounded crowns, mainly growing as thickets, 2.5–5 (7) m tall, with thorns 1.2–3.5 cm long; leaf blades 1.3–9.5 cm long, 0.8–5.8 cm wide, lanceolate to elliptic, oblanceolate, or obovate, acute to obtuse apically, cuneate basally, serrate to doubly serrate, seldom lobed; petioles often with a pair of raised sub-basal glands; inflorescence glabrous; sepals triangular-attenuate, entire or serrulate, 1.5–3.5 mm long; petals white, 3–7.8 mm long and about as broad or broader; stamens 10–20; styles normally 5; fruit blackish, 6–12 mm thick. The species occurs from southeastern Alaska east to Michigan. Two rather well defined varieties are present.

1. Petals 3–3.8 mm long, 2–4.2 mm wide; leaves slender, at least some 2–4 times longer than broad; fruit 6–8 mm thick when dried; plants of the Uinta Basin *C. douglasii* var. *duchesnensis*
- Petals 4.5–8 mm long, 5–7.8 mm wide; leaves commonly less than twice longer than broad; fruit 8–12 mm thick when dried *C. douglasii* var. *rivularis*

Var. *duchesnensis* Welsh Stream courses at 1800 to 2450 m in Duchesne (type from NW of Duchesne) and Uintah counties; endemic; 8 (ii).

Var. *rivularis* (Nutt.) Sarg. River Hawthorn. [*C. rivularis* Nutt. in T. & G.]. Terraces, flood plains, alluvial fans and canal banks and other moist sites at 1370 to 2135 m in Beaver, Box Elder, Cache, Daggett, Davis, Juab, Millard, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Utah, Wasatch, Washington, and Weber counties; Wyoming and Idaho, south to Arizona and New Mexico; 34 (iv).

Crataegus monogyna Jacq. One-seeded Hawthorn; English Hawthorn. [*C. oxyacantha* var. *monogyna* (Jacq.) Loudon; *C. oxyacantha* L. nom. illeg.]. Shrub or small tree to 6 m tall, with thorns to 2 cm long; leaf blades 1.5–5.5 cm long and about as wide, broadly ovate to orbicular in outline, deeply 3- to 7-lobed, obtuse to truncate basally; petioles lacking glands; inflorescences glabrous or glabrate; sepals broadly triangular, 1.5–2.5 mm long; petals pink or white, 3–4 mm long, 4–5 mm wide; stamens commonly 20; styles 1 (2); fruit reddish or orange, 5.5–8 mm thick; $2n = 34$. Cultivated ornamental in Cache, Davis, Juab, Salt Lake, Utah, Weber and perhaps in other counties, escaping in some; introduced from the Old World; 13 (0).

Crataegus succulenta Schrader ex Link. Red Hawthorn. Shrubs or small trees, mainly 2–4 m tall with thorns to 4.5 cm long; leaf blades 1.8–7 cm long, 1–4.5 cm broad, elliptic to obovate, serrate to doubly serrate and often lobed; attenuate to cuneate basally, abruptly acuminate apically; petioles lacking glands; inflorescence sparingly villous to glabrate; petals white 5–7 mm long, 5.8–7.7 mm wide; stamens 10–20; styles 2–4; fruit red, 7–12 mm thick when dry; $2n = 34+$, 51. Indigenous in riparian habitats, mainly in Provo Canyon, Utah County; Colorado eastward to Pennsylvania and southeastern Canada; 3 (i). Note: *Crataegus mollis* (T. & G.) Scheele and/or *C. crus-galli* L., and perhaps other species of hawthorn occur in cultivation in Utah. The extent is not known, at present.

Cydonia Miller

Small trees, unarmed; leaves alternate, simple, entire; stipules foliose, glandular-margined, deciduous; flowers perfect, regular, solitary, terminal on leafy shoots; hypanthium short; sepals 5, persistent; petals 5, white or pale pink; stamens 15–20; pistil 1, the ovary inferior, commonly 5-loculed; styles 5; fruit a tomentose pome.

Cydonia oblonga Miller Quince. [*Pyrus cydonia* L.; *C. vulgaris* Pers.]. Trees to 6 m tall; leaves petiolate, the blades 1.1–9.5 cm long, 0.8–7 cm wide, ovate to ovate-oblong, villous-tomentose beneath, tomentose above when young, becoming glabrate; flowers solitary; sepals foliose, 6–9 mm long, tomentose (especially within), glandular-margined; petals 13–25 mm long, 8–17 mm wide, obovate to orbiculate, white to pale pink; fruit 6–10 cm in diameter, yellow, densely tomentose, fragrant, broadly pyriform; $2n = 34$. Cultivated ornamental and botanical curiosity in Utah, Washington, and possibly other counties; introduced from the Middle East; 2 (0).

Dryas L.

Shrubs or subshrubs, with stoloniferous branches; leaves alternate, simple, crenate to entire, sometimes incised at the base, evergreen; stipules narrowly lanceolate, adnate to the petiole, persistent; flowers perfect (rarely imperfect), regular, solitary; hypanthium saucer-shaped, with an internal glandular disk; sepals 8–10,

persistent; petals 8–10; stamens numerous; pistils numerous, distinct, the ovaries superior, each 1-loculed; style 1 per pistil, much elongated in fruit; fruit an achene with a long-plumose style.

Hulten, E. 1959. Studies in the genus *Dryas*. Svensk Bot. Tidskr. 5: 507–542.
Porsild, A. E. 1947. The genus *Dryas* in North America. Canad. Field-Naturalist 61: 175–192.

***Dryas octopetala* L.** Mat-forming shrubs; leaves petio- late, the petioles glabrous to sparingly villous and often glandular; leaf blades mostly 1–4 cm long, 3–10 mm broad, lanceolate to lance-oblong, obtuse apically, obtuse to subcordate basally, crenate, green and glabrous to pubescent above, tomentose below, commonly with stip- itate glands on the midrib below, often revolute; scapes 1–11 cm long, tomentose and stipitate- glandular; petals white (fading yellowish) or rarely yellowish, 9–15 mm long; staminal filaments glabrous; style plumose, in fruit to 4 cm long; 2n = 18. Moraines, slopes, and ridge crests in alpine tundra and meadows at 3500 to 3965 m in Daggett, Duchesne, Summit, and Uintah counties; wide- spread in northern North America; circumboreal; 18 (ii). Our material is assignable to var. *hookeriana* (Juz.) Brei- tung (*D. hookeriana* Juz.; *D. octopetala* ssp. *hookeriana* (Juz.) Hulten).

***Exochorda* Lindl.**

Shrubs, deciduous, unarmed; leaves alternate, simple, entire or serrate; stipules none; flowers more or less imperfect (polygamo-dioecious), borne in terminal racemes; hypanthium flaring, with a broad disk inter- nally; sepals 5; petals 5, white; stamens 15–25; pistils 5, connate except for the 5 free styles, the ovary superior, 5-loculed; fruit a bony capsule.

***Exochorda racemosa* (Lindl.) Rehder** Pearl Bush. (*Amelanchier racemosa* Lindl.; *E. grandiflora* Hook.). Slender shrubs with spreading crowns, to 2.5 m tall or more, the herbage glabrous; leaf blades 1.2–6.5 cm long, 0.5–3.5 cm wide, elliptic to oblong or obovate, cuneate basally, mucronate apically, entire or some serrate in the upper half; racemes 3- to 10-flowered; flowers very showy; sepals 1–2 mm long, broadly rounded, erose apically, chartaceous; petals 10–17 mm long. Introduced ornamental in Utah County and in other low elevation urban areas; native to Asia; 2 (0).

***Fallugia* Endl.**

Shrubs, deciduous, unarmed; leaves alternate, pinately dissected; stipules adnate to the petiole, triangul- ar-subulate, persistent; flowers mainly perfect, regular, terminal and solitary or in few-flowered cymes; hypan- thium hemispheric, persistent, hairy within; sepals 5, alternating with slender bractlets; petals 5, white; sta- mens numerous; pistils numerous, the ovaries superior, of 1 carpel each; style terminal; fruit an achene, tipped by the plumose style.

***Fallugia paradoxa* (D. Don) Endl.** Apache Plume. (*Sieversia paradoxa* D. Don). Shrubs to 1.5 m tall, the herbage stellate hairy, the bark scaly; leaves mainly 4–16 mm long, cuneate-flabellate, 3- to 5-lobed, green and lepidote above, rusty-lepidote beneath; pedicels 2–18 mm long; sepals 4–7 (11) mm long, broadly ovate, abruptly acuminate-cuspidate apically; petals 11–14 mm long, 8–15 mm wide, white; pistils numerous; style plumose, 2–4 cm long in fruit. Wash bottoms in mixed

desert shrub and pinyon-juniper communities at 940 to 2290 m in Emery, Garfield, Iron, Kane, San Juan, Wash- ington, and Wayne counties; Nevada and California east to Texas and south to Mexico; 32 (vii).

***Fragaria* L.**

Herbaceous, rosulate perennials, commonly stolonif- erous; leaves compound, with 3 serrate leaflets; stipules adnate to base of elongate petiole; flowers more or less imperfect (polygamo-dioecious), solitary or in scapose cymes; hypanthium widely spreading; sepals 5, alternat- ing with bractlets; petals 5, white or pinkish; stamens 20, sometimes abortive; pistils numerous, on a pulpy recep- tacle, superior; fruit of achenes, on a fleshy accessory receptacle.

Rydberg, P. A. 1908. *Fragaria*. N. Amer. Fl. 2: 356–365.

- 1. Petioles spreading-hairy; terminal tooth of leaflets rela- tively well developed, commonly surpassing the adjacent lateral teeth; inflorescence usually as long as or longer than the leaves *F. vesca*
- Petioles with hairs ascending to appressed-ascending; terminal tooth of leaflets small, commonly surpassed by the adjacent lateral teeth; inflorescence usually shorter than the leaves *F. virginiana*

***Fragaria vesca* L.** Starving Strawberry. Stoloniferous herbs, with stems, petioles, and peduncles pubescent with slender spreading to somewhat ascending hairs; petioles 0.8–17.5 cm long (rarely longer); leaflets 3, the terminal one 1.3–6.5 cm long, 1–4.2 cm wide, thin, elliptic to oblong or obovate, coarsely serrate, silky pi- lose, subsessile or indistinctly petiolulate; scapes ul- timately equaling or surpassing the leaves; cymes 3- to 15-flowered; sepals 3.5–7.2 mm long, acuminate to cau- date; bracteoles 1.6–5.8 mm long, often bilobed; petals 5–10.5 mm long, white or pinkish; fruit to 1 cm thick, succulent, and palatable; 2n = 14. Stream banks, ter- races, and slopes, broad-leaved deciduous and coniferous woods and brushlands at 1800 to 3200 m in Box Elder, Cache, Carbon, Davis, Duchesne, Salt Lake, San Juan, Sanpete, Summit, Tooele, Utah, and Weber counties; British Columbia and Alberta south to California and New Mexico; 34 (ii). Our material is referable to var. *bracteata* (Heller) R. J. Davis [*F. bracteata* Heller; *F. vesca* ssp. *bracteata* (Heller) Staudt; *F. helleri* Holz.].

***Fragaria virginiana* Duchesne** Mountain Strawberry. Stoloniferous herbs with stems, petioles, and peduncles with appressed to ascending hairs; petioles 2–15 cm long; leaflets 3, the terminal one 1.1–4.4 cm long, 0.5–2.2 cm wide, thickish, obovate to elliptic, coarsely serrate, silky pilose to glabrate, commonly petiolulate; scapes shorter than to surpassing the leaves; cymes 2- to 12-flowered; sepals 3.1–6.5 mm long; bracteoles 1.8–4.5 mm long, not or seldom bilobed; petals 3.5–10 mm long, white or rarely pinkish; fruit to 1 cm thick or more, succulent and palatable; 2n = 56. Meadows, deciduous and coniferous woods at 2280 to 3300 m in Beaver, Duchesne, Emery, Garfield, Iron, Kane, Piute, Sanpete, Summit, Tooele, Utah, and Wayne counties; Alaska to Northwest Territo- ries, south to Colorado and California; 22 (vi). Our ma- terial has been treated as belonging to two rather weak and intergrading varieties. The phase with large petals (i.e., more than 6 mm long) is supposedly more densely pubescent with spreading hairs. That phase is known as

var. *platypetala* (Rydb.) Hall [*F. platypetala* Rydb.]. It apparently intergrades completely with the small-flowered supposedly scantily pubescent phase with appressed hairs, known as var. *glauca* Wats. [*F. vesca* var. *americana* Rydb., not T. C. Porter; *F. glauca* (Wats.) Rydb.; *F. virginiana* ssp. *glauca* (Wats.) Staudt]. In a broad sense, as herein interpreted, all of our material is best referred to a single taxon. The oldest available epithet appears to be var. *glauca* Wats. (type from Parleys Park, Summit County).

Geum L.

Perennial rhizomatous herbs; leaves alternate or opposite or mainly basal, pinnatifid to lyrate-pinnatifid; stipules foliose (at least on cauline leaves); flowers perfect, regular, solitary or in open cymes; hypanthium campanulate to saucer-shaped; sepals 5, persistent, alternating with 5 bractlets; petals 5, usually yellow (sometimes pinkish or purplish); stamens numerous; pistils numerous, the ovaries superior, each 1-carpellate; style straight to bent or strongly geniculate and jointed, in some elongate in fruit and in some then with a deciduous terminal segment, in others plumose and persistent; fruit an achene.

1. Stems decidedly leafy; plants often more than 3.5 dm tall; sepals reflexed at anthesis; style strongly geniculate and jointed, the persistent base hooked apically 2
- Stems subscapose; plants commonly less than 3.5 dm tall; sepals ascending to erect at anthesis; style neither geniculate nor jointed 4
- 2(1). Persistent style base glandular-pubescent; terminal segment of basal leaves much larger than the lateral lobes, mostly rounded or subcordate at base; our common meadow and woodland *Geum* *G. macrophyllum*
- Persistent style base glabrous or hirsute, not glandular; terminal segment of basal leaves only somewhat larger than the lateral lobes, cuneate at base; plants uncommon 3
- 3(2). Petals equal to or shorter than the sepals; receptacle pubescent with coarse hairs; stem leaves with lobes or leaflets often about as broad as long, tapering to a rounded or acute apex; achenes ca 70 *G. urbanum*
- Petals longer than the sepals; receptacle minutely hairy; stem leaves with lobes or leaflets distinctly longer than broad and mostly tapering to an acute apex; achenes 200 or more *G. aleppicum*
- 4(1). Cauline leaves opposite; petals white, pink, or only yellow-tinged, erect or convergent; style much elongate and plumose in fruit *G. triflorum*
- Cauline leaves alternate; petals yellow, spreading; style about as long as the achene, glabrous *G. rossii*

Geum aleppicum Jacq. Erect Avens. [*G. canadense* Murray, not Jacq.; *G. strictum* Ait.; *G. aleppicum* var. *strictum* (Ait.) Fern.; *G. aleppicum* ssp. *strictum* (Ait.) Clausen]. Plants shortly rhizomatous, 4.5–8 (10) dm tall, the stems and petioles spreading-hirsute; basal leaves 8–23 cm long, lyrate-pinnatifid, main lobes 5–9, all cuneate-obovate, strongly cleft and toothed, the terminal lobe larger but similarly shaped; cauline leaves several; flowers 2 to several; sepals soon reflexed, 4–8 mm long; petals yellow, spreading, about equaling the sepals; stamens 60 or more; achenes 3–4.5 mm long, tipped by persistent style; style strongly geniculate above the middle, the lower segment hirsute to glabrous, not glandular near the base, persistent and hooked apically; $2n = 42$.

Wet to dryish meadows at 1400 to 2300 m in Carbon, Grand, Salt Lake, San Juan, Summit, Utah, and Wasatch counties; widespread in North America and Eurasia; 5 (0).

Geum macrophyllum Willd. Large-leaved Avens. [*G. urbanum* ssp. *oregonense* Scheutz; *G. oregonense* (Scheutz) Rydb.; *G. macrophyllum* var. *rydbergii* Farw.]. Plants shortly rhizomatous, 2.3–11.5 dm tall, the stems erect, with spreading hairs; basal leaves 4–28 cm long or more, long-petiolate, the leaflets 9–25 or more, the apical lobe 2.5–13 cm long, 2–15 cm wide, acute to truncate or subcordate basally, dentate and conspicuously lobed, glabrate to glabrous above, hairy along the veins beneath; cauline leaves numerous; sepals 2.5–4.8 mm long, reflexed at anthesis; bracteoles 0.5–3.5 mm long, linear to lanceolate or lacking; petals yellow, 3–5.8 mm long; style elongate with an S-shaped curve above the middle, glabrous or hairy above the bend, glandular (often sparingly so, or the glandular hairs deciduous) below the bend, hooked at apex, the apical section deciduous; $2n = 42$. Aspen, spruce-fir, birch-willow, and grass-sedge communities at 1280 to 3050 m throughout Utah; widespread in North America; Asia; 94 (xiii). Our materials, as described above, belong to a poorly differentiated variety, the var. *perincisum* (Rydb.) Raup [*G. perincisum* Rydb.; *G. macrophyllum* ssp. *perincisum* (Rydb.) Hulten].

Geum rossii (R. Br.) Ser. Ross Avens. [*Sieversia rossii* R. Br.; *Acomastylis rossii* (R. Br.) Greene; *S. scapoidea* A. Nels. in Coult. & Nels, type from W of Marysvale, Piute County]. Herbs, shortly rhizomatous, the rhizomes and stem bases with a persistent thatch of marcescent petioles and stems; stems 0.3–1.8 dm tall, erect, often with 1–3 greatly reduced leaves below the inflorescence; basal leaves 2.2–12 cm long, short-petiolate, pinnatifid, with 15–31 entire to several-toothed or -lobed lateral divisions, the apical lobes similar to the lateral ones except smaller, glabrous to pubescent along veins below, ciliate; sepals 2.9–5.1 mm long, ovate to ovate-lanceolate; bracteoles 2–3.9 mm long, lanceolate; petals yellow, 6.4–8.6 mm long; styles straight, elongate, glabrous except at base, erect; $2n = 70$. Alpine meadows, rock stripes, and talus slopes at 3050 to 3400 m in Beaver, Box Elder, Daggett, Duchesne, Garfield, Grand, Iron, Juab, Piute, Salt Lake, San Juan, Summit, Uintah, Utah, and Wayne counties; Alaska and Yukon south to Oregon, Nevada, Arizona, and New Mexico; Asia; 71 (viii). The specimens from Utah are referable to var. *turbinatum* (Rydb.) C. L. Hitchc. [*Potentilla nivalis* Torr., not Lapeyr.; *G. turbinatum* Rydb.; *Sieversia turbinata* (Rydb.) Greene; *Acomastylis turbinata* (Rydb.) Greene; *G. sericeum* Greene; *S. sericea* (Greene) Greene], which is only weakly separable from the larger typical phase that occurs in the arctic.

Geum triflorum Pursh Purple Avens; Old Man's Beard. [*Sieversia triflora* (Pursh) R. Br.; *Erythrocoma triflora* (Pursh) Greene; *G. ciliatum* var. *triflorum* (Pursh) Jepson; *E. brevifolia* Greene, type from Panguitch Lake, Garfield County]. Plants shortly rhizomatous, clothed basally with persistent leaf bases; stems 1–4 dm tall, with 1–2 pairs of opposite leaves; basal leaves 2–18.5 cm long, pinnatifid, with mostly 15–31, cleft to lobed divisions, puberulent to pilose; flowers 1–7 (9); sepals showy, reddish to pink or purplish, 7–10 mm long; bracteoles linear to narrowly elliptic; petals yellowish to pink or suffused with crimson, 7–11.2 mm long; styles

straight to moderately geniculate, plumose, 2–4 cm long at maturity. Oak-sagebrush, aspen, aspen-fir, and mixed conifer communities, often in meadows, at 1980 to 3500 m in Beaver, Box Elder, Cache, Daggett, Duchesne, Garfield, Iron, Juab, Kane, Millard, Piute, Rich, Salt Lake, Sanpete, Sevier, Summit, Tooele, Wasatch, and Wayne counties; British Columbia east to Newfoundland, south to Nevada, Arizona, New Mexico, Nebraska, and Illinois; 76 (vi). Our specimens are assignable to the weakly differentiated var. *ciliatum* (Pursh) Fassett [*G. ciliatum* Pursh; *Sieversia ciliata* (Pursh) D. Don; *Erythrocoma ciliata* (Pursh) Greene].

***Geum urbanum* L.** Plants shortly rhizomatous, (3) 6–10 dm tall, the stems and petioles spreading-hirsute; basal leaves mainly 2–10 cm long, pinnatifid, the main lobes 3–5 (10), cuneate-obovate, rounded to acute at the apex, the terminal one rhombic-ovate and slightly larger than the lateral ones; cauline leaves several to many; sepals spreading to reflexed, 4–7 mm long; petals yellow, spreading, somewhat shorter than the sepals; achenes 3–6 mm long, tipped by the persistent style; style strongly geniculate above the middle. Disturbed sites in Salt Lake County (Arnow 5546, UT); adventive from Eurasia; 1 (0).

Holodiscus Maxim.

Shrubs unarmed; leaves simple, alternate, toothed, deciduous; stipules lacking; flowers perfect, regular, each closely subtended by 1–3 bracteoles, numerous, borne in panicles; hypanthium saucer-shaped, lined with a disk; sepals 5, persistent; petals 5, white to cream or less commonly pinkish; stamens ca 20; pistils 5, the ovaries superior, each 1–carpellate; style terminal, persistent; fruit a short-stipitate, villous achene.

Ley, A. 1943. A taxonomic revision of the Genus *Holodiscus* (Rosaceae). Bull. Torrey Bot. Club 70: 275–288.

***Holodiscus dumosus* (Nutt.) Heller** Mountain Spray. [*Spiraea dumosa* Nutt. in T. & G.; *S. discolor* var. *dumosa* (Nutt.) Wats.; *Schizonotus argenteus* var. *dumosus* (Nutt.) Kuntze; *H. discolor* var. *dumosa* (Nutt.) Dippel; *Schizonotus dumosus* (Nutt.) Koehne; *S. discolor* var. *dumosus* (Nutt.) Rehder; *Sericotheca dumosa* (Nutt.) Rydb.; *H. microphyllus* Rydb., type from Alta; *S. microphylla* (Rydb.) Rydb.; *H. discolor* var. *microphyllus* (Rydb.) Jepson; *S. concolor* Rydb.]. Shrubs, densely to intricately branched, mainly 0.5–1.5 m tall; main foliage leaves on spur branches, the blades 0.5–3.2 cm long, 0.2–2.3 cm wide, obovate to oblanceolate or elliptic, cuneate basally, prominently toothed or lobed, villous to glabrate or glabrous on one or both surfaces, pale beneath; inflorescence 3–15 cm long; sepals 1.3–1.7 mm long, villous, sometimes pinkish; petals 1.9–2.2 mm long, white, cream, or pinkish; achenes somewhat flattened, villous-hirsute. Ubiquitous in numerous plant communities, where especially common on rock outcrops, slickrock plateau margins, and at bases of cliffs, or in talus slopes at 1280 to 3550 m in all Utah counties; Oregon east to Wyoming and south to California, Nevada, Arizona, and New Mexico; 60 (xii). Attempts at recognition of infraspecific taxa are fraught with difficulties which are likely ecological rather than genetic reflections. A conservative approach is indicated.

Ivesia T. & G.

Perennial herbs, from a caudex; leaves pinnately compound, alternate or primarily basal; stipules of cauline leaves foliose; flowers perfect, regular, borne in compact to open cymes; sepals 5, alternating with 5 bracteoles; hypanthium saucer- to cup-shaped, lined with a disk; petals 5, yellow or white; stamens 5 or 20; pistils 1–15, the receptacle hairy, the ovaries superior; style subterminal; fruit of achenes.

Keck, D. D. 1938. Revision of *Horkelia* and *Ivesia*. Lloydia 1: 75–142.

1. Leaflets usually fewer than 20; plants of western Utah . . . 2
- Leaflets commonly 22–80 or more; plants various 3
- 2(1). Leaflets mainly 3–10 mm long or more; leaves often over 10 cm long; plants known from the Deep Creek Mts. *I. setosa*
- Leaflets mainly 1–3 mm long; leaves commonly less than 8 cm long; plants known from western Beaver County *I. shockleyi*
- 3(1). Petals white; stems more or less radiate-decumbent 4
- Petals yellow; stems erect or ascending 5
- 4(3). Stamens 5; hypanthium cup-shaped; plants of Utah, Salt Lake, and Summit counties *I. utahensis*
- Stamens 20; hypanthium saucer-shaped; plants of Beaver, Garfield, Sevier, and Tooele counties . . . *I. kingii*
- 5(3). Hypanthium cup-shaped; flowers in dense, congested cymes; plants widespread in central and northern Utah, our most common *Ivesia* *I. gordonii*
- Hypanthium saucer-shaped; flowers in open cymes; plants of Beaver, Garfield, Kane, and Washington counties *I. sabulosa*

***Ivesia gordonii* (Hook.) T. & G.** Gordon *Ivesia*. [*Horkelia gordonii* Hook.; *Potentilla gordonii* (Hook.) Greene]. Plants erect, 7–30 cm tall, from a thick woody caudex clothed with persistent leaf bases; herbage puberulent, glandular-puberulent, or glabrous; basal leaves 1–25 cm long; leaflets 20–50 or more, 2–17 mm long, divided to base; cymes congested, many-flowered, 1, few, or several; hypanthium campanulate; sepals 2.6–5 mm long, erect at anthesis, triangular-subulate; bracteoles 1.2–2.8 mm long; stamens 5; pistils 1–6; style not glandular; achenes 1.7–2.1 mm long. Ponderosa pine, spruce-fir, and mixed conifer woods and upwards in alpine sites, often in rocky meadows, at 2050 to 3660 m in Beaver, Cache, Davis, Duchesne, Garfield, Juab, Millard, Morgan, Piute, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, and Weber counties; Washington to Montana, south to California and Colorado; 69 (iv). Specimens from the Wasatch Mts. are more robust than those of other places, but do not seem worthy of taxonomic recognition.

***Ivesia kingii* Wats.** King *Ivesia*. [*Potentilla kingii* (Wats.) Greene; *Horkelia kingii* (Wats.) Rydb.; *P. eremica* Cov.; *H. eremica* (Cov.) Rydb.; *P. kingii* var. *incerta* Jones; *I. halophila* Heller]. Plants decumbent, the stems 5–22 cm long, radiating from a thickened caudex clothed with blackish persistent leaf bases; herbage glabrous or pubescent, not glandular; basal leaves 0.5–12 cm long or more; leaflets 24–60 or more, 1–6 mm long, entire or ternately divided; cymes dichotomously divided, open; hypanthium saucer-shaped; sepals 2.5–3.1 mm long, spreading at anthesis, lance-attenuate; bracteoles 1.3–1.9 mm long, ovate-lanceolate; petals white, 3–4.2

mm long, 2.5–3 mm wide, clawed; stamens 20; pistils 2–9; style not glandular; achenes 1.8–2.2 mm long. Saline meadows and pans in rabbitbrush, saltgrass, shadscale, greasewood, and sedge communities at 1460 to 2380 m in Beaver, Garfield, Iron, Sevier, and Tooele counties; Nevada and California; 10 (vii). The plants tend to blend with the pale substrate of the saline pans, perhaps accounting for the paucity of our records from Utah.

Ivesia sabulosa (Jones) Keck Sevier Ivesia. [*Potentilla sabulosa* Jones, types from head of Sevier River, "25 miles south of Panguitch"; *Comarella sabulosa* (Jones) Rydb.; *Horkelia sabulosa* (Jones) L. O. Williams; *H. mutabilis* Brandegee; *I. mutabilis* (Brandegee) Rydb.]. Plants erect, the stems 10–42 (50) cm tall, from a woody caudex clothed with persistent leaf bases; herbage glabrous to villous and glandular; basal leaves 3.5–23 (30) cm long, the petioles often suffused red purple; leaflets 30–80, paired, 1–13 mm long, usually divided to the base; cymes branched, open; hypanthium saucer-shaped; sepals 3.3–5.5 mm long, triangular-acuminate, spreading at anthesis; bracteoles 1.3–2.7 mm long, lanceolate; petals yellow, 2.1–3 mm long, 0.3–0.5 mm wide; stamens 5; pistils 1–5; style glabrous or nearly so; achenes 1.7–2.2 mm long. Sagebrush, pinyon-juniper, pygmy sagebrush, ponderosa pine, and spruce communities, commonly on limestone at 1735 to 2745 m in Beaver, Garfield, Kane, Sevier, and Washington counties; Arizona and Nevada; 20 (vii). The type locality of *I. sabulosa* is imprecisely known. Jones states (see Leaf. West. Bot. 10: 216, 1965) that "... And 4 miles below Ranch I got 6031 to 33f." The type of *I. sabulosa* is his number 6032. Jones further states that "Ranch is the name of the post office at the head of the Sevier and serves a little farming area there." Presumably "Ranch" and the collecting site are both in Garfield County.

Ivesia setosa (Wats.) Rydb. [*Horkelia baileyi* var. *setosa* (Wats.) Rydb.; *I. baileyi* ssp. *setosa* (Wats.) Keck]. Plants 4–25 cm tall, from a woody caudex clothed with persistent leaf bases; herbage glandular-pubescent; basal leaves 3.5–12 cm long; leaflets 10–20, 3–15 mm long, parted to divided; hypanthium discoid; sepals 2.5–3.2 mm long, ovate-lanceolate; bracteoles lance-oblong to ovate; petals white or cream, subequal to the sepals; stamens 5; pistils 3–7; style glandular; achenes 1.6–2.3 mm long. Mountain slopes at 1700 to 3100 m in Tooele County (Deep Creek Mts.); eastern Nevada; 1 (0).

Ivesia shockleyi Wats. [*Horkelia shockleyi* (Wats.) Rydb.; *Potentilla shockleyi* (Wats.) Jepson]. Plants with stems decumbent to erect, from a woody caudex, this clothed with marcescent leaf bases; herbage pale, densely glandular-puberulent; basal leaves 2–7 cm long, the leaflets in 7–10 crowded pairs, 1–3 mm long, divided into 2–5 oblanceolate to orbicular segments; cymes open, few-flowered; hypanthium yellow, disciform, finally pentagonal; sepals broadly lanceolate, 1.5–3.5 mm long; petals pale yellow, shorter than the sepals; stamens 5, the filaments linear-subulate; pistils typically 3; style scarcely glandular; achenes brown, 2–2.5 mm long. Quartzitic outcrop in pinyon-juniper and ponderosa pine communities at 1950 to 2410 m in western Beaver County; Nevada and California; 4 (0).

Ivesia utahensis Wats. Utah Ivesia. [*Potentilla utahensis* (Wats.) Greene; *Horkelia utahensis* (Wats.) Rydb.]. Plants decumbent or ascending, the stems radiating from a thickened caudex clothed with brownish leaf bases;

herbage glandular-viscid or glandular-pubescent; basal leaves 1.2–9 cm long; leaflets 30–40, paired, 1–4 mm long, divided to base; cymes capitate or in congested corymbs; hypanthium campanulate; sepals 1.5–2.7 mm long, narrowly triangular; bracteoles 1–1.3 mm long, oblong; petals white, 1.8–2.7 mm long, 1–1.7 mm wide; stamens 5; pistils commonly 2; style not glandular; achenes 1.7–1.9 mm long. Alpine tundra and krummholz communities, often in talus, at 3200 to 3600 m in Salt Lake (type from Bald Mt.), Summit, Utah, and Wasatch counties; endemic; 5 (0).

Kerria DC.

Cultivated shrubs, unarmed, deciduous; leaves alternate, simple, doubly serrate; stipules lance-linear, deciduous; flowers perfect, regular, solitary, terminating short lateral branchlets of the current year; hypanthium short, lined by a disk; sepals 5, small, entire; petals 5, yellow; stamens numerous; pistils 5–8, the ovaries superior; style slender; fruit an achene (seldom produced).

Kerria japonica (L.) DC. Japanese *Kerria*. [*Rubus japonicus* L.]. Shrubs with slender green arching branches; leaves 1–7 cm long, 0.7–3.5 cm wide, ovate to lanceolate, long-acuminate, bright green; pedicels 0.5–2.5 cm long; sepals ca 3.5 mm long, broad-ovate, membranous; petals yellow, 12–20 mm long; achenes 4–5 mm long. Widely cultivated ornamental, persisting but not spreading, observed in Box Elder, Cache, Davis, Salt Lake, Utah, and Weber counties; introduced from Japan and China; 2 (i). Double flowered phases are common.

Malus Miller

Trees with mainly unarmed branches; leaves alternate, simple, not or rarely lobed; stipules linear, caducous; flowers perfect, regular, borne in umbels; hypanthium short; sepals 5, persistent or deciduous; petals 5, white or pink; stamens usually 15–50; pistil 1, the ovary inferior, usually 5-loculed; styles 2–5, connate at the base; fruit variously shaped, applelike, the flesh usually lacking stone-cells. Note: The apples are all introduced into our flora. Mostly they are cultivated and persist following cultivation, but some escape and are established widely in Utah, especially the pomological varieties. The following key is tentative; our cultivars often represent hybrid derivatives involving two to several of the species types. Other taxa probably are present in the state.

1. Leaves on elongated shoots lobed or notched; a crab-apple *M. ioensis*
- Leaves on elongated shoots neither lobed nor notched . . . 2
- 2(1). Mature leaves glabrous, crenate-serrate, but not sharply so; fruit mainly 1.5–2.5 cm in diameter; a crab-apple *M. sylvestris*
- Mature leaves more or less tomentose on one or both surfaces or, if glabrous, the pedicels very long and the fruit smaller 3
- 3(2). Pedicels 3–4.5 cm long, very slender; fruit mainly 0.8–1.2 cm in diameter; a crabapple *M. hupchensis*
- Pedicels mainly shorter than 3 cm long, slender to moderately thickened; fruit size various 4
- 4(3). Leaf margins sharply serrate; flowers ordinarily pink; flowering ornamental crabapple *M. floribunda*
- Leaf margins merely crenate-serrate to serrate; flowers various 5

- 5(4). Flowers commonly pink; fruit 0.8–1.2 cm in diameter; a crabapple *M. baccata*
- Flowers commonly white within (pink sometimes on dorsal surface; apple of commerce *M. pumila*

***Malus baccata* (L.) Borkh.** Siberian Crab. [*Pyrus baccata* L.]. Small trees to 5 m, the branchlets glabrous; leaves ovate to oblong, 2–8 cm long, serrate, glabrous to puberulent on one or both sides; petioles 1.5–5 cm long; petals white or pink, 12–18 cm long; fruit 0.8–1.2 cm in diameter, the calyx deciduous. Cultivated ornamental tree in lower elevation portions of Utah; introduced from Asia; 4 (0).

***Malus floribunda* Sieb. ex Van Houtte** Showy Crab. [*Pyrus floribunda* Sieb.]. Small trees to 8 m, the branchlets pubescent; leaves ovate to oblong, 2–7 cm long, sharply serrate, usually tomentose on one or both sides; petioles mostly 1.5–5 cm long; petals rose pink, 15–20 mm long or more; fruit mostly 0.5–1 cm in diameter. Cultivated ornamental trees in lower elevation portions of Utah; introduced from Japan; 5 (0).

***Malus hupehensis* (Pamp.) Rehder** Tea Crab. [*Pyrus hupehensis* Pamp.; *M. theifera* Rehder]. Small trees to 5 m tall, the branchlets glabrous or essentially so; petioles 0.8–4 cm long; leaf blades oblong-elliptic to ovate, 2.5–7.8 cm long, minutely tomentulose on both sides at maturity; peduncles 3–4.5 cm long; sepals 4–6 mm long; petals 15–20 mm long, commonly white; fruit 0.8–1.2 cm in diameter. Cultivated ornamental trees of lower elevations in Utah; introduced from Asia; 7 (0).

***Malus ioensis* (Wood) Britt.** Iowa Crab. [*Pyrus ioensis* (Wood) Bailey]. Small trees to 9 m tall, the branchlets tomentose; leaves ovate to oblong, 2.5–10 cm long, tomentose on both sides, at least when young; petals usually white (sometimes pinkish), 12–25 mm long; fruit 2–3 cm in diameter. The Iowa crab is grown occasionally in lower elevation portions of Utah; introduced from the north-central states; 4 (0).

***Malus pumila* Miller** Common Apple. [*M. domestica* Borkh.]. Small to moderate trees to 10 m tall, the branchlets tomentose when young, becoming glabrous; leaves ovate to oblong or elliptic, 1.5–10 cm long, tomentose on one or both sides (even in age); petals usually white within, often pink dorsally, 12–25 mm long; fruit mainly 2.5–12 cm in diameter, red, reddish purple, or yellow. This is the apple of commerce, and it is widely cultivated in Utah; it persists and occurs as established trees throughout the state; introduced from Eurasia; 18 (ii).

***Malus sylvestris* Miller** Crabapple. Small to moderate trees to 10 m tall, the branchlets glabrous or puberulent when young, often somewhat thorny; leaf blades 2–6 cm long, ovate to elliptic, crenate-serrate, acuminate or cuspidate; petals 8–20 mm long, white or pink; fruit mainly 1.5–2.5 cm in diameter, sour. Introduced cultivated trees, persisting and escaping in Utah; native to Eurasia; 6 (i).

***Peraphyllum* Nutt. in T. & G.**

Shrubs, unarmed, deciduous; leaves alternate, simple, entire or nearly so; stipules adnate to petioles, triangular, minute, deciduous; flowers perfect, regular, solitary or few on lateral branchlets of the season; hypanthium campanulate, disk-lined; sepals 5, spreading to reflexed, persistent; petals 5, white or pink; stamens 15–20; pistil 1, the ovary inferior, 2- to 3-carpellate but falsely 4- to

6-loculed by intrusion of parietal septa; styles 2 or 3, the stigma capitate; fruit a fleshy applelike pome.

***Peraphyllum ramosissimum* Nutt. in T. & G.** Squaw-apple. Shrubs 4–15 (20) dm tall, intricately branched; leaves alternate, mainly on short lateral spurs, 1.1–3.9 cm long, 0.4–0.9 cm wide, oblanceolate, abruptly acute, appressed puberulent (especially beneath), entire or minutely serrulate; pedicels 4–13 mm long, with 1–3 caducous bractlets; sepals 2.9–4 mm long, triangular-acuminate, serrulate to entire; petals white to pink, 6.5–9 mm long, 5–8.5 mm wide; pomes 8–18 mm thick, yellow orange, the flavor bad when ripe. Oak-sagebrush, pinyon-juniper, mountain brush, and ponderosa pine communities at 1500 to 2500 m in Beaver, Garfield, Grand, Iron, Juab, Kane, Millard, Piute, San Juan, Sanpete, Sevier, Uintah, and Washington counties; Oregon and Idaho south to California and Colorado; 27 (iv). The fruit is attractive when ripe but the flavor is not agreeable. Perhaps, when cooked with sugar it might be better?

***Petrophytum* (Nutt.) Rydb.**

Shrubs, prostrate and mat-forming, conforming to the rock substrate; leaves alternate, commonly appearing rosulate, simple, entire, stipules lacking; flowers perfect, regular, borne in compact spikelike panicles on scape, bracteate peduncles; pedicels with 1 or more bractlets; hypanthium cup-shaped, lined with a disk; sepals 5, erect at anthesis; petals 5, white; stamens numerous; pistils commonly 5, the ovaries superior, each 1-loculed; styles slender, exerted from the flower; fruit of usually 5 follicles.

***Petrophytum caespitosum* (Nutt.) Rydb.** Rock Spiraea. [*Spiraea caespitosa* Nutt. in T. & G.; *Eriogyna caespitosa* (Nutt.) Wats.; *Luetkea caespitosa* (Nutt.) Kuntze]. Mat-forming shrubs to 10 dm broad or more; leaves 3–17 mm long, 1.5–4.5 mm wide, spatulate to oblanceolate or obovate, pilose on one or both surfaces, rarely almost or quite glabrous; peduncles 0.5–12 cm long, with bractlike leaves much reduced upward; panicles spikelike, 0.5–2.5 cm long, often branched at base or with axillary panicles along axis of peduncle; pedicels 0.5–3 mm long, bracteolate; sepals 1.2–2.1 mm long, narrowly triangular; petals 1.3–2.5 mm long, 0.4–0.8 mm wide, white; fruit 1.5–2.1 mm long. On limestone or granitic outcrops or gravels from sagebrush upward to spruce-fir communities at 1375 to 3050 m, and on sandstone (Entrada, Navajo, Kayenta, Cedar Mesa, etc.) often in hanging gardens at 1125 to 1895 m in Beaver, Box Elder, Cache, Daggett, Garfield, Grand, Iron, Juab, Kane, Millard, Piute, Salt Lake, Summit, Tooele, Uintah, Utah, Washington, and Wayne counties; Oregon east to South Dakota and south to California, Arizona, New Mexico and Texas; 73 (xvii). This beautiful dwarf shrub flowers in late summer and autumn. Major variations involve the tendency to glabrous leaves of some Great Basin specimens, and a tendency to short peduncles in some materials from the hanging gardens of southeastern Utah. More materials are required to adequately access the variation.

***Physocarpus* Maxim.**

Shrubs, unarmed, deciduous, with exfoliating bark; leaves alternate, simple, palmately lobed and veined, usually with at least some stellate hairs; stipules membranous, deciduous; flowers perfect, regular, borne in terminal corymbs, hypanthium cup-shaped, lined with a disk;

sepals 5; petals 5, white or pink; stamens 20–40, inserted with petals at edge of disk; pistils 1–5, the ovaries superior and partially connate; styles slender, the stigmas capitate; fruit of one or more follicles, each several seeded.

Howell, J. T. 1931. A Great Basin species of *Physocarpus*. Proc. Calif. Acad. Sci. IV. 20: 129–134.

1. Pistil and style solitary; leaves less than 2 cm long; staminal filaments of two alternating and markedly unequal lengths *P. alternans*
- Pistils and styles 2 or 3, or the carpels connate below; leaves various but commonly over 2 cm long; staminal filaments subequal or somewhat unequal 2
- 2(1). Leaves mainly 0.7–2.5 cm long; mature carpels swollen, not flattened; plants evidently rare in Utah *P. monogynus*
- Leaves mainly 2–8 cm long; mature carpels flattened; plants common in south central to northern Utah *P. malvaceus*

***Physocarpus alternans* (Jones) J. T. Howell** Dwarf Ninebark. [*Niellia monogyna* var. *alternans* Jones; *Opulaster alternans* (Jones) Heller]. Shrubs commonly 4–12 dm tall, and about as broad; twigs stellate pubescent and sometimes glandular; bark shreddy on older twigs; leaf blades 0.3–2 cm long, 0.3–2.2 cm wide, oval-ovate to ovate, cordate to subcordate basally, more or less 3-lobed, doubly crenate, pubescent to sparingly pubescent on both sides; inflorescence subumbellate, (1) 2– to 12 (17) -flowered; pedicels 2–10 mm long; hypanthium stellate-hairy; sepals 1.3–3.2 mm long, oval to suboblong; petals 1.8–3.2 mm long, 1.5–3 mm wide, white or suffused with red pink; follicle solitary, densely stellate, 4–5 mm long. Rock outcrops, ledges, and cliff faces in desert shrub, pinyon-juniper, oak, and ponderosa pine communities at 1980 to 2750 m in Box Elder, Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Juab, Millard, Salt Lake, San Juan, Tooele, Utah, Washington, and Wayne counties; Idaho, Nevada, and Colorado; 24 (iv). Jones (*Zoe* 4: 38–44. 1893) discussed the problems within the genus *Physocarpus* then called *Niellia*. The basic problems are still as Jones outlined them eight decades ago. The genus is still in need of a definitive revision.

***Physocarpus malvaceus* (Greene) Kuntze** Mallow-leaved Ninebark. [*Niellia malvacea* Greene; *Opulaster malvaceus* (Greene) Kuntze; *N. monogyna* var. *malvacea* (Greene) Jones; *Spiraea opulifolia* var. *pauciflora* T. & G.; *Opulaster pubescens* Rydb.; *O. cordatus* Rydb.] Shrubs, mainly 8–20 dm tall, rarely more, and often as broad; twigs glabrous to minutely stellate; bark shreddy on older branchlets; leaf blades (0.8) 2.2–8 cm long, (1.2) 2–8.2 cm wide, ovate to broadly ovate, cordate basally, 3-lobed, doubly crenate, glabrous above, stellate-pubescent to glabrous beneath; inflorescence corymbose, 5– to 30 (+) -flowered; pedicels 0.7–2.3 cm long; hypanthium stellate-hairy; sepals 2.2–4.6 mm long, ovate to lance-oblong; petals 3.3–6.7 mm long, 1.5–4.8 mm wide, white; follicles paired, connate to the middle or above, substipitate, densely stellate, 4.9–6 mm long. Moist slopes and streamsides in mountain brush, aspen, and mixed conifer woodlands at 1600 to 3300 m in Cache, Emery, Garfield, Juab, Millard, Salt Lake, San Juan, Sanpete, Summit, Tooele, Utah, Wasatch, and Weber counties; British Columbia east to Alberta and south to

Oregon and Wyoming; 69 (vii). Two other large-leaved ninebark species are grown in Utah. They are *P. opulifolia* (L.) Raf. [*Spiraea opulifolia* L.] and *P. capitata* (Pursh) Kuntze [*Spiraea capitata* Pursh]. They both possess 3–5 glabrous pistils connate only at the base. They differ in that the leaves of *P. opulifolia* are commonly glabrous beneath while those of *P. capitatus* are ordinarily densely stellate beneath. The extent of these species in cultivation is not known.

***Physocarpus monogynus* (Torr.) Coult.** Mountain Ninebark. [*Spiraea monogyna* Torr.; *Opulaster monogynus* (Torr.) Kuntze]. Shrubs, mainly 4–20 dm tall; twigs glabrous to densely stellate; bark shreddy on older branchlets; leaf blades 0.5–2.8 cm long, 0.6–3.2 cm wide, ovate to orbicular, cordate basally, commonly 3-lobed, doubly crenate, glabrate or glabrous on both sides or sometimes stellate-hairy especially below; inflorescence corymbose, 9– to 25-flowered (sometimes more); pedicels 0.3–0.8 cm long; hypanthium stellate-hairy; sepals 2.3–3 mm long, ovate; petals 2.2–3.9 mm long, 2.6–3.5 mm wide, white; follicles paired, connate to the middle or above, substipitate, densely stellate, 3–4.5 mm long. Canyon bottoms and moist slopes in mountain brush, aspen, and Douglas fir communities at 1650 to 2150 m in Carbon and Utah counties; South Dakota and Wyoming south to Texas and Arizona (?); 4 (i). Our material seems to fit well within the range of variation of materials from Colorado, New Mexico, and South Dakota. The plants are smaller in all features from the similar *P. malvaceus* (q.v.).

Potentilla L.

Annual, biennial, or perennial herbs (a shrub in *P. fruticosa*); leaves alternate or basal, palmately or pinnately compound; stipules lanceolate to ovate, sometimes sheathing; flowers perfect, regular, borne solitary or in cymes; hypanthium saucer- to cup-shaped; sepals 5, alternating with bractlets; petals 5, yellow to ochroleucous (fading white in some), broadly obovate and often emarginate; stamens 10–25; pistils numerous, on a hemispheric to conical receptacle, superior; fruit of achenes, the styles terminally, medially, or basally attached, jointed, finally deciduous, glabrous or papillose. Note: This is a rather difficult genus, with many interpretations, due partially to hybridization, which obscures differences between taxa, and because of different weight given to portions of the genus as providing basis of segregation into several genera. Segregate genera *Argentina*, *Drymocalis*, and *Pentaphylloides* are cited in synonymy. Synonymy is restricted to basionyms and those involving Utah plant types.

Hitchcock, C. L. 1961. Rosaceae. In: Hitchcock, C. L., A. Cronquist, M. Ownbey, and J. W. Thompson. Vascular plants of the Pacific Northwest. Univ. Washington Publ. Biol. 17(3): 89–194.

Keck, D. D. 1940. *Potentilla glandulosa* and its allies: Taxonomy. pp. 128–137. In: Clausen, J., D. D. Keck, and W. M. Hiesey. Environmental studies on the nature of species. I. Effect of varied environments on western north American plants. Carnegie Inst. Washington Publ. 520: 31–194. *Potentilla gracilis* and its allies.

Rydberg, P. A. 1898. Monograph of the North American Potentillae. Mem. Dept. Bot. Columbia Univ. No. 2.

———. 1908. Potentillaceae. N. Amer. Fl. 22(3/4): 268–377.

1. Flowers reddish purple to dark red or maroon; petals less than half as long as the sepals *P. palustris*
- Flowers white, cream, or yellow, not at all red or purple 2

- 2(1). Plants woody shrubs; styles laterally attached to the ovary; ovaries and achenes hairy *P. fruticosa*
- Plants herbaceous; styles basal, terminal, or lateral; ovaries and achenes glabrous 3
- 3(2). Plants strongly stoloniferous; styles laterally attached to the ovary; leaves evidently pinnate, strongly bicolor- ed, silvery white beneath *P. anserina*
- Plants without stolons, or rarely somewhat stolonifer- ous; styles basal or terminal; leaves usually not evi- dently pinnate and strongly bicolor 4
- 4(3). Plants annual, biennial, or perennial from a taproot; basal leaves poorly developed; leaves green on both sides, never tomentose 5
- Plants perennial, commonly with well-developed caudices; basal leaves well developed, tomentose or green 8
- 5(4). Leaflets 5–9; stamens commonly more than 20; plants of low elevations *P. paradoxa*
- Leaflets commonly 3 (rarely 5 on some leaves); sta- mens 10–20; plants of various elevations 6
- 6(5). Stems pubescent with multicellular, glandular hairs; sepals glandular *P. biennis*
- Stems pubescent with hirsute or crinkly simple hairs; sepals not glandular 7
- 7(6). Stems softly pubescent with crinkly, villous hairs; lowermost leaves sometimes 5–foliolate *P. rivalis*
- Stems rough hairy with spreading, hirsute hairs; leaves all 3–foliolate *P. norvegica*
- 8(4). Leaves with 3 leaflets; plants of high elevations, La Sal Mts. *P. nivea*
- Leaves with more than 3 leaflets (if rarely with 3 leaflets not from the La Sal Mts.) 9
- 9(8). Leaves palmately compound 10
- Leaves pinnately compound 13
- 10(9). Plants mainly 0.5–2 dm tall; leaflets villous or villous- tomentose on one or both sides; mainly alpine and subalpine 11
- Plants mainly 2–5 dm tall; leaflets variously pubescent to subglabrous; typically montane but sometimes alpine 12
- 11(10). Leaflets deeply divided into oblong lobes, pilose above, tomentose beneath; plants of high elevations in the Uinta Mts. *P. rubricaulis*
- Leaflets subtentire to toothed or lobed, the lobes (if any) tapering to the apex, pilose above, tomentose and pilose beneath; plants widespread, but not known from high elevations in the Uinta Mts. *P. concinna*
- 12(10). Leaflets toothed from somewhat below the middle or above, the base long-cuneate, green or gray green on both sides; anthers mostly 0.4–0.7 mm long *P. diversifolia*
- Leaflets commonly toothed to well below the middle, the base cuneate or not, commonly bicolor, often tomentose or paler beneath; anthers mainly 0.8–1.3 mm long *P. gracilis*
- 13(9). Styles lateral near the base of the achene; leaflets broadly obovate to ovate, green on both sides 14
- Styles subterminal or borne above the midlength of the achene; leaflets various, but never both broadly obovate to ovate and green on both sides 15
- 14(13). Inflorescence narrow and erect, often much elongate, the branches suberect; sepals equaled or exceeded by the pale yellow petals; plants uncommon *P. arguta*

- Inflorescence open, the branches often diverging; sepals surpassing the yellow to pale yellow petals; plants common *P. glandulosa*
- 15(13). Styles shorter than mature achene, glandular-thick- ened at base; leaflets toothed 1/2 the distance to the middle or more; stipules often cleft 16
- Styles exceeding the mature achene, not glandular- thickened at the base; leaflets various; stipules entire or only shallowly lobed 17
- 16(15). Leaflets 5–11 (more than 5 on some leaves); plants widely distributed *P. pennsylvanica*
- Leaflets 3–5; plants of the Uinta Mts. *P. rubricaulis*
- 17(15). Plants mainly 0.5–1.5 dm tall; leaflets deeply dis- sected, or 5 or fewer and silky pilose-tomentose 18
- Plants mainly 1.8–5 dm tall; leaflets various but, if deeply dissected, the plants larger and otherwise different 20
- 18(17). Leaflets commonly 3–5, subpalmate, densely silky- villous *P. concinna*
- Leaflets commonly 7–21, pinnate, densely silky-pi- lose to pilose or strigose and green on both surfaces 19
- 19(18). Leaflets silky-sericeous on both surfaces, 7–21; stems ascending to erect *P. ovina*
- Leaflets green on both surfaces, 7–11; stems decum- bent to ascending *P. plattensis*
- 20(17). Leaflets mostly 5–7, often subpalmate and deeply cleft, green on both sides *P. diversifolia*
- Leaflets mostly 5–13, pinnate (subpalmate in some *P. gracilis*), tomentose on one or both sides 21
- 21(20). Leaflets toothed to the base, mainly 5–9, often sub- palmate; anthers over 0.8 mm long *P. gracilis*
- Leaflets toothed from below the middle or only at the apex, mainly 7–13, pinnate; anthers less than 0.8 mm long 22
- 22(21). Leaflets shallowly toothed near the apex, usually en- tire below the middle, pilose-sericeous beneath, sel- dom also tomentose *P. crinita*
- Leaflets toothed from below the middle, definitely tomentose beneath the pilose-sericeous hairs *P. hippiana*

Potentilla anserina L. Common Silverweed. [*Argentina anserina* (L.) Rydb.]. Perennial herbs, with long strawberrylike stolons; leaves 2–10 cm long or more, pinnately compound with 5–25 main leaflets interspersed by smaller ones, the terminal leaflet 0.5–5.5 cm long, 0.3–2.6 cm wide, oval to oblong or oblanceolate to obovate, coarsely serrate, green and glabrous to pilose above, pale and villous over a tomentum beneath; scapes 1.5–15 cm long or more, villous to densely so, leafless; sepals ovate, 3–10 mm long, pubescent to glabrous, erect, en- larging in fruit; petals yellow, 7.5–16 mm long; achenes 1.5–2 mm long; 2n = 28, 42. Meadows, lake shores, terraces, and floodplains, especially where wet part of the season, at 1300 to 2600 m in all Utah counties, except Davis, Grand, Iron, Morgan, Washington, and Weber; widespread in North America; circumboreal; 55 (iv). The worldwide review by Rousi (Ann. Bot. Fenn. 2: 47–112. 1965) indicates that formal varieties are not warranted.

Potentilla arguta Pursh Acute Cinquefoil. Perennial, glandular-pubescent herbs, 2.5–6 (8) dm tall, from a caudex; basal leaves 6–30 mm long, pinnately compound with 5–11 leaflets, the terminal one 15–60 mm long (or more), 12–40 mm wide, oval to elliptic or obovate, dou-

bly dentate to somewhat lobed, green and glandular-pubescent on both surfaces; flowers several to many, showy; sepals 4–8 mm long, lance-ovate, longer in fruit; bracteoles 2–6 mm long, oblong to narrowly lanceolate; petals yellow to cream or white, mostly 5–8 mm long; receptacle sparsely hairy; achenes 1–1.5 mm long; styles basal, ca 1 mm long, deltoid. Mountain brush, aspen, and spruce-fir communities, often in meadows, at 1950 to 3360 m in Box Elder, Cache, Carbon, Daggett, Davis, Iron, Juab, Morgan, Salt Lake, San Juan, Sanpete, Summit, Utah, Washington, and Weber counties; the species is widespread in North America; 24 (iii). Our material is referable to var. *convallaria* (Rydb.) F. T. Wolf [*P. convallaria* Rydb.], and is transitional to *P. glandulosa* (q.v.).

Potentilla biennis Greene Cinquefoil. [*P. latriflora* Rydb., type from Utah]. Annual or biennial herbs, mostly 1–6 (7) dm tall, from taproots; leaves mainly cauline, palmately 3 (4)-foliolate, the terminal leaflet 1–5 cm long, 1–3 cm wide, obovate to oblanceolate, crenate-serrate, pubescent with spreading to appressed hairs and multicellular glandular ones; flowers several to numerous, inconspicuous; sepals mostly 2–4 mm long, ovate to lance-ovate; bracteoles 2–3 mm long, ovate-lanceolate to oblong; petals yellow, 1.5–3 mm long; achenes numerous, ca 1 mm long; styles terminal, ca 1 mm long, basally thickened. Meadows, streamsides, springs, and seeps at 1525 to 2324 m in Beaver, Box Elder, Cache, Daggett, Davis, Duchesne, Garfield, Iron, Juab, Millard, Salt Lake, Sevier, Wasatch, Washington, and Weber counties; widespread in western North America; 7 (v).

Potentilla concinna Richards. Pretty Cinquefoil. Perennial herbs, the stems decumbent- spreading to ascending, 0.1–1 dm tall; leaves mainly basal, palmately to pinnately 5– to 7 (9)-foliolate, the terminal leaflet 0.3–3.8 cm long, 1–10 mm wide, obovate to oblanceolate, toothed only at apex or along the length, often folded, not markedly bicolored, pilose and tomentose beneath, pilose to glabrous (less commonly tomentose) above; cauline leaves 1 or 2; cymes (1) 2– to 7-flowered, the flowers showy; sepals 2.2–4.8 mm long, triangular-ovate; bracteoles 1.3–3.5 mm long, oblong to lanceolate; petals yellow, 2.7–7.3 mm long; achenes numerous, 1.6–2 mm long; style subapically attached, smooth or glandular, not basally thickened, sometimes clavate. Three largely sympatric, variable, and often weak varieties are present in Utah. It seems likely that some, if not most, of the variation can be accounted for by intermediacy with other taxa beyond the circumscription of *P. concinna*. The trends are separable as follows:

1. Leaflets pinnately disposed, often 7, the lowermost often scattered or reduced; stems usually trailing, longer than the basal leaves; pubescence translucent-brownish; plants of western Utah *P. concinna* var. *proxima*
- Leaflets palmately disposed, commonly 5–9; stems shorter than the basal leaves; pubescence white 2
- 2(1). Leaflets toothed from the middle or below (at least some), commonly flat and green above; plants widespread *P. concinna* var. *modesta*
- Leaflets toothed at apex only, rarely minutely crenate also, commonly folded, the obscured upper surface greenish or not *P. concinna* var. *bicrenata*

Var. *bicrenata* (Rydb.) Welsh & Johnston [*P. bicrenata* Rydb.]. Pinyon-juniper, grassland, sagebrush, pon-

derosa pine, and spruce-fir communities at 2050 to 2875 m in Beaver, Duchesne, Emery, Garfield, San Juan, Sevier, and Wayne counties; Colorado, Wyoming, and New Mexico; 18 (iv).

Var. *modesta* (Rydb.) Welsh & Johnston [*P. modesta* Rydb.]. Sagebrush, meadow, aspen, spruce-fir, and Douglas fir communities at 2280 to 3480 m in Carbon, Emery, Garfield, Piute (type from Mt. Barrett, near Marysville), Sanpete, Sevier, Wasatch, and Wayne counties; endemic; 22 (v). The *modesta* phase of the pretty cinquefoil occurs generally above the range of var. *bicrenata*, with which it forms intermediates. Specimens from Emery and Sanpete counties approach *P. gracilis*.

Var. *proxima* (Rydb.) Welsh & Johnston [*P. proxima* Rydb., type from Mt. Belknap Peak, Piute County; *P. beanii* Clokey; "*P. quinquefolia*" sensu Rydb.]. Pinyon-juniper, sagebrush, ponderosa pine, and spruce-fir communities at 2200 to 3000 m in Beaver, Carbon, Garfield, Iron, Piute, and Wayne counties; Nevada; 40 (v).

Potentilla crinita Gray Hair-tuft Cinquefoil. [*Ivesii lemmonii* Wats.; *P. lemmonii* (Wats.) Greene; *P. crinita* var. *lemmonii* (Wats.) Kearney & Peebles]. Perennial herbs, the stems ascending to erect, 1.3–4.3 dm tall; leaves mainly basal, pinnately 7– to 13-foliate, the terminal leaflet 0.6–3 cm long, 0.2–0.9 cm wide, elliptic-oblong to narrowly oblanceolate, toothed at the apex only (somewhat below on some leaves), not markedly bicolored, pilose and sometimes slightly tomentose beneath, strigose-pilose to glabrate above; cauline leaves 2 or 3; cymes several- to many-flowered, the flowers showy; sepals 3–5.4 mm long, oblong-lanceolate, acuminate; petals yellow, 5–6.5 mm long; achenes several, 1.3–1.8 mm long; styles subapical, filiform, 1.8–2.1 mm long. Sagebrush, mountain brush, pinyon-juniper, ponderosa pine, and aspen communities at 1890 to 2590 m in Garfield and Wayne counties; Arizona, Nevada, New Mexico, and Colorado; 14 (iii). The varieties are connected by intermediates. Two varieties have been distinguished on the basis of pubescence types and purported leaflet tooth number differences. They are sympatric and wholly confluent. Their segregation appears to be moot. This taxon is distinguished from *P. hippiana* by the narrow, few-toothed leaflets, strigose-glandular pubescence, and openly branched inflorescence with smaller flowers. Intermediates are known, and possibly *P. crinita*, which is wholly within the range of *P. hippiana*, would best be represented at infraspecific rank within that species, a fact not proposed herein.

Potentilla diversifolia Lehm. Wedge-leaf Cinquefoil. Perennial herbs, the stems ascending to erect, 0.6–3.2 dm tall; leaves mainly basal, palmately to less commonly pinnately (3) 5– to 7-foliate, the terminal leaflet 1.2–4 cm long, 0.3–1.8 cm wide, obovate to oblanceolate, toothed mainly above the middle, not bicolored, green on both sides, strigose to pilose on both sides, seldom tomentose below; cauline leaves 1–3; cymes several-flowered, the flowers showy; sepals 5–6.5 mm long, triangular to triangular-attenuate; bracteoles 2.1–4.5 mm long, oblong to lanceolate; petals yellow, 5.6–9.5 mm long; achenes numerous, 1.5–1.9 mm long; style subapical, 1.9–2.6 mm long, smooth or glandular, not basally thickened. Two varieties are present:

- 1. Leaves palmately or subpalmately disposed, merely toothed or lobed; plants common and widespread *P. diversifolia* var. *diversifolia*
- Leaves pinnately disposed (on at least some leaves), the leaflets dissected almost to the midvein; plants of the Deep Creek Mts. *P. diversifolia* var. *multisecta*

Var. *diversifolia* Dry to wet meadows, lake margins, stream banks, forest margins, alpine tundra, and rocky ridges at 2745 to 3500 m in all Utah counties, except Carbon, Davis, Kane, Millard, Morgan, Rich, Washington, and Weber; Alaska and Yukon, south to California, Arizona, New Mexico, and South Dakota; 89 (xii). This is a highly variable taxon, transitional to both *P. gracilis* and *P. ovina*. Reports of var. *perdissecta* (Rydb.) C. L. Hitchc. from the Uinta Mts. appear to be based on plants with pinnately disposed leaflets intermediate between var. *diversifolia* and other taxa. The following variety is the most pronounced of regional ecotypes, but is difficult to distinguish in all cases.

Var. *multisecta* Wats. [*P. dissecta* var. *multisecta* (Wats.) Wats.; *P. multisecta* (Wats.) Rydb.]. Ponderosa pine, spruce-fir, and limber pine communities at 2135 to 3050 m in Juab County; Nevada, Idaho, and Montana; 7 (ii).

Potentilla fruticosa L. Shrubby Cinquefoil; Yellow Rose; Tundra Rose. [*Dasiphora riparia* Raf.; *D. fruticosa* (L.) Rydb.; *P. floribunda* Pursh; *Pentaphylloides floribunda* (Pursh) A. Love]. Shrubs to 1 m tall or more; bark shreddy; leaves 1–5 cm long, pinnately 3– to 7-foliolate, the terminal leaflet 0.5–2.5 cm long, 0.2–1 cm broad, oblong to elliptic, entire, green and sparsely hairy to glabrate above, grayish and silvery hairy below, somewhat revolute; flowers 1 to several, conspicuous; sepals 3.5–9 mm long, ovate-lanceolate; bracteoles 4–13 mm long, lanceolate to elliptic; petals yellow, 6–14 mm long, rounded; receptacle hairy; achenes 1.5–2 mm long, white-hairy; 2n = 14, 28. Meadows, sagebrush, aspen, lodgepole, ponderosa pine, and spruce-fir communities often on floodplains or stream banks at 1700 to 3500 m in all Utah counties, except Beaver, Davis, Millard, Morgan, and Tooele; Alaska east to Newfoundland, south to California, New Mexico, Iowa and New Jersey; Eurasia; 111 (xiv). This handsome plant is known in cultivation in Utah, Summit, and Salt Lake counties at elevations below 1900 m, and should be grown widely in the state.

Potentilla glandulosa Lindl. Glandular Cinquefoil. [*Drymocallis glandulosa* (Lindl.) Rydb.] Perennial glandular-pubescent herbs, 0.8–6 (7) dm tall, from a caudex; basal leaves 3–22 cm long, pinnately compound, with 5–9 leaflets, the terminal one 0.7–6.8 cm long, 0.6–4.2 cm wide, obovate to elliptic, doubly dentate or lobed, green and variously pubescent or glandular on both surfaces; flowers several to many, showy or inconspicuous; sepals 5.5–9.3 mm long, lance-ovate, often acuminate, longer in fruit; bracteoles 4.5–7.2 mm long, oblong to narrowly lanceolate; petals mainly yellow, mostly 4–7.5 mm long; receptacle sparsely hairy; achenes numerous, 1–1.2 mm long; styles from below the middle, 0.8–1 mm long. The glandular cinquefoil is widespread and common in much of Utah, where it consists of a series of intergrading populations varying by degree from each other and only arbitrarily separable from *P. arguta* (q.v.), with which it probably should be combined. In that case, the name would be *P. arguta*, since that epithet has priority. The complex was summarized by Keck (Carnegie Institu-

tion Washington 520: 26–124, 1940). He recognized four morphological phases from Utah (i.e., the subspecies *arizonica*, *micropetala*, *glabrata*, and *pseudorupestris*). Examination of a fairly large series of specimens from Utah demonstrates that all, except that designated as *micropetala*, are connected by a series of intermediates, and might best be regarded as belonging to a single polymorphic and highly plastic var. *intermedia*. The following arbitrary key will serve to differentiate most specimens of those two varieties.

- 1. Petals much shorter than the sepals, 4–5 mm long, 2–4 mm broad *P. glandulosa* var. *micropetala*
- Petals shorter than to slightly exceeding the sepals, mainly 5–7.5 mm long and about as broad *P. glandulosa* var. *intermedia*

Var. *intermedia* (Rydb.) C. L. Hitchc. [*Drymocallis pseudorupestris* var. *intermedia* Rydb.]. Mountain brush, ponderosa pine, lodgepole pine, aspen, and spruce-fir communities, often in meadows at 1890 to 3200 m in Beaver, Box Elder, Cache, Carbon, Daggett, Duchesne, Garfield, Juab, Millard, Piute, Rich, Salt Lake, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, Washington, and Weber counties; British Columbia and Alberta south to Oregon, Arizona, and Wyoming; 86 (viii).

Var. *micropetala* (Rydb.) Welsh & Johnston [*Drymocallis micropetala* Rydb., type from City Creek Canyon; *P. glandulosa* ssp. *micropetala* (Rydb.) Keck]. Sagebrush, mountain brush, upwards to alpine meadows at 1430 to 3050 m in Cache, Salt Lake, Sanpete, Sevier, Summit, and Weber counties; Idaho and Wyoming; 6 (i). This small-petaled phase resembles *P. norvegica* in flower size and in general conformation, but differs inter alia in pistil features and leaflet number.

Potentilla gracilis Dougl. ex Hook. Slender Cinquefoil. Perennial, variably pubescent herbs from a caudex; stems ascending to erect, 0.4–6 (8) dm tall; basal leaves 3–30 cm long, or more, palmately or pinnately compound, with 5–9 leaflets, the terminal one 1.3–10.7 cm long, 0.4–3.7 cm wide, obovate to oblanceolate, crenate, serrate, or toothed to dissected, commonly bicolored, but not uncommonly green on both sides; flowers several to numerous, showy; sepals 3.5–9.5 mm long, lanceolate to lance-ovate, acute to attenuate-acuminate; bracteoles 2.4–8.5 mm long, lance-oblong; petals yellow, 5.6–8 (10) mm long; achenes numerous, 1.3–1.6 mm long; styles subapical, 2–2.3 mm long, filiform or thickened to ca 1/2 the length, tapered to stigma. Several intergrading phases are recognizable at varietal level in this most common and widespread of our cinquefoil species. Variants tend to represent recombinant types of several recurrent features, i.e., glands on calyx teeth, tomentum on lower leaflet surface, and depth of incision of leaflet margin. There are four more or less intergrading varieties separable as follows:

- 1. Leaflets dissected almost or quite to the midrib, or some teeth, at least, more than 5 mm long; plants uncommon, often of marshes at lower to moderate elevations *P. gracilis* var. *elmeri*
- Leaflets seldom dissected as much as 1/2 the distance to the midrib; teeth seldom to 5 mm long; plants more common to abundant, often at moderate to higher elevations 2

- 2(1). Leaves prominently discolored, green above, white-tomentose beneath, often subpinnate to pinnate *P. gracilis* var. *pulcherrima*
 — Leaves less prominently discolored, pilose to glabrate, less commonly somewhat tomentose beneath 3
- 3(2). Calyx lobes and often the leaflets glandular and stiffly pilose; plants often drying brownish *P. gracilis* var. *brunnescens*
 — Calyx lobes and leaflets without glandular hairs; plants usually green *P. gracilis* var. *glabrata*

Var. *brunnescens* (Rydb.) C. L. Hitchc. [*P. brunnescens* Rydb.]. Meadows, mountain brush, aspen, spruce-fir, and alpine tundra at 2300 to 3180 m in Box Elder, Cache, Duchesne, Emery, Salt Lake, Sanpete, Sevier, Summit, Uintah, and Utah counties; Washington and Montana south to Nevada and Wyoming; 15 (iii). This variety is freely transitional to var. *pulcherrima* and to *P. diversifolia* where they occur together.

Var. *elmeri* (Rydb.) Jepson [*P. elmeri* Rydb.; *P. pectinsecta* Rydb., type from Salt Lake City; *P. pecten* Rydb.]. Stream banks, meadows, and seeps at 1370 to 2680 m in Box Elder, Duchesne, Juab, Rich, Salt Lake, Sanpete, Sevier, Summit, Uintah, Utah, Wasatch, Washington and Weber counties; Oregon to Montana and south to California and New Mexico; 27 (0). The variety is transitional to var. *glabrata*.

Var. *glabrata* (Lehm.) C. L. Hitchc. [*P. nuttallii* var. *glabrata* Lehm.]. Mountain brush, sagebrush, aspen, and spruce-fir communities at 1675 to 2745 m in Daggett, Emery, Piute, Sanpete, Sevier, Summit, Wasatch, and Weber counties; British Columbia and Alberta south to California, New Mexico, and Nebraska. Included in our limited materials are those specimens with spreading hairs on petioles and stems, passing as var. *permollis* (Rydb.) C. L. Hitchc. [*P. permollis* Rydb.]. They seem to be transitional completely with var. *glabrata*; 13 (i).

Var. *pulcherrima* (Lehm.) Fern. [*P. pulcherrima* Lehm.; *P. hippiana* var. *pulcherrima* (Lehm.) Wats.]. Sagebrush, mountain brush, aspen parkland, and spruce-fir communities often in meadows at 1890 to 3450 m in all Utah counties, except Kane, Millard, Morgan, Tooele, Wayne, and Weber; British Columbia east to Saskatchewan, south to Nevada, Arizona, New Mexico, and South Dakota; 125 (vii). This phase of *P. gracilis*, especially, forms intermediates with *P. hippiana* and *P. concinna*. It is likewise freely transitional to the other varieties of *P. gracilis*.

***Potentilla hippiana* Lehm.** Hipp Cinquefoil; Woolly Cinquefoil. [*P. wardii* Greene, type from Thousand Lake Mt., Wayne County]. Perennial, variably pubescent herbs from a caudex, the stems ascending to erect, 1.1–4.8 (5.5) dm tall; basal leaves 2.5–19 cm long or more, pinnately compound with 7–11 leaflets, the terminal one 0.9–4.7 cm long, 0.4–1.9 cm wide, oblanceolate to oblong or elliptic, serrate or toothed less than half way to midrib, the teeth from below the middle, grayish tomentose to pilose on one or both surfaces; flowers several to numerous, showy; sepals 4.3–6.5 mm long, lance-ovate, acute to acuminate; bracteoles 2.4–5.5 mm long, lance-oblong; petals yellow, 6–7.7 (9.5) mm long; achenes several to numerous, 1.5–1.9 mm long; styles subapical, 1.8–2.3 mm long. Meadow, aspen, spruce-fir, and alpine tundra communities at 2250 to 3450 m in Beaver, Daggett, Duchesne, Emery, Garfield, Grand, Iron,

Kane, Piute, Salt Lake, San Juan, Sevier, Summit, Uintah (?), Wasatch, and Wayne counties; British Columbia east to Michigan and south to New Mexico, Arizona, and Nebraska; 66 (iv). Apparent intermediates are known between the Hipp cinquefoil and *P. gracilis*, and especially var. *pulcherrima*, but also with var. *brunnescens*.

***Potentilla nivea* L.** Perennial non-glandular herb, the stem decumbent to ascending, 0.7–2 dm long, from a caudex; stems and petioles densely tomentose; basal leaves 2–9 cm long, trifoliate, the terminal leaflet 0.8–2.7 cm long, 0.7–1.7 cm wide, obovate to elliptic or oblanceolate, coarsely toothed to near the base, green and silky-pubescent above, densely snow-white tomentose below, strongly bicolored; flowers 1–15 in an open inflorescence, showy; sepals 2.5–5 mm long, lanceolate; bracteoles 1.8–4.5 mm long, oblong to lanceolate; petals yellow, 4–7 mm long; achenes several, 1–1.5 mm long; style subterminal, ca 1 mm long, uniformly thickened; 2n = 14, 28, 49, 56, 63, 70. Alpine tundra at 3050 to 3965 m in Grand, Juab, San Juan, and Summit counties; Alaska east to Greenland, south in the Rocky Mountains to New Mexico and southeastern Utah; Eurasia; 8 (iii).

***Potentilla norvegica* L.** Rough Cinquefoil. [*P. monspeliensis* var. *norvegica* (L.) Farw.; *P. monspeliensis* L.; *P. norvegica* ssp. *monspeliensis* (L.) Asch. & Graebn.]. Annual or biennial (short-lived perennial?) herbs, the stems erect, 0.7–5 dm tall or more, from a taproot, the stems and petioles sparsely stiff-hairy; leaves mostly cauline, palmately (or subpinnately) compound with 3 (rarely 5) leaflets, the terminal one 1–8 cm long, 0.6–2.7 cm wide, obovate to oblanceolate, coarsely toothed to near the base or entire and cuneate in the lower part, green and sparsely stiff-hairy to glabrous above, paler and stiff-hairy beneath, especially along the veins; flowers several to many, inconspicuous; sepals 4–6 mm long, ovate-lanceolate, enlarging in fruit; bracteoles 3–6 mm long, oblong to elliptic or lanceolate; petals yellow or whitish, 2.5–3.6 mm long; achenes numerous, 0.8–1.1 mm long; style subterminal, 1.6–0.9 mm long; 2n = 56, 63?, 70. Floodplains, wet meadows, lake shores, and other moist sites at 1370 to 2930 m in Beaver, Cache, Duchesne, Emery, Garfield, Grand, Iron, Kane, Morgan, Salt Lake, Sevier, Summit, Uintah, Utah, Wasatch, and Wayne counties; widely distributed in the northern hemisphere; 16 (ii).

***Potentilla ovina* Macoun** Perennial herbs, from a caudex, the stems decumbent to ascending, 1–3.5 (5) dm tall; leaves mainly basal, pinnately compound with (5) 9–18 leaflets, the terminal mostly 0.6–2.1 mm long, 0.4–1.1 cm wide, deeply pinnately dissected or apically few-toothed, conspicuous; calyx 6–8 (10) mm long, lobes ovate-lanceolate to lance-attenuate; bracteoles 1.8–4 mm long, oblong to lance-oblong; petals yellow, 5–6.4 mm long; achenes many, 1.1–1.7 mm long; style subterminal, 1.8–2.7 mm long, filiform. There are two fairly distinct varieties in Utah:

1. Leaflets densely to uniformly sericeous, grayish green or gray, often with a lower layer of sparse tomentum, 5–10 mm long, often with more than 6 teeth, leaf rachis 2–6 cm long *P. ovina* var. *ovina*
- Leaflets glabrous to sparsely sericeous-strigose, usually green, never tomentose, 10–20 mm long, often with 3–5 teeth, leaf rachis 3–12 cm long *P. ovina* var. *decurrens*

Var. *decurrens* (Wat.) Welsh & Johnston [*P. dissecta* var. *decurrens* Wats., type from Uinta Mts., Summit

County]. Meadows and rocky ridges, ponderosa pine, lodgepole, spruce-fir, aspen, and (less commonly) alpine tundra communities, often on siliceous substrates, at 2200 to 3500 m in Beaver, Box Elder, Cache, Daggett, Davis, Duchesne, Garfield, Grand, Piute, Salt Lake, San Juan, Sanpete, Summit, Tooele, Uintah, and Wayne counties; Colorado to Nevada and Wyoming, north to Alberta; 57 (iv). This is a characteristic form of montane meadows in the Uinta Mts. It forms intermediates with the following and with *P. diversifolia*, sometimes simulating *P. diversifolia* var. *multisecta* (q.v.).

Var. *ovina* [*P. diversifolia* var. *pinnatisecta* Wats., type from Uinta Mts., Summit County]. Meadows and rocky ridges, openings in spruce-fir and alpine tundra communities, often on limestone, at 2800 to 3900 m in Box Elder, Cache, Daggett, Davis, Duchesne, Grand, Juab, Piute, Salt Lake, San Juan, Sanpete, Summit, Uintah, Utah, and Wasatch counties; Alberta to Oregon and Wyoming; 21 (i). This taxon has been confused with *P. plattensis*, but its tomentulose leaflets and erect-ascending pedicels in fruit appear to be diagnostic. Hybrids between *P. ovina* (usually var. *decurrens*) and *P. gracilis* var. *pulcherrima* are frequently encountered in Utah (Box Elder, Cache, Daggett, Piute, and Summit counties); leaves are pinnate or subpalmate with 7–15 leaflets that are usually bicolorated and moderately tomentose beneath, and stems are ascending, contrasting with the usually decumbent *ovina* and the erect-ascending *pulcherrima*.

Potentilla palustris (L.) Scop. Marsh Cinquefoil. [*Comarum palustre* L.]. Perennial, rhizomatous, palustrine herbs, the stems prostrate to ascending, purplish, glabrous to hairy, mostly 1–10 dm long; leaves mostly cauline, the lower ones the largest, mostly 0.5–2 dm long, pinnately (3) 5– to 7-foliolate, the terminal leaflet 1.8–8.5 cm long, 0.7–3.2 cm broad, oblanceolate to elliptic, coarsely serrate (sometimes doubly so), green and hairy to glabrous above, paler and hairy beneath; flowers few to several, showy; sepals 7–15 mm long, ovate-lanceolate, enlarging in fruit, purplish; bracteoles 3.5–11 mm long, lanceolate to linear; petals purplish or reddish purple, 2.5–5 mm long; receptacle glabrous; achenes numerous, 1–1.5 mm long. Wet meadows and bogs at 2865 to 2930 m in the Uinta Mts., Uintah County; Alaska and Yukon east to Labrador, south to California and Wyoming; circumboreal; 4 (0). This remarkable potentilla species was discovered in Utah by Mr. Joel Tuhy.

Potentilla paradoxa Nutt. in T. & G. Contrary Cinquefoil. Annual, biennial or short-lived perennial herbs, the stems decumbent to ascending or erect, 0.8–9 dm tall, sparsely to moderately villous; leaves mainly cauline, all pinnately compound with 5–11 leaflets, the terminal one 1.2–4.5 cm long, 0.4–2.5 cm wide, often dissected into 3 main confluent lobes, obovate to oblanceolate, toothed to below the middle, cuneate to the base, green on both sides, strigose to strigulose; flowers few to many, not especially showy; sepals 3–5.2 mm long, ovate, shorter than the bracteoles, enlarging in fruit; bracteoles 4–6.5 mm long, lanceolate; petals yellow or whitish, 3.2–4.3 mm long; achenes numerous, 0.8–1 mm long, laterally enlarged along ventral suture; style subterminal, 0.5–0.7 mm long. Beaches, marshes, and lake shores at 1350 to 1650 m in Salt Lake and Utah counties; widespread in North America; Asia; 6 (0).

Potentilla pensylvanica L. Perennial, glandular to non-glandular herbs from a caudex, the stems ascending to erect, 0.5–4.5 dm tall or more; leaves mostly basal, 2–18 (25) cm long, erect, pinnately compound with 5–17 leaflets, the terminal one 0.9–4.5 (6) cm long, 0.4–1.2 cm wide, elliptic to oblong or oblanceolate, coarsely toothed to narrowly lobed, the sinuses extending more than half way to the midrib, conspicuously revolute-margined, green and somewhat hairy above, white- or more commonly greenish- or yellowish tomentose below; flowers few to many in a glomerate inflorescence, showy; sepals 3.5–7.5 mm long, ovate-lanceolate; bracteoles 3–6 mm long, narrowly lanceolate; petals yellow, 5–8 mm long; receptacle glabrous; achenes numerous, 0.9–1.2 mm long; style subterminal, 0.9–1.0 mm long, conic, with a conspicuously thickened and often papillose base. This is a highly variable species throughout its large range in North America; the taxonomic problems in this species are mirrored in the whole section (sect. Multifidae), to which *P. rubricaulis* and *P. multifida* belong. There is seemingly only one entity in Utah which merits separation from typical *P. pensylvanica*:

- 1. Leaflets 5–7, subdigitate (10–30% of the rachis occupied with leaflets); pubescence silvery or yellowish white, often of long entangled hairs densely matted; plants alpine *P. pensylvanica* var. *paucijuga*
- Leaflets 7–17, often pinnate (30–60% of rachis occupied); pubescence olive-greenish, dull, not silvery, usually composed of short curly hairs sparsely matted; plants widespread, sometimes alpine *P. pensylvanica* var. *pensylvanica*

Var. *paucijuga* (Rydb.) Welsh & Johnston [*P. paucijuga* Rydb., type from La Sal Mts.]. Grassy tundra and alpine communities at 3200 to 3800 m in Duchesne, Grand, Juab, Piute, San Juan, and Summit counties; endemic to Utah; 3 (0). In the La Sal Mts. this form may hybridize with *P. nivea*; the taxa are usually distinguished by the glomerate inflorescence with glandular pubescence, revolute-margined leaflets, and pinnate leaves of var. *paucijuga*.

Var. *pensylvanica* Sagebrush, sagebrush-grass, and meadow communities at 2200 to 3725 m in Beaver, Box Elder, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Piute, San Juan, Sevier, Wayne, and Wasatch counties; Hudson Bay to Alaska, south to northern Mexico, Texas, and Arizona. 55 (iv).

Potentilla plattensis Nutt. Perennial herbs with stems 0.5–2.5 dm long, decumbent or creeping through meadow herbs and grasses; leaves basal and cauline, 3–11 cm long, pinnately compound with 11–23 leaflets, these verticillate or subverticillate; terminal and lower leaflets all pinnately toothed with 5–8 teeth cutting 70–90% to midrib, glabrous to sparsely strigose, green to grayish green on both surfaces; stems with 3–15 flowers on recurved pedicels in fruit; calyx (5) 6–8 mm long, strigose or puberulent; achenes numerous; styles subterminal, 1.5–3.0 mm long, filiform. Wet meadows, bogs, and valley bottoms at 1820 to 2700 m in Kane and Wayne counties; Alberta and Manitoba south through Wyoming and Colorado to central Arizona and New Mexico; 2 (0). This species has been confused with *P. ovina* in the past, but the habitats are usually sharply distinct, and the combination of trailing stems, pinnately-dissected leaflets, and recurved pedicels are diagnostic for *P. plat-*

tensis. Sometimes there are two forms at the same site; a lax trailing form in moist portions of a meadow, and a more compact form with prostrate stems on better-drained soil in the same meadow.

Potentilla rivalis Nutt. [P. millegrana Engelm. ex Lehm.; P. leucocarpa Rydb. in Britt. & Br.]. Annual or biennial herbs from a taproot, the stems 2-6 dm tall, spreading to suberect, pubescent with fine villous or villous-tomentose hairs; leaves mainly cauline, palmately to subpinnately compound with 3-5 leaflets, the terminal 1-4 cm long, 0.4-1.3 cm wide, obovate to oblong to oblanceolate, coarsely toothed (at least above the middle), green and minutely villous on both sides; flowers numerous, inconspicuous; sepals 2.3-4.2 mm long, ovate; bracteoles 3.3-4 mm long, lanceolate; petals yellow, 1.5-1.9 mm long, not enlarged laterally; style subterminal, 0.6-0.8 mm long, fusiform. Reservoir shores and other mesic sites at 1400 to 2320 m in Carbon, Salt Lake, Sevier, and Uintah counties; widespread in North America; 4 (i).

Potentilla rubricaulis Lehm. [P. hookeriana Lehm.; P. saximontana Rydb.; P. pedersenii Rydb.; P. furcata Porsild]. Perennial herbs, stems ascending from a caudex, leaves mostly basal, eglandular, palmate to subpinnate with 5-7 leaflets, the terminal one 1.0-2.5 cm long and 0.5-1.0 cm wide, few-toothed with narrow-crenate or serrate teeth, usually deeply divided 50-90%, often revolute-margined, densely grayish tomentose below, sparsely tomentose to puberulent above, strongly bicolored, often pilose as well below with tufts of hairs at the tips of ultimate segments, the petioles pilose-sericeous with subsidiary tomentum; cymes 1- to 10-flowered, the flowers showy but small; sepals 4-6 mm long; bracteoles 3-6 mm long; style subapical, 0.9-1.1 mm long, conic, usually conspicuously thickened and papillose below. Alpine tundra meadows and rocky ridges at 2410 to 3780 m in Duchesne, Grand, San Juan, Summit, and Uintah counties; Greenland to Alaska, south to British Columbia, sparsely and rarely through Montana into Wyoming, and Colorado; 9 (0). This name is very often misapplied, but here it is taken for a strictly alpine species with cone-shaped, thickened style ca 1 mm long, more or less digitate leaves with 5-7 leaflets, and petioles with long straight hair in addition to tomentum. It has affinities with sect. Multijugae (see P. pensylvanica), but may be allied to P. nivea and its relatives as well, with whom it may hybridize.

Prunus L.

Shrubs or small trees with unarmed branches; leaves alternate, simple, entire to serrate or serrulate, rarely lobed, commonly with glands on petioles or blade bases; stipules lance-attenuate to linear, caducous; flowers perfect, regular, solitary, in umbellate clusters, or in racemes; sepals 5, borne atop a cup-shaped to turbinate hypanthium; petals 5, white, pink, rose, or red; stamens numerous; pistil 1, free from the usually deciduous hypanthium; style 1, elongate, with capitate stigma; fruit a drupe. Note: The genus is represented by only three indigenous species in Utah, P. emarginata, P. fasciculata, and P. virginiana. However, the numerous introduced species persist following cultivation, and many escape. They are treated herein for those reasons.

- 1. Leaves entire or serrate only near the apex, borne in fascicles, less than 2 cm long and 5 mm wide; shrubs with divaricate branches, of low elevations, indigenous in Beaver, Millard, and Washington counties *P. fasciculata*
- Leaves various, usually larger; shrubs to trees of moderate size, variously distributed, but not of desert shrublands 2
- 2(1). Flowers borne in pedunculate, elongate or corymbose clusters 3
- Flowers borne singly or in sessile umbellate clusters from winter buds 8
- 3(2). Flowers borne in corymbose racemes, the pedicels subtended by persistent bracts 4
- Flowers borne in elongate racemes, the pedicels without persistent bracts 6
- 4(3). Flowers to 20 mm wide or more, the petals often pink or double or both; bracts 3-8 mm long, cuneate, the truncate apex fringed-serrulate; flowering cherry *P. serrulata*
- Flowers ca 12 mm wide, the petals white, single; bracts ca 1 mm long, ovate, serrulate 5
- 5(4). Corymbs subumbellate; fruit red; leaves much longer than wide; plants indigenous, uncommon *P. emarginata*
- Corymbs elongate; fruit black; leaves about as wide as long; plants introduced, escaping (rootstock) *P. mahaleb*
- 6(3). Leaves leathery thickened, more or less evergreen, entire; plants cultivated shrubs *P. laurocerasus*
- Leaves not especially thickened, serrate to serrulate; shrubs or small trees, cultivated or not 7
- 7(6). Hypanthium pubescent within; racemes pendulous or spreading in anthesis; cultivated ornamental *P. padus*
- Hypanthium glabrous within; racemes erect or ascending in anthesis; indigenous or less commonly cultivated *P. virginiana*
- 8(2). Leaves cordate-ovate to broadly ovate; cultivated apricot, rarely escaping *P. armeniaca*
- Leaves lanceolate to oblong, or less commonly oblanceolate to broadly elliptic; cultivated ornamental and fruit trees and shrubs 9
- 9(8). Plants shrublike, mainly 2 m tall or lower 10
- Plants shrub or treelike, mainly 2-5 m tall or more 12
- 10(9). Leaves glabrous, less than 2 cm broad; flowers commonly 2-4 per bud *P. besseyi*
- Leaves hairy, at least along veins beneath; flowers solitary (rarely 2) per bud 11
- 11(10). Leaves long-villose beneath, sparingly villosulose above, broadly elliptic to oblong; flowers single; cultivated for ornament and for fruit *P. tomentosa*
- Leaves sparingly villosulose on both sides; flowers mostly double; cultivated ornamental *P. triloba*
- 12(9). Flowers solitary, or sometimes 2 or 3 per bud 13
- Flowers 3 or more per bud 16
- 13(12). Axillary buds on fruiting branchlets borne in 3's, the lateral ones producing flowers 14
- Axillary buds on fruiting branchlets borne singly 15
- 14(13). Leaves pubescent beneath; pedicels pubescent; cultivated plum *P. domestica*
- Leaves glabrous beneath, except on midrib; pedicels glabrous; cultivated flowering plum *P. cerasifera*

- 15(13). Leaves sharply serrate; fruit not leathery and splitting, exposing the stone at maturity; cultivated peach, commonly escaping *P. persica*
- Leaves crenate-serrate; fruit leathery, splitting and exposing stone at maturity; sparingly cultivated almond, not escaping *P. dulcis*
- 16(12). Plants forming shrubby thickets; flowers 14 mm across or less; fruit an astringent plum *P. americana*
- Plants tree-like or small trees, not forming thickets; flowers 10–30 mm across or more; fruit a cherry 17
- 17(16). Inner flowerbud scales reflexed or spreading; petals 8–14 mm long; sweet cherry *P. avium*
- Inner flower bud scales erect; petals 6–9 mm long; tart cherry *P. cerasus*

***Prunus americana* Marshall** American Plum; Pottawatami Plum. Shrubs, often forming thickets, rarely tree-like, to 5 m tall; branchlets sometimes thornlike, glabrous; leaves 2.5–7 cm long, 0.5–3 cm wide, elliptic to ovate or lanceolate, sharply serrate, long-attenuate apically, acute to obtuse basally, glabrous or pubescent along veins beneath; petioles usually glandless; flowers 1–4, in sessile or subsessile umbels, from lateral buds, appearing before the leaves, in ours mainly 14 mm broad or less; petals white, 5–7 mm long, 2.5–3 mm wide; sepals spreading, puberulent; hypanthium puberulent without and within; fruit a yellow to red plum. Cultivated fruit plant, and probably indigenous in portions of Utah, but also introduced by pioneers to all areas of the state. The plants spread underground and form thickets which persist in Cache, Duchesne, Piute, Uintah, Salt Lake, Utah, Washington, and Wayne counties; introduced from central U. S.; 12 (ii).

***Prunus armeniaca* L.** Apricot. Small trees to 8 m tall or taller; branchlets green to brown, armed or unarmed; leaf blades mainly 1.5–7 cm long, 1–6 cm wide on mature branches, cordate-ovate to ovate, obtusely serrate, abruptly attenuate, obtuse to cordate basally, glabrous, or hairy along veins beneath; petioles usually with glands; flowers solitary, appearing before leaves; petals white (rarely pinkish), 8–12 mm long, orbiculate to orbicular; sepals glandular, the hypanthium glabrous except basally; pedicels villosulose; fruit pubescent, fleshy and edible. Apricot trees are grown in the lower elevation portions of the state, where they escape and persist as waifs along canals, roadsides, and fence rows. Specimens examined are from Beaver, Carbon, Millard, Utah, and Wayne counties; introduced from China; 10 (iii).

***Prunus avium* L.** Sweet Cherry. Trees to 8 m tall or taller; branchlets soon brown, unarmed; leaf blades mainly 3–10 cm long, 2.5–8 cm wide, broadly oblanceolate to obovate or elliptic, obtusely serrate to doubly serrate, abruptly short-attenuate, obtuse to rounded basally, glabrous or long-hairy especially along veins beneath; petioles commonly with glands; flowers 2–4 per bud, appearing with early leaves; petals white (rarely pink), 8–14 mm long, orbiculate to orbicular; sepals, hypanthium, and pedicels glabrous; fruit glabrous, red to almost black, edible. The Bing, Lambert, Royal Ann, and other cultivars of the sweet cherry are grown commercially and in garden orchards at low elevations in Utah, where frost is not prohibitive. Trees escape from cultivation along canals and in riverbottoms. Many are grown as grafted stock; some on rootstocks of other *Prunus* species, especially on *P. mahaleb* (q.v.). Specimens examined are

from Carbon, Utah, and Washington counties; introduced from Eurasia; 9 (i).

***Prunus besseyi* Bailey** Western Sand Cherry. Shrubs to 1.3 m tall; branchlets soon brownish, not thornlike; leaf blades mainly 1.5–5 cm long, 0.5–1.8 cm wide, elliptic to oblanceolate, obtusely serrate, acute to cuspidate apically, cuneate basally; glabrous; petioles commonly lacking glands; flowers commonly 2–4 per bud, appearing with early leaves; petals white, 4–6 mm long, 2.5–3.5 mm wide, elliptic; sepals, petals, and hypanthium glabrous; fruit glabrous, black, commonly astringent. The western sand cherry is used as a dwarfing rootstock for peaches, cherries, and other *Prunus* species. The plants persist and escape in orchard areas of the state; erosion control and wildlife plantings are probable; specimens were examined from Utah and Wasatch counties; introduced from the Great Plains; 3 (i).

***Prunus cerasifera* Ehrh.** Cherry Plum; Flowering Plum. Small trees to 6 m tall, rarely taller; branchlets soon brown, not thornlike; leaf blades mainly 1.8–6.5 cm long, 1.2–4 cm wide, ovate to elliptic, serrate to doubly serrate, acute apically, acute to rounded basally, villous along the veins beneath; petioles seldom with glands; flowers solitary, or less commonly 2 or 3 per bud; petals pink to violet or white, 6–9 mm long, 4.5–7 mm wide, suborbicular; sepals, hypanthium, and pedicels glabrous, except along marginal insertion of filaments; fruit red to purple, edible; 2n = 16. Cultivated ornamentals of streets, lawns, and gardens, persisting and in lower elevation portions of the state; specimens examined from Utah County; introduced from Asia; 19 (i). The hybrid between *P. cerasifera* and *P. mume* Sieb. & Zucc., the Japanese apricot is also cultivated in Utah, under the name *P. x blireana* Andre. The hybrid has broad purple leaves.

***Prunus cerasus* L.** Sour Cherry; Pie Cherry. Small trees to 5 m tall, rarely more; branchlets soon brown, not thornlike; the leaf blades mainly 3–10 cm long, 1.2–5 cm wide, oblanceolate to obovate or elliptic, doubly serrate, abruptly acuminate, acute to rounded basally, glabrous except hairy along veins beneath; petioles bearing glands; flowers commonly 3 per bud (less commonly fewer); petals white, 7–9 mm long and about as broad; sepals crenate-serrate, glabrous; hypanthium and pedicels glabrous; fruit red, soft, sour. This is the tart cherry of commerce, widely cultivated in Utah and a favorite food of robins; specimens examined from Utah County; introduced from Eurasia; 2 (0). The species flowers later than does the sweet cherry, and fruit is harvested in mid- to late July, after the sweet cherries have been harvested. The trees long persist.

***Prunus domestica* L.** Common or European Plum; Italian Prune. Small trees to 5 m tall, with grayish or ashy bark; branchlets pubescent when young, not especially thornlike; leaf blades mainly 2–10 cm long and 1–6 cm wide, ovate to obovate, coarsely serrate, rough and thinly pubescent above, pubescent beneath; petioles commonly with glands; flowers solitary or sometimes 2 or 3 per bud; petals white, ca 10 mm long; sepals and hypanthium pubescent or glabrous; pedicels commonly pubescent; fruit commonly blue purple, glaucous; 2n = 48. Included here are the yellow fleshed plums known as Damsun and green-gage, other plums, and the Italian prune. The species is widely cultivated in Utah, where it persists and less commonly escapes. The red-fleshed plums, called Japanese or Satsuma, belong to *P. salicina* Lindl. and are

cultivated in the area too, but less commonly; specimens were examined from Beaver and Utah counties; introduced from Eurasia; 5 (i).

Prunus dulcis (Miller) D. A. Webb Almond. Small trees to 5 m tall or taller; branchlets pale, not thornlike; leaf blades 2–7 cm long, 0.7–2 cm long on mature branches, oblong-lanceolate, crenate-serrate, abruptly short-apiculate, glabrous; petioles usually bearing glands; flowers solitary, appearing before or with early leaves; petals pink; sepals villous at margin; fruit pubescent, splitting at maturity and exposing the stone; $2n = 16$. Sparingly cultivated ornamental, botanical curiosity, and "nut" tree, known from Utah and Washington counties; persisting, but not escaping (?); introduced from the Old World; 9 (i).

Prunus emarginata (Dougl.) Walp. Bitter Cherry. [*Cerasus emarginata* Dougl.]. Shrubs or small trees to 4 m tall or more, typically with glabrous, red, shining branchlets; leaves mainly 1.5–5 cm long, the blades oblong-obovate to elliptic, acutish to obtuse, finely serrulate, sparingly pubescent to glabrous, short-petioled; corymbs mainly 2–4 cm long, 3- to 10-flowered; hypanthium campanulate, glabrous, ca 3 mm long; sepals 1.4–2 mm long; petals 5–7 mm long, obovate, white; fruit red, bitter, 6–8 mm long, the stone ellipsoid. Mixed chaparral and pinyon-juniper communities at ca 1525 m in Washington County (Warrick 1474 BRY); British Columbia to Idaho, south to California; 1 (0).

Prunus fasciculata (Torr.) Gray Desert Peach. [*Emplectocladus fasciculatus* Torr.]. Low intricately branched shrub to 1.5 (2) m tall; branchlets pubescent, ashy or grayish, more or less thornlike; leaves mainly 0.5–2.5 cm long, 0.1–0.6 cm wide, cuneate-spatulate, entire or few toothed near the apex, apiculate or cuspidate, sessile or nearly so; not bearing glands at leaf base, more or less puberulent on both sides; flowers mainly 1 per bud; petals cream to white, 3.5–5 mm long, spatulate to elliptic; sepals, hypanthium, and pedicels glabrous; fruit hairy, thin-fleshed, inedible. The desert peach occurs in mixed desert shrub, chaparral, and lower pinyon-juniper communities at 625 to 1770 m in Beaver, Millard, Iron (?), and Washington counties; Arizona, Nevada and California; 42 (viii). This species is now being tested as a rootstock for grafting of other *Prunus* species.

Prunus laurocerasus L. Cherry-Laurel. Evergreen shrub to 2 m, rarely more; branchlets pallid, glabrous, not at all thornlike; leaf blades mainly 3–10 (13) cm long, and 1–3 cm wide, entire or remotely crenate-serrate, elliptic to oblong, attenuate to abruptly so, cuneate to acute basally, leathery-thickened, glabrous; petioles lacking glands; racemes not leafy, commonly 3–10 cm long, many-flowered; the pedicels 0.5–1.5 mm long, subtended by large caducous bracts; flowers ca 1 cm wide or less; petals white, 3–4 mm long, obovoid; sepals fringed, glabrous; hypanthium and pedicel glabrous; fruit black, inedible. Cultivated ornamental; specimens from Davis, Utah and Weber counties; introduced from Eurasia; 13 (0).

Prunus mahaleb L. Mahaleb; St. Lucie Cherry. Small trees to 6 m tall or taller; branchlets pale brown, copiously pubescent, not thornlike; leaf blades mainly 2–6 cm long, 1.5–4.5 cm wide, oval to elliptic or ovate, finely crenulate, abruptly acute, acute to rounded basally, commonly glabrous on both sides; petioles sometimes with glands; racemes with 3–12 flowers, corymbose, the axis short,

leafy bracted at base; petals white, 4–6 (8) mm long, oblong-ob lanceolate; sepals, hypanthium, and pedicels glabrous; fruit black. The Mahaleb Cherry is used as rootstock for other cherry cultivars. It persists and escapes, becoming established along canals and in river-bottom forests in Salt Lake and Utah counties; introduced from Asia; 8 (ii).

Prunus padus L. European Bird Cherry; May Day Cherry. Small trees to 8 m tall, rarely taller; branchlets soon brown, glabrous or puberulent, not thornlike; leaf blades 1.5–20 cm long, 0.7–3.5 cm wide, elliptic to oblanceolate or obovate, serrate, abruptly acuminate, acute to truncate basally, glabrous except sometimes on veins beneath; petioles usually bearing glands; racemes with leafy peduncles, commonly 7–12 cm long, 15- to 25-flowered, the pedicels 5–17 mm long, subtended by caducous bracts; flowers 12–20 mm broad; petals white, 5–7.5 mm long, almost as broad; sepals fringed, glabrous; hypanthium and pedicels glabrous; fruit black, bitter, astringent; $2n = 32$. Cultivated ornamental of yards and other plantings; Utah County; introduced from Eurasia; 1 (0).

Prunus persica (L.) Batsch Peach. Small trees to 3 (4) m tall, seldom more; branchlets green to pallid, becoming ashy in age, glabrous, not thornlike; leaf blades mainly 3–15 cm long (or more), 0.5–5.5 cm wide, oblong-lanceolate to lanceolate, serrate to crenate-serrate, attenuate, obtuse to acute basally, glabrous; petioles usually bearing glands; flowers solitary, appearing before the leaves; petals pink, white, or red; sepals villous at margin; fruit pubescent, fleshy at maturity, edible. Cultivated fruit and ornamental trees at lower elevations in the state, widely escaping along roads; specimens seen from Carbon, Salt Lake, Utah, and Washington counties; introduced from China; 23 (ii). Numerous horticultural forms are grown in the state.

Prunus serrulata Lindl. Flowering Cherry. Trees to 10 m tall or more; branchlets pallid, becoming brown, glabrous, not thornlike; leaf blades mainly 3–15 cm long, 1.2–8 cm wide, ovate to lance-ovate, abruptly long-acuminate, aristate-serrate, acute to obtuse basally; petioles usually bearing glands; racemes corymbose, 3- to 5-flowered, naked at the base, the pedicels 1.5–30 mm long, each subtended by a cuneate bract fringed at the truncate apex; petals 12–20 mm long, oval, white, rose, pink, often double; sepals glabrous, acuminate or toothed; hypanthium and pedicels glabrous; fruit small, black. This flowering cherry is gaining in popularity, especially in grafted or pendulous forms; specimens examined from Utah County; introduced from Japan; 9 (0).

Prunus tomentosa Thunb. Bush Cherry. Shrubs to 2 m tall (commonly lower); branchlets brown, copiously pubescent, not thornlike; leaf blades mainly 2–6 cm long, 1.5–3 cm wide, obovate to elliptic, abruptly acuminate, doubly serrate and obscurely lobed (in some), puberulent above, long-villous beneath; petioles pubescent, not bearing glands; flowers 1 (rarely 2) per bud, appearing before the leaves, sessile or subsessile; petals white or pink, 7–9 mm long, oval; sepals serrulate, pilose; hypanthium glabrous below; fruit red, sparingly pubescent, sour, edible. Cultivated ornamental, escaping and persisting in Utah County; introduced from Asia; 4 (0).

Prunus triloba Lindl. Flowering Almond. Shrubs to 2 m (rarely taller); branchlets brown, glabrous; leaf blades commonly 2–5 cm long, 1.5–4 cm broad, ovate to obo-

vate, sharply doubly serrate, pubescent on both sides; flowers 1 or 2 per bud, short-pedicellate; petals pink or white, 8–15 mm long, oval, commonly double; sepals serrulate, glabrous; hypanthium glabrous; pedicels puberulent; fruit red, seldom produced. Sparingly cultivated shrubs, in Salt Lake and Utah counties; introduced from China; 1 (0).

Prunus virginiana L. Chokecherry. Shrubs or small trees to 8 m tall with ashy bark; branchlets brown, glabrous, not thornlike; leaf blades 2–10 cm long, 1.5–7 cm wide, elliptic to oblong-ovate, serrate, abruptly acuminate, acute to rounded basally, glabrous or sometimes pubescent beneath; petioles usually bearing glands; racemes 4–20 cm long, the peduncles usually leafy, 2–8 cm long; flowers 10–20 mm wide, numerous, the pedicels 4–17 mm long, each subtended by a caducous bract; petals white, 4–6 mm long, suborbicular; sepals fringed, glabrous; hypanthium and pedicels glabrous; fruit black when ripe, astringent, edible. Sagebrush, pinyon-juniper, mountain brush, and aspen communities at 1370 to 3050 m in probably all Utah counties; widely distributed in North America; 192 (xxv). Chokecherry fruit has been gathered since early days for making of jelly and syrup, and prior to that by indigenous peoples as a component of pemican. Our material has been assigned to var. *melanocarpa* (A. Nels.) Sarg. [*Cerasus demissa* var. *melanocarpa* A. Nels.; *P. melanocarpa* (A. Nels.) Rydb.; *P. demissa* var. *melanocarpa* (A. Nels.) A. Nels.]. Reports of *P. demissa*, or of *P. virginiana* var. *demissa* (Nutt.) Torr., for Utah belong to var. *melanocarpa*. That variety is widely distributed in western North America.

Purpusia Brandege

Plants perennial, caespitose, glandular herbs, arising from a caudex; leaves mainly basal, pinnately compound; flowers perfect, regular, borne in few-flowered cymes; hypanthium campanulate to turbinate, usually lacking bractlets; sepals 5; petals 5, white to yellowish; stamens 5, opposite the sepals; pistils mostly 6–12, on a stalked receptacle; fruit of achenes.

Purpusia saxosa Brandege [*P. arizonica* Eastw.; *P. osterhoutii* A. Nels.; *Potentilla osterhoutii* (A. Nels.) J. T. Howell]. Perennial glandular herbs from a caudex, the stems 0.5–2 dm tall; basal leaves pinnate with 5–11 leaflets, the leaflets 0.5–1.5 cm long, deeply toothed or cleft; sepals 2.5–3 mm long, lance-ovate, acuminate; petals yellow or white, 3–4 mm long, oblanceolate, acuminate; achenes on a receptacle 1.5–2 mm long. This species is included in Utah on the basis of a collection reported by Meyer (1976) taken at Kolob Reservoir, Washington County; Arizona, Nevada, and California; 0 (0).

Purshia DC. ex Poir.

Shrubs or small trees with unarmed branches; leaves alternate, simple, pinnatifid or apically 3-toothed, usually glandular; stipules triangular-attenuate, persistent; flowers perfect, regular, solitary, on short lateral spur branchlets; sepals 5, borne atop a turbinate-funnelform persistent hypanthium; petals 5, white to cream or yellow; stamens ca 25; pistils 1 to 12 (typically 1 or 5), borne on a stipe at base of hypanthium; fruit an achene, this plumose-tailed or not. The genus, as treated here, includes the species traditionally placed in *Cowania* D. Don.

1. Pistils 4–12 (typically 5); styles persistent as apical plumes on the achene *P. mexicana*
- Pistil 1 (2 or 3); styles not plumose on the achene apex ... 2
- 2(1). Leaves conspicuously punctate, with depressed glands, glabrous above; plants of Washington County *P. glandulosa*
- Leaves lacking punctate, depressed glands, puberulent above; plants widespread *P. tridentata*

Purshia glandulosa Curran Shrubs, much branched, 1–2 (3) m tall; branchlets prominently glandular; leaves 3–10 mm long, 1– to 4–mm wide, cuneate, glabrous above, slightly tomentose beneath, the margins revolute; hypanthium glabrous to tomentose, 2.5–5 mm long, funnelform; petals 4–8 mm long, spatulate, creamy white to yellowish; achenes oblique, ca 2 cm long, including style, puberulent. Blackbrush, chaparral, and pinyon-juniper communities at 1065 to 1375 m in Washington County; Nevada, Arizona, and California; 10 (ii). This taxon is presumed to have arisen as a product of hybridization between *P. mexicana* and *P. tridentata*. It resembles the former in vegetative characteristics and the later in pistil number (usually 1, but sometimes 2 or 3), and non-plumose styles.

Purshia mexicana (D. Don) Welsh Cliff-rose. [*Cowania mexicana* D. Don]. Much branched shrubs or small trees, mainly 0.6–3.5 m tall with shreddy bark and glandular branchlets; leaves 3–15 mm long, cuneate-flabellate, mainly 5-lobed, glandular-punctate and green above, white-tomentose beneath; pedicels 2–8 mm long; sepals 4–6 mm long, ovate; petals 5–9 mm long, white to cream or yellowish; pistils commonly 5; styles plumose 2–6 cm long or more in fruit. Blackbrush, live oak, pinyon-juniper, ponderosa pine, desert peach, mixed grass-desert shrub, and mountain brush communities at 975 to 2745 m in Beaver, Box Elder, Cache, Carbon, Emery, Garfield, Grand, Iron, Juab, Kane, Millard, Salt Lake, San Juan, Sanpete, Sevier, Tooele, Utah, Washington, and Wayne counties; Nevada, Colorado, Arizona, California, New Mexico, and Mexico; 179 (xxx). Our materials belong to var. *stansburiana* (Torr.) Welsh [*Cowania stansburiana* Torr., type from Great Salt Lake; *C. mexicana* var. *stansburiana* (Torr.) Jepson; *C. mexicana* ssp. *stansburiana* (Torr.) Murray]. This species forms introgressants with *Purshia tridentata* (q.v.). The problem has been investigated by Stutz and Thomas (1964). Evolution 18: 183–195.

Purshia tridentata (Pursh) DC. Bitterbrush. [*Tigareia tridentata* Pursh]. Shrubs, much branched, to 2 m tall (rarely taller); branchlets brown, tomentulose; leaves mainly 4–20 mm long, 2–12 mm wide, cuneate, apically 3 (5)-toothed, tomentose but green above, grayish tomentose beneath, the margins more or less revolute; hypanthium tomentose and stipitate glandular; sepals mainly 4–6 mm long, ovate-oblong, entire; petals 5–9 mm long, oblong to obovate or spatulate, yellow; achenes obliquely ovoid, 1–2 cm long, the beak ca 1/3 the length, puberulent. Bitterbrush is a plant of sagebrush, mountain brush, pinyon-juniper, and ponderosa pine communities at 1220 to 2775 m in all counties in Utah; British Columbia east to Montana and south to California, Arizona, and New Mexico; 159 (ix). This species forms hybrids with *P. mexicana*; such plants are distinguished by the more lobed leaves, and longer and more numerous achenes.

Pyracantha Roemer

Evergreen shrubs, armed with thorns; leaves alternate, simple, crenate-serrate, petiolate; stipules minute, caducous; flowers perfect, regular, borne in simple or branched corymbs; sepals 5; petals 5, white; stamens 20, the filaments subulate; pistil 1, the ovary inferior, 5-loculed; styles usually 5; fruit a pome.

Pyracantha coccinea Roemer Fire-thorn. Shrubs to 3 m tall or more, with thorns 0.5-1.5 cm long or more; leaf blades 0.8-4.5 cm long, 0.5-1.8 cm wide, elliptic to oblanceolate, acute apically, cuneate to acute basally, crenate-serrate; petioles puberulent; inflorescence pilosulous at anthesis; sepals broadly triangular; petals white, 3-4 mm long, 2-3 mm wide; pomes red orange, persistent. Cultivated ornamental, persisting, and escaping rarely in Salt Lake and Utah counties; introduced from Eurasia; 6 (0).

Pyrus L.

Trees with unarmed branches; leaves alternate, simple, not or seldom lobed; stipules deciduous; flowers perfect, regular, borne in corymbs; hypanthium short; sepals 5, persistent; petals 5, white; stamens many; pistil 1, the ovary inferior, usually 5-loculed; styles 3-5, separate to the base; fruit usually pear-shaped, the flesh with stone-cells.

Pyrus communis L. Common pear. Small trees to 6 m tall, the branchlets commonly glabrous; leaves 2-8 cm long, ovate to oblong or elliptic, glabrous or glabrate, leathery, crenate-serrulate to subentire; flowering with the leaves; petals white, mainly 12-18 mm long; fruit pear shaped to almost spherical; 2n = 34. Cultivated fruit plant at low to moderate elevations in Garfield, Salt Lake, Utah, Washington, and Wayne counties; introduced from Eurasia; 15 (iii). This the pear of commerce is widely grown in Utah, with Bartlet being the most common cultivar. The Callery or Bradford pear, *P. calleryana* Decne., is now widely grown in Utah as a shade and ornamental tree. It differs in having ovate to orbicular leaves, and very small fruit, resembling some crabapples.

Rosa L.

Shrubs, deciduous; stems armed with prickles or spines, rarely unarmed; leaves alternate, pinnately 3- to 9-foliolate; stipules conspicuous, adnate to petioles; flowers perfect, solitary or in corymbs; hypanthium urn-shaped to globose or ellipsoid, red, red orange, yellow, or purplish, fleshy at maturity; sepals 5; petals 5 (or numerous in double forms); stamens numerous, inserted on margin of ringlike disk; pistils few to numerous; styles exerted through or to orifice of disk; fruit of achenes, enclosed in the fleshy hypanthium (hip). The cultivated roses are largely of hybrid derivation, and are not well represented in herbaria. The key includes both indigenous and cultivated taxa because of the propensity of some species to escape and of others to persist for long periods following cultivation. The key is tentative at best, because of the propensity of all roses to hybridize.

- 1. Stipules deeply fringed or pectinate, appearing as lateral projections of petiole base; flowers white (or pink in some hybrids keying here); cultivated and escaping *R. multiflora*
- Stipules entire, or rarely fringed, but not cut to the petiole; flowers variously colored 2

- 2(1). Flowers mostly 5-9 cm broad; styles long-exserted from hypanthium; cultivated and persisting *R. odorata*
- Flowers mostly less than 5 cm broad; styles not exerted, forming a dense headlike stopper in orifice of hypanthium 3
- 3(2). Leaflets stipitate-glandular beneath; sepals strongly stipitate-glandular, erect or spreading in fruit; cultivated and escaping *R. eglanteria*
- Leaflets not at all or only sparingly stipitate-glandular beneath; sepals various in fruit; cultivated and escaping or indigenous 4
- 4(3). Sepals reflexed and finally deciduous after flowering; stipitate glands sparse on lower midveins and sepals; cultivated and escaping *R. canina*
- Sepals erect and persistent following flowering; stipitate glands rarely present; plants indigenous 5
- 5(4). Sepals 1.5-4 cm long; petals 2.2-4 cm long; hips 1-2 cm long at maturity *R. nutkana*
- Sepals 1-2.2 cm long; petals 1-2.5 cm long; hips 0.6-1.5 cm long at maturity *R. woodsii*

Rosa canina L. Dog Rose. Shrub 1-3.5 (4) m tall; stems sometimes clambering, armed with scattered strongly curved to straight spines and no prickles, glabrous; stipules entire; leaves 3-8 cm long or more, with 3-7 leaflets, the terminal leaflet 0.6-2.2 cm long, 0.3-1.2 cm broad, glabrous to sparingly villous and stipitate-glandular along the veins beneath, serrate to doubly serrate; flowers single, solitary or 2-5 on short glabrous or glandular pedicels; sepals 1.2-1.5 cm long, sparingly stipitate-glandular, reflexed in fruit, soon shattering; petals white or pink, 1-1.8 cm long; hips ovoid, ca 1 cm thick, red; 2n = 35. Cultivated, persisting, and rarely escaping in lower elevation portions of Utah, specimens examined from Salt Lake and Utah counties; introduced from Europe; 3 (0).

Rosa eglanteria L. Sweetbriar. [*R. rubiginosa* L.]. Shrubs 0.5-2 m tall; stems erect or ascending, armed with distinctive flattened infrastipular spines and often with straight internodal prickles; leaves 3.5-10 cm long, with 5-7 (9) leaflets, the terminal one 1.2-3.5 cm long, 0.8-3 cm wide, conspicuously stipitate glandular on one or both surfaces; doubly serrate; flowers solitary or 2-4; sepals 1-2 cm long; petals 0.8-2 cm long, pink to white; hips 1-1.5 cm long, ellipsoid to subglobose. Cultivated, persisting, and escaping in Cache, Salt Lake, Tooele, and Uintah counties; introduced from Utah; 4 (0).

Rosa multiflora Thunb. Multiflora Rose. Shrub to 2 or 3 m tall or more; stems sometimes clambering, armed with prickles or rarely unarmed, glabrous; stipules about half as long as the petiole, pectinate, cut almost to petiole; leaves 4-9 cm long or more, 5- to 11-foliolate, the terminal leaflet 1.5-3 cm long, glabrous or puberulent and rarely with some glands beneath, serrate; flowers numerous (to 50 or more), white (pink in some hybrids), single (double); sepals reflexed in fruit, pubescent; petals 5, or numerous, 0.6-0.8 cm long; hips ovoid, ca 6 mm thick, brownish red; 2n = 14. Herbarium specimens are very few for this species in Utah, and those involve hybrids with other species and are only tentatively placed herein. Specimens examined are from Uintah and Utah counties; introduced from Japan; 3 (0).

Rosa nutkana Presl Nutka Rose. [*R. spaldingii* C. P. N.]. Shrubs 0.3-2 m tall, rarely more; stems erect or ascending, armed with distinctive infrastipular spines (or rarely unarmed), the internodal prickles lacking or few

and different from the infrastipular spines; leaves 6–13 cm long, with 5–7 (9) leaflets, the terminal one 1.5–7 cm long, 0.8–3.5 cm broad, pubescent to glabrous, rarely stipitate-glandular beneath, serrate to doubly serrate; flowers solitary (rarely 2 or 3); sepals 1.5–4 cm long, 3–6 mm wide; petals 5, pink, 2.2–4 cm long; hips ellipsoid to subglobose, 1–2 cm long and thick, red orange to purplish. Oak-maple, aspen, mountain brush, sagebrush, Douglas fir, cottonwood, and spruce-fir communities at 1525 to 3355 m in most if not all Utah counties; Alaska south to California, Nevada, and Colorado; 45 (viii). The features of larger fruit, longer and broader sepals, and usually solitary flowers are diagnostic when taken in combination for most specimens. However, intermediate specimens between Nootka and Woods rose are known. Our material has been assigned to var. *hispida* Fern.; 45 (vii).

Rosa odorata Sweet Tea Rose; Hybrid Rose. Shrubs, 0.3–6 m long or more; stems erect or ascending to clambering, armed with infrastipular and/or internodal spines or prickles, or unarmed; leaves 4–20 cm long, with usually (3) 5 leaflets, the terminal 1–7 cm long, 0.8–4 cm wide, once or twice serrate, glabrous or pilose and somewhat stipitate glandular; flowers solitary or usually few to numerous; petals 5, or more commonly numerous, of various colors and sizes; hips various in size, shape, and color. Included within this catch-all name are the hybrid tea roses of commerce, grown widely in Utah for ornament. The cultivars are mainly complex hybrids, with ancestors involving *R. moschata* J. Herrmann, *R. foetida* J. Herrmann, *R. gallica* L., *R. chinensis* Jacq., and *R. multiflora* Thunb. (see Flora Europaea, 1968, p. 26 for a more complete discussion). The hybrid roses persist and are present around abandoned farmsteads in Utah; introduced from Eurasia; 3 (i).

Rosa woodsii Lindl. Woods Rose. [*R. fendleri* Crepin; *R. neomexicana* Cockerell; *R. manca* Greene; *R. arizonica* Rydb.; *R. californica* var. *ultramontana* Wats.; *R. macounii* Greene; *R. chrysocarpa* Rydb., type from Abajo Mts.; *R. puberulenta* Rydb., type from Montezuma Canyon]. Shrubs 0.1–2.5 (3) m tall; stems armed with infrastipular spines and/or internodal prickles or spines, or unarmed; leaves 1.5–13 cm long, 0.4–2.5 cm broad, pubescent to glabrous and rarely stipitate glandular, serrate to doubly serrate; flowers solitary or 2 to several; sepals 1–2.2 cm long, 2–3.5 cm wide; petals 5, pink (rarely white), 1–2.5 cm long; hips ellipsoid to subglobose, 0.6–1.5 cm long and thick, red orange to yellow. Streamsides, irrigation canals, marsh lands, lake shores and hillsides in palustrine, lacustrine, and riparian habitats in mountain brush, juniper, aspen, and spruce-fir communities at 850 to 3355 m in all Utah counties; Alaska and MacKenzie east to Hudson Bay and south to California, Texas, Missouri, and Wisconsin; 183 (xviii). The species is represented in Utah by a variable assemblage, which has been included within the concept of var. *ultramontana* (Wats.) Jepson. There are plants from Garfield and San Juan counties, especially, which have very coarse internodal as well as infrastipular spines. These would key to *R. neomexicana* Cockerell, but gradient specimens tie these striking exceptions to the mass of variation within the complex of forms. The unusual *R. stellata* Wootton, might occur in southern Utah. The young stems of that species are stellate-pubescent or copiously glandular hispidulous or both, and the older stems are armed with numerous long, nearly straight prickles.

Rubus L.

Shrubs; stems armed with prickles or bristles, or unarmed; leaves alternate, pinnately compound or palmately veined and lobed; stipules various, usually persistent, flowers perfect or imperfect, regular, solitary or few to numerous in cymes; hypanthium short, saucerlike, lined with a glandular disk; sepals usually 5, lacking bracteoles; petals the same number as the sepals; stamens 15 to numerous, linear-subulate; pistils several to many, the ovaries superior, each 1-loculed; styles 1 per pistil, the stigma capitate; fruit of separate drupelets, or the drupelets coherent and free of the receptacle, hence an "aggregate" fruit.

Bailey, L. H. 1941. Species Batorum. The genus *Rubus* in North America. *Genes. Herb.* 5: 1–932

- 1. Leaves simple, palmately veined and lobed; stems unarmed 2
- Leaves compound pinnately 3- to 5- foliolate; stems armed 3
- 2(1). Leaves mainly less than 6 cm wide, the lobes rounded in general outline, green above, white tomentose beneath; flowers mainly solitary, plants rare, known only from low elevations in San Juan County . *R. neomexicanus*
- Leaves mainly 6–30 cm wide, the lobes acute to attenuate in general outline; flowers borne in clusters of 2–6 or more; plants locally common, montane, widespread *R. parviflorus*
- 3(1). Main prickles straight, slender, retrorsely disposed along stem; fruit red when ripe *R. idaeus*
- Main prickles flattened, curved or straight, retrorse or retrorsely curved 4
- 4(3). Receptacle fleshy, the drupelets adhering, not slipping free when ripe; stems usually strongly armed, trailing or clambering; cultivated, persisting, and escaping *R. discolor*
- Receptacle not fleshy, the drupelets slipping free when ripe; stems arching, but not trailing or clambering; indigenous and with cultivated phases *R. leucodermis*

Rubus discolor Weihe & Nees Himalayan Blackberry. [*R. procerus* Muell.-Arg.]. Shrubs, often clambering or sprawling, the stems to several meters long, armed with strong, straight, flattened spines; stipules linear, entire; leaves 7–20 cm long, pinnately to palmately compound, with 3–5 leaflets, the terminal leaflet 3–12 cm long, 2–8 cm wide, green and glabrous above, tomentose beneath; flowers usually perfect, conspicuous, mainly 3–20 in clusters; sepals 6–10 mm long, lanceolate; petals white (rarely reddish), 10–15 mm long; staminal filaments linear; pits to 3 mm long, the drupelets adherent to receptacle, numerous, the flavor agreeable. Roadsides, field margins, and abandoned farmsteads at 850 to 1525 m in Juab, Utah, and Washington counties (likely elsewhere); introduced from the Old World; 5 (i). This is a vigorous, strongly armed shrub that is locally established. The fruit is of excellent quality, but difficult to pick, due to the spiny nature of the plants.

Rubus idaeus L. Raspberry. [*R. strigosus* Michx.; *R. idaeus* var. *strigosus* (Michx.) Maxim.; *R. sachalinensis* H. Levl.; *R. idaeus* ssp. *sachalinensis* (H. Levl.) Focke; *R. idaeus* var. *canadensis* Richards.; *R. melanolasius* Dieck]. Shrubs, 2–15 (20) dm tall, the stems, petioles, and veins on lower leaf surfaces with glandular pricklike processes or prickles, or both; stipules linear; leaves 2–20

cm long, pinnately compound with 3–5 leaflets, the terminal leaflet 1.2–10 cm long, 0.6–7.5 cm broad, green and glabrate to hairy above, white- or gray-hairy to glabrate and greenish beneath; flowers perfect, not conspicuous, solitary or 1 to few in clusters; sepals 4–12 mm long, lanceolate; petals white, 4–7 mm long; staminal filaments slender, often somewhat clavate; pits 2–2.5 mm long, the drupelets coherent, red, several to many, the flavor agreeable; $2n = 14$. Riparian sites and talus slopes in aspen and mixed conifer communities at 2135 to 3420 m in probably all Utah counties; Alaska east to the Atlantic and south to California, Mexico, Iowa, and North Carolina; Eurasia; 60 (xii). Our indigenous material belongs to ssp. *melanolasius* (Dieck) Focke. Cultivated phases belong mainly to ssp. *idaeus*.

Rubus leucodermis Dougl. ex T. & G. Black Raspberry. Shrubs, mainly 1–3 m long, the stems, petioles, and some veins on lower leaf surfaces armed with retrorsely curved, flattened, catclawlike prickles; stipules linear; leaves 6–14 cm long, pinnately compound, with 3–5 leaflets, the terminal leaflet 3–7.5 cm long, 2–6 cm wide, green and almost or quite glabrous above, white-tomentose beneath; flowers usually perfect, not conspicuous, mainly 2–10 in clusters; sepals 6–12 mm long, lance-acuminate; petals white, shorter than the sepals; staminal filaments slender, linear-subulate; pits to 2.5 mm long, the drupelets coherent, several to many, the flavor agreeable. Dry open slopes in mountain brush and in riparian communities at 1220 to 2200 m in Box Elder, Emery, Iron, Millard, Salt Lake, Utah, and Washington counties; British Columbia east to Montana and south to California and Nevada; 6 (0). The plants are rare in collections, and the distribution is probably wider than indicated.

Rubus neomexicanus Gray Shrubs, 0.5–1.5 m tall, the stems, petioles, and leaves unarmed, merely villous-puberulent and sometimes minutely glandular; stipules lance-ovate, entire or serrate; leaves palmately lobed and veined, simple, the blades 1.2–4.2 cm long (from sinus to apex), 1.5–5.5 cm wide, green above, pale green beneath, puberulent on one or both sides; flowers usually perfect, solitary, showy; sepals 10–14 mm long, lance-ovate, entire or serrate; petals white, 2–17 mm long, the drupelets not especially coherent, red, several to many, thinly-fleshed, hardly palatable. Hanging garden with *Ostrya knowltonii*, at 1130 to 1160 m in Ribbon, Knowles, and Cataract canyons, San Juan County; Arizona and New Mexico; 8 (vi). This is a truly attractive species, with startlingly large white roseline flowers.

Rubus parviflorus Nutt. Thimbleberry. Shrubs, 0.5–2 m tall, rarely taller, the stems, petioles, and leaves unarmed, stipitate-glandular; stipules lanceolate, entire or serrate; leaves palmately lobed and veined, simple, the blades 4.5–15 cm long (from sinus to apex), 5.5–20 cm wide, green above, pale beneath, puberulent on one or both sides, or glabrate above; flowers usually perfect, in clusters of 2–7, showy; sepals 8–19 mm long, ovate, the apex caudate-attenuate, entire; petals white, 13–18 (20) mm long, or more; staminal filaments linear-subulate; pits to 3 mm long, the drupelets coherent as an aggregate, red, numerous, thinly fleshy, almost dry at maturity, palatable. Riparian habitats in aspen, spruce, fir, lodgepole, Douglas fir, and mountain brush communities at 1435 to 2745 m in Box Elder, Cache, Davis, Duchesne, Emery, Salt Lake, San Juan, Saupete, Summit, Tooele, Uintah, Utah, Wasatch and Weber counties; Alaska east

to Great Lakes, and south to California, Arizona, New Mexico and the Dakotas; 40 (ii). Our plants belong to var. *parviflorus*.

Sanguisorba L.

Perennial herbs, from a branching caudex; leaves basal and alternate, pinnately compound; stipules adnate to the petioles, persistent; flowers mostly imperfect, regular, numerous in short to elongate, dense spikes; hypanthium subglobose, restricted near the apex; sepals 4, petaloid; petals lacking; stamens numerous; pistils 1–3, the ovary superior, 1-loculed; styles 1 per pistil, the stigma capitate, fringed; fruit an achene, enclosed by the usually 4-angled to 4-winged hypanthium.

Sanguisorba minor Scop. Burnet. Plants mainly 2–5 dm tall; caudex clothed with persistent stipules and petioles; basal leaves 4–18 cm long, with mostly 9–17 oval to obovate-oblong leaflets, 0.6–1.8 cm long, coarsely serrate; spikes subglobose to cylindrical, 8–40 mm long; bractlets ovate; flowers mainly imperfect, the lower staminate and the upper pistillate; calyx greenish or pinkish; hypanthium cone-shaped in fruit, woody; stamens numerous, the filaments filiform, long-exserted; $2n = 28$, 56. Introduced revegetation and erosion control plant at 1525 to 2135 m elevation in Cache, Davis, Duchesne, Emery, Garfield, Grand, Iron, Millard, Salt Lake, San Juan, Tooele, Utah, and Washington counties; introduced from Europe; 15 (ii).

Sibbaldia L.

Perennial herbs from a caudex; leaves basal or cauline and alternate, long-petioled, palmately 3-foliolate; stipules adnate to petioles, persistent, lanceolate; flowers perfect, regular, borne in leafy-bracted cymes; hypanthium short, saucer-shaped, lined with a glandular disk; sepals 5, alternating with 5 sepaloid bracteoles; petals 5; stamens usually 5; pistils 5–20, distinct, the ovaries superior; styles 1 per pistil, the stigmas capitate; fruit an achene.

Sibbaldia procumbens L. Sibbaldia. Plants low, mat-forming, the flowering stems 0.4–1.4 dm tall; leaves 2–12 cm long, the 3 leaflets oblanceolate to obovate, 3 (rarely 5)-toothed apically, the terminal leaflet 11–32 mm long, 7–18 mm broad, stiffly hairy on both surfaces; flowers inconspicuous; sepals 2.5–5 mm long; petals pale yellow, 1.5–3 mm long; achenes stipitate, ca 1 mm long; $2n = 14$. Alpine tundra, krummholz, spruce-fir, meadow, and lodgepole pine communities, often in talus or gravel at 2745 to 3660 m in Beaver, Box Elder, Daggett, Duchesne, Garfield, Grand, Iron, Juab, Piute, Salt Lake, San Juan, Sevier, Summit, Uintah, Utah, and Wayne counties; Alaska east to Newfoundland and south to California, Colorado, Quebec, and New Hampshire; circumboreal; 47 (vi).

Sorbaria (Scr.) A. Br.

Shrubs with unarmed branches; leaves alternate, pinnately compound; stipules persistent; flowers perfect, regular, borne in terminal panicles; hypanthium short, lined with a glandular disc; sepals 5, persistent; petals 5, white; stamens 20–50, pistils 5, somewhat connate basally; styles 1 per pistil, the stigmas capitate; fruit of follicles.

Sorbaria sorbifolia (L.) A. Br. Sorbaria. [*Spiraea sorbifolia* L.]. Shrubs to 2 m tall, sometimes taller; leaves

8–20 cm long or more; leaflets 11–23, lanceolate to oblong-lanceolate, serrate or doubly so, long-acuminate, glabrous or puberulent, the hairs stellate; inflorescence 10–25 cm long; flowers white, ca 8 mm wide; hypanthium glabrous; fruit glabrous; $2n = 36$. Cultivated ornamental in Davis, Salt Lake and Utah counties, and probably elsewhere; introduced from Asia; 7 (0).

Sorbus L.

Shrubs or small trees with unarmed branches; leaves alternate, pinnately lobed or compound; stipules persistent or deciduous; flowers perfect, regular, numerous in corymbose cymes; hypanthium short, lined with a glandular disk; sepals 5, persistent; petals 5, cream to white; stamens 15–20; pistil 1, the ovary inferior, 2- to 5-loculed; styles 2–5, the stigmas capitate; fruit a pome.

Jones, G. N. 1939. A synopsis of the North American species of *Sorbus*. J. Arnold. Arb. 20: 1–43.

1. Leaves simple, lobed or pinnatifid; petioles and branchlets of inflorescence densely white villous-tomentose *S. hybrida*
- Leaves compound; petioles and branchlets of inflorescence sparingly tomentose 2
- 2(1). Winter buds densely white-villous, the surface obscured by the hairs; maximum leaflet number commonly 15; plants cultivated *S. aucuparia*
- Winter buds sparingly hairy, the shiny surface not at all obscured by the hairs; maximum leaflet number 13; plants indigenous *S. scopulina*

Sorbus aucuparia L. European Mountain-ash. Trees, mostly 3–6 m tall, with grayish or yellowish green smooth bark; winter buds densely white-villous; leaves pinnately compound; leaflets 11–15, 3–5 cm long, 1–1.8 cm broad, the margins coarsely serrate except at the base; petioles and branches of inflorescence sparingly white-hairy at least in flower; stipules persistent; flowers 8–10 mm broad; sepals triangular; petals white to cream, orbicular, 3–4.5 mm long; fruit 9–11 mm long, scarlet, drying purplish; $2n = 34$. Cultivated ornamental, persisting, and escaping (?) in Salt Lake, Summit, and Utah counties; introduced from Europe; 14 (0).

Sorbus hybrida L. Trees, mostly 3–6 m tall, with grayish or yellowish green smooth bark; winter buds white villous-tomentose; leaves simple or pinnatifid, usually with at least 1 pair of lobes free at base of blade, the lobes coarsely serrate or doubly serrate; petioles and branches of inflorescence densely white villous-tomentose; stipules deciduous; flowers 10–14 mm broad; sepals triangular; petals white to cream, broadly elliptical 5–6 mm long; fruit 10–12 mm long, globose, red. Cultivated ornamental, persisting, in Cache, Salt Lake, and Utah counties; introduced from Europe; 8 (0).

Sorbus scopulina Greene Rock Mountain-ash. Shrubs, 1–4 m tall, with grayish red or yellowish bark; winter buds glutinous and glossy, white-hairy to glabrous; leaves pinnately compound; leaflets 7–13, 2–9 cm long, 0.7–3 cm broad, sharply serrate almost to the base; branches of inflorescence sparingly to rather densely pubescent with white hairs; stipules persistent or tardily deciduous; flowers 8–12 mm broad; sepals triangular; petals white to cream, oval, 4–6 mm long; fruit 5–10 mm long, scarlet to orange, drying purplish. Aspen, spruce-fir, white fir, Douglas fir, and ponderosa pine communities at 2075 to

2900 m in Cache, Carbon, Davis, Duchesne, Morgan, Salt Lake, San Juan, Sanpete, Summit, Utah, Wasatch, Washington, and Weber counties; Alaska south to California, New Mexico, and the Dakotas; 28 (vi).

Spiraea L.

Deciduous shrubs with unarmed branchlets; leaves alternate, simple; stipules obsolete; flowers perfect, regular, borne in terminal corymbs; hypanthium cup-shaped; sepals 5, persistent; petals 5; stamens 25 or more; pistils 3–7 (usually 5), distinct, the ovaries superior, each 1-loculed; styles 1 per pistil, the stigmas capitate; fruit a few-seeded follicle.

Spiraea x vanhouttei (Briot) Zabel [*S. aquilegifolia vanhouttei* Briot]. Shrubs to 2 m tall; stems finally arching; leaves 0.8–3.5 cm long, 0.4–1.7 cm wide, cuneate-obovate, serrate to doubly serrate at the apex and often 3–5 lobed; inflorescences pedunculate, terminal on short lateral branches; petals white, 3.5–4.5 mm long, oval; follicle to 5 mm long (including styles). Commonly cultivated ornamental, persisting in Carbon, Salt Lake, and Utah counties; introduced from Eurasia; 8 (0). This plant of hybrid derivation from *S. cantoniensis* Lour. x *S. trilobata* L.

RUBIACEAE A. L. Juss.

Madder Family

Herbs or subshrubs; leaves opposite or whorled, simple, entire; stipules sheath- or leaflike; flowers sympetalous, perfect or dioecious, regular, usually in paniculate or cymose clusters, less commonly solitary; calyx with 4–8 lobes, persistent; corolla funnelform, salverform, or rotate; stamens 3–5, inserted on the corolla tube; pistil 1, the ovary inferior or partly so, crowned by a disk, 1- to several-loculed; style filiform, divided above; fruit a capsule, berry, drupe, or schizocarp; $x = 6–17$.

1. Leaves opposite; corolla tube elongate 2
- Leaves whorled, corolla tube short 3
- 2(1). Ovules and seeds several in each carpel; fruit a 2-loculed capsule, lacking hooked hairs *Houstonia*
- Ovules and seeds solitary in each carpel; fruit didymous, hispid with hooked hairs *Kelloggia*
- 3(2). Corolla with 3–4 lobes; fruit dry, glabrous, or hairy with straight or hooked bristles *Galium*
- Corolla 5-lobed; fruit fleshy, glabrous *Rubia*

Galium L.

Annual or perennial herbs, or occasionally subshrubs; stems 4-angled, slender, erect or clambering; leaves whorled or apparently so (the stipules large and leaflike in some); flowers small, perfect or imperfect, in cymes or panicles; sepals minute or lacking; corolla rotate, usually with 4 lobes; stamens 4 (3); ovary 2-lobed, 2-loculed, 2-seeded; styles 2; fruit didymous, of 2 indehiscent dry carpels.

Dempster, L. 1959. A reevaluation of *Galium multiflorum* and related taxa. Brittonia 11: 105–122.

Dempster, L. and F. Ehrendorfer. 1965. Evolution of the *Galium multiflorum* complex in western North America. II. Critical taxonomic revision. Brittonia 17: 289–334.

Ehrendorfer, F. 1956. Survey of the *Galium multiflorum* complex in western North America. Contr. Dudley Herb. 5: 1–36.

- 1. Leaves 5–8 per whorl 2
- Leaves 2–4 per whorl 5
- 2(1). Ovary and fruit glabrous; leaves obtuse or rounded apically *G. trifidum*
- Ovary and fruit bristly hairy; leaves acute or bristle-tipped 3
- 3(2). Flowers several on each branch, borne in a terminal paniculate cluster; fruit ca 1 mm thick, with bristles less than 0.3 mm long *G. mexicanum*
- Flowers mostly 2 or 3 in axillary cymes; fruit more than 1 mm thick 4
- 4(3). Plants perennial; leaves ovate-oblong to broadly obovate, 7–13 mm broad *G. triflorum*
- Plants annual; leaves linear to narrowly oblong or oblanceolate, mainly 3–5 (7) mm broad *G. aparine*
- 5(1). Plants herbaceous, not at all woody at the base 6
- Plants woody at the base, at least in the previous years growth 8
- 6(5). Plants perennial; fruit glabrous *G. trifidum*
- Plants annual; fruit with hooked hairs 7
- 7(6). Fruiting pedicels 3–30 mm long; plants glabrous; leaves unequal in the whorl *G. bifolium*
- Fruiting pedicels to 1 mm long; plants hispidulous; leaves subequal in the whorl *G. proliferum*
- 8(5). Mature fruits glabrous or merely puberulent; flowers numerous in terminal paniculate clusters *G. boreale*
- Mature fruits densely bristly, with hairs almost equaling body of fruit 9
- 9(8). Plants shrubby; leaves rigid and acerose; known from Washington County *G. stellatum*
- Plants herbaceous to suffrutescent; leaves not especially rigid or acerose; distribution various *G. multiflorum*

Galium aparine L. Cleavers. [*G. vaillantii* DC. in Lam.]. Clambering annuals, 1–20 dm tall or more; stems with angles retrorsely hispid; leaves 2–5 cm long, 2–7 mm wide, 6–8 per whorl, linear to linear-oblong, or oblanceolate, cuspidate, 1–veined; flowers perfect, in 1- to 3-flowered cymes, in upper leaf axils; pedicels well developed; corolla white to greenish white; fruit 2–5 mm wide, with short uncinuate bristles or subglabrous. Sagebrush, mountain brush, pinyon-juniper, aspen, and spruce-fir communities at 915 to 3050 m in Beaver, Box Elder, Cache, Davis, Juab, Kane, Millard, Morgan, Salt Lake, San Juan, Sanpete, Tooele, Utah, Wasatch, Washington, and Weber counties; widely distributed in North America; Eurasia, 48 (viii). Our materials belong to var. *echinospermum* (Wallr.) Farw. [*G. agreste* var. *echinospermon* Wallr.].

Galium bifolium Wats. Twinleaf Bedstraw. Erect or ascending annual herbs, 0.5–2 dm tall, glabrous; leaves 1–2.5 cm long, 1–5 mm broad, with 2–4 per whorl, when 4, dimorphic, with 2 smaller and 2 larger ones, thin, linear-elliptic, obtuse to acutish, 1–veined; flowers perfect, solitary, on peduncles 5–30 mm long in fruit; corolla white; fruit 2.5–3.5 mm thick, with uncinuate hairs. Mountain brush, sagebrush, ponderosa pine, meadow, lodgepole pine, aspen, and spruce-fir communities at 1400 to 3235 m in all Utah counties except Grand, Piute, San Juan, Summit, and Wayne; Montana to British Columbia, south to California and Colorado; 42 (ix). The type is from the Wasatch Mts.

Galium boreale L. Northern Bedstraw. [*G. utahense* Eastw., type from Soldier Summit]. Perennial herbs, from rhizomes, the stems mostly 2–8 (10) dm tall, erect or ascending, rough to smooth along the angles, not retrorsely bristly; leaves 1–6.5 cm long, 2–12 mm wide, narrowly lanceolate to oblong or linear, borne in whorls of 4, glabrous or roughened marginally and on the veins beneath, 3–veined, rounded apically; flowers several to numerous, borne in terminal cymose panicles; corolla white to cream, 3–7 mm broad, 4-lobed; fruit 1.5–2 mm long, pubescent with straight or curled hairs, rarely glabrous; 2n = 44, 64?, 66. Sagebrush, mountain brush, lodgepole pine, aspen, meadow, and spruce-fir communities at 1650 to 3100 m in Cache, Carbon, Daggett, Duchesne, Emery, Grand, Salt Lake, San Juan, Sanpete, Sevier, Summit, Uintah, Utah, Wasatch, and Weber counties; widely distributed in North America; circumboreal; 53 (v).

Galium mexicanum H.B.K. Rough Bedstraw. [*G. filipes* Rydb., type from City Creek Canyon]. Clambering or prostrate perennial herbs, 2–8 dm tall; stem angles retrorsely scabrous; leaves 1.5–4 cm long, 2–12 mm wide, 4–5 (6) per whorl, elliptic to narrowly linear, cuspidate, 1–veined, retrorsely scabrous or glabrous; flowers perfect, in loose, leafy-bracteate cymose panicles; corolla white; fruit ca 1 mm thick, with very short (0.3 mm) hooked bristles; 2n = 22, 44. Mountain brush, aspen, and fir communities at 2000 to 2700 m in Cache, Morgan, Salt Lake, and Tooele counties; Washington to Montana, south to Mexico and Central America; 3 (i). Our materials belong to var. *asperulum* (Gray) Dempster [*G. asperillum* var. *asperulum* Gray]. The more compact var. *asperinum* (Gray) Higgins & Welsh [*G. asperillum* Gray] occurs near the Utah boundary in Colorado, and should be sought in eastern or southeastern Utah.

Galium multiflorum Kellogg Erect or ascending, clump-forming perennial herbs or subshrubs; stems herbaceous or woody below, glabrous to hispid; leaves 5–20 mm long, 1–8 mm wide, usually 4 per whorl, linear to ovate, acute to cuspidate, the midrib evident and with lateral veins evident near the base; flowers imperfect, dioecious, in narrow panicles; corolla greenish yellow, to 4 mm wide; fruit, including hairs, 4–5.5 mm wide, the hairs straight or curved, flattened, 1.5–2.5 mm long. This complex of forms has been interpreted as belonging to a series of species and infraspecific taxa recognizable only arbitrarily by use of morphological features and differences in chromosome levels. For the purposes of practical taxonomy they are treated more conservatively herein as belonging to two variable and intergrading taxa.

- 1. Leaves mainly 5–10 times longer than broad, mostly 1–2 mm wide and 10–20 mm long, glabrous or nearly so; plants of the Colorado drainage system (and in the Virgin River area) *G. multiflorum* var. *coloradoense*
- Leaves mainly 1.5–6 times longer than broad, mostly 1–5 mm wide and 3–15 mm long, glabrous or hispid; plants widely distributed *G. multiflorum* var. *multiflorum*

Var. *coloradoense* (Wight) Cronq. [*G. coloradoense* Wight]. Warm desert shrub, shadscale, sagebrush, mountain brush, and pinyon-juniper communities at 1500 to 2300 m in Grand, San Juan, Uintah, and Washington counties; Colorado, Arizona, and New Mexico; 27 (vii).

Var. multiflorum [*G. multiflorum* var. *watsonii* Gray, type from Wasatch Mts.; *G. munzii* Hilend & J. T. Howell; *G. hypotrichium* ssp. *utahense* Ehrend., type from Utah County; *G. hypotrichium* ssp. *scabriusculum* Ehrend. (including *G. scabriusculum* (Ehrend.) Dempster & Ehrend., type from Calf Springs Wash, Emery County, not Dalla Torre & Sarnth., and *G. emeryense* Dempster & Ehrend., type from San Rafael Swell; *G. scabriusculum* ssp. *protoscabriusculum* Dempster & Ehrend., type from Castle Gate); *G. desereticum* Dempster & Ehrend., type from Fish Springs]. Blackbrush, sagebrush, mountain brush, riparian poplar-willow, and pinyon-juniper communities at 1125 to 2700 m in Beaver, Box Elder, Cache, Carbon, Daggett, Emery, Garfield, Grand, Iron, Juab, Kane, Millard, Salt Lake, Sanpete, Sevier, Tooele, Uintah, Utah, Washington, and Weber counties; Washington to Idaho, south to California, New Mexico, and Arizona; 65 (xxii).

***Galium proliferum* Gray** Erect annual herbs, 0.5–3 dm tall, simple or branched, glabrous or hispidulous; leaves 5–8 mm long, 0.5–2 mm wide, 4 per whorl, unequal, lanceolate to ovate; flowers perfect, solitary, subsessile in axil of leafy bracts on axillary peduncles, apparently lateral; corolla white, minute; fruit 1.5–3 mm thick, uncinately-hairy. Blackbrush, creosote bush, and other warm desert shrub communities at 885 to 1130 m in Kane and Washington counties; Nevada and California, east to Texas and Mexico; 7 (iii).

***Galium stellatum* Kellogg** Stellate Bedstraw. Dioecious shrubs, mainly 2–7 dm tall; stems much branched, scabrous to hispidulous, with exfoliating white epidermis; leaves 4–10 mm long, 1–3 mm wide, 4 per whorl, lanceolate, hispidulous, revolute, acuminate-cuspidate, 1-veined; staminate flowers in dense panicles, the pistillate solitary at branchlet ends, short-pedicellate; corolla greenish yellow, bristly hairy externally; fruit 2–3 mm thick, with dense white or tawny hairs 1–2 mm long. Larrea, blackbrush, buddleja, and other warm desert shrub communities, often on limestone or dolomite outcrops, at 850 to 1100 m in Washington County (where rare); Nevada, Arizona, and California; 8 (iii).

***Galium trifidum* L.** Small Bedstraw. [*G. brandegei* Gray; *G. subbiflorum* (Wieg.) Rydb.; *G. trifidum* var. *subbiflorum* Wieg.; *G. tinctorium* var. *subbiflorum* (Wieg.) Fern.]. Clambering to ascending perennial herbs with fibrous roots from short stolons, 0.5–3 dm long or more, retrorsely scabrous on stem angles to subglabrous; leaves 3–15 mm long, 0.8–3 mm wide, 4–6 per whorl, elliptic-oblong to linear, obtuse, 1-veined, glabrous to obscurely scabrous on margins and vein; flowers perfect, 1–3 on axillary peduncles 5–18 mm long; corolla whitish or greenish, mostly 3-merous; fruit glabrous, 1–1.5 mm thick; $2n = 24$. Bogs, stream banks, and lake and pond margins in mountain brush, ponderosa pine, aspen, lodgepole pine, spruce-fir, and hairgrass-sedge communities at 1370 to 3355 m in Beaver, Box Elder, Cache, Daggett, Duchesne, Emery, Garfield, Grand, Kane, Piute, Salt Lake, Sanpete, Sevier, Summit, Uintah, Utah, Wasatch, and Washington counties; widespread in North America; circumboreal; 39 (xii).

***Galium triflorum* Michx.** Sweet-scented Bedstraw. Clambering to ascending perennial herbs, mainly 2–8 dm tall; stems retrorsely scabrous on the angles; leaves 1.5–6 cm long, 4–15 mm wide, usually 6 (4 or 5) per whorl, elliptic to oblong-ovate, thin, cuspidate, glabrous or

thinly strigulose below and on the veins; flowers perfect, on trifurcate 3-flowered peduncles, the pedicels divergent; corolla greenish white or cream; fruit ca 2 mm thick, densely bristly with hooked hairs 0.5–1 mm long. Moist sites, commonly in riparian areas, in mountain brush, ponderosa pine, Douglas fir-white fir, and aspen communities at 1220 to 2500 m in Box Elder, Cache, Daggett, Duchesne, Garfield, Grand, Juab, Piute, Salt Lake, San Juan, Sanpete, Tooele, Uintah, Utah, Washington, and Weber counties; widespread in North America; circumboreal; 28 (ix).

Houstonia L.

Perennial herbs; leaves opposite, stipulate, mostly linear; flowers perfect, showy, 4-merous, heterostylous or homostylous; corolla salverform; style slender; stigmas 2; ovary inferior or partly so, 2-loculed; fruit a capsule, loculicidally dehiscent; seeds several.

***Houstonia rubra* Cav.** Bluets. [*Hedyotis rubra* (Cav.) Gray; *Houstonia saxicola* Eastw., type from San Juan County]. Caespitose herbs from a slender taproot; stems short, from a multicapital caudex, ca 0.5–1 dm long; leaves 1–3 cm long, 1–2.5 mm wide, linear, revolute; flowers subsessile in the axils, in fruit with stout recurved pedicels 1–3 mm long; calyx lobes 2–4 mm long; corolla deep rose to purple, rarely white, 1.5–3 cm long; style elongate; ovary inferior, becoming half inferior in fruit; seeds several in each locule, black. Desert shrub, blackbrush, and juniper communities at ca 1280 to 1400 m in San Juan County; Arizona and New Mexico, south to Mexico; 4 (i).

Kelloggia Torr.

Rhizomatous perennial herbs; stems simple or sparingly branched, glabrous; leaves opposite, lanceolate, with interpetiolar stipules; flowers in loose terminal forked cymes, 4- to 5-merous; corolla pinkish white, small, funnelliform; stamens exerted; ovary inferior, 2-loculed, style filiform, exerted; stigmas 2, linear-clavate; fruit dry, uncinately-hispid.

***Kelloggia galioides* Torr.** Stems 1–6 dm tall; leaves 2–5 cm long, 2–15 mm wide, lanceolate to linear, glabrous; pedicels filiform, 1–12 cm long, divergent; corolla 3–7 mm long, mostly 4-lobed; fruit broadly clavate, 3–4 mm long. Pinyon-juniper, sagebrush, mountain brush, aspen, ponderosa pine, and spruce-fir communities at 1500 to 3000 m in Beaver, Garfield, Grand, Iron, Kane, Piute, Utah, and Washington counties; Washington to Idaho, south to California, Nevada, and Arizona; 12 (iv).

Rubia L.

Coarse, clambering perennial herbs; leaves whorled, coarsely scabrous on margins and midvein; flowers small in axillary or terminal cymes; calyx minute or obsolete; corolla 5-lobed; ovary glabrous; style bifid; stigmas capitate; fruit fleshy.

***Rubia tinctoria* L.** Madder. Stems mainly 5–15 dm long, with hooked prickles on the angles; leaves 3–11 cm long, 0.5–3 cm wide, 4–6 per whorl, lance-elliptic to oblong-elliptic, or ovate; corolla pale yellow, broadly funnelliform-campanulate; fruit dark green, turning blackish at maturity, 6–8 mm thick. Weedy plants of roadsides, ditchbanks, and other disturbed areas below 1600 m in Cache, Garfield, Iron, Juab, Kane, Salt Lake, Sanpete,

Tooele, Utah, and Washington counties; widespread in North America; adventive from Europe; 16 (iv).

RUTACEAE A. L. Juss.

Citrus Family

Shrubs or small trees; leaves alternate, simple or compound, glandular-punctate with aromatic oil glands; stipules lacking; flowers commonly perfect, in axillary or terminal clusters; sepals and petals of 3–5 separate or fused parts; stamens 4–8, inserted on a glandular disk; pistil 1, the ovary and fruit superior; carpels mainly 2 or 3; stigma simple or lobed; fruit a capsule or samara; $x = 7-11+$.

1. Leaves compound, thin; large shrubs or small trees; plants indigenous in southern Utah and cultivated widely *Ptelea*
- Leaves simple, thickish; low ill-scented indigenous shrubs in Washington County *Thamnosma*

Ptelea L.

Unarmed, aromatic, polygamo-dioecious shrubs or small trees, the bark greenish to whitish; leaves alternate, trifoliolate; leaflets variable in size and shape; flowers in terminal panicles, greenish white; sepals 4 or 5 (6), imbricate in bud, broadly elliptic to ovate or linear-oblong; stamens 4–6, alternate with the petals; disk lobed, serving as a gynophore; ovaries compressed; fruit a samara, with a thin wing around the margin.

Bailey, V. L. 1962. Revision of *Ptelea*. Brittonia 14. 1–45.

Ptelea trifoliata L. Hoptree. Large shrubs or small trees; leaves with 3 ovate to elliptic or linear-lanceolate leaflets 1.3–10 cm long and 3–50 mm wide, petiolate, the leaflets subsessile, entire or finely crenulate, glabrous or variously pubescent; flowers 10 mm wide or less, greenish white, in corymbs 2–5 cm broad; fruit 10–25 mm wide, oblong-orbicular to orbicular, the thin broad wing very veiny. There are two groups of this species present in our area, an indigenous taxon that occurs rarely in southern Utah and a cultivated introduced taxon of dubious origin growing widely in the state.

1. Twigs pubescent, greenish; leaflets ovate to broadly elliptic; plants cultivated *P. trifoliata* ssp. *trifoliata*
- Twigs glabrous, pale; leaflets linear-lanceolate to oblong-lanceolate *P. trifoliata* ssp. *pallida*

Ssp. *pallida* (Greene) V. L. Bailey [*P. pallida* Greene; *P. neglecta* Greene, type from Kane County]. Along canyons in Garfield (?), Kane, and Washington counties, Arizona; 1 (0). Our material is reported as belonging to var. *lutescens* (Greene) V. L. Bailey (*P. lutescens* Greene), a variable taxon at best that intergrades with other taxa in Arizona. Reports of this species from Garfield County (Baxter & Kraus sn 1926 MICH and Siler 1552h MO are likely from Kane County, as is Wetherill sn 1897 CAS). The plant should be sought near Kanab, and possibly it persists still in Glen Canyon along the shores of Lake Powell.

Ssp. *trifoliata* Cultivated ornamentals in Cache, Salt Lake, Utah, and Weber counties; widespread in the U. S.; 5 (0).

Thamnosma Torr. & Frem.

Ill scented low shrubs, with punctate glands; leaves alternate, narrow, simple, early deciduous; flowers cymosely arranged, but apparently racemose, perfect; calyx 4-lobed, persistent; petals 4, erect; stamens 8, inserted on the disk; ovary mostly 2-loculed and 2-lobed, stipitate, the style filiform; stigma capitate; fruit a leathery capsule, 2-lobed, dehiscent at the apex; seeds reniform, 4–6.

Thamnosma montana Torr. & Frem. Stems branching, broomlike, yellowish green, 3–6 dm tall; leaves 5–15 mm long, linear-oblong to oblanceolate; sepals ovate to orbicular, 3–4 mm long, greenish or purplish; petals ovate to oblong, 8–12 mm long, purple (rarely white); stamens 8, 4 long and 4 short, with filiform filaments; style usually exceeding petals; capsule with 2 subglobose glandular lobes, each ca 5 mm thick; seeds 1–3 per locule, whitish, ca 4 mm long. Creosote, Joshua tree, and other warm desert shrub communities at 760 to 1300 m in Kane (near Glen Canyon) and Washington counties; New Mexico, Arizona, and California; 22 (v).

SALICACEAE Mirbel

Willow Family

Dioecious dwarf shrubs to large trees; leaves alternate, simple, entire, serrate, crenate, rarely lobed, usually stipulate, but the stipules often readily deciduous; flowers borne in aments (catkins), without a perianth, each subtended by a small, scalelike bract (commonly referred to as a scale); staminate flowers of (1) 2 to many stamens; pistillate flowers of a single pistil with 2–4 carpels and as many stigmas; placentation parietal or basal; fruit a sessile or stipitate capsule with 2–4 valves; seeds numerous, small, covered with long white hairs, dispersed easily by wind; $x = 11, 12, 19$.

1. Trees with pendulous aments; leaf-buds covered by several, usually resinous scales *Populus*
- Trees, shrubs, or dwarf shrubs with mostly ascending to erect aments; leaf buds covered by a single nonresinous scale *Salix*

Populus L.

Small to large trees; leaf buds covered by several overlapping scales, resinous in most taxa; aments pendulous, mostly appearing before the leaves, and often soon deciduous, the scalelike bracts caducous, deeply lobed to lacinate, often dilated; each flower subtended by a cup-like disk; stamens 6–60 or more, the filaments free; inserted on the disk; capsules pedicellate, with 2–4 valves, glabrous (except in *P. balsamifera*).

Eckenwalder, J. E. 1977. North American cottonwoods (*Populus*, Salicaceae) of sections *Abaso* and *Aiegiros*. J. Arnold Arboretum 58: 194–208.

Hitchcock, C. L., and A. Cronquist. 1964. Vascular plants of the Pacific Northwest. Part 2: Salicaceae to Saxifragaceae. Univ. Washington Publ. Biol. Vol. 17. 597 pp.

Rehder, A. 1951. Manual of cultivated trees and shrubs hardy in North America. Macmillan Co., New York. 996 pp.

1. Leaves deeply 3–5 lobed and aceriform (at least some), often densely tomentose beneath; plants introduced, cultivated, and escaping *P. alba*

- Leaves not deeply lobed, not aceriform, merely toothed, glabrous or nearly so; plants indigenous or cultivated 2
- 2(1). Bark white and smooth, covered with a whitish powdery bloom, furrowed and gray only in great age; plants not confined to water courses *P. tremuloides*
- Bark soon turning gray or brown and roughly furrowed on older trunks; plants mostly cultivated or growing along water courses or edges of lakes 3
- 3(2). Leaves 0.6–1.3 times longer than wide, deltoid to rhombic or ovate; petioles compressed laterally 4
- Leaves (1) 1.2–7 (10) times longer than wide, ovate to lanceolate; petioles terete or dorsiventrally compressed 6
- 4(3). Bud scales and twigs of the season pubescent; leaf blades commonly with 4–10 (15) fine to coarse teeth on each side; plants native, sometimes cultivated, common along the drainages of the Colorado River system, and sporadic elsewhere *P. fremontii*
- Bud scales and twigs typically glabrous; leaf blades with 15–25 (30) fine teeth on each side; plants introduced, cultivated, sometimes persisting 5
- 5(4). Leaf blades rhombic-ovate, cuneate at the base, seldom over 7 cm long; capsules 2-valved; trees columnar (in those planted in our area) *P. nigra*
- Leaf blades more or less deltoid or broadly ovate, broadly cuneate at the base, some regularly over 7 cm long; capsules 2- to 4-valved; trees not columnar *P. x canadensis*
- 6(3). Leaf blades distinctly darker above than beneath, very strongly resinous especially when young, the petiole terete or nearly so; ovary and young fruit hairy or glabrous; stamens 30–60 *P. balsamifera*
- Leaf blades about equally yellow green on both sides, ovary and young fruit glabrous; stamens mostly 12–30 .. 7
- 7(6). Leaf blades (1.8) 2.5–6 (9.5) times longer than wide; petioles 1/5–1/3 (2/5) as long as the blades, dorsiventrally compressed; carpels 2 *P. angustifolia*
- Leaf blades 1–2.4 times as long as wide; petioles 1/5–3/4 as long as the blades, subterete or somewhat flattened; carpels 2 or 3; plants hybrids, intergrading with *P. angustifolia*, *P. fremontii*, and others *P. acuminata*

Populus acuminata Rydb. (hybrid) Lanceleaf Cottonwood. This is a series of hybrids between *P. angustifolia*, *P. fremontii*, and other taxa with broad leaves, having features intermediate between the parents and intergrading into *P. angustifolia* on one hand and into the broadleaved parent on the other; petioles commonly (1.5) 2.5–5.5 (6.5) cm long, 1/5–3/4 times as long as the blade; leaf blades 1–2.4 times longer than wide. Along streams and rivers and around ponds and lakes, often in mouths of canyons where the parental types come together, also probably cultivated, at 1370 to 1920 m in Box Elder, Cache, Duchesne, Emery, Garfield, Iron, Kane, Salt Lake, San Juan, Sevier, Uintah, Utah, Wasatch, Washington, and Wayne counties; Colorado and Arizona; 29 (0). The name *P. acuminata* in the strict sense is applied to crosses of *P. angustifolia* and *P. deltoides* Marshall var. *occidentalis* Rydb. It is used here in a broad sense to include crosses with other broadleaved taxa.

Populus alba L. White Poplar. Trees spreading by root sprouts, to ca 30 m tall, the trunk to 1 m or more in diameter, the branches usually spreading, the crown more less rounded; bark gray green to whitish and smooth on upper parts of the trunk and branches, rough and

furrowed and turning blackish on lower parts of old trunks; twigs tomentose or glabrous; buds tomentose; petioles terete, 1–5 cm long, 0.2–0.6 times as long as the blade; leaf blades longer than wide, deltoid-ovate in outline, undulate-toothed to deeply palmately 3- to 5-lobed and aceriform, the lobes serrate or crenate, the 2 primary lateral lobes sometimes hastately lobed, dark green above, silvery white-tomentose beneath or glabrous; aments appearing before or with the leaves, the rachis pilose-tomentose, the bracts entire to toothed, not lacinate, ciliate-fringed with long-pilose hairs, very quickly deciduous; staminate aments 8 cm long or more, the flowers with 6–10 stamens; pistillate aments 4–9 cm long; capsules 2–5 mm long, glabrous, 2 or 3 valved, the pedicels ca 1 (2) mm long; stigmas 2, each 2-lobed, the lobes linear, not dilated; 2n = 38. Introduced from Eurasia, cultivated, escaping, and more or less naturalized, in populated areas, along fencelines, ditchbanks, and abandoned homesteads and fields, at ca 1370 to 1980 m, to be expected in all counties of the state; widely distributed in the U. S.; introduced from Europe; 21 (ii). Trees with leaves densely white-tomentose beneath are referable to var. *alba*. Those with leaves and twigs glabrous or glabrate and fastigate crowns are referable to var. *bolleana* Lauche, the Lombardy poplar. These may be hybrids between *P. alba* and some other species.

Populus angustifolia James Narrowleaf Cottonwood. Trees ca 7–15 (20) m tall, the trunk 3–6 (8) dm in diameter, the branches erect-ascending, the crown more or less pyramidal; bark pale green to whitish when young, furrowed and grayish on old trunks, twigs glabrous or pubescent; buds ovoid-conic, pointed, strongly resinous, reddish brown, glabrous or pubescent; petioles semiterete or horizontally flattened and channeled above, especially near the blade, 3–25 mm long, ca 0.3–0.4 times as long as the blade; leaf blades 4–14 cm long, 0.7–2.5 (4) cm wide, (1.8) 2.5–6 (9.5) times longer than wide, lanceolate or occasionally narrow elliptical or ovate, glabrous or nearly so, usually acute at the apex, rounded at the base, the margins finely to coarsely serrate; aments often developing with the leaves, the rachis glabrous or nearly so, the bracts broadly obovate, deeply and irregularly lacrate; staminate aments 2–6 cm long, the flowers with 12–20 stamens; pistillate aments 6–10 cm long; capsules 3–6 (7) mm long, 2-valved, glabrous, the pedicels about 2–10 mm long; stigmas 2, dilated, irregularly lobed. Along water courses, often in canyons, from ca 1525 to 2440 m in all counties of the state; Washington and Alberta to Montana, South Dakota, and Nebraska, south to Nevada, Arizona, New Mexico, and Mexico; 79 (i). This species crosses rather freely with broadleaved species of the genus (see *P. acuminata*).

Populus balsamifera L. Balsam Poplar; Black Cottonwood. Tree 15–30 (50) m tall, the trunk mostly 0.6–1 (1.5) m in diameter, bark furrowed and grayish on older trunks; buds large, the scales very resinous, glabrous or inconspicuously puberulent; petioles more or less terete, 2–6.2 cm long, 1/4–3/4 as long as the blade; leaf blades 4.3–11 cm long, 3.2–8 cm wide, 1.3–2.6 times longer than wide, ovate-acuminate, cuneate to cordate at the base, the margins crenulate, sometimes short ciliate, strongly resinous, glabrous at maturity on both sides, the upper side dark green, the lower side distinctly paler and often rufus tinged in dried specimens; bracts of aments lacerate-fringed, otherwise glabrous or sometimes with

minute hairs, these to 0.5 mm long; staminate aments 2–3 (5) cm long, readily deciduous; stamens commonly 30–60; pistillate aments 8–20 cm long; capsules 5–8 mm long, glabrous or pubescent, subsessile; stigmas broadly dilated; $2n = 38$. Along streams, mostly in canyons, and cultivated at 1370 to 2350 m in Cache, Juab, Salt Lake, Sevier, Utah, Wasatch and Wayne counties; widespread in North America from Newfoundland south to New York and west to Alaska (ssp. *balsamifera*), and from Alaska south to Baja California (ssp. *trichocarpa*); 9 (0). The native trees of our area are assignable to ssp. *trichocarpa* (T. & G.) Brayshaw [*P. trichocarpa* T. & G.] with mostly pubescent and 3 (rarely 2–4) carpellate capsules. Some of the cultivated trees might be ssp. *balsamifera* with mostly glabrous and 2 (rarely 3–4) carpellate capsules.

Populus x canadensis Moench Carolina Poplar; Gray Poplar. Cultivated and persisting, rarely escaping, to 35 m tall, the trunk 0.5–1.5 (2) m in diameter; bark deeply furrowed and grayish on old trunks; buds large, the scales glabrous but resinous; petioles laterally flattened 3.5–8.5 cm long, 1/3 to as long as the blade; leaf blades mostly 3.5–11.5 cm long, 3.5–11 cm wide, or much larger on stump sprouts, 0.9–1.3 (rarely to 1.5) times as long as wide, deltoid-ovate, acuminate at the apex, mostly broadly cuneate or truncate at the base, the margin crenate-serrate, glabrous and equally green on both sides; staminate aments 4–7 cm long; stamens 15–25; pistillate aments unknown. Cultivated for shade tree in Utah, probably in all counties; widely grown in North America; 15 (iii). This plant probably originated in France as a cross between *P. deltoides* Marshall and *P. nigra* (Rehder, 1951). *P. deltoides*, one of the putative parents of *P. x canadensis*, might also be expected in the state as an introduced tree from the eastern U. S., but no specimens were seen that are clearly assignable to that taxon. The original Carolina poplar is *P. deltoides*, but for many years the nursery stock distributed under that name has been *P. x canadensis* (Hitchcock and Cronquist, 1964).

Populus fremontii Wats. Fremont Cottonwood. Trees 10–25 m tall with broad rounded crowns, the crown often as broad or broader than the tree is high, the trunk 0.5–2 m in diameter; bark smooth and whitish on young trees and on twigs and young branches, deeply furrowed and grayish or brownish on old trunks; petioles (0.8) 3–9.5 cm long, 1/2 to as long as the blade, flattened, rarely with 2 glands at the summit; leaf blades (2) 4–10 cm long, (15) 4.5–12.5 cm wide, or much larger on sterile sprouts, 0.6–1.2 times as long as wide, deltoid, ovate, rarely nearly rhombic, with truncate, cuneate, or cordate base, acuminate apically, coarsely to finely crenate or serrate with ca 8–11 (15) glandular teeth, glabrous, greenish or yellow green on both sides, turning yellow in autumn; staminate aments 4–10 cm long, the flowers with a broad oblique disk and 50–80 stamens with dark red anthers; pistillate aments 5–15 cm long, the flowers with a cup shaped disk, this to 5 mm wide in fruit; capsules 7–10 (12) mm long, to 8 mm wide, ovoid to subglobose, 3– to 4-valved, glabrous, the stipes 2–6 (10) mm long; stigmas strongly dilated and irregularly lobed; $2n = 38$. Along flood plains of rivers and along washes, irrigation ditches, and occasionally cultivated, from 760 to 1860 m, in Cache, Duchesne, Garfield, Grand, Iron, Kane, Salt Lake, San Juan, Sevier, Tooele, Uintah, Utah, Washington, Wayne, and Weber counties; Colorado, Arizona, New Mexico, and Nevada; 98 (ii). This tree is part of a transcon-

tinental complex, of which *P. arizonica* Sarg., *P. deltoides*, *P. sargentii* Dode, and *P. wislizenii* (Wats.) Sarg. are portions. *P. arizonica* and *P. wislizenii* have generally been considered closely allied to *P. fremontii* and they have by some authors been included as varieties of or as synonymous with *P. fremontii*. Specimens having capsules with stipes up to 6 or even 20 mm long are found in Emery County and other points along the Colorado River system. These trees have been referred to as *P. fremontii* var. *wislizenii* Wats. Based on the long stipes, they have recently been assigned to *P. deltoides* var. *wislizenii* (Wats.) Eckenwalder (Eckenwalder, 1977). However, the plants are similar to *P. fremontii* in the lack of glands at the junction of petiole and blade and in the few, broad, and coarse teeth on leaf margins, and it seems best to regard them as part of *P. fremontii*.

Populus nigra L. Black Poplar. Tree to 30 m tall; bark deeply furrowed and grayish on old trunks; bud scales glabrous, resinous; petioles flattened laterally, slender 1–4.5 cm long, 0.4–0.8 times as long as the blade; leaf blades 2.2–6.5 cm long, 1.8–8 cm wide, occasionally larger 0.8–1.2 (rarely 1.4) times as long as wide, very often as wide or wider than long, rhombic ovate, or orbicular, usually strongly acuminate at the apex, cuneate at the base, glabrous, equally green on both sides or a little darker above, the margin crenate-serrate, not ciliate; bracts of aments laciniate; staminate aments 4–6 cm long; stamens 20–30; pistillate aments not seen; $2n = 38$. Introduced, cultivated for shade and wind breaks, in Beaver, Salt Lake, and Utah counties, but to be expected throughout the state; previously widely grown in western North America; 6 (0). Most of the trees in our area, known as Lombardy poplar or Mormon tree, are from a staminate clone with strongly ascending branches that produced a narrow, often nearly cylindrical crown. Trees of this clone have been assigned to var. *italica* Duroi, Lombardy poplar. The foxtail shaped trees were a mark of Mormon cities and towns, especially in the first century following colonization.

Populus tremuloides Michx. Aspen; Quaking Aspen; Quakey. [*P. aurea* Tidestrom]. Colonial tree 10–15 (20) m tall, seldom taller; trunk seldom over 40 cm in diameter; bark white and smooth, covered with a powdery white bloom, turning black and rough where scarred and at the base of very old trunks; branches usually spreading, the crown usually rounded; bud scales shiny but hardly resinous; petioles laterally flattened, 2–5.5 cm long, (1/2) 3/4 to nearly as long as the blade; leaf blades 2–6.5 cm long, 1.8–6.5 cm wide, or much larger on stump sprouts, 3/4–1 1/3 times longer than wide, ovate to reniform-cordate, the margin subentire to serrate or undulate, ciliate, glabrous on the surfaces at maturity; bracts of the aments more or less persistent, especially the staminate ones, 3– to 7-lobed or -cleft, silky-pilose ciliate, the hairs up to 2 mm long; staminate aments 2–4 cm long, readily deciduous; stamens 6–14; pistillate aments 4–12 cm long, to 13 mm wide; capsules 4–6 mm long, the stipes 1–2 mm long, subtended by a cuplike disk ca 2 mm across; carpels 2; stigmas 2, each deeply cleft into 2 or more slender lobes; $n = 19, 28, 29$. Along water courses and forming clones and aggregates of clones in canyons and on mountain sides at 1400 to 3200 m in all Utah counties; widespread in North America from Labrador to Alaska and south to Tennessee and northern Mexico; 96 (i). Aspen is cultivated as a reclamation, shade, or ornamental tree. In recent years,

nursery stock has become readily available from commercial nurseries. The plant is consistently used by beaver for food and dam material.

Salix L.

Depressed, mat-forming dwarf shrubs to large trees; buds covered with 1 nonresinous scale; aments erect to spreading, rarely drooping, developing before (precocious), with (coetaneous) or after (serotinous) the leaves, the bracts mostly entire, occasionally with a slightly toothed apex; flowers with 1, occasionally 2 minute glands near the base; stamens (1) 2–8 (12), the filaments free or united toward the base, inserted on the base of the bract; capsules sessile or stipitate, glabrous or pubescent. Note: Difficulty in identification of the willows is compounded by unisexual plants, aments that are sometimes precocious and mostly caducous, and variation among the usually smaller leaves of the flowering branches, which often lack or have inconspicuous stipules, and the usually much larger leaves and stipules of vegetative branchlets or vigorous young shoots. Thus, herbarium specimens of each species often bear 3 or 4 phases (pistillate, staminate, flowering twigs with or without the deciduous aments, and vegetative twigs). Vigorous young shoots sometimes add a fifth dimension. At times whole plants in the field bear only one or two of the various phases. To facilitate identification of plants of the different phases, pistillate, staminate, and vegetative features have been included in many of the leads in the key. Thus, some of the leads are rather long and features not applicable to a particular specimen will need to be skipped. An alternative approach to lengthy leads is separate keys for the different sexual and vegetative phases. Many such keys have been written, but these sometimes also contain a mixing of vegetative and sexual features. To have an adequate basis for a staminate key, many more staminate specimens are required.

- 1. Shrubs or dwarf shrubs not over 1 (1.5) m tall, subalpine to alpine 2
- Shrubs or trees, mostly over 1.5 m tall, of valleys to montane 3
- 2(1). Shrubs depressed, dwarf, 1–10 (20) cm tall mostly alpine, often forming mats, the stems ereeping on or below the ground surface Key 1
- Shrubs (1) 2–10 dm tall or taller, subalpine or alpine, not forming mats on the ground, the stems ascending to erect Key 2
- 3(1). Leaves 10–30 times longer than wide; plants colonial, spreading underground and forming patches, our most common and widespread low-land willow *S. exigua*

- Leaves less than 8 times as long as wide 4
- 4(3). Bracts persistent, dark brown to blackish or, if pale green or pale brown in age, silky pilose and with the hairs exceeding the bract by 1–2 mm and the capsules pubescent (rarely glabrous); stamens 2, the filaments glabrous or pilose in a few species; shrubs or occasionally trees, mostly native Key 3
- Bracts of at least the pistillate aments caducous, pale green or yellowish tan in age, short pubescent, the hairs not exceeding the bract by more than 1 mm, if at all; capsules glabrous; stamens more than 2 or, if only 2, the filaments pilose; plants mostly trees or treelike except in *S. lasiandra* 5
- 5(4). Plants native; stamens 3–9 per flower; stipes of capsules mostly 1–2 mm long, obviously longer than the gland Key 4
- Plants introduced; stamens 2, except in *S. pentandra*; capsules sessile or the stipes mostly less than 1 mm long and hardly longer than the gland Key 5

Key 1.

Depressed mat-forming dwarf shrubs, 1–10 (20) cm tall, at or above timberline.

- 1. Leaves elliptic to orbicular, 1.4–2.6 times longer than wide, glaucous and strongly reticulate-veined beneath, the tips mostly rounded or obtuse *S. reticulata*
- Leaves elliptic or narrow elliptic, (1.2) 2.3–4.7 times longer than wide, glaucous or not, not strongly reticulate-veined beneath, the tips mostly pointed 2
- 2(1). Leaves 2–5 (7) mm wide, 2–4.7 times longer than wide, sessile or the petiole to 3 mm long, plants seldom over 3 cm tall, aments 0.5–2.2 cm long *S. cascadenis*
- Leaves 5–20 mm wide, mostly 2–3 times longer than wide, with petiole 3–13 mm long; plants mostly 5–10 (20) cm tall; aments (1) 2–4 cm long *S. arctica*

Key 2.

Low shrubs (1) 2–10 (30) dm tall, subalpine or alpine.

- 1. Capsules glabrous, the style and stigma together less than 1 mm long; leaves permanently pubescent on both sides, the lower surface not glaucous but often more densely pubescent and thus lighter than the upper surface *S. wolfii*
- Capsules pubescent at least until mature or style and stigma together over 1 mm long; leaves often glaucous beneath, glabrous or pubescent 2
- 2(1). Mature leaves glabrous, dark green and shiny above, strongly glaucous and glabrous or with a few hairs beneath; twigs of the season glabrous or very scattered pubescent, dark chestnut to lustrous purplish black *S. planifolia*
- Mature leaves pubescent on both sides, but sometimes glabrate or glabrous in age; twigs of the current season densely pubescent, aments coetaneous or subserotinous, born on stalks to 2 (4) cm long, these usually bearing and subtended by bractlike leaves 3
- 3(2). Bracts of aments pale green when young, tan in age; capsules 3–5 mm long, pubescent even in age, crowded and nearly sessile so as to mostly conceal the rachis at the center of the aments, the stipes seldom over 0.5 mm long; pistillate aments 0.8–2 (2.5) cm long, 8–10 mm wide *S. brachycarpa*

- Bracts of aments brown to blackish, sometimes light brown to whitish tan but not green even when young; capsules (4) 5–7 (8) mm long, sometimes glabrate in age, dense but often not so crowded as to conceal the rachis at the center of the ament, the stipes 0.5–2 mm long; pistillate aments (1.8) 2.5–5 cm long, 11–15 mm wide *S. glauca*

Key 3.

Native (or some introduced) shrubs or small trees; aments mostly with dark bracts; stamens 2; capsules glabrous or pubescent.

- 1. Capsules glabrous; leaves not both glaucous and pubescent on the lower surface when fully expanded 2
- Capsules mostly pubescent except in *S. lasiolepis*; leaves both glaucous and pubescent on the lower surface when fully expanded 6
- 2(1). Leaves glaucous beneath, not or scarcely pubescent when fully expanded 3
- Leaves not glaucous beneath, although sometimes lighter colored due to hairs; pubescent at least in part on both sides when fully expanded, but sometimes glabrate in age 5
- 3(2). Leaves mostly entire, often slightly revolute; twigs dark chestnut to lustrous purplish black, essentially glabrous; plants often less than 1.5 m tall . . . *S. planifolia*
- Leaves serrate, serrulate, or entire, not at all revolute; twigs variously colored, glabrous or those of the current season more often pubescent; plants often over 1.5 m tall 4
- 4(3). Styles 0.7–1.5 (1.8) mm long; leaves of fertile and vegetative twigs often less than 3 times longer than wide, evidently crenulate-serrate or subentire; bark of older twigs not ashy gray or whitish; plants apparently uncommon, in the eastern and central part of the state, mostly montane *S. monticola*
- Styles 0.2–0.7 mm long; leaves of vegetative twigs 2–5 times longer than wide, serrulate or entire; bark of older twigs usually ashy gray or white; plants widespread, mostly of valleys and lower montane . . . *S. lutea*
- 5(2). Aments (1.5) 2–5 cm long, with dense crisped-villous, tangled hairs; leaves subglabrate in age, with inconspicuous hairs, entire or sometimes serrulate; plants over 2 m tall *S. boothii*
- Aments 0.8–1.5 (3) cm long, with hairs straight or nearly so; leaves permanently pubescent throughout on both sides even in age, the hairs readily conspicuous with a 10 x lens, entire; plants 0.6–1.5 (2) m tall . . . *S. wolfii*
- 6(1). Twigs strongly blue glaucous, the bloom sometimes evanescent; capsules densely pubescent 7
- Twigs not glaucous or those of the current season often pubescent, or leaves not sericeous; capsules pubescent or glabrous 8
- 7(6). Pistillate aments 2–5 cm long; capsules sessile or the stipes to 1 mm long, the style and stigmas together 0.8–1.3 mm long; staminate aments ca 2 cm long, the filaments glabrous *S. drummondiana*
- Pistillate aments 1–2 cm long; capsules stipitate, the stipes 2–3 mm long, the style and stigmas together ca 0.5 mm long; staminate aments 8–15 mm long, the filaments pilose on the lower 1/2 *S. geyeriana*

- 8(6). Shrubs 0.6–3 m tall, midmontane to above timberline, the stems less than 4 cm thick; leaves mostly less than 2 cm wide, elliptic to narrowly lanceolate . . . Key II
- Shrubs or small trees, commonly 3–4 m tall or taller, of valleys or montane; stems of mature plants often 4–10 cm thick or thicker; leaves sometimes over 2 cm wide, oblong, obovate, oblanceolate, or elliptic 9
- 9(8). Capsules glabrous; filaments about 3–5 mm long; bracts of aments blackish or purplish black, about as wide as long and rounded at the apex, densely pilose-tomentose, the hairs exceeding the bracts by ca 1 mm; plants of Great Basin and Virgin River drainages *S. lasiolepis*
- Capsules pubescent; filaments longer or bracts not as dark; bracts of aments of lighter color or, if blackish, with hairs exceeding the bracts by ca 2 mm, pointed or somewhat rounded; plants of various distribution . . . 10
- 10(9). Twigs of the second and current year and the dark red bud scales velvety villous; lower surface of leaves densely velvety villous throughout the season; twigs with longitudinal ridges beneath the bark; aments precocious; plants introduced, cultivated . . . *S. cinerea* L.
- Twigs of the second year glabrous, those of the current season villous or with appressed hairs; lower surface of leaves villous at first but usually rather scattered-villous to glabrate in age; aments various; plants native 11
- 11(10). Capsules long-beaked, loosely arranged so as to expose much of the rachis; filaments of stamens 3–6 mm long; leaves mostly elliptic, occasionally lanceolate or obovate *S. bebbiana*
- Capsules not long beaked, densely arranged and mostly concealing the rachis; filaments ca 10 mm long; leaves obovate or oblanceolate *S. scouleriana*

Key 4.

Native, tall shrubs or trees; bracts pale green or yellow, at least the pistillate ones, deciduous; stamens 3–8 (12); capsules glabrous with a stipe 1–2 mm long.

- 1. Bracts 3–4 mm long; bud scales fused, without free overlapping margins; styles 0.5–1 mm long; plants mostly multi-stemmed, large shrubs from large root crowns, rarely trees, widespread in the state . . . *S. lasiandra*
- Bracts of aments 1–2 mm long; bud scales with free overlapping margins; styles 0.1–0.2 mm long; plants mostly trees with solitary or few trunks, of various distribution 2
- 2(1). Leaf blades not glaucous beneath, (2.5) 4–7 times longer than wide; twigs whitish or grayish yellow; plants of the southern 1/2 of the state *S. gooddingii*
- Leaf blades glaucous beneath, variously shaped; twigs and distribution various 3
- 3(2). Twigs reddish or reddish brown, often pubescent at least near the nodes, horizontal or spreading; some of the leaf blades usually 4–5 times longer than wide, shiny dark green above; plants of San Juan and Washington counties *S. laevigata*
- Twigs ashy gray or yellowish when fresh, glabrous, tending to droop; leaf blades usually not over 3 times longer than wide, not shiny dark green above; plants widespread in the state, mostly north of the counties listed above *S. amygdaloides*

Key 5.

Small to rather large trees, introduced, cultivated, sometimes escaping and persisting; bracts pale green or yellowish, at least the pistillate ones deciduous; capsules glabrous, sessile or nearly so.

(Note: The cultivated species of this key, except *S. fragilis*, are not described due to lack of adequate specimens in herbaria.)

- 1. Stamens 3–12; leaves with glands on upper part of petiole and lower margins of blade, the blade seldom over 3 times longer than wide, usually glabrous, except along the midrib above, lighter beneath but not glaucous (hay willow) *S. pentandra* L.
- Stamens 2, leaf blades 3–5 times longer than wide, usually glaucous beneath, glabrous or variously pubescent 2
- 2(1). Pistillate aments 1–2.5 (3) cm long, the capsules 1–2.5 mm long; staminate aments to 4 cm long, petioles glandless; trees weeping, with very slender, greatly elongate, pendulous branches or, if not weeping, the twigs more or less contorted 3
- Pistillate aments mostly over 3 cm long, the capsules 3–6 mm long; petioles sometimes with small glands near the base of the blade; trees not weeping, with upright branches; twigs spreading, not contorted 5
- 3(2). Trees not weeping; twigs not pendulous; aments 1–1.5 cm long; trees with twigs and branches twisted and contorted are referable to *f. tortuosa* Rehder (corkscrew willow), those with broad umbrella-shaped or semiglobose crowns are *f. umbraculifera* Rehder (umbrella or globe willow) *S. matsudana* Koidz.
- Trees weeping; twigs pendulous, very straight; aments sometimes longer than above 4
- 4(3). Leaves mostly 3–15 mm wide, mostly deciduous in October; twigs often bright yellow; capsules sessile (weeping willow) *S. babylonica* L.
- Leaves 15–22 mm wide, often persisting into December; twigs greenish or yellow-green; capsules with stipe exceeding the gland; plants hybrids of *S. babylonica* x *S. fragilis* (Niobe or Wisconsin weeping willow) *S. x blanda* Anderss.
- 5(2). Leaves glabrous when unfolded, the margin of mature leaves usually serrate with 4–8 teeth per cm; twigs glabrous or nearly so; stipe of capsules 0.5–0.8(1) mm long; plants common, cultivated and escaping . . . *S. fragilis*
- Leaves sericeous, or glabrous when unfolded, the margin of mature leaves finely serrulate with 9–10 teeth per cm; twigs sometimes pubescent; capsules sessile or subsessile; plants not known outside of cultivation (white willow) *S. alba* L.

***Salix amygdaloides* Anderss.** Peach-leaf Willow. Mostly small trees, rarely shrublike, 4–10 (12) m tall, often with 2–4 ascending trunks; twigs whitish, yellowish, or ashy-gray, rarely reddish, glabrous except when very young; stipules minute and soon deciduous; petioles (3) 5–15 (25) mm long; leaf blades, (1.8) 2.3–6 (7.5) cm long, (7) 12–19 (23) mm wide, or up to 10.5 cm and 3.2 cm wide on vigorous young shoots, elliptical to lanceolate, entire or serrulate, glabrous except when very young, glaucous beneath, green above; aments coetaneous, rarely subprecocious, on leafy or bracteate twigs of the season, 1.5–4 cm long; bracts 1–2 mm long, at least the pistillate ones soon deciduous, pale green, orbicular, the dorsal side woolly-pilose below and along the margins,

but mostly glabrous toward the apex, the ventral surface woolly-villose, the hairs seldom exceeding the bract by more than 0.5 mm; staminate aments 2–10 cm long, 7–11 mm wide; stamens 4–7, the filaments pilose on the lower half; pistillate aments (1.5) 2.5–8 cm long, 13–20 mm wide; capsules 4–7 mm long, glabrous, the stipe 1.2–3 mm long, the style ca 0.2 mm long, not surpassing the stigmas; 2n = 38. Riparian and palustrine habitats, and in neglected fields and pastures, at 1070 to 1710 m in Beaver, Box Elder, Cache, Daggett, Davis, Duchesne, Emery, Grand, Juab, Salt Lake, San Juan, Tooele, Uintah, Utah, and Washington (?) counties; southern Canada and widespread in the U. S., except the southern part; 63 (vi).

***Salix arctica* Pallas** Arctic Willow. [*S. anglorum* var. *antiplasta* Schneid.]. Depressed shrubs with stems creeping on or under the ground, seldom more than 10 (20) cm tall, tending to form mats; stipules minute or lacking; petioles 2–12 mm long; leaf blades (5) 11–47 mm long, (4) 6–16 mm wide, elliptical, narrow elliptical, obovate, or oblanceolate, entire, slightly paler beneath than above but not strongly glaucous, pilose-sericeous when young, sparingly pubescent or glabrous in age; aments coetaneous, leafy or naked pedunculate, the peduncles 7–35 mm long; bracts persistent, dark brown, pinkish purple basally, pilose-sericeous on both sides, sometimes less so dorsally than ventrally, the hairs to 1 mm longer than the bract; staminate aments 15–25 mm long, 7–9 mm wide; stamens 2, the filaments glabrous, to ca 7 mm long; pistillate aments 1.5–7 cm long, 10–12 mm wide, with 25–75 fruits; capsules 4–7 mm long, pubescent, the stipe ca 1 mm long, the style and stigmas together 1–2 mm long; 2n = 76, 114. Snowbanks, meadows, shores of lakes, and rocky slopes near or a little above timberline at 2775 to 3600 m in Beaver, Cache, Duchesne, Piute, Salt Lake, Summit, and Utah counties; circumboreal and south to California and New Mexico; 16 (ii). Our plants are var. *petraea* Anderss. They intergrade with *S. cascadenensis* in the Uinta Mts.

***Salix bebbiana* Sarg.** Bebb Willow. Shrubs, occasionally treelike, (2) 4–6 (8) m tall, with 1 to several stems; branchlets glabrous, puberulent or densely pubescent; stipules usually inconspicuous and caducous; petioles (2) 3–8 (10) mm long, reddish or pale; leaf blades 1–4 cm long, 1.2–2 cm wide or to 7 cm long and 3 cm wide on vigorous shoots, 2.2–2.8 times longer than wide, typically elliptical, occasionally obovate or oblanceolate, entire to slightly undulate-crenate, dark green above, glaucous beneath, pubescent when young on both sides; fully expanded leaves glabrous above, usually with a few hairs beneath near the midrib; aments coetaneous on a bracteate peduncle 3–15 mm long; bracts persistent, pale green to pale brown in age, sometimes reddish at the apex, particularly in staminate aments, silky pubescent, the hairs exceeding the bract by ca 1 mm; staminate aments 1.5–2 cm long, to 13 mm wide; stamens 2, the filaments 3–6 mm long, glabrous or sparingly pilose at the base; pistillate aments 1.5–4 (5) cm long, to 2 cm wide; capsules 6–8 (10) mm long, rostrate, with a rounded basal portion 1–2 mm wide and a long slender beak, pubescent, rather loosely arranged and not concealing the rachis, the stipe 2–3.5 mm long, the style 0.1–0.2 mm long; stigmas 0.3–0.5 mm long, bilobed to the base; 2n = 76. Riparian communities and occasionally along irrigation ditches at 1370 to 2710 m in Box Elder, Cache, Daggett, Davis,

Garfield, Grand, Juab, Kane, Morgan, Rich, Salt Lake, San Juan, Sevier, Summit, Uintah, Utah, Wasatch, Washington, and Wayne counties; widespread in the U. S. and Canada; 87 (xx). Our plants with leaves sparsely appressed pubescent and soon glabrous beneath and rather weakly raised reticulate-veiny are often referred to as var. *perrostrata* (Rydb.) Schneider, but the separation is probably taxonomically insignificant.

Salix boothii Dorn Booth Willow. [*S. pseudocordata* (Anderss.) Rydb., misapplied]. Shrubs (1.5) 2–4 m tall; young twigs finely hairy, stipules small, inconspicuous and caducous or larger and leaflike on vigorous shoots; petioles mostly 2–5 mm long or to 2 cm long on vigorous shoots; leaf blades (0.8) 2.5–6 cm long, (4) 8–22 mm wide, or to 11.2 cm long and 4 cm wide, elliptical, lanceolate, or almost linear, rarely oval, entire or serrulate, not glaucous beneath, sparingly to moderately pubescent on both sides or glabrate in age, subequally pubescent apically and basally, finally coriaceous; aments subprecocious or coetaneous, sessile or on a naked or bracteate peduncle to 8 mm long; bracts persistent, dark brown to purplish black at the apex, often with a lighter base; aments sericeous-pilose at first but soon crisped-villous, the hairs somewhat entangled, usually exceeding the bracts by 1–2 mm, sometimes deciduous; staminate aments 1–2.5 cm long, stamens 2, the filaments ca 5 mm long, glabrous; pistillate aments (1) 2–4 (6) cm long; capsules 3–6 mm long, glabrous, the stipe 1.5–2 mm long; styles 0.3–1 (1.5) mm long. Riparian and wet meadow communities at 2075 to 3050 m, particularly common on the plateaus of central Utah, but from all counties of the state, except Millard, Morgan, Rich, San Juan, Tooele, Washington, Wayne, and Weber; Colorado west to California and north to Alberta and British Columbia; 139 (xii). Our plants are closely related to *S. myrtillifolia* Anderss. of Alaska and Canada. They vary from those of Alaska and Canada by either taller stature, pubescent leaves (or both), and longer stipules, which are more sharply acute at the apex. The plants might be treated best as a variety of *S. myrtillifolia*, but no new combination is proposed here. They have been referred to *S. pseudocordata*, but that name is synonymous with *S. myrtillifolia* (Dorn, 1975). Plants occasionally trend toward *S. wolfii* in pubescence of leaves and sometimes are difficult to distinguish from that species vegetatively. This species is similar to *S. lutea*, with which it is sometimes confused, but the leaves are coriaceous in age, more persistently pubescent, not glaucous beneath, and the plants occur generally at higher elevations.

Salix brachycarpa Nutt. Barren-ground Willow. Shrubs 2.5 6–15 dm tall, rarely taller; internodes with epidermis breaking in translucent flakes, branchlets dark or reddish beneath the dense pubescence; stipules inconspicuous, deciduous; petioles 1–4 mm long, usually not longer than the bud, often reddish; leaf blades (0.6) 1.5–4 cm long, (3) 5–18 mm wide, or to 7 cm long and 3 cm wide on sterile branches, 2–4 (5) times longer than wide, elliptical, broadly lanceolate, or almost linear, entire, thinly to moderately sericeous to nearly glabrous on both sides, strongly glaucous beneath, the midrib sometimes reddish; aments coetaneous or serotinous, nearly sessile or more often on leafy peduncles; bracts pale green, tan, or light brown in age, rarely pink or pale reddish at apex, scattered to densely pilose on both sides, the hairs exceeding the bract by ca 1 mm or less; staminate aments

(6) 8–10 (12) mm long, 5–6 mm wide; stamens 2, the filaments 2.5–5 mm long, densely pilose at base and scattered pilose for 1/3–3/4 the length, the pubescent portion sometimes exceeding the scale, anthers 0.3–0.5 (0.6) mm long, orbicular, yellowish; pistillate aments 8–25 mm long, 3–10 mm wide; capsules 3–5 mm long, contiguous and mostly concealing the rachis, sessile or on stipes to 0.5 (1) mm long, pubescent, the hairs persistent even on over-wintering capsules, the style 0.5–1 mm long, the stigmas ca 0.5 mm long, bilobed to the base; $2n = 38$. Riparian sites, wet meadows, dry rocky and talus slopes, and rocky open (mostly basic) ground in mountains at 2070 to 3230 m in Cache, Duchesne, Emery, Garfield, Grand, Iron, Juab, Kane, Salt Lake, Sanpete, Sevier, Summit, Utah, and Wasatch counties; Alaska, south to Oregon and Colorado; 86 (xi). Our plants are assignable to var. *brachycarpa* with bracts greenish at anthesis and subspherical or short cylindrical, densely flowered pistillate aments, leaves coarsely pubescent on both sides, and with comparatively tall stature. This willow is closely related to and, often confused with, *S. glauca*. In addition to the features given in the key, *S. brachycarpa* differs from *S. glauca* in having twigs with more numerous aments, distal leaves of fertile twigs often considerably larger than the 3 or 4 proximal ones, and reddish as well as yellowish petioles with the reddish color sometimes extending onto the midrib. Although most of our plants seem quite distinct, apparently there is widespread introgression with *S. glauca* in the Rocky Mt. Region and particularly southward in Colorado (Argus 1965); see discussion under *S. glauca*.

Salix cascadiensis Cockerell Cascade Willow. Depressed, mat-forming subshrubs, 1–3 cm tall, from a tap root and much-branched rhizomatous caudex; petiole lacking or to 3 mm long; leaf blades 6–18 mm long, 1.5–4 mm wide, 2–4.7 times longer than wide, linear or narrow elliptical, entire, pilose-sericeous when young, soon glabrous and green on both sides or slightly paler below, some persistent for 1 or more years; aments coetaneous, terminal on short leafy lateral branches, these ca 8–22 mm long; bracts persistent, black or purplish black, reddish purplish basally, 1–2 mm long, 1 mm wide, pilose on both sides, but less so to nearly glabrous at the base ventrally, the hairs ca 1 mm long; staminate aments 3–12 mm long, 5–8 mm wide; stamens 2, separate to the base, the filaments ca 3–4 mm long, glabrous, the anthers reddish or purplish; pistillate aments 5–22 mm long, 5–11 mm wide; capsules 3–4 mm long, pubescent, sessile or the stipe less than 1 mm long, the style and stigmas together ca 1.5 mm long. Alpine tundra in the Uinta Mts. at 3350 to 3935 m in Daggett, Duchesne, Summit, and Uintah counties; British Columbia to Montana, south to Colorado; 15 (iv).

Salix drummondiana Barratt in Hook. Drummond Willow. [*S. subcoerulea* Piper]. Shrubs (1) 2–3 (4) m tall; twigs glabrous or puberulent when very young, heavily glaucous, the bloom persisting into the second year, yellow brown to blackish purple beneath the bloom; stipules narrow, small and deciduous, or larger and more persistent on vigorous shoots; petioles 4–12 mm long; leaf blades 2.2–8 cm long, (5) 13–20 mm wide, or to 14 cm long and 3 cm wide on juvenile shoots, lanceolate or narrowly elliptical, rarely oblanceolate, entire, sometimes with slightly revolute margins, dark green and glabrous or thinly pubescent above, densely silvery white

pubescent beneath with short appressed or spreading and slightly tangled hairs, pale glaucous beneath the pubescence; aments precocious or subcoetaneous; bracts persistent, purplish black or purplish brown, pilose on both sides, the longest hairs exceeding the bract by 1.5–2 mm; staminate aments 19–22 mm long, 3–10 mm wide, sessile or on a peduncle to 3 mm long; stamens 2, the filaments, 4–9 mm long, glabrous; pistillate aments 2–4.5 cm long, 3–12 mm wide; capsules 3–6 mm long, pubescent, sessile or the stipe to 1 mm long, the style 0.5–0.7 mm long, the stigmas 0.3–0.6 mm long; $2n = 38$, 76. Riparian habitats, wet meadows, and other wet sites at 2135 to 3290 m in Beaver, Box Elder, Cache, Daggett, Davis, Duchesne, Emery, Grand, Piute, Salt Lake, Sanpete, Sevier, Summit, Uintah, Utah, and Wasatch counties; British Columbia and Alberta south to California and New Mexico; 84 (xxv).

Salix exigua Nutt. Coyote, Dusky, or Narrowleaf Willow. Colonial shrub (1) 2–3 m tall or rarely treelike and to 8 m tall; stems ashy gray, branches often reddish, twigs of the season greenish, pubescent; leaves (1) 2–11 cm long, (0.1) 0.2–1 cm wide, sessile or with petiole 1–3 mm long, or to 17.5 cm long and 1.6 cm wide with petiole up to 12 mm long on juvenile shoots, linear, entire or serrulate-dentate with glandular teeth, glabrate to densely white sericeous; aments coetaneous or serotinous, on slender leafy peduncles or twigs of the season, these 0.5–14 cm long; bracts ca 2 mm long and 1 mm wide, pale green or yellowish, deciduous, pubescent on both sides but often glabrate or glabrous dorsally especially toward the apex, occasionally only ciliate ventrally; staminate aments 1.5–4.5 cm long, 0.5–1 cm wide; stamens 2, the filaments pilose on the lower 1/2; pistillate aments 1.5–6 cm long, 8–16 mm wide; capsules 4–7 mm long, mostly glabrous, sometimes pubescent, sessile or the stipe up to 0.8 mm long, the style obsolete. Riparian habitats and other moist sites, often on saline soils, at 825 to 2590 m in all Utah counties; widespread in North America; 170 (ii). Most of our specimens have glabrous capsules and belong to ssp. *exigua* var. *stenophylla* (Rydb.) Schneider. Some specimens from the northern part of the state have somewhat pubescent capsules and might be referable to var. *exigua*. The closely related *S. melanopsis* Nutt. has been reported for Utah, but I have seen no materials.

Salix fragilis L. Crack Willow. Large trees to 20 m tall, the trunks to 1.3 m in diameter, solitary or few, erect or ascending, with thick furrowed gray or blackish gray bark; branches ascending, often large; branchlets spreading, not pendulous, very brittle; leaf blades lanceolate to narrow elliptic, (2.5) 3–17 cm long, (7) 10–32 mm wide, acute or acuminate, serrate, glaucous or glaucescent beneath, glabrous or sericeous when young and glabrous when mature; aments coetaneous on branchlets of season, these 1–2.5 cm long, with (1) 2–3 (4) reduced leaves, the leaves like those of the nonfloriferous twigs but sometimes oblanceolate; bracts pale green, pale yellow green, or greenish white, tan or very pale brown upon drying, the pistillate deciduous by capsule maturity, sericeous, with the hairs exceeding the bract by about 1–1.5 mm; staminate aments 3.5–7 (9) cm long, 9–12 mm wide; stamens 2; filaments 3–6 mm long, yellow, pilose toward the base, the pilose portion subequal to or shorter than the subtending bract; pistillate aments (2.5) 4–7 cm long, 10–13 mm wide; capsules 4–6 mm long, crowded but the rachis usually apparent, glabrous, the stipes ca 1 mm

long; styles 0.5–1 mm long, the stigmas 0.2–0.3 mm long; $2n = 38$, 76. Cultivated shade and windbreak trees, persisting, escaping and naturalized along irrigation and natural waterways and lake margins, solitary to forming groves, at 1370 to 2075 m in Beaver, Box Elder, Cache, Duchesne, Juab, Rich, Salt Lake, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, and Wasatch counties; widely grown in the U. S.; introduced from Eurasia; 30 (xiv).

Salix geyeriana Anderss. Geyer Willow. Shrubs 1.5–4.5 m tall; twigs glabrous or sparingly puberulent, strongly glaucous, the bloom sometimes evanescent; stipules minute and deciduous; petioles 3–10 mm long; leaves (1) 2–4.5 cm long (4) 8–12 mm wide, elliptical or narrow elliptical to narrow lanceolate, entire or nearly so, glaucous beneath, sericeous when unfolding, sparsely to moderately sericeous at maturity especially below, the hairs white or a few pale reddish; aments subprecocious to coetaneous; peduncles of aments leafy or bracteate, the staminate 2–5 mm long, the pistillate 3–10 mm long; bracts persistent, sericeous-pilose on both sides, or glabrate or glabrous ventrally, especially in age, the hairs exceeding the bract by 0.5–1 mm, the staminate light brown when young, turning reddish to purplish black at the tips, the pistillate greenish brown to brown; staminate aments 7–15 mm long, 5–9 mm wide; stamens 2, the filaments ca 4 mm long, pilose to about midlength, the pilose portion subequal to or exceeding the bract; pistillate aments 1–2 cm long, 6–15 mm wide; capsules 4–7 mm long, pubescent, the stipe (1) 2–3 mm long, the style 0.2–0.3 mm long; stigmas ca 0.2 mm long; $2n = 38$. Along streams and rivers and in other wet places at 2195 to 2895 m, common in the Uinta Mts. to Strawberry Valley and occasional elsewhere, in Beaver, Cache, Daggett, Duchesne, Emery, Garfield, Kane, Rich, Salt Lake, Sevier, Summit, Uintah, Utah, Wasatch, Washington, and Wayne counties; British Columbia south to California and east to Montana and Colorado; 67 (xix). Our plants are assignable to var. *geyeriana*.

Salix glauca L. Glaucous Willow; Grayleaf Willow. [*S. pseudolapponum* Seemann in Engler]. Mostly low shrubs (0.1) 0.3–1 (3) m tall; branchlets sometimes glaucous, the epidermis of internodes exfoliating in translucent flakes, reddish beneath whitish pubescence, occasionally glabrate, often with a tuft of pilose hairs at the node; stipules mostly small and caducous; petioles (1) 2–6 (18) mm long, mostly yellowish or greenish, the color often extending onto the midrib; leaf blades 2–55 mm long, 7–22 mm wide, or to 9 cm long and to 5 cm wide on juvenile stems, elliptical, pubescent when young to glabrate or glabrous in age, entire or rarely serrate; aments coetaneous, subsessile on twigs or on leafy peduncles; bracts persistent, pale brown to blackish, pilose; staminate aments 1.5–4 cm long; stamens 2, the filaments free or rarely united, glabrous or sparsely pilose at the base, the anthers 0.5–0.8 mm long; pistillate aments 1.5–5 cm long, 11–15 mm wide; capsules (4) 5–7 (9) mm long, densely pubescent to glabrate or glabrous in age, crowded but the rachis usually apparent, the stipes 0.5–2 mm long; style 0.6–1 mm long, the stigmas ca 0.5 mm long; $2n = 76$, 114, 144. Along streams, other wet sites, on talus slopes, and in snowflush areas and dry alpine tundra at 2775 to 3660 m in Cache, Daggett, Duchesne, Salt Lake, Sanpete, Summit, Uintah and Wasatch counties; circumboreal, south to New Mexico; 57 (xii). Plants of the Uinta Mts. are comparable to those that have

passed under the name of *S. pseudolapponum*. On windswept alpine summits, they approach the stature of *S. arctica*, but the stems are still ascending to erect. The Uinta Mt. materials tend more toward glabrescence in the capsules and have darker scales than is typical of those in the Bear River Range. The twigs are quite persistently pubescent, and the leaves are seldom over 5 cm long or over 2 cm wide. Plants from the Bear River and Wasatch ranges have densely and persistently pubescent capsules, pale brown to dark brown to occasionally pinkish tan or rarely whitish tan scales, with twigs often soon glabrate and some of the leaves are frequently over 5 cm long and over 2 cm wide. Specimens from Horseshoe Flat area of the Wasatch Plateau have glabrous or pubescent capsules, mostly dark scales, and glabrate and unusual distinctly serrate leaves. The variability in *S. glauca* almost encompasses *S. brachycarpa*. However, I prefer to follow Argus (1965) in keeping them separate.

Salix gooddingii Ball Black Willow. [*S. nigra* Marshall sens. lat.]. Trees or occasionally shrubs (2) 6–10 (24) m tall; branchlets yellowish, glabrous or initially finely pubescent; stipules to 8 mm long, more or less glandular, usually caducous; petioles 3–7 mm long; leaf blades 2–7.5 cm long, 6–16 mm wide or to 10.2 cm long and 18 mm wide with petiole to 15 mm long on juvenile shoots, narrowly to broadly lanceolate, short to long acuminate, entire or more often glandular-serrulate, greenish on both sides, pubescent initially but finally glabrate; aments coetaneous; peduncles 1–6 cm long, with 3–6 leaves; floral bracts pale green or pale yellow, soon fading tan, and the pistillate ones deciduous, pubescent on both sides or glabrous toward the apex, entire or with 1–3 minute, rounded teeth; staminate aments 2.5–6.5 cm long, 5–10 mm wide; stamens 3–6, the filaments pilose to about midlength; pistillate aments 1.5–6 cm long, 10–17 mm wide; capsules 4–7 mm long, glabrous, the rachis apparent between them, the stipe 1–2 mm long; style 0.1–0.3 mm long. Along rivers and other drainages at 825 to 1585 m in Garfield, Grand, Kane, San Juan, and Washington counties; Kansas to California, south to Mexico; 25 (ii). *S. gooddingii* is a part of the *S. nigra* complex. The relationship of these taxa is in need of further study.

Salix laevigata Bebb. Red Willow. Shrubs or trees 2–15 m tall; branchlets reddish brown or dull brown, ashy red or ashy gray; stipules inconspicuous or to 6 mm long on juvenile shoots, usually deciduous; petioles stout, 4–14 mm long; leaf blades (1) 1.8–4 (6) cm long, 5–20 cm wide, or to 19 cm long and 4 cm wide on vigorous young shoots, narrowly to broadly lanceolate, glandular-serrulate, somewhat revolute, usually thick and firm, dark green and glabrous above, glaucous and glabrous or pubescent toward the base and along the midrib; aments subprecocious to coetaneous, on leafy peduncles; bracts 1–2 mm long, at least the pistillate deciduous, pale yellow, crinkly pilose on both sides or often glabrous dorsally, entire or erose to dentate at apex; staminate aments 3–6 cm long, ca 1 cm wide; stamens 3–7, pilose on lower half; pistillate aments 4–8 (11) cm long, to 1.5 mm wide; capsules 4–5 (6) mm long, glabrous, the stipes 1.5–2.5 mm long, styles 0.1–0.2 mm long, equaling the bilobed stigmas. Along drainages at 700 to 1370 m in Kane (?), San Juan, and Washington counties; Arizona, California, Nevada, and Baja California; 16 (0). Perhaps the red willow is not distinct from *S. bonplandiana* H. B. K., with which it was synonymized by Dorn (1977).

Salix lasiandra Benth. Whiplash Willow; Caudate Willow. Shrubs or small trees (2) 3–6 (12) m tall; twigs glabrous or finely hairy when young; stipules often well developed, broadly rounded, gland-toothed, 2–10 mm long, eventually deciduous; petioles 3–15 (25) mm long, often bearing 2 or more glands on the upper side at or near the base of the blade; leaf blades (2.2) 5.5–11.5 cm long, (5) 12–21 mm wide, or to 26 cm long and 5.5 cm wide on juvenile shoots, lanceolate, elliptical or narrow elliptical, gradually long acuminate, closely serrulate, glabrous except in youth; aments coetaneous, on leafy peduncles 1–3.5 cm long, these with 3–5 leaves to 6.5 cm long and 1.2 cm wide, deciduous after the fruit matures; bracts deciduous by capsule dehiscence, 3–4 mm long, glabrous or nearly so on the upper 1/2, pubescent toward the base, entire or minutely toothed apically with a few rounded teeth, the staminate yellow, the pistillate pale greenish; staminate aments 1.8–4.5 cm long, 3–12 mm wide; stamens 3–8, usually 5, the filaments pilose; pistillate aments 2–7 cm long, 11–18 mm wide; capsules 4–8 mm long, glabrous, the stipe 1–2 mm long, the style 0.5–1 mm long, the stigmas to 0.5 mm long; $2n = 76$. Riparian and palustrine habitats at 1525 to 2625 m in Beaver, Box Elder, Cache, Carbon, Daggett, Davis, Duchesne, Emery, Garfield, Juab, Millard, Morgan, Piute, Rich, Salt Lake, San Juan, Sanpete, Sevier, Summit, Uintah, Utah, Wasatch, and Washington counties; Alaska and Yukon to California and New Mexico; 48 (xxi). Our plants belong to var. *caudata* (Nutt.) Sudw. [*S. pentandra* var. *caudata* Nutt.].

Salix lasiolepis Benth. Arroyo Willow. Shrubs or small trees mostly 4–6 m tall in our range; twigs yellowish olive to reddish, usually soft puberulent when young; stipules minute, soon deciduous or lacking, occasionally well developed on juvenile shoots; petioles 3–15 mm long; leaf blades 1.5–4.2 cm long, 6–13 mm wide, or to 11 cm long and 2.5 cm wide on vigorous shoots, usually oblanceolate or oblong, occasionally elliptical, entire, rarely minutely toothed, somewhat revolute, dark green and glabrous above, at maturity glaucous beneath, more or less coriaceous, rather densely soft pubescent on both sides when unfolding, more or less hairy beneath at maturity; aments precocious to subcoetaneous on bracteate or naked peduncles 3–6 mm long; bracts persistent, purple black, obovate, broadly rounded apically, densely villous, obscured by the hairs; staminate aments 2.2–4.5 cm long; stamens 2, the filaments glabrous; pistillate aments (1.8) 2.2–4.5 cm long, 10–12 mm wide; capsules 3–4 (5) mm long, glabrous, the stipe 1–2 cm long; style ca 0.5 mm long, the stigmas 0.2–0.3 mm long. Along streams, ditches, and washes at 1460 to 2330 m in Beaver, Iron, Juab, Kane, Millard, Sevier, Tooele, Utah, and Washington counties; British Columbia south to Baja California and east to Idaho, Texas, and northern Mexico; 40 (xx).

Salix lutea Nutt. Yellow Willow. [*S. lutea* var. *platyphylla* Ball, type from the La Sal Mts.; *S. lutea* var. *watsonii* (Bebb) Jepson]. Shrubs or rarely small trees, (2) 3–5 (9) m tall; branchlets slender, yellowish to reddish initially, often pale on one side and red purple on the other, glabrous; older twigs and smaller branches often grayish white; stipules small and inconspicuous or to 1 cm long or more and foliose on vigorous shoots, usually deciduous; petioles 1–11 (20) mm long; leaf blades (1) 2–5.5 cm long, (4) 9–21 mm wide or to 10.7 cm long and 3 cm wide on vigorous young shoots, elliptical or lanceolate,

rarely linear, entire or occasionally serrulate, glaucous beneath and usually glabrous at maturity, the lower surface glabrous or less pubescent than above; aments precocious or subprecocious; peduncles 1–7 cm long, naked or with 1–3 bracts; rachis and usually peduncle covered with a tangle of crisped-villous white hairs; bracts persistent, pubescent with crisped-villous, entangled hairs, sometimes only moderately pilose-woolly toward the base or near the apex ventrally, the dorsal side usually glabrous apically and often throughout as the crinkly hairs are readily deciduous; staminate aments 2–5 cm long, ca 1 cm wide; stamens 2, the filaments glabrous, the anthers yellowish or turning purple; pistillate aments 2–7 cm long, to 2 cm wide; capsules 3–6 mm long, glabrous, compactly to subcompactly disposed; the stipe (1) 1.3–3 (4) mm long; style 0.2–0.7 mm long, the stigmas often scarcely bilobed; $2n = 38$. Along streams and ditches in valleys and canyons and occasionally on mountains at 1340 to 2350 m in all Utah counties, except Carbon, Davis, Iron, Morgan, and Rich; New Mexico to California, north to Alberta; 160 (xxx). Our plants are closely related to and possibly a part of the *S. eriocephala* Michx. complex. They have been referred to as *S. rigida* Muhl., but Argus (1980) has placed *S. rigida* in synonymy under *S. eriocephala*. He did not place *S. lutea* in synonymy, but suggested that more study is needed. Until such a study is made, it seems best to retain the traditional name for our plants. *S. lutea* var. *ligulifolia* Ball (*S. ligulifolia* (Ball) Ball has been reported for southern Utah, but I have seen no material that fits the description exactly. Hence, the taxon is not treated formally herein.

Salix monticola Bebb ex Coulter. Shrubs 1.5–4 m tall; twigs yellowish when fresh, drying blackish, initially puberulent; stipules small and inconspicuous or foliose on vigorous shoots; petioles 5–10 (15) mm long; leaf blades 2–5 cm long, 0.7–1.5 mm wide or up to 11 cm long and 4 cm wide on juvenile shoots, mostly elliptical or elliptic-obovate, crenate-serrate or subentire, slightly pubescent when very young, more so above than beneath, usually glabrous when fully expanded, glaucous beneath; aments precocious or coetaneous, subsessile or on peduncles to 1 cm long, often subtended by bracts; floral bracts persistent, dark brown to blackish, pilose, or soon crisped-villous, the hairs exceeding the bract by ca 2 mm, more or less tangled; staminate aments 2–3.5 cm long, 1–1.5 cm wide; filaments 2, glabrous; pistillate aments 2–6 cm long, 1–1.5 cm wide; capsules 4–7 mm long, glabrous, subsessile, the stipe less than 1 mm long; style 0.7–1.8 mm long, longer than the stigmas; $2n = 38, 114$. Along streams and other wet places at 2195 to 3200 m in Beaver, Garfield, Piute, San Juan, Sanpete, Sevier, Uintah and Wasatch counties; Wyoming, Colorado, Arizona, and New Mexico; 12 (0). This willow is closely allied to both *S. boothii* and *S. lutea* and rather easily confused with them. Separation from *S. boothii* is often compounded by the lack of glaucescence on young leaves. More specimens are needed to gain a better understanding of this plant in the state. All materials examined to date could pass for broadleaved specimens of *S. boothii*.

Salix planifolia Pursh Plainleaf Willow. [*S. phyllicifolia* ssp. *planifolia* (Pursh) Hiit.]. Shrubs 0.5–1.5 (4) m tall; internodes often with epidermis exfoliating in translucent flakes or strips, branchlets typically glabrous and lustrous black or purplish black, rarely glaucous in part; stipules small and usually deciduous; petioles 2–10 mm long; leaf

blades 1.2–3.8 (8) cm long, 4–13 (30) mm wide, or to 5 (13) cm long and 2 (5) cm wide on juvenile twigs, elliptical or narrow elliptical, soon glabrous and dark green above, glaucous and glabrous to sparingly pubescent below, entire or rarely with minute teeth; aments precocious (at least the staminate) to coetaneous, nearly sessile or rarely on a naked peduncle to 0.5–1 cm long; bracts persistent, blackish, scattered to densely villose to pilose, the hairs usually exceeding the bract by ca 2 mm; staminate aments 10–25 mm long; stamens 2, the filaments glabrous, ca 6 mm long; pistillate aments 2–4 cm long, 1–1.5 cm wide; capsules 3–7 mm long, pubescent, at least near the base, or glabrate in age, the stipe mostly less than 1 mm long; style and stigmas together more than 1.5 mm long. Streamside meadows, margins of lakes and ponds and other wet places at 2255 to 3660 m in Daggett, Duchesne, Garfield, Iron, Salt Lake, Sanpete, Sevier, Summit, Uintah, and Wasatch counties; circumboreal, south to California and New England; 40 (x). Our plants mostly fall well within the concept of var. *monica* (Bebb) Jepson [*S. monica* Bebb]. However, some taller plants having larger leaves at moderate elevations in the Uinta Mts. are apparently var. *planifolia*. The differences do not seem to be taxonomically significant.

Salix reticulata L. [*S. nivalis* Hook.; *S. nivalis* var. *saximontana* (Rydb.) Schneider]. Caespitose dwarf shrubs; stems creeping at or just below the ground surface, the slender aerial twigs rarely more than 2–3 cm long, usually prostrate; stipules minute and deciduous or none; petioles 1–8 (15) mm long; leaf blades 0.5–3 cm long, 0.3–2 cm wide, ovate, obovate, orbicular or occasionally broadly elliptical, entire, glabrous, green above, glaucous beneath, strongly reticulate veined; aments subcoetaneous, but mostly serotinous, on the ends of current shoots; bracts persistent, pale green or yellowish, sometimes with reddish tops, spatulate or obovate, glabrous or sparsely pubescent ventrally, especially toward the margin with short hairs that extend less than 1 mm beyond the bract; staminate aments 0.5–2 cm long, slender, the flowers loose and not concealing the puberulent rachis, on a slender glabrous peduncle ca 10–12 mm long; stamens 2; filaments 1.5–2 mm long, glabrous or pilose toward the base; anthers soon reddish or purple; pistillate aments 5–15 mm long, 5–8 mm wide, on a slender peduncles 1–2 cm long; capsules 1.5–3 mm long, pubescent, or glabrous in age, sessile or the stipe to 0.5 mm long; style obsolete or to 0.2 mm long, the stigmas 0.1–0.2 mm long; $2n = 38$. Open rocky slopes and ridges and alpine tundra at 2985 to 3965 m in Daggett, Duchesne, Grand, Salt Lake, San Juan, Summit, and Utah counties; circumboreal, south to California, New Mexico, Utah, and Colorado; 33 (0). Most of our plants are referable to var. *saximontana* (Rydb.) Kelso, which may not be distinct from var. *reticulata*. A few specimens approach var. *nivalis* (Hook.) Anderss. The diagnostic features seem to be poorly correlated in our plants.

Salix scouleriana Barratt in Hook. Scouler Willow. Shrubs or small trees 3–7 m tall; stipules small and inconspicuous or large and leaflike on juvenile shoots, finally deciduous; petioles 2–11 mm long; leaf blades 2–6 cm long, (0.8) 1–3 cm wide or to 11.5 cm long and 4 cm wide on vigorous shoots, obovate to oblanceolate, rounded to acute or sometimes acuminate at the apex, entire or finely serrate, or often coarsely crenate or serrate on larger leaves of innovations, densely crisp-hairy or

sericeous especially beneath initially, the mature ones dark green and glabrous above, except sometimes puberulent above the midrib, the lower side strongly glaucous, sparsely puberulent with translucent whitish or rusty minute hairs, or occasionally densely felty-villous; bracts of aments blackish or purplish-black nearly throughout, reddish or pale at the very base, sericeous-pilose on both sides, the hairs at the apex usually exceeding the bract by 1.5–2 mm; staminate aments 15–35 mm long, nearly as wide as long, strictly precocious, nearly sessile or on thickened bracteate peduncles to 7 mm long, the bracts 3–4 mm long, about 2 mm wide, pale green to whitish, sericeous; stamens 2, the filaments to 11 mm long at maturity, glabrous; pistillate aments 2–6 cm long, 13–17 mm wide, precocious or subcoetaneous, nearly sessile or on thickened bracteate peduncles to 17 mm long, the bracts to 7 mm long and 2 mm wide, not at all leaflike; capsules (5) 6–9 mm long, pubescent, subsessile or with a stipe 1–3 mm long; style 0.3–0.4 mm long, rarely shorter, the stigmas 0.5–1 mm long; $2n = 76, 114?$ Around springs, along streams, and on well-drained slopes in aspen and conifer woods at 1400 to 3355 m in all Utah counties except Beaver, Emery, Kane, Morgan, Piute, and Wayne; Alaska and Yukon to California, Arizona and New Mexico; 69 (xi). Scouler willow is most closely allied to *S. humilus* Marshall and to *S. discolor* Muhl. of eastern U. S. and Canada. The staminate phase of *S. discolor* might be cultivated in the state as pussy willow, but all specimens of pussy willow examined prior to this publication belong to the Eurasian *S. cinerea*. Occasionally specimens of Scouler willow have leaves densely pubescent beneath. Arnov et al. (1980) attributed this to hybridization with *S. drummondiana*.

Salix wolfii Bebb in Rothr. Wolf Willow. Shrubs 0.6–1.5 (2) m tall; twigs yellow to orange when young, chestnut brown in age, those of the season thinly villous-puberulent; stipules 1–5 mm long, often glandular-serrulate, eventually deciduous; petioles 2–10 mm long; leaf blades 1.2–4.2 cm long, 5–13 mm wide or to 5.3 cm long and 16 mm wide towards the ends of juvenile twigs, narrow elliptical, linear-lanceolate or occasionally oblanceolate, entire, sparsely to densely sericeous-tomentose on both sides, even in age, or finally glabrate; aments coetaneous or subsertotinous, subsessile or on bracteate peduncles to 1 cm long; floral bracts persistent, blackish or pale at the very base, pilose-sericeous on both sides, the hairs exceeding the bract by ca 1 mm; staminate catkins 10–15 mm long, 8–10 mm wide; stamens 2, the filaments about 3–4 mm long, glabrous; pistillate aments 8–20 (30) mm long, 6–10 mm wide; capsules 3–5 mm long, glabrous or rarely pubescent, the stipe less than 1 mm long; style ca 0.5 mm long, the stigmas about 0.2 mm long; $2n = 38$. Along streams and lakes and ponds margins at 2470 to 3290 m in Cache, Daggett, Duchesne, Emery, Summit, Uintah, and Wasatch counties; Oregon to Montana, south to Nevada, and Colorado; 44 (ix). Our plants belong var. *wolfii*. One specimen (B. Maguire, D. Hobson, & R. Maguire 14104 UT) from White Pine Lake, Cache County has pubescent capsules and leaves that are larger than others from the state. This specimen is like *S. wolfii* var. *idahoensis* Ball, which is known from well north and west of Utah. Other specimens from the vicinity of Whitepine Lake and other places in the Bear River Range have glabrous capsules, and I prefer not to list var. *idahoensis* for the state based on this one specimen. The

plants from the Bear River Range with pistillate aments 15–30 mm long do, however, seem intermediate toward var. *idahoensis* when compared to those of the Uinta Mts. with pistillate aments 8–15 mm long. The specimen with pubescent capsules and somewhat larger leaves is probably the basis of reports of *S. commutata* Bebb for Utah.

SANTALACEAE R. Br.

Sandalwood Family

Perennial parasitic herbs; leaves alternate, short-petiole to nearly or quite sessile, entire, simple, green; flowers perfect, at least some, borne in terminal or axillary corymbose clusters, white to greenish or pinkish; sepals usually 5; petals lacking; stamens as many as the sepals and opposite them, inserted on a fleshy disk; pistil 1, the ovary inferior, 1-loculed; style 1; fruit drupaceous; $x = 5, 6, 7, 12, 13+$.

Comandra Nutt.

Glabrous perennials; stems striate; leaves alternate, sessile; flowers small, perfect; sepals usually 5; ovary 1-loculed; stigma capitate; fruit a drupe.

Comandra umbellata (L.) Nutt. Bastard Toadflax. [*Thesium umbellatum* L.; *C. linearis* Rydb., type from Green River]. Stems erect, 0.8–3.4 dm tall, simple or branched; leaves 1–3.3 cm long, 1–10 mm wide, linear to narrowly elliptic or lanceolate, pale green and glaucous; sepals oblong to lanceolate, 2.5–5 mm long, persistent; fruit 6–9 mm thick, globose to ovoid, somewhat fleshy or dry when old, purplish to brown; $n = 26$. This species is present in numerous plant communities from 850 to 2780 m in most if not all Utah counties; widely distributed in North America; 110 (v). Our material belongs to var. *pallida* (A. DC.) Jones [*C. pallida* A. DC. in DC.].

SAPINDACEAE A. L. Juss.

Soapberry Family

Trees or large shrubs; leaves alternate, pinnately or bipinnately compound; flowers perfect or imperfect, irregular, borne in panicles; sepals 4 or 5, distinct or connate at the base; petals 4 or 5, inserted below an annular fleshy disk, with 2 upturned appendages at the base of the blade; disk borne between the petals and the stamens; stamens 8 or fewer, the filaments distinct; pistil 1, the ovary superior, 3-loculed, with 2 ovules per locule, the placentation axile; style 1; fruit a loculicidal capsule; $x = 10–16$.

Koelreuteria Laxmann

Showy ornamental umbrella shaped trees; leaves large, odd-pinnate to bipinnate, the leaflets serrate; flowers yellow, borne in summer; capsules bladderly, often persisting through winter.

Koelreuteria paniculata Laxmann Goldenrain Tree. Trees or shrubs, mainly 2.5–7 m tall, with the canopy spreading; bark fissured, grayish; leaves 10–40 cm long, with (3) 5–15 leaflets, these irregularly ovate to oblong or lance-ovate, coarsely and irregularly lobed to doubly crenate-serrate, acute to acuminate apically, rounded to obtuse basally, green and glabrous above, paler and usually hairy along the veins beneath; flowers numerous, mainly

8–12 mm long, bright yellow, borne in July and August; capsules mainly 4–6 cm long, the valves soon separating at the margins, cordate to ovate in outline, bladdery inflated, often persisting through the autumn and winter. Commonly grown ornamental tree, especially of streets and byways in the major population centers, producing seeds abundantly, escaping and tending to be weedy, mainly below 1525 m in Carbon, Grand, and Utah counties; introduced from Asia; 17 (i).

SAURURACEAE Meyer

Lizard-tail Family

Erect more or less aromatic perennial herbs from elongate stolons; Leaves mostly basal, alternate, simple, usually petioled; stipules adnate to the petiole; flowers perfect, in congested spikes or lax racemes subtended by conspicuous petaloid bracts; perianth lacking; stamens 6–8, free or adnate to ovary base, or epigynous; anthers 2–loculed; pistils 3 or 4, distinct or united basally; seeds several; x = 11, 12(?)

Anemopsis H. & A.

Colonial herbs; stems nodose, scapellike; leaves mostly basal, minutely punctate; spike conic, with a persistent white involucre of several bracts; ovary sunk in axis of spike; stigmas 3–4; fruit a capsule.

Anemopsis californica (Nutt.) H. & A. Yerba Mansa. [*Anemia californica* Nutt.]. Plants 1–5 dm tall, pubescent, with a broadly clasping ovate leaf above the middle; flowering stems arising from thick simple caudices; basal leaves 3.5–5.0 cm long or more, the blades elliptic-oblong, the petioles as long or longer than the blades, entire, cordate basally; spikes 1.5–4 cm long; involucre bracts at base of inflorescence 1–3 cm long, white or suffused with red, each flower subtended by a white obovate clawed bract; ovules 6–10 on each placenta; n = 22. Wet, marshy, usually saline areas adjacent to seeps, springs, and streams in Utah and Washington counties; California to Colorado and Texas, south to Mexico; 16 (iii).

SAXIFRAGACEAE A. L. Juss.

Saxifrage Family

Perennial herbs or shrubs; leaves basal, alternate, or opposite, with or without stipules; flowers perfect, regular, solitary to many and racemose or cymose; sepals, petals, and stamens borne on a floral cup or hypanthium; hypanthium saucer- or cup-shaped or tubular, sometimes small or essentially lacking; sepals 4 or 5, often appearing as lobes of the hypanthium, petallike in *Ribes*; petals 4 or 5, distinct, alternate with the sepals; stamens (4), 5, 8, 10, or more; pistil 1 (the carpels sometimes almost distinct), the ovary superior, partly inferior, or inferior; style 1 or more; fruit a capsule, follicle, or berry; x = 6–15, 17, 30. This is an extremely variable family. As treated herein it includes: Grossulariaceae (*Ribes*), Hydrangiaceae (*Philadelphus*), and Parnassiaceae (*Parnassia*).

- 1. Plants shrubs, woody well above ground level 2
- Plants herbaceous, sometimes with woody caudices at or below ground level 7

- 2(1). Leaves alternate, lobed and toothed; petals shorter than the sepals, not over 4 mm long, often similar in texture and color to the sepals; ovary inferior; fruit a berry *Ribes*
- Leaves opposite, entire or toothed; petals longer than the sepals, over 4 mm long (except in *Fendlerella*), of contrasting texture and color from the sepals; ovary not completely inferior; fruit a capsule 3
- 3(2). Stamens more than 10; petals 4 (or sometimes more in cultivated plants) *Philadelphus*
- Stamens 8 or 10, petals 4 or 5 4
- 4(3). Leaves toothed, with petioles 2–10 mm long, or rarely sessile; petals 5, 4–13 mm long, stamens 10 5
- Leaves entire, sessile, or the petiole 1–2 mm long, petals 4 and 13–20 mm long, or 5 and only 2–4 mm long; stamens 8 or 10 6
- 5(4). Flowers rather numerous, paniculate; ovaries and sometimes the petals stellate-pubescent; filaments often petaloid and bifid apically; plants introduced, cultivated *Deutzia scabra* Thunb.
- Flowers few, in small cymes; ovaries sericeous-canescenscent; petals glabrous; filaments hardly petaloid, sometimes dilated basally, not bifid apically; leaves sericeous-canescenscent; plants indigenous *Jamesia*
- 6(4). Petals 4, 13–20 mm long; stamens 8; styles 4. leaf blades 9–30 mm long, the lower surface without pustulate hairs; shrubs ca 1–2 m tall, of Grand and San Juan counties *Fendlera*
- Petals 5, 2–4 mm long; stamens 10, styles 3; leaf blades 4–12 mm long, the lower surface sometimes with pustulate hairs; shrubs to ca 1 m tall, of other distribution *Fendlerella*
- 7(1). Leaves all basal, distinctly and often abruptly petioled, not lobed more than 1/2 the distance to the midrib; flowers on naked scapes or these with a solitary bract; stamens 5 or 10 8
- Leaves not all basal, or sometimes so in depauperate plants, but then the blades not distinctly petioled or else lobed more than 1/2 the distance to the midrib; flowers often not scape; stamens 10 12
- 8(7). Flowers solitary and terminal on long scapes with a solitary bract; petals 6–14 mm long; leaves not toothed, sometimes cordate, otherwise not lobed; fertile stamens 5 *Parnassia*
- Flowers not solitary; scapes without bracts; petals 2–4 mm long; leaves either toothed or lobed or both and sometimes cordate as well, fertile stamens various 9
- 9(8). Leaves peltate, the blades 5–40 cm wide, cupped in the center; petioles and scapes to 10 dm long or more *Peltiphyllum*
- Leaves not peltate, the blades to 10 cm wide, not cupped in the center; petioles not over 2.5 dm long; scapes less than 7.5 dm long 10
- 10(9). Flowers in simple, very narrow, elongate, spikelike, ebracteate racemes; petals parted or divided into filiform segments; leaves toothed and lobed *Mitella*
- Flowers not in spikelike racemes or, if so, bracteate; petals entire 11
- 11(10). Leaves crenate-toothed and lobed; stamens 5; plants often of dry rocky places *Heuchera*
- Leaves subtentire, crenate, or very coarsely dentate but not lobed, stamens 10; plants mostly of dry meadows or wet places *Saxifraga*
- 12(7). Leaves parted or divided to the midrib, the basal ones abruptly constricted into slender petioles 0.5–10 cm long; petals deeply lobed or cleft *Lithophragma*

- Leaves entire, toothed, or lobed, but not divided more than 1/2 the distance to the midrib or, if so, sessile or nearly so; petals entire 13
- 13(12). Leaf blades of basal and stem leaves crenate-toothed (the teeth more than 10), also shallowly lobed, reniform or orbicular; petals pink to deep red; floral cup 4–7 mm long, often reddish or purplish; plants of the Bear River Range *Boykinia*
- Leaf blades entire, toothed, or lobed, (the teeth or lobes 8 or fewer); petals yellow or white, sometimes with purple markings; floral cup 1–3 mm long, greenish or purplish; plants variously distributed . . . *Saxifraga*

Boykinia Nutt.

Caulесcent, glandular herbs from woody branched caudices and thick scaly rootstocks; leaves petioled, basal and alternate, with membranous stipules; flowers perfect, regular, borne in compact, few-flowered, bracteate cymes; hypanthium calyxlike; sepals 5; petals 5; stamens 10; ovary ca 1/2 inferior; styles 2, free or connate below; fruit a capsule; seeds several.

Boykinia jamesii (Torr.) Engler James Saxifrage. [*Saxifraga jamesii* Torr.; *Telesonix jamesii* (Torr.) Raf.]. Perennial caulescent herbs, 6.5–20 cm tall; caudices clothed with broad marcescent leaf bases; stems hirsute and stipitate-glandular; petioles 1.5–5.5 cm long, glandular; leaf blades 12–60 mm wide and about as long, reniform or orbicular, truncate or cordate at the base, crenate and more or less shallowly lobed; bracts similar to the upper leaves but smaller and less toothed, the upper ones usually entire; hypanthium 4–7 mm long, campanulate, glandular to pilose-glandular, often reddish or purplish; sepals 3–4.5 mm long, glandular; petals subequal to the sepals or shorter, pinkish or reddish. Crevices, often in limestone, at 2680 to 2990 m in the Bear River Range, Cache County; Idaho and Montana to Colorado, and southern Nevada (Spring Mts.); 6 (0). Our plants are referable to var. *heucheriformis* (Rydb.) Engler [*Therefon heucheriforme* Rydb.].

Fendlera Engelm. & Gray

Shrubs with opposite, nearly sessile; leaves without stipules, deciduous; flowers perfect, showy; hypanthium calyxlike; sepals 4; petals 4; stamens 8, the filaments flattened, lobed at the apex; ovary inferior at the base, 4-loculed; styles 4; stigmas minute; fruit a capsule, over 1/2 superior, septicial; seeds few in each locule.

Fendlera rupicola Gray Fendlerbush. [*F. tomentosa* Thornb.]. Much branched shrubs 1–2 m tall; bark of twigs longitudinally ridged and grooved, reddish or straw colored, turning gray; leaves opposite or appearing fasciculate-opposite, 9–30 mm long, 2–7 mm wide, lance-linear, linear, elliptic, or less often ovate, entire, sometimes slightly revolute, sparingly strigose on both sides, the midrib prominent, grooved above, ridged beneath; flowers solitary or 2–3 together at the ends of short branches; hypanthium 2–3 mm long; sepals 3–5 mm long, to 8 mm in fruit, persistent, strigose beneath, tomentose-villous above; petals 13–20 mm long, constricted to a narrow claw, the blade to 11 mm wide, white; staminal filaments ca 6–8 mm long, to 2 mm wide at the base, 2-lobed apically, the lobes 2–3 mm long, the anther shorter or longer than the lobes; styles 4, appearing as 2 at anthesis, glabrous or with multicellular hairs; capsules 8–15 mm long. Blackbrush, mixed desert shrub, and pinyon-juni-

per communities at 1370 to 1710 m in Grand and San Juan counties; Colorado and Arizona to Texas; 11 (0).

Fendlerella Heller

Shrubs with opposite, sessile, or nearly sessile leaves, lacking stipules; flowers perfect, in small compound cymes; hypanthium calyxlike; sepals 5; petals 5; stamens 10, the filaments dilated below the narrow apex; ovary ca 1/2 inferior, 3-loculed; styles 3; fruit a septicial capsule; seeds 1 in each locule.

Fendlerella utahensis (Wats.) Heller Utah Fendlerella. [*Whipplea utahensis* Wats., type from near Kanab, Kane County]. Sprawling or ascending, much branched shrubs to 1 m tall; bark of twigs strigose, whitish, exfoliating in milky or translucent strips or flakes; leaves 4–12 mm long, 1–6 mm wide, linear-oblongate, linear, elliptic, or less commonly ovate, entire, slightly revolute, strigose, the hairs sometimes pustulate, especially on the lower surface; flowers in small compound cymes; hypanthium inconspicuous at first, finally to 2 mm long in fruit, turbinate-campanulate; sepals 1–1.5 mm long; petals 2–4 mm long, white; staminal filaments dilated and petaloid just below the narrow apex, white; styles ca 1.5–2 mm long; capsules 3–4 mm long. Sagebrush, pinyon, juniper, and mountain brush communities, mostly on sandstone and sandy soil, at 1480 to 2745 m in Garfield, Kane, Millard, Uintah, Utah, and Washington counties; northwestern Colorado to Arizona and west to California; 17 (0).

Heuchera L.

Perennial scapose herbs from scaly, somewhat woody branched caudices or rootstocks; leaves basal, stipulate; flowers paniculate or racemose or nearly spicate, bracteate, perfect, regular; hypanthium calyxlike; sepals 5; petals 5, small, entire, usually clawed; stamens 5; ovary partly inferior, 1-loculed; styles 2; fruit a capsule, opening between the 2 more or less divergent styler beaks; seeds many.

Rosendahl, C. O., F. K. Butters, and O. Lakela. 1936. A monograph on the genus *Heuchera*. Minnesota Stud. Pl. Sci. 2: 1–180.

- 1. Stamens shorter than the sepals; petals ca 1–2 mm long; sepals not reddish or pinkish; pedicels 1–2 mm long or nearly obsolete *H. parvifolia*
- Stamens exerted 1–4 mm beyond the sepals; petals 3–4 mm long; sepals often pinkish or reddish; pedicels (1) 2–7 mm long *H. rubescens*

Heuchera parvifolia Nutt. in T. & G. Littleleaf Alumroot. [*H. utahensis* Rydb., type from Salt Lake County.]. Scapose glandular herbs, 12–71 cm tall, the caudex branches clothed with marcescent leaf bases; scapes stipitate-glandular; petioles 1–13 cm long, with stipules glandular-puberulent or glabrate; leaf blades (1) 1.5–6.5 cm wide, wider than long, orbicular or reniform, cordate, palmately lobed with 3–7 primary lobes, these crenate and usually again shallowly lobed, commonly with scattered stipitate glands below, glabrate above and sometimes throughout; flowers in open or congested panicles or sometimes racemose or spicate, bracteate, the bracts toothed or fimbriate; inflorescence 2–35 mm long; pedicels obsolete or 1–2 mm long; hypanthium 2.5–3.5 mm long or to 5 mm in fruit; sepals 0.5–1 mm long, sometimes yellowish; petals ca 2 mm long, white; stamens shorter than the sepals; capsules 4–7 mm long. Pinyon,

juniper, sagebrush, mountain brush, ponderosa pine, aspen, grass-forb, Douglas fir, and white fir communities, often in rocky places, at 1675 to 3200 m in all Utah counties, except Kane, Morgan, and Sevier; Alberta to New Mexico and west to Idaho and Nevada; 96 (v). Our plants are referable to var. *utahensis* (Rydb.) Garrett.

Heuchera rubescens Torr. in Stansbury Red Alum-root. Scapose perennial herbs, 5–30 (53) cm tall, the stem bases clothed with marcescent leaf bases; herbage glabrous to glandular-puberulent or hirsute; petioles 1–6 (8) cm long, glabrate, the stipular bases often fimbriate; leaf blades 0.7–4.3 cm wide, slightly longer than wide to wider than long, orbicular to broadly ovate, cordate or truncate, palmately lobed, the primary lobes sometimes again shallowly lobed, dentate or crenate, hirsute-ciliate; flowers in racemose or spicate panicles, the inflorescence 3–18 (31) cm long; pedicels (1) 2–7 mm long; hypanthium 2–4 mm long, campanulate, pinkish, lavender, or whitish; sepals 1–2.5 mm long, or to 3.5 mm long in fruit, mostly pinkish or lavender; petals 3–4 mm long, white; stamens exerted ca 1–4 mm beyond the sepals; capsules ca 4–6 mm long. There are two more or less morphologically and geographically correlated varieties.

- 1. Petioles hirsute, the spreading hairs to 2 mm long *H. rubescens* var. *versicolor*
- Petioles merely puberulent *H. rubescens* var. *rubescens*

Var. *rubescens* [*H. versicolor* Greene f. *pumila* Rosend, Butters, & Lakela, type from Utah?]. Crevices of rock outcrops, and other rocky places, in pinyon, juniper, sagebrush, mountain brush, ponderosa pine, limber pine, bristlecone pine, aspen, fir, and spruce communities at (1525) 1825 to 3355 m in Beaver, Box Elder, Cache, Garfield, Grand, Millard, Piute, Salt Lake, Sanpete, Tooele (type from Stansbury Island), Utah, Wayne, and Weber counties; Oregon and Idaho to California, east to Arizona, and Colorado; 59 (viii).

Var. *versicolor* (Greene) M. G. Stewart [*H. versicolor* Greene]. Pinyon, juniper, mountain brush, and spruce-fir communities, often on rock outcrops, at 1370 to 2590 m in Garfield, Iron, Kane, San Juan, and Washington counties; Arizona, western New Mexico, and southeastern Nevada; 16 (0). In addition to the hirsute petioles, var. *versicolor* is reported to have filaments not noticeably flattened toward the base and attached at or slightly below the point of attachment of the petals. These features appear to be weakly, if at all, correlated in Utah materials. Our plants might represent intermediates between var. *rubescens* and the more southern var. *versicolor*, or perhaps the distinction is so tenuous as to be of little taxonomic value.

Jamesia T. & G.

Shrubs; leaves opposite, mostly petioled, without stipules; flowers perfect, regular, cymose; hypanthium calyx-like; sepals 5; petals 5, white; stamens 10; filaments narrow; ovary ca 1/2 inferior, partly 3- to 5-loculed at first, finally 1-loculed; styles 3–5, distinct; fruit a capsule, ca 1/3 inferior, with 3–5 valves, these with slender beaks; seeds numerous.

Jamesia americana T. & G. Cliff Jamesia. [*Edwinia americana* (T. & G.) Heller; *E. macrocalyx* Small, type from American Fork Canyon]. Shrubs 3–15 dm tall; fo-

liage and young twigs pubescent with multicellular hairs; bark of twigs reddish or whitish, exfoliating in long whitish or translucent strips; petioles 2–10 mm long, canescent or sericeous-tomentose, sometimes lacking; leaf blades 7–40 mm long, (3) 6–32 mm wide, ovate or elliptic, serrate or dentate, rarely nearly entire, green and sparingly strigose on the upper surface, sericeous-canescenscent below; flowers few in small cymes; hypanthium 1–3 mm long in fruit, sericeous-canescenscent; sepals 3–4 mm long in flower, 5–6 mm long in fruit; petals 5–11 mm long, white, clawed, somewhat pubescent subapically; filaments gradually dilated basally; capsules 4–5 mm long. Mountain brush and spruce-fir communities, mostly on cliffs and other rocky places at 1220 to 3200 m in Juab, Millard, Salt Lake, Utah, and Washington counties; Wyoming to New Mexico, Nevada, and California; 25 (0).

Lithophragma Nutt.

Small, usually stipitate-glandular herbs from fibrous roots and very slender rhizomes, bearing ricelike bulblets; leaves basal and alternate, variously palmately cleft or divided; flowers in racemes, perfect, regular; hypanthium calyxlike; sepals 5; petals 5, variously palmately lobed or cleft, with a narrow claw and expanded blade; stamens 10; ovary 1-loculed; styles 3; fruit a 3-valved capsule; seeds numerous.

Taylor, R. L. 1965. The genus *Lithophragma* (Saxifragaceae). Univ. California Publ. Bot. 37: 1–122.

- 1. Plants with few to several purple bulblets in the inflorescence and usually in axils of the upper leaves; lower pedicels 1.5–3 times longer than the hypanthium *L. glabra*
- Plants without bulblets in inflorescence or in leaf axils; lower pedicels ca 0.5–1.5 times longer than hypanthium 2
- 2(1). Petals mainly 3-lobed, 5–9 mm long, excluding the claw, white; ovary inferior or nearly so; plants of north-central mountains *L. parviflora*
- Petals 5- to 7-lobed, 3–6 mm long excluding the claw, pinkish or white, ovary ca 1/2 inferior or less; plants of western and southern Utah *L. tenella*

Lithophragma glabra Nutt. in T. & G. Fringecup. [*L. bulbifera* Rydb.; *L. glabra* var. *bulbifera* Jepson]. Plants 5–35 cm tall, glandular-pubescent, the gland-tips mostly dark purple; petioles of lower leaves 1.2–4.8 cm long; leaf blades 5–24 mm long, 8–48 mm wide, orbicular or reniform in outline, parted or divided and trifoliate or palmate, the main divisions again lobed to parted, reduced above and often with purple bulblets in the axils; inflorescence simple or branched, purple, 1–5 (13) cm long, with (1) 2–4 normal flowers and others reduced to bulblets; pedicels 2–10 mm long; hypanthium 2–5 mm long, campanulate; sepals ca 1 mm long; petals pinkish, white, or pale lavender, the claw 1–2 mm long, the blades 4–7 mm long, 3- to 5-lobed or parted; ovary ca 1/4 inferior; seeds muricate. Aspen, oak-maple, sagebrush, pinyon-juniper, mountain brush, riparian, ponderosa pine, spruce, fir, lodgepole pine, and rarely in greasewood communities at 1310 to 3050 m in Beaver, Box Elder, Cache, Carbon, Daggett, Davis, Duchesne, Grand, Juab, Iron, Millard, Morgan, Rich, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, Washington, and Weber counties; British Columbia to California, east

to Alberta, the Dakotas, and Colorado; 82 (vi). Our plants are referable to var. *ramulosa* (Suksd.) Goodrich [*L. tenella* var. *ramulosa* Suksd.]

Lithophragma parviflora (Hook.) Nutt. in T. & G. Smallflower Woodlandstar. [*Tellima parviflora* Hook.]. Perennial herbs from fibrous roots and slender rootstocks bearing small bulblets, 9–47 cm tall, pubescent with mostly glandular hairs, rather densely so in the inflorescence; petioles of basal leaves 2–11 cm long; leaf blades 9–35 mm long, 11–50 mm wide, orbicular or reniform in outline, 3-parted or 3-foliolate, with the divisions again lobed, cleft, or parted; cauline leaves similar to the basal ones but sometimes reduced upwards; racemes congested, 1–2 (3) cm long in flower, to 7.5 cm long in fruit, 4– to 7-flowered, the pedicels 1–5 mm long in flower, to 8 mm long in fruit; hypanthium (3.5) 4–5 mm long in flower, to 6 mm long in fruit, wedge-shaped or funnellform basally and gradually tapered to the pedicel; sepals 0.7–1.4 mm long; petals white, clawed, the claws 2–3.5 mm long; ovary inferior or nearly so; seeds smooth. Oak-maple, sagebrush, aspen, riparian, meadow, lodgepole pine, spruce, and fir, communities at 1450 to 2590 (3050) m in Box Elder, Cache, Carbon, Davis, Emery, Juab, Millard, Morgan, Salt Lake, Sanpete, Summit, Tooele, Uintah, Utah, Wasatch, and Weber counties; British Columbia to northern California, east to Alberta, South Dakota, and Colorado; 88 (i).

Lithophragma tenella Nutt. in T. & G. Slender Woodlandstar. [*L. australis* Rydb.]. Plants 10–43 cm tall, pubescent, the hairs mostly glandular, the gland-tips whitish or pale purplish; petioles 0.5–4.5 cm long; leaf blades 4–25 mm long, (5) 9–30 mm wide, orbicular or ovate, parted or 3-foliolate, the main divisions again lobed or parted; racemes ca 1–3 cm long in flower, to 15 cm long in fruit, with 4–13 flowers; pedicels 2–7 mm long; hypanthium campanulate, 2–3 mm long; sepals ca 1 mm long; petals pinkish or whitish, the claws 1–2 mm long, the blades 3–6 mm long, with 5–7 lobes; ovary ca 1/2 inferior; seeds smooth. Pinyon-juniper, sagebrush, mountain brush, ponderosa pine, aspen, riparian, meadow, and spruce communities at (1310) 2075 to 3050 m in Beaver, Box Elder, Cache, Garfield, Grand, Iron, Juab, Kane, Piute, Salt Lake, San Juan, Sevier, Tooele, and Washington counties; western Washington south to Arizona, east to Montana and New Mexico; 50 (ii).

Mitella L.

Scapose glandular-puberulent herbs from rhizomes; leaves basal, palmately lobed, cordate; flowers in racemes, perfect, regular; hypanthium calyxlike; sepals 5; petals 5, pinnately or palmately lobed, small and soon withered; stamens 5; ovary ca 1/2 inferior, 1-loculed; style 1; fruit a capsule, dehiscent by ventral suture and appearing almost circumscissile; seeds numerous.

1. Petals with (2) 3 lobes; racemes secund, pedicels lacking or to 3 mm long; sepals whitish or purplish; leaf margin often ciliate *M. stauropetala*
- Petals pinnately divided; racemes not especially secund; pedicels mainly 2–8 mm long; sepals greenish; leaf margin seldom if ever ciliate *M. pentandra*

Mitella pentandra Hook. Fivestar Miterwort. Scapose perennial herbs, 10–35 cm tall; petioles 1.8–10 cm long, glabrous or sparingly pilose; leaf blades 1.5–5.7 cm wide, ovate to orbicular, cordate basally, with 5–9 shallow

lobes, the lobes dentate, the teeth mucronate, seldom if at all ciliate, glabrous, or more often hirsute to pilose; scapes glandular above; racemes 3–16 cm long, 4– to 20-flowered; pedicels 2–8 mm long, shorter above; hypanthium saucer-shaped to campanulate, 1–2.5 mm long; sepals less than 1 mm long; petals 2–3 mm long, greenish, pinnately dissected into 4–10 filiform segments; capsules ca 2 mm long. Meadows and other moist sites, often where shaded, in aspen, conifer, and willow communities at 1740 to 3650 m in Box Elder, Daggett, Davis, Duchesne, Emery, Salt Lake, Sanpete, Summit, Uintah, Utah and Wasatch counties; Alaska south to northern California, east to Alberta and Colorado; 33 (iii).

Mitella stauropetala Piper Smallflower Miterwort. Perennial scapose herbs 15–50 cm tall or more; petioles 1.2–13 cm long, glandular and sometimes hirsute; leaf blades 1–7.8 cm wide and about as long, orbicular or broadly ovate, cordate, 5– to 9-lobed, the lobes crenate, the margin ciliate, glabrous or minutely glandular and sparingly hirsute; scapes glandular to the base; racemes 4.5–18 (24) cm long, mostly strongly secund, 7– to 24-flowered, mainly with 1 flower per node; pedicels obsolete or to 2 or 3 mm long; hypanthium ca 1–2 mm long, cup-shaped; sepals ca 1.5 mm long, oblong, whitish or purplish; petals 2–4 mm long, 3 (2)-lobed or rarely entire, the lobes filiform; capsules ca 2 mm long. Mountain brush, aspen, ponderosa pine, fir, and spruce communities at 1615 to 3050 m in Box Elder, Cache, Carbon, Duchesne, Emery, Juab, Millard, Salt Lake, San Juan, Sanpete, Summit, Tooele, Utah, Wasatch, and Weber counties; eastern Washington and Oregon to Montana, south to Colorado; 65 (ii). Our plants are referable to var. *stenopetala* (Piper) Rosend. [*M. stenopetala* Piper, type from the Wasatch Mts.]

Parnassia L.

Scapose perennial glabrous herbs from short rootstocks; leaves basal, entire; scapes with a solitary, entire bract or bractlike leaf; flowers solitary and terminal, perfect, regular; hypanthium calyxlike, sometimes nearly obsolete; sepals 5; petals 5, white; stamens 5, alternating with clusters of gland-tipped staminodia; ovary superior or slightly inferior, 1-loculed; styles lacking; stigmas 3 or 4, sessile; fruit a capsule, loculicidal at the apex; seeds numerous.

1. Petals fringed below the middle; petioles (1.5) 3–16 cm long; leaf blades cordate to truncate basally, 12–45 mm wide, broader than long; bract mostly borne above the middle of the scape *P. fimbriata*
- Petals entire; petioles 0.7–4 cm long; leaf blades cuneate or obtuse basally (rarely truncate or cordate), 5–20 mm wide, mostly longer than broad; bract borne below the middle of the scape *P. palustris*

Parnassia fimbriata Koenig Fringed Grass-of-Parnassus. Perennial, scapose glabrous herbs, 14–43 cm tall; petioles (1.5) 3–16 cm long; leaf blades 12–45 mm wide, about as long, reniform, orbicular, or broadly ovate, cordate or truncate at the base; bracts of scapes ovate to orbicular, 7–17 mm long, mostly clasping, borne at or above the middle of the scape; flowers solitary and terminal; hypanthium nearly obsolete; sepals 4–7 mm long, 2–4 mm wide, sometimes slightly fimbriate; petals 8–15 mm long, including the narrow clawlike base, strongly fimbriate below the middle; staminodia thickened and

scalelike, flared above the middle and usually with a central subterminal larger lobe and 7-9 marginal ones; capsules to 1 cm long. Moist habitats in aspen, spruce, fir, and mountain brush communities at 2010 to 3355 m in Cache, Duchesne, Salt Lake, San Juan, Summit, and Utah counties; Alaska south to California, east to Alberta and New Mexico; 45 (v). Our plants are referable to var. *fimbriata*.

Parnassia palustris L. Perennial scapose glabrous herbs, 8-44 cm tall; petioles 0.7-4 cm long; leaf blades 7-27 mm long, 5-20 mm wide, ovate to nearly orbicular, mostly cuneate or obtuse at the base, rarely truncate; bracts of scapes linear to ovate, (3) 5-25 mm long, sessile and sometimes clasping, borne mostly below the middle of the scape; flowers solitary and terminal; hypanthium ca 2 mm long; sepals 3-10 mm long; petals 6-14 mm long, including the narrow claw, entire, white; staminodia with a thickened scalelike base, flared upwards and divided into (5) 7-11 (or many) slender filamentous segments, these terminating in capitate knobs; capsule ovoid 8-10 (12) mm long. Wet meadows and other moist sites, sometimes in woods, at (1375) 1830 to 3415 m in Beaver, Box Elder, Cache, Duchesne, Emery, Garfield, Grand, Iron, Juab, Kane, Piute, Sanpete, Summit, Uintah, Utah, Washington, and Wayne counties; arctic America east to Quebec and south to Colorado, Nevada (Spring Mts.), and California; Eurasia; 64 (0). Our plants are assignable to var. *montanensis* (Fern. & Rydb.) C. L. Hitchc. [*P. montanensis* Fern. & Rydb.]. Many of our specimens have been identified previously as *P. parviflora* DC., which is known from well to the north of our area, and which may be only a small-flowered phase of *P. palustris* not worthy of taxonomic recognition.

Peltiphyllum Engler

Scapose perennial herbs from thick rhizomes; leaves developing after the scapes; petioles long; blades peltate, very large; flowers in bractless, panicle-corymbose cymes, showy, regular; hypanthium very short, adnate to the ovary; sepals 5; petals 5; stamens 10; carpels 2, free above the hypanthium, tapering to the discoid-capitate stigma; fruit a follicle, fully dehiscent; seeds cellular-rugulose.

Peltiphyllum peltatum (Torr.) Engler in Engler & Prantl Shieldleaf. [*Saxifraga peltata* Torr. ex Benth.]. Robust perennial herbs; rhizomes fleshy but tough, to 5 cm thick; petioles to 1 m tall or more, hirsute; leaf blades 5-40 cm broad, peltate, depressed at the center above the point of attachment to the petiole, nearly orbicular, 10- to 15-lobed, the divisions again lobed and serrate-dentate; scapes 3-6 dm tall or more, hirsute-glandular, naked, or with a small bract; sepals 2.5-3.5 mm long, reflexed; petals 4.5-7 mm long, white to bright pink; filaments flattened and broad at the base; follicles 6-10 mm long, purplish, fused basally. Known in Utah from a small colony growing along a cold mountain stream on the east side of Mt. Timpanogos, Utah County; coastal southwestern Oregon and northern California; 4 (0). The widely disjunct colony may be from an introduction.

Philadelphus L.

Shrubs; leaves opposite, subsessile or on short petioles; flowers perfect, regular, in few-flowered cymes at the ends of leafy branches; hypanthium calyxlike; sepals 4 (5); petals 4 (5), white or nearly white; stamens many (ca

20-60); ovary at least 2/3 inferior, with 3-5 locules; styles 3-5, distinct or united; fruit a loculicidal capsule, leathery or woody; seeds numerous. Note: In addition to the taxa included in the key, *P. verrucosus* Schrader and *P. x virginalis* Rehder are occasionally cultivated in Utah. These differ from those treated below in having sepals pubescent on the back, not just on the margins. *P. verrucosus* has single flowers and *P. x virginalis* has double flowers. Possibly *P. lewisii* Pursh of the Northwest is also cultivated in the state.

- 1. Leaves entire, 4-26 mm long; plants native *P. microphyllum*
- Leaves toothed, sometimes larger than above; plants introduced, to 3 m tall, our common cultivated mockorange *P. coronarius* L.

Philadelphus microphyllum Gray Littleleaf Mockorange. [*P. nitidus* A. Nels.]. Shrubs 8-20 dm tall, with opposite leaves; branchlets appressed pubescent; petioles ca 1 mm long; leaf blades 4-26 mm long, 2-13 mm wide, mostly elliptic or ovate to lanceolate or linear, entire, slightly revolute, sparingly to moderately strigose or glabrate; pedicels to 3 mm long, strigose-sericeous; hypanthium ca 2-3 mm long, pubescent like the pedicels; sepals 2-5 mm long; petals 8-15 mm long, white; stamens subequal to the sepals; capsules 6-8 mm long. Pinyon-juniper, mountain brush, ponderosa pine, aspen, and fir communities, mostly on sandstone at 1220 to 2650 m in Beaver, Carbon, Daggett, Emery, Garfield, Grand, Iron, Juab, Millard, Piute, San Juan, Sevier, Tooele, Uintah, Washington, and Wayne counties; Wyoming and Utah to Texas; 80 (iii). Plants from the southern part of the state have leaves that are slightly larger on the average than those from more northern areas, but the difference does not seem to warrant taxonomic recognition.

Ribes L.

Shrubs with or without bristles and spines; leaves alternate, palmately lobed, crenate or dentate; stipules none or adnate to the petiole; flowers perfect, regular, in racemes, or rarely solitary; pedicels subtended by bracts and usually with 2 bractlets above midlength; hypanthium mostly corollalike; sepals 5, mostly petaloid; petals 5 (4), often smaller than the sepals; stamens 5 (4-6); ovary completely inferior, 1-loculed; styles 2, united or distinct; fruit a berry, crowned by the withered flowers; seeds several to many. Note: The taxa with jointed and disarticulating pedicels, several flowers per raceme, and stipitate-glandular or glabrous berries are referred to as currants. The currants in our area are without spines or bristles except for *R. lacustre* and *R. montigenum*. The taxa with nonjointed and persistent pedicels and with only (1) 2 or 3 flowers per raceme and without stipitate-glandular hairs on the berries are referred to as gooseberries. The gooseberries of Utah all have nodal spines.

Berger, A. 1924 A taxonomic review of currants and gooseberries. New York State Agr. Exp. Sta. Tech. Bull. 109: 1-115.

- 1. Branchlets armed with nodal spines, sometimes also with internodal bristles 2
- Branchlets unarmed 8
- 2(1). Racemes with 3-15 flowers; ovaries and berries with setose-stipitate glands; hypanthium saucer-shaped ... 3

- Racemes with 1–3 flowers; ovaries and berries glabrous or pubescent, but not with setose-stipitate glands; hypanthium tubular or cup-shaped 4
- 3(2). Racemes with 3–8 flowers; berries red; leaf blades cleft 3/4 of the way to nearly all the way to the base; plants common and widespread *R. montigenum*
- Racemes with (5) 7–15 flowers; berries black or purple black; leaf blades lobed 2/3 of the way to the base or less; plants of the Uinta and Wasatch mts.
. *R. lacustre*
- 4(2). Leaves 7–20 mm wide; styles connate to near the apex; free hypanthium and sepals pubescent externally; plants of desert ranges of western and southern Utah 5
- Leaves over 20 mm wide (at least some), and/or styles lobed or cleft 1/4–1/2 the length; free hypanthium and sepals mostly glabrous externally; plants of various distribution 6
- 5(4). Free hypanthium 4–5.5 mm long; sepals 4–6 mm long; ovaries and berries mostly glabrous
. *R. leptanthum*
- Free hypanthium 1–2 mm long; sepals 2–4 mm long; ovaries and berries glabrous to hairy *R. velutinum*
- 6(4). Hypanthium pubescent within; berries greenish or yellowish (ripening purplish); plants cultivated, persisting, and rarely escaping. English Gooseberry
. *R. grossularia* L.
- Hypanthium glabrous within, but the styles pubescent; berries reddish or blackish; plants indigenous 7
- 7(6). Free hypanthium 2–3.5 mm long; berries reddish purple; nodal spines 1 (rarely 3) or lacking; branchlets usually glabrous; plants common and widespread
. *R. inerme*
- Free hypanthium 4–5 mm long; berries purple black; nodal spines usually 3; branchlets finely puberulent and sometimes with internodal bristles; plants rather rare, except along the south slope of the Uinta Mts.
. *R. setosum*
- 8(1). Flowers bright yellow, often reddish in part in age, glabrous; ovaries and berries glabrous; leaves glabrous, not cordate, with 3 (rarely 5) primary lobes, the primary lobes seldom with more than 3 teeth or lobes *R. aureum*
- Flowers not yellow, often pubescent or glandular; ovaries and berries with sessile or stipitate glands (except in *R. sativum* and *R. inerme*); leaves often pubescent, mostly cordate, with (3) 5–7 primary lobes, these with usually more than 3 teeth or lobes 9
- 9(8). Leaf blades, flowers, and fruit stipitate-glandular or, if sparingly so, flowers pinkish and berries red, free hypanthium 4–11 mm long, campanulate to cylindrical; anthers glandular apically 10
- Leaf blades not stipitate-glandular, glabrous or with hairs mostly on veins, or with sessile glands; flowers rarely pinkish; berries red only in *R. inerme*; free hypanthium mostly less than 4 mm long, variously shaped; anthers eglandular 11
- 10(9). Flowers (1) 2 or 3 per raceme, pinkish, the hypanthium less than 3 mm wide; berries red; leaf blades 7–30 (44) mm wide, not pilose-hirsute *R. cereum*
- Flowers 4–12 per raceme, greenish white to cream, the hypanthium 3–6 mm wide; berries blackish; leaf blades 30–100 mm wide, at least some, pilose-hirsute and stipitate-glandular *R. viscosissimum*
- 11(9). Ovaries and berries stipitate-glandular or with crystalline, yellowish, sessile glands; lower leaf surface with sessile glands; berries blackish; flowers (5) 8–30 per raceme; styles glabrous 12
- Ovaries and berries glabrous or, if with sessile nonglandular spots, the flower 1–3 per raceme and styles pubescent; berries red or reddish purple 15
- 12(11). Lower surface of leaves and floral parts with scattered, crystalline yellow glands; racemes many-flowered (to 30); plants strongly aromatic 13
- Leaves and/or floral parts with stipitate glands, or variously glandular, but not with yellow crystalline glands; racemes with (5) 8–16 flowers; plants not strongly aromatic 14
- 13(12). Sepals longer than the free hypanthium; racemes erect or ascending; plants indigenous *R. hudsonianum*
- Sepals shorter than the free hypanthium; racemes spreading to pendulous; plants cultivated. Black or Bedbug Currant *R. nigrum* L.
- 14(12). Bracts of racemes 3–4 mm long, ca 1/2 as long as the pedicels, oblong; flowers whitish or greenish; stipitate hairs of racemes whitish or pale greenish, rarely purplish, often sparse except on ovary and berry; racemes crowded, the upper internodes seldom over 3 mm long; plants of the La Sal Mts. and portions of central Utah *R. wolfii*
- Bracts of racemes 1–2 mm long, less than 1/2 as long as the pedicels, linear to acute; flowers pinkish or purplish; stipitate hairs of racemes mostly with purple tips, usually well developed on rachis and pedicels as well as on ovaries and berries; racemes loose, 1 or more of the upper internodes regularly over 3 mm long, plants of the Deep Creek Mts.
. *R. laxiflorum*
- 15(11). Flowers 1–3 per raceme, white; sepals longer than wide; free hypanthium ca 2–3.5 mm long; styles pubescent; plants indigenous *R. inerme*
- Flowers 8–20 per raceme, greenish; sepals wider than long; hypanthium to 2 mm long; styles glabrous; plants cultivated and escaping. Red Currant
. *R. sativum* Syme
- Ribes aureum* Pursh Golden Currant.** Shrubs, 1–3 m tall, unarmed; branchlets glabrous; petioles 0.5–2.5 (3) cm long; leaf blades 0.6–4.7 cm long, 1–6.7 cm wide, orbicular, reniform, obovate, cuneate to truncate basally, strongly 3-lobed, the lobes entire or crenate to lobed, glabrous; racemes with (3) 6–9 flowers; bracts 3–12 mm long, entire; pedicels to 3 mm long; free hypanthium cylindrical, yellow, or often reddish in age, corollalike; sepals 4–6 mm long yellow, spreading; petals ca 2 mm long, yellow, cream, or reddish; stamens subequal to the petals, the anthers longer than the filaments; styles united to near the apex; berries 8–12 mm long, black, red, orange, or translucent-golden, glabrous. Riparian and palustrine habitats in greasewood-shadscale, sagebrush, pinyon-juniper, mountain brush, ponderosa pine, and Douglas-fir communities at 1340 to 2590 m in all Utah counties, except Grand and San Juan; Washington to Saskatchewan, south to California and New Mexico; 150 (iii). The golden currant is similar to *R. odoratum* Wendl. of the eastern U. S. and Canada, which may also be cultivated in the state. The berries are the most palatable of any species of *Ribes* in Utah, and for that reason the plants are widely grown in cultivation in Utah.
- Ribes cereum* Dougl. Wax or Squaw Currant.** Shrubs, (0.2) 0.5–1.5 (2) m tall, unarmed; branchlets pilose-vil-

lous and stipitate-glandular; petioles 0.4–2.2 (2.9) cm long; leaf blades 0.5–2.5 (3.4) cm long, 0.7–3 (4.4) cm wide, orbicular, reniform, rarely ovate, cordate or truncate basally, with 3–7 shallow lobes, the lobes crenate or dentate, puberulent and stipitate glandular, or glabrous except on margins and along veins beneath; racemes with 2 or 3 flowers, the axis very short; bracts 2–5 mm long ciliate, fringed or lacerate, glandular; free hypanthium 4–11 mm long, pinkish, pilose, sometimes also stipitate-glandular; sepals ca 2 mm long, spreading to deflexed, whitish or pinkish; petals ca 1 mm long, whitish; staminal filaments subequal to the anthers; styles united to near the apex; ovaries stipitate-glandular; berries 6–8 mm long, reddish, sparingly stipitate-glandular, rarely glabrate. Mountain brush, sagebrush, pinyon-juniper, riparian, ponderosa pine, aspen, limber pine, spruce-fir, krummholz, alpine, and less commonly desert shrub communities at 1520 to 3260 m in all but Davis County; British Columbia to Montana, south to California and New Mexico; 230 (vi). Most of our plants are referable to *var. inebrians* (Lindl.) C.L. Hitchc. [*R. inebrians* Lindl.]. Occasional specimens have fan-shaped bracts that are truncate to broadly rounded and prominently toothed or with as many as 6 lobes. These specimens might be referable to *var. cereum*, but the distinction is tenuous at best. Intergradation of the morphological features is common and no geographical correlation is apparent in Utah.

Ribes hudsonianum Richards. Northern Black Currant. Shrubs, 0.5–1.5 (2) m tall, rather strongly scented, unarmed; herbage bearing crystalline, yellowish glands, usually puberulent; petioles (1) 2.5–8.5 cm long; leaf blades (2.1) 2.7–8.2 cm long, (2) 5–12.2 cm wide, orbicular or ovate in outline, strongly 3-lobed and doubly dentate, the lateral lobes again lobed, cordate basally; racemes ca 20– to 30-flowered, to 12 cm long in fruit; bracts ca 0.5–1.5 mm long, awl-shaped, soon deciduous; free hypanthium to ca 1 mm long, whitish; sepals 2.5–4 mm long, white; petals ca 1/2 as long as sepals; styles united for more than 1/2 their length; berries 7–12 mm long, blackish, glabrous except for sessile glands. Stream-sides, usually in aspen, lodgepole pine, or spruce-fir communities at 1830 to 2590 m in Box Elder, Duchesne, Salt Lake, Summit, Utah, and Wasatch counties; Alaska to Hudson Bay, south to California, Wyoming, and Minnesota; 11 (i). Our plants are referable to *var. petiolare* (Dougl.) Jancz. [*R. petiolare* Dougl.].

Ribes inerme Rydb. Whitestem Gooseberry; Wine Gooseberry. Shrubs 7.5–20 dm tall; branchlets often whitish, glabrous, armed at the nodes with 1 (3) spines, or the spines lacking; internodal bristles mostly lacking or few and sparse; petioles (0.3) 0.5–4.5 cm long, sometimes with 1 to few pilose gland-tipped hairs; blades (0.8) 1.5–9 cm long, orbicular or nearly so, cordate to truncate with 3–5 main lobes, these again lobed and crenate-dentate toothed, the major sinuses cut 1/3–2/3 to the base, glabrous, glabrate with hairs mostly along the veins or occasionally with moderately dense strigose, not glandular, paler beneath than above; racemes 1– to 4-flowered, the axis to ca 12 mm long; bracts 1–2 mm long, greenish, glabrous or glandular ciliate and puberulent; pedicels 2–5 mm long; free hypanthium 2–3.5 mm long, cylindrical to narrowly campanulate, greenish or greenish cream, sometimes purplish tinged, densely pilose to villous-wooly inside; sepals ca 3 mm long, colored as the hypan-

thium; petals about 1–1.5 mm long, obovate to narrowly fan-shaped, white; stamens (1.5) 2–2.5 times longer than the petals, 2–4 (5) mm long; styles subequal to or slightly longer than the stamens, cleft 1/2–2/3 to the base, rather densely pilose on the lower 1/2 or more; berries 7–10 mm long, reddish or reddish purple, succulent, more or less edible. Pinyon-juniper, mountain brush, aspen, willow, Douglas fir, spruce-fir, tall forb, and meadow communities at 1830 to 3100 m, in Cache, Carbon, Daggett, Duchesne, Garfield, Grand, Juab, Piute, San Juan, Salt Lake, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, and Weber counties. British Columbia to California, Montana to New Mexico; 56 (vii).

Ribes lacustre (Pers.) Poir. in Lam. Swamp Black Gooseberry. [*R. oxyacanthoides* var. *lacustre* Pers.]. Shrubs, 7.5–15 dm tall; branchlets armed with internodal prickles and nodal spines, puberulent, eglandular; petioles 0.3–5 cm long, glabrous or with scattered stipitate-glandular hairs; leaf blades (0.6) 1.5–5.6 cm long, (1) 2–8 cm wide, orbicular in outline, cordate at the base, usually 5-lobed, the lobes again lobed and doubly crenate-dentate, glabrous or sparingly hairy along the veins; racemes rather loosely 5– to 15-flowered, the axis to 4.5 cm long in fruit, stipitate-glandular with reddish or purplish glands, puberulent; bracts 2–3 mm long, ciliate-glandular; pedicels 3–8 mm long; free hypanthium less than 1 mm long, saucer-shaped, yellowish green, pinkish, or reddish; sepals 2.5–3 mm long, yellow green, pinkish, or reddish; petals shorter than the sepals, pinkish; stamens subequal to the petals; styles parted to the base; berries 6–8 mm long, dark purple, coarsely stipitate-glandular. Moist sites, often in conifer and aspen woods, at 2100 to 3350 m in the Uinta and Wasatch mts., in Duchesne, Salt Lake, Summit, and Wasatch counties; Alaska to Newfoundland, south to California, Colorado, South Dakota, and Michigan; 20 (iv).

Ribes laxiflorum Pursh Western or Trailing Black Currant. Shrubs to ca 0.7 m tall, the stems sprawling or ascending, unarmed; branchlets and some older branches puberulent; petioles (0.5) 2–4.5 cm long, puberulent, sometimes short stipitate-glandular near the blade; leaf blades (1) 2–5 cm long, 1.5–6.5 cm wide, orbicular or nearly so, cordate, with 3–5 primary lobes, these again lobed and crenate-dentate toothed, the major sinuses cut ca 1/3–1/2 to the base, glabrate or with some puberulent and stipitate glandular hairs, especially toward the base on veins beneath, slightly paler beneath with translucent crystalline sessile glands; racemes 5–10 flowered, stipitate glandular and puberulent, the axis 2–4 cm long; bracts 1–2 mm long, linear or narrowly triangular, greenish; pedicels 4–10 mm long, jointed just below the ovary, some usually persisting at least until fruit is nearly mature; free hypanthium less than 1 mm long; sepals 2–3 mm long, pinkish or purplish; petals ca 1 mm long, 1–1.3 mm wide, broadly fan-shaped with concave margins; stamens subequal to the petals; styles cleft 1/3–2/3 their length; berries to ca 1 cm long, blackish, stipitate-glandular, the glands and stalks mostly purplish. Known in Utah from a single small population in the Deep Creek Mts., Juab County, where abundant in wet shady places among downed timber and boulders, in a spruce-aspen community; Alaska to Washington and along the coast to southwest California, east to Alberta and northern Idaho, widely disjunct in Utah; 2 (i). The closely related *R. coloradense* Cov. of Colorado and New Mexico has been reported for

Utah, but I have seen no specimens. It is separable, reportedly, from *R. laxiflorum* by glandular hairs on the back of sepals (a feature that occasionally shows up in plants as far away as Alaska), by petals nearly twice as broad as long, and by berries without bloom. The separation appears rather tenuous at the species level. The combination *R. laxiflorum* var. *coloradense* (Cov.) Jancz. is available. The amazingly disjunct population in Utah seems more closely allied to the coastal and northern plants than to those of Colorado.

***Ribes leptanthum* Gray** Trumpet Gooseberry. Shrubs, 0.5–2 m tall; branchlets armed at the nodes with 1–3 spines, usually lacking internodal bristles, puberulent; petioles 0.2–1.2 cm long; leaf blades 0.5–1.6 cm long, 0.7–2 cm wide, orbicular, cordate basally, mostly 5-lobed, the main lobes again shallowly lobed or toothed, glabrous or less commonly puberulent and rarely glandular; racemes 1- to 3-flowered, the axis very short; bracts glabrous except glandular-ciliate or -toothed; pedicels ca 1 mm long; free hypanthium 4–5.5 mm long, whitish, pilose or short-villous; sepals 4–6 mm long, whitish; petals 2.5–3 mm long, whitish; stamens subequal to the petals; anthers shorter than the filaments; styles glabrous, apically notched; berries ca 6–10 mm long, blackish, glabrous. Pinyon-juniper, mountain brush, ponderosa pine, aspen, spruce-fir, and meadow communities at 1830 to 2590 m in Beaver, Emery, Garfield, Grand, Kane, Piute, and San Juan counties; Colorado, New Mexico, and Arizona; 22 (i).

***Ribes montigenum* McClatchie** Gooseberry Currant. [*R. lacustre* var. *lentum* Jones, type from Henry Mts.]. Shrubs, 2–7 dm tall; branchlets armed with 1–5 nodal spines, the internodal bristles lacking or present, puberulent or glabrous; petioles 0.4–4 cm long; leaf blades 0.4–3.7 cm long, 0.6–5 cm wide, orbicular in outline, cordate at the base, usually 5-lobed, the primary lobes again lobed or toothed, the vesture of glandular or nonglandular hairs and sometimes with sessile crystalline glands; racemes 3- to 8-flowered, the axis to 3.5 cm long in fruit; bracts 2–3 mm long, glandular-pubescent; pedicels 1–3 mm long; free hypanthium ca 1 mm long, saucer-shaped, lined with a yellowish or pinkish disk, glandular-hairy; sepals ca 3 mm long, pinkish lavender to whitish; petals ca 1 mm long, pinkish or pink purple; stamens subequal to the petals; filaments longer than the anthers; style divided to near the base, glabrous; berries mostly 5–10 mm long, red, stipitate-glandular. Spruce-fir, Douglas fir, lodgepole pine, bristlecone pine, aspen, krummholz, sagebrush-snowberry, and sedge-grass communities, and often in talus and scree slopes at 2135 to 3660 m in all Utah counties except Davis, Millard, Morgan, and Rich; British Columbia to southern California, east to Montana and New Mexico; 151 (v).

***Ribes setosum* Lindl.** Missouri Gooseberry. Shrubs 7.5–20 dm tall; branchlets sometimes armed with internodal bristles, the nodes with 1–3 spines; petioles 1–4.8 cm long, often puberulent to pubescent, sometimes with a few long glandular seta; blades (1.5) 2–5.7 cm long, orbicular or nearly so, truncate to cordate, with ca 5 main lobes that are again lobed and crenate-dentate, the major sinuses cut a little less than 1/2 to 2/3 to the base of the blade, scattered to moderately pubescent with short curved hairs or rarely glabrate, the hairs rarely confined to the nerves, often stipitate glandular and/or with sessile translucent glandular dots especially beneath, slightly

paler beneath; racemes 1–4 flowered, the axis to ca 5 mm long; bracts 1–3 mm long, greenish, minutely glandular ciliate; pedicels 2–5 mm long; free hypanthium 4–5 mm long, cylindrical, greenish white or pinkish tinged, pilose to villous-woolly within; sepals 3–4 mm long, the color of the hypanthium; petals ca 2 mm long, obovate, white; stamens subequal to the petals, shorter than the erect to ascending sepals; styles subequal to the sepals, cleft 1/2–2/3 to the base, densely pilose below; berries 10–12 mm long, blackish or deep purple black, succulent, more or less edible. With aspen, alder, birch, and willows in riparian or palustrine habitats at 2130 to 2750 m in Box Elder, Duchesne, Juab, and Uintah counties; Alberta east to the Dakotas and Michigan; 15 (iii). A few Utah specimens seem intermediate to *R. inerme*.

***Ribes velutinum* Greene** Desert Gooseberry. Shrubs, mostly 1–2 m tall, with 1 (2 or 3) nodal spine (s), lacking internodal bristles; branchlets usually pubescent; petioles 0.3–1.5 cm long; leaf blades 0.5–1.4 cm long, 0.7–2 mm wide, orbicular, 3- to 5-lobed, the main lobes usually again lobed, pubescent or glabrous; racemes 1- to 3-flowered, the axis very short; bracts 2–3 mm long, puberulent; pedicels 1–2 mm long; free hypanthium ca 1–2 mm long, pubescent externally, whitish or pinkish; sepals 2–4 mm long, whitish; stamens subequal to the petals; filaments subequal to the anthers; style simple, subequal to the stamens; styles united to the apex; berries 5–8 mm long, reddish (?), glabrous or hirsute, not very fleshy. Pinyon-juniper, mountain brush, and sagebrush-desert shrub communities at 1340 to 2321 m in Beaver, Kane, Millard, Tooele, and Washington counties; Washington to California, east to Idaho and Arizona; 23 (ii). Our plants are referable to var. *velutinum*.

***Ribes viscosissimum* Pursh** Sticky Currant. Aromatic shrubs, mostly 1–2 m tall, unarmed; branchlets pilose-hirsute and stipitate-glandular; petioles 0.6–7 cm long; leaf blades 0.9–6.6 cm long, 1.3–10 cm wide, orbicular, rarely ovate, cordate basally, 3- to 7-lobed, the main lobes crenate or dentate and sometimes again lobed, glandular-hairy and often pilose or hirsute; racemes 4- to 12-flowered, the axis 5–30 mm long, glandular; bracts 3–10 mm long, entire to toothed, glandular; pedicels 3–17 mm long; free hypanthium 5–9 mm long, whitish or pale green, stipitate-glandular and pilose-hirsute; sepals 3–5.5 mm long, white or yellow green, or occasionally pinkish; petals 2–3 mm long, whitish; stamens subequal to the petals; filaments longer than the anthers; styles simple, glabrous or nearly so; berries 10–13 mm long, black, rather dry, stipitate-glandular. Commonly growing in shade of aspen, fir, Douglas fir, lodgepole pine, and spruce woods, and less commonly in mountain brush, meadows, and openings at 1965 to 2925 m in Box Elder, Cache, Carbon, Daggett, Duchesne, Kane, Millard, Morgan, Salt Lake, Sanpete, Summit, Tooele, Uintah, Utah, Wasatch, and Washington counties; British Columbia, south to California, east to Montana and Arizona. This plant is unique among our species in the dense stipitate-glandular and nonglandular hairs of the herbage and in the rather broad and long hypanthia. Our plants are referable to var. *viscosissimum*; 42 (ii).

***Ribes wolfii* Rothr.** Rothrock Currant. [*R. mogolicum* Greene]. Shrubs, 0.5–3 m tall, unarmed; branchlets glabrous or puberulent; petioles 0.7–4.5 cm long, glabrous or puberulent; leaf blades 1.2–5.7 cm

long, 1.2–8 cm wide, orbicular, cordate basally, 3 (5) -lobed, the main lobes again lobed and variously 1- or 2-crenate or -dentate, glabrous except for sessile, clear crystalline glands; racemes 8- to 16-flowered, glandular, the axis ca 1–4 cm long; bracts 3–6 mm long, mostly entire; pedicels 1–5 (7) mm long; free hypanthium 0.7–1.5 mm long, green, bowl-shaped, glabrous or puberulent; sepals 2–3 mm long, whitish; petals ca 1.5 mm long, white; styles free or united below the middle; berries 6–10 mm long, blackish, not very fleshy, stipitate-glandular. Mountain brush, aspen, Douglas fir, and spruce-fir communities, usually in shade, at 1645 to 3350 m in Carbon, Emery, Grand, Juab, Millard, Salt Lake, San Juan, Sanpete, Sevier, Tooele, and Utah counties; Colorado, Arizona, and New Mexico, and in Washington and Idaho; 80 (iv). Vegetative specimens of *R. wolfii* are sometimes confused with *R. hudsonianum*. Both have sessile crystalline glands on the lower surface of the leaves. In *R. wolfii*, these glands are more clear than yellow, smaller, and they are seldom noticeable on the often puberulent petioles and young twigs. In *R. hudsonianum* the glands are yellowish, larger, and more conspicuous, and they often extend down the less puberulent petioles and twigs.

Saxifraga L.

Perennial herbs; leaves alternate or basal; flowers perfect; hypanthium obsolete to well developed; sepals 5, erect to deflexed; petals 5, clawless or clawed, deciduous or persistent; stamens 10, the filaments subulate, linear, or flattened; carpels 2–5, connate only at the base or to near the tip; stigmas capitate; fruit capsular and dehiscent across the top or follicular; seeds numerous.

- 1. Leaves all basal, the blades subtire to coarsely toothed but not lobed, commonly over 15 mm long, usually distinctly petioled; flowers mostly more than 10; plants common and widespread 2
- Leaves cauline, at least in part or, if all basal, less than 15 mm long, not distinctly petioled or, if so, the blades lobed but not toothed; flowers 1–5 or rarely more; plants mainly of high mountains 3
- 2(1). Inflorescence open; leaf blades orbicular to reniform; petioles 1.2–23 cm long, usually longer than the blades; plants 16–67 cm tall *S. odontoloma*
- Inflorescence congested, occasionally interrupted; leaf blades rhombic, obovate or ovate, cuneate at the base; petioles 0.3–2.5 cm long, usually shorter than the blades; plants 3–20 (30) cm tall *S. rhomboidea*
- 3(1). Petioles evident, 0.5–4.5 cm long, usually longer than the blades; blades orbicular or reniform, palmately lobed or trilobate, cordate or truncate basally, with some usually over 5 mm wide 4
- Petioles not especially evident; blades linear to oblanceolate, entire or 3- to 7-lobed, not cordate or truncate basally, 0.5–5 mm wide 5
- 4(3). Bulblets present in upper leaf-axils and inflorescence, not at petiole bases of lower leaves; hypanthium ca 1 mm long, not turbinate *S. cernua*
- Bulblets not present in upper leaf-axils and inflorescence, often present at petiole bases of lower leaves; hypanthium 2–3 mm long, turbinate *S. debilis*
- 5(3). Leaves toothed (sometimes obscurely) or lobed; petals white; sepals erect or somewhat spreading, ca 1/2 as long as the hypanthium; plants glandular 6

- Leaves entire; petals yellow (white in *S. bronchialis*), but fading whitish; sepals spreading to reflexed, mostly more than 1/2 as long as the hypanthium 7
- 6(5). Plants depressed-caespitose; leaves lobed, those of the stem generally less deeply lobed than the basal ones; petals gradually narrowed to the base, clawless or very shortly clawed; filaments longer than the sepals *S. caespitosa*
- Plants not depressed caespitose; leaves merely toothed, those of the stems often more prominently toothed than the basal ones, petals abruptly narrowed to a short claw; filaments shorter than the sepals *S. adscendens*
- 7(5). Plants stoloniferous; sepals ascending; hypanthium ca 1/2 to as long as sepals; herbage stipitate-glandular; leaves ciliate; petals yellow *S. flagellaris*
- Plants not stoloniferous; sepals spreading to reflexed or the petals white; hypanthium obsolete or very short; herbage not stipitate-glandular (or the stem sparingly so); leaves glabrous or, if ciliate, the petals white 8
- 8(7). Petals white; racemes often more than 3-flowered; leaves ciliate; sepals erect to spreading *S. bronchialis*
- Petals yellow when fresh; flowers mostly solitary; leaves not ciliate; sepals finally reflexed 9
- 9(8). Petals 4–5 mm long, short-clawed; sepals 2–3 mm long, glabrous; leaves 4–8 mm long, 0.5–1.5 mm wide; stems with minute stipitate glands, not pilose; plants 2–6 cm tall *S. chrysantha*
- Petals 7–10 (15) mm long, not clawed; sepals 4–5 mm long, often pilose; leaves often over 8 mm long and some over 1.5 mm wide; stems often rusty pilose; plants 6–20 cm tall *S. hirculus*

Saxifraga adscendens L. Wedge-leaf Saxifrage. Plants short-lived perennials, 3–10 cm tall, from a small simple caudex, strongly glandular-pubescent; leaves 5–15 mm long, sessile or gradually narrowed to a petiolelike base, entire, or 3 (5) -toothed or shallowly lobed at the apex, obovate; sepals about 1–2 mm long, usually reddish purple; petals white, 3–6 mm long, narrowed abruptly to a claw; filaments slender; ovary inferior or nearly so; capsules 3.5–5 mm long. Alpine tundra and rocky slopes in Grand, San Juan, and Summit counties; northern Rocky Mts. and Cascades to Colorado, and Europe; 2 (0). Our material is referable to var. *oregonensis* (Raf.) Breitung [*Ponista oregonensis* Raf].

Saxifraga bronchialis L. Spotted Saxifrage. Plants (1) 3–15 cm tall, arising from a caudex with a taproot; caudex branches prostrate to ascending, clothed with densely imbricate persistent leaves; flowering stems glandular-pubescent, with few to several alternate leaves; leaves 3–15 mm long, 1–3 mm broad, sessile, entire, leathery, elliptic to oblong or spatulate, setose-ciliate and spinulose-tipped; flowers showy, yellowish or whitish; sepals greenish, ovate, 2–3 mm long, erect to spreading, glabrous, not ciliate; petals whitish or yellowish, yellow to red-spotted, 3–6 mm long, indistinctly 3-veined; stamens shorter to longer than the petals, the filaments subulate; ovary only slightly inferior; capsules 4–6 mm long. Open rocky slopes at ca 3050 to 3931 m in the La Sal Mts., Grand and San Juan counties; Alaska and Yukon, south to Oregon, Idaho, and New Mexico; 9 (0). Our plants are apparently referable to var. *austroripariensis* (Wiegand) G. N. Jones [*S. austroripariensis* Wiegand].

Saxifraga caespitosa L. Tufted Saxifrage. [*S. caespitosa* ssp. *exaratooides* var. *purpurea* Engl. & Irm., type from the La Sal Mts.]. Plants 1–17 cm tall, from a caudex

and a taproot; caudex branches prostrate to ascending, clothed with densely imbricate leaves; flowering stems glandular-pubescent, often densely so, with 1 to several alternate leaves; basal leaves 3–15 mm long, 2–7 mm wide, with 3–5 (7) apical, triangular to lanceolate or narrowly oblong lobes, cuneate, glandular-ciliate, not spinulose-tipped; cauline leaves often entire; flowers solitary or 2–4, moderately showy; sepals often purplish, nearly linear to ovate, 1–2 mm long, erect, glandular-pubescent and ciliate; petals white, cream, or yellowish, 2–3 mm long, 3-veined; stamens shorter than the petals, longer than the sepals, the filaments subulate; ovary almost completely inferior; capsule 3–4 (7) mm long. Spruce and alpine tundra communities, fell fields, and rocky slopes at 2985 to 3990 m in Beaver, Duchesne, Grand, Piute, Salt Lake, San Juan, Summit, and Utah counties; circumboreal, south to Nevada, Arizona, and New Mexico; 29 (0). Specimens from above 3660 m on Kings Peak have many entire basal leaves and have sometimes been confused with *S. ascendens*. Fresh petals of some plants (Franklin 955 BRY) are yellowish. Our plants seem to be referable to var. *minima* Blank.

Saxifraga cernua L. Nodding Saxifrage. Plants 6–15 cm tall, arising from fibrous roots; stems sparsely to densely glandular-villous, with several alternate leaves; basal leaves with petioles 0.5–3 cm long, the blades (3) 5- to 7-lobed, reniform, 4–15 mm long, 6–15 mm wide; cauline leaves becoming smaller, fewer lobed, and shorter petioled upwards, at least the upper ones bearing purplish bulblets in the axils; flowers showy, solitary (rarely 2) at the apex of the inflorescence, the others replaced by bulblets; sepals green to dark reddish purple, ovate to lanceolate, 2.5–3 mm long, erect, sparsely to densely glandular, somewhat ciliate; petals white, 5–8 (12) mm long, 3- to 5-veined; stamens longer than the sepals, much shorter than the petals; ovary slightly if at all inferior; capsules rarely developing. Rocky places at 3445 to 3960 m in the Uinta and La Sal mts., Grand, San Juan and Summit counties; circumboreal, south to New Mexico; 10 (0).

Saxifraga chrysantha Gray Golden Saxifrage. Plants 2–6 cm tall, arising from slender rhizomes, sometimes mat-forming; stems glandular; leaves imbricate at the stem base and scattered upwards, 4–8 mm long, 0.5–1.5 mm wide, narrowly spatulate to narrowly oblong, entire, glabrous or occasionally sparsely glandular; flowers solitary; sepals 2–3 mm long, strongly reflexed, glandular externally, green or purplish; petals 4–5 mm long, yellow; stamens longer than the sepals but shorter than the petals; ovaries slightly inferior; capsules 6–8 mm long, ovoid. Alpine tundra, fell fields, and rock stripes at 3415 to 3960 m in the Uinta Mts., Duchesne and Summit counties; Wyoming south to New Mexico; 6 (0).

Saxifraga debilis Engelm. Pygmy Saxifrage. Plants 2–15 cm tall, arising from fibrous roots; stems usually glandular, rarely pilose; basal leaves sometimes with whitish or purple-tipped bulbils in the axils; petioles 0.5–6 cm long; leaf blades 3–15 (20) mm wide, mostly wider than long, reniform or orbicular, with 3–7 lobes; flowers solitary and terminal or 2 or 3 on naked or bracteate, slender pedicels, 0.5–5 mm long; sepals 1.5–2 mm long; petals 2–5 mm long, white; stamens exceeding the sepals, but shorter than the petals; ovaries only slightly inferior; capsules about 5–8 mm long. Alpine tundra, cirque basins, and Engelmann spruce communi-

ties, often near melting snowbanks at 2743 to 3960 m in Beaver, Daggett, Duchesne, Garfield, Grand, Iron, Piute, Salt Lake, San Juan, Summit, Tooele, Uintah, and Utah counties; British Columbia south to California, east to Montana and Arizona; 30 (i). Some plants from Kings Peak are rather densely pilose and have slightly shorter and relatively broader sepals than others from the state. These plants seem more like those from the northern Rocky Mts. and Cascades than others from the state.

Saxifraga flagellaris Willd. Flagellate Saxifrage. Plants 3–10 (12) cm tall, arising from slender rhizomes and with naked flagellate stolons; stems erect, stipitate-glandular villous, with several cauline leaves; basal leaves 5–17 mm long, 1–5 mm broad, entire, cuneate-oblong to spatulate, entire, setose-ciliate; cauline leaves similar to the basal ones except becoming glandular-ciliate and smaller above; flowers 1 to few, showy; sepals greenish to reddish purple, oblong to lanceolate or ovate, 2.5–4.5 mm long, stipitate-glandular, the glands purplish; petals bright yellow, but faded in dried specimens, 6–12 mm long, 7- to 9-veined; stamens longer than the sepals, the filaments subulate; ovary only slightly to 1/4 inferior; capsules 4–5 mm long. Alpine tundra at 3350 to 3962 m in the Uinta and La Sal mts., Duchesne, Grand, San Juan, and Summit counties; circumboreal, south to Arizona and New Mexico; 7 (0).

Saxifraga hirculus L. Yellow Marsh Saxifrage. Plants 6–20 cm tall; flowering stems erect, brownish or yellowish tomentose, at least above, arising from a basal rosette with fibrous roots, with usually several cauline leaves; basal leaves 1.2–3.5 cm long, 1–3 (4) mm wide, entire, linear-oblong to spatulate, glabrous or glabrate; cauline leaves similar to the basal only smaller above; flowers 1 to few, showy; sepals greenish to reddish, oblong to lanceolate, 2.5–5.5 mm long, spreading, glandular-villous to glabrate, ciliate; petals bright yellow, 7–12 mm long, 5- to 7-veined; stamens longer than the sepals, the filaments subulate; ovary only slightly inferior; capsules 7–12 mm long. Wet meadows in the Uinta Mts., Daggett County; circumboreal, south to Colorado; 3 (ii).

Saxifraga odontoloma Piper Brook Saxifrage. [*S. arguta* D. Don, misapplied]. Plants scapose, 16–78 cm tall, from rootstocks with fibrous roots; leaves all basal, glabrous or nearly so; petioles 1.2–23 cm long; blades 1–9.5 cm wide and about as long, orbicular to reniform, cordate or truncate at the base, coarsely dentate or crenate-dentate; scapes glabrous below, glandular above; inflorescence a spreading cymose panicle, several-flowered, stipitate-glandular; sepals 2–3 mm long, strongly reflexed in anthesis, purplish; petals 2.5–4 mm long, white, spreading; stamens equaling or exceeding the petals; capsules 5–9 mm long. Along streams, springlets, and about ponds and lakes, and in other moist sites in montane plant communities at 1830 to 3350 m in all Utah counties except Daggett, Davis, Kane, Millard, Morgan, Rich, Washington, Wayne, and Weber; Alaska to California, east to Alberta and New Mexico; 104 (ii).

Saxifraga rhomboidea Greene Diamondleaf Saxifrage. Plants scapose, 3–20 (30) cm tall, from short rootstocks and fibrous roots; leaves all basal; petioles 0.3–2.5 cm long, usually pilose-ciliate or fringed, rather broad and flat, gradually differentiated from the blade; blades 9–35 mm long, 3–20 mm wide, rhombic, obovate, or ovate, dentate or crenate to subentire, not lobed, glabrous or ciliate; inflorescence cymose-paniculate, mostly very

congested, globose or headlike, glandular; flowers several to many; sepals 1–2 mm long, more or less triangular, not reflexed; petals 2–4 mm long, white; stamens longer than the sepals, subequal to the petals; capsules 4–6 mm long excluding the styler beaks. Meadows in alpine tundra and sometimes in ponderosa pine, Douglas fir, and spruce communities at 2075 to 3965 m in Beaver, Box Elder, Cache, Daggett, Duchesne, Garfield, Grand, Iron, Juab, Millard, Piute, Salt Lake, San Juan, Sevier, Summit, Tooele, Uintah, Utah, Washington, and Wayne counties; British Columbia to Colorado; 111 (iii). *S. integrifolia* Hook. has been discovered in Cache County (Thorne 4831 BRV). It differs in having entire or merely denticulate leaves.

SCROPHULARIACEAE A. L. Juss.

Figwort Family

Annual, biennial, or perennial herbs or shrubs or vines, some parasitic or hemiparasitic; leaves alternate, opposite, all basal or sometimes whorled, simple to pinnatifid; inflorescence of spikes, panicles, thyrsoid panicles or in some the flowers solitary on leaf axils or on long slender pedicels; bracts foliaceous to reduced; calyx lobes 4 or 5 (rarely 2), distinct or united; corolla sympetalous, regular or bilabiate, some saccate at the base or spurred, 4- or 5-lobed, commonly 2-lipped, tubular, rotate to campanulate; stamens epipetalous, alternate with the corolla lobes, 4 and didynamous, or 4 fertile and 1 sterile, or 5 fertile (*Verbascum*), the anthers 2-celled, equal or unequal; ovary superior, 2-locular; style 1, sometimes forked into 2 stigmatic lobes; fruit a capsule; seeds usually many and small or rarely few, winged or wingless; $x = 6+$.

- 1. Leaves opposite or sometimes whorled in *Collinsia* . . . 2
- Leaves alternate (at least above) or mostly all basal . . . 9
- 2(1). Fertile stamens 2 3
- Fertile stamens 4 4
- 3(2). Corolla tubular, bilabiate; stigmas distinct; calyx 5-lobed; capsule not compressed *Gratiola*
- Corolla subrotate, regular to slightly irregular; stigmas completely united; calyx 4-lobed; capsule compressed *Veronica*
- 4(2). Plants annual 5
- Plants perennial 7
- 5(4). Flowers with a fifth sterile stamen; lower corolla lip keeled-saccate and forming a pouch that encloses the stamens and style *Collinsia*
- Flowers lacking a sterile stamen 6
- 6(5). Calyx strongly 5-angled (ribs prominent), the lobes equal or, if unequal, less than half the tube length; anthers all well developed; capsule glabrous *Mimulus*
- Calyx 5-sulcate but not angled (ribs obscure), the lobes unequal, the anterior lobes at least half the calyx length; lower anther pairs reduced or wanting; capsule glandular puberulent *Mimetanthe*
- 7(4). Style forked; stigmatic lobes 2, distinct *Mimulus*
- Style entire with 1 stigma 8
- 8(7). Corolla small, 8.5–14 mm long, urceolate, not showy; staminode flabellate, attached high on the corolla tube *Scrophularia*
- Corolla mostly longer, tubular to strongly ventricose, ampliate, mostly showy; staminode filiform, attached well down in the corolla tube *Penstemon*

- 9(1). Stamens 5 and usually all bearing anthers; basal leaves forming a rosette, the cauline alternate, simple, sessile *Verbascum*
- Stamens 2 or 4; leaves various 10
- 10(9). Basal leaves well developed; cauline leaves bractlike, sessile, alternate 11
- Leaves mostly cauline 13
- 11(10). Scapose, stoloniferous perennial; flowers solitary on slender pedicels arising from the basal leaves; plants submerged or on muddy shores *Limosella*
- Subscapose perennials with fibrous roots; flowers borne in a dense spike or spikelike raceme; moist alpine meadows and open ridges 12
- 12(11). Blade of the basal leaves crenate to crenate-serrate; corolla wanting, vestigial or, if present, strongly bilabiate *Besseya*
- Blade of the basal leaves lacinate to pinnatifid; corolla present, campanulate to subrotate *Synthyris*
- 13(10). Upper lip of the corolla forming a hood that encloses the anthers 14
- Upper lip not forming a hood, usually distinctly lobed, if present 17
- 14(13). Anther cells alike, equal; galea rounded dorsally; leaves mostly pinnatifid or bipinnatifid or crenate to serrate *Pedicularis*
- Anther cells dissimilar, obliquely positioned; galea mostly straight; leaves entire to pinnately-lobed 15
- 15(14). Plants perennial or, if annual (*Castilleja exilis*), the leaves and bracts entire and the galea longer than the lower lip *Castilleja*
- Plants all annual; leaves, bracts, and galeas various 16
- 16(15). Calyx forming 2-lobes, cleft to or nearly to the base in front, bractlike *Cordylanthus*
- Calyx forming 4 lobes, cleft 2/5 the calyx length, tubular-campanulate *Orthocarpus*
- 17(13). Corolla spurred at the base *Linaria*
- Corolla not spurred at the base, gibbous or pouched at the base 18
- 18(17). Corolla 4–5 cm long, typically spotted on the lower lip and within; plants cultivated and persisting *Digitalis*
- Corolla typically less than 4 cm long, seldom if ever with the lower lip maculate; plants mainly indigenous (cultivated in *Antirrhinum majus*) 19
- 19(18). Plants perennial; leaves coarsely toothed or hastately lobed, palmately veined and lobed *Maurandya*
- Plants annual; leaves entire, not palmately veined 20
- 20(19). Plants densely hairy from ground level to cotyledons and above; flowers either yellow and peduncles twining or pale lavender and axillary *Antirrhinum*
- Plants not densely hairy at the base; flowers yellow, axillary, lacking twining peduncles *Mohavea*

Antirrhinum L.

Plants annual or perennial herbs; stems erect or twining; leaves opposite, or the upper alternate, entire, lanceolate to linear, sessile; flowers few to several in a bracteate raceme; calyx 5-lobed; corolla yellow or blue to purple or white, strongly bilabiate; stamens 4, didynamous, filament sometimes dilated apically; stigmas capitate, united; capsule woody, asymmetrical or symmetrical, irregularly dehiscent or regularly so; style deflexed, persistent; seeds many with longitudinal corky, tuberculate

ridges. Note: The segregate genus *Neogaerrhinum* consists of only two species, which are likely more closely related to species within *Antirrhinum* than they are to each other. Thus, *A. filipes* is here treated traditionally. The garden snapdragon, *A. majus* L., is commonly grown in Utah. The large multicolored flowers serve to distinguish it from the slender and diminutive flowered indigenous species.

- 1. Pedicels prehensile; capsules lacking pores *A. filipes*
- Pedicels not prehensile; capsules with pores *A. kingii*

Antirrhinum filipes Gray Twining Snapdragon. [*Neogaerrhinum filipes* (Gray) Rothm.]. Stems densely hairy from root apex to first foliage leaves, mostly 3–8 dm long, simple or branched, clambering or with twining pedicels; leaves 15–30 mm long, 4–8 mm wide below, 1–2 mm wide on the upper stem, ovate to lanceolate or linear respectively; flowers yellow; calyx 3–5 mm long, the segments subequal; corolla 10–15 mm long, bilabiate, the tube yellow, maculate with brown on the lower lip, glandular-hairy, the palate hairy; capsule 3.8–5.5 mm long. Creosote bush, Joshua tree, and other warm desert shrub communities at ca 700 to 900 m in Washington County; California, Nevada, and Arizona; 5 (i). The species is rare in collections, probably because it is so inconspicuous. The slender stems blend into the vegetation on which the plants climb. The flowers are individually beautiful.

Antirrhinum kingii Wats. King Snapdragon. Slender, erect annual, 1–3 dm high; stems simple or branched, often flowering to the base; herbage densely woolly below, glabrous upward from the woolly area; leaves 0.6–2.5 cm long, narrowly lanceolate to linear, reduced upward; flowers solitary in the leaf axils and branches, 2–3.5 mm long; sepals irregular; corolla white with purple veins, 5–7 mm long, bilabiate, the palate closing the throat; capsule 2.5–4 mm long, subglobose; seeds 0.7–0.8 mm long, ovoid, tuberculate. Gravely slopes and flats, wash banks in creosote bush, Joshua tree, other warm desert shrub, sagebrush, and shadscale communities at 1525 to 1830 m in Beaver, Juab, Millard, Sevier, Tooele (type from Stansbury Island) and Washington counties; Arizona, Nevada, California, and Oregon; 8 (i). This plant has evidently suffered great reduction of range since it was initially taken in Utah in 1850. The plants are small and difficult to see among other vegetation, and that might account, in part, for the paucity of modern records.

Besseyia Rydb.

Plants subscapose, herbaceous perennials; basal leaves well developed, petiolate, the blades rounded to cordate or cuneate to truncate, crenate-serrate; cauline leaves bracteate, sessile, much smaller than the basal, alternate; inflorescence a terminal, dense spike; sepals 2–4, distinct or united; corolla vestigial or present and bilabiate, colored; stamens 2; stigma capitate; capsule loculicidal; seeds numerous, flat.

- 1. Corolla present, violet purple; filaments inconspicuously colored, southeastern Utah *B. alpina*
- Corolla lacking, filaments conspicuously colored, Uinta and Raft River mts. *B. wyomingensis*

Besseyia alpina (Gray) Rydb. Alpine Kittenails. [*Synthyris alpina* Gray]. Subscapose perennial herbs, 0.5–2

dm tall; stems simple, erect; herbage woolly to glabrate; basal leaves petiolate, the petiole 1–1.5 cm long, blades 3–5 cm long, 1.5–4 cm wide, elliptic to ovate, crenate; cauline leaves alternate, bracteate, sessile; inflorescence dense, villous, the bracts spatulate to obovate; sepals 4, 4–6 mm long, white-villous; corolla violet to purple, 5–8 mm long; filaments inconspicuously colored; capsule 3–5 mm long, orbicular, the style 3–4 mm long; seeds flat, orbicular, 1–1.5 mm long. Moist rocky alpine meadows 3290 to 3660 m in the La Sal Mts., Grand and San Juan counties; Colorado, New Mexico, and Wyoming; 2 (i).

Besseyia wyomingensis (A. Nels.) Rydb. Wyoming Kittenails. [*Synthyris wyomingensis* Heller]. Subscapose perennial herb, 1–2.5 dm tall; stems simple, erect; herbage woolly to glabrate; basal leaves long petiolate, the blade 2.5–11.5 cm long, 1.5–5 cm wide, broadly lanceolate to ovate, crenate to serrate; cauline leaves much reduced, bracteate, alternate, sessile to short-petiolate; inflorescence dense, subspicate, villous, calyx 3–5 mm long, 2 or sometimes 3-lobed; corolla lacking; filaments violet or purple, 5–10 mm long; capsule 3.5–6 mm long, the style 4–6.5 mm long; seeds 1–1.5 mm long, flat, orbicular. Moist open areas on high ridges and in meadow areas, 2684 to 3355 m in Box Elder (Raft River Mts.) and Duchesne (Uinta Mts.) counties; north in the Rocky Mts. to British Columbia, east to South Dakota; 7(ii).

Castilleja Mutis ex L. f.

Perennial or rarely annual herbaceous plants; stems usually several, erect or decumbent; leaves alternate, entire or pinnately divided, sessile, all cauline; inflorescence of terminal spikes, these prominently bracteate; calyx 4-cleft, tubular, variously colored; corolla narrowly tubular, bilabiate, upper lip (galea) beaklike, its lobes united to the apex and enclosing the anthers, the lower lip 3-toothed; stamens 4, didynamous; stigma capitate, entire or 2-lobed; capsule loculicidal; seeds numerous.

- 1. Plants annual, growing in alkaline meadows, seeps, springs, and marshes, usually in the valleys, stems mostly erect, solitary; leaves and bracts all entire, linear-lanceolate, the upper 1/3–1/2 of the bracts red *C. exilis*
- Plants perennial growing in various habitats; stems usually 2 or more in a cluster, often decumbent to ascending or erect; leaves and bracts various 2
- 2(1). Plants low with decumbent to ascending stems 3–9 cm long; corolla short, 9–14 mm long, the lobes small, yellow to pink tipped, plants of the Deep Creek Mts. above 3050 m *C. nana*
- Plants larger or, if small, with erect stems and larger corollas; corolla 1.3–4.3 cm long, the lobes mostly showy and variously colored 3
- 3(2). Calyx divided more deeply below than above 4
- Calyx equally or subequally divided above and below 5
- 4(3). Inflorescence mostly yellow, rarely reddish; corolla 15–22 mm long *C. flava*
- Inflorescence mostly red to orange red, rarely yellow; corolla 2.5–5.2 cm long *C. linarifolia*
- 5(3). Inflorescence predominantly yellow (rarely tinged with purple in *C. occidentalis*) or yellow-green 6
- Inflorescence rarely yellow, typically pink, orange yellow, red to scarlet or crimson 10
- 6(5). Upper leaves and bracts deeply divided 7

- Leaves and bracts mostly entire or only shallowly divided near the apex 8
- 7(6). Inflorescence hispid-villous, yellow or white; lateral leaf lobes 1 mm wide or more *C. angustifolia*
- Inflorescence viscid-villous, sometimes tinged with purple *C. pulchella*
- 8(6). Stems decumbent to ascending, 2.2 dm tall or less; inflorescence often tinged with purple; plants from the La Sal Mts. above timberline at 3264 to 3599 m *C. occidentalis*
- Stems erect, mostly taller than 2 dm; inflorescence yellow, not tinged with purple; mostly below timberline in meadows and open areas in conifer or conifer-aspen communities 9
- 9(8). Plants with 1 to few stems; 1.2–2.6 dm tall; leaves linear, appressed-ascending; plants of Garfield County *C. aquariensis*
- Plants with few to several stems, 1.5–6.8 dm tall; leaves linear to lance-ovate, appressed to spreading; plants of the La Sal Mts., Wasatch Plateau, and northward *C. rhexifolia*
- 10(5). Lower portion of the stems devoid of chlorophyll and with bracteate leaves; stems 0.5–2.2 dm tall; upper portion of the corolla (galea) often completely exerted from the calyx *C. scabrada*
- Stems green and the leaves mostly well-developed; galea equaling the calyx or slightly longer or, if well exerted, the plants well over 2.2 dm tall 11
- 11(10). Leaves (at least the upper) deeply cleft into linear, spreading lobes; herbage hispid to glandular pubescent; calyx a little more deeply cut in back than in front 12
- Leaves entire or the upper leaves sometimes shallowly lobed at the tip; herbage glabrous to puberulent or villous above 14
- 12(11). Plants glandular-pubescent; leaves wavy-margined *C. applegatei*
- Plants finely puberulent to hispid-villous, rarely glandular; leaves not wavy-margined 13
- 13(12). Inflorescence orange to yellow orange or whitish, rarely yellow or red; western Utah; Millard County northward to Box Elder County *C. angustifolia*
- Inflorescence orange red to bright red, rarely yellow; throughout the state, except infrequently in western Utah *C. chromosa*
- 14(11). Galea 5–8 mm long, stems 0.9–2.1 dm long; southwestern central Utah *C. parvula*
- Galea 8–18 mm long, stems mostly over 2.1 dm long 15
- 15(14). Bracts lanceolate to ovate, shallowly lobed, magenta or purple, rarely red; galea 8–12 mm long *C. rhexifolia*
- Bracts narrowly lanceolate to lanceolate, mostly divided to below the middle, red, or reddish-orange; galea 1.2–1.8 cm long *C. miniata*

Castilleja angustifolia (Nutt.) G. Don [*Euchroma angustifolia* Nutt.]. Herbaceous perennial, 0.6–3.4 dm tall; stems erect, mostly in clusters; herbage hispid-villous; leaves 1–5 cm long, the lower usually entire, linear to lanceolate, the upper leaves with 1 or 2 pair of lateral lobes; inflorescence villous-hispid, yellow, yellow orange, white, or pink; bracts lanceolate, mostly with 1 or 2 pairs of lateral lobes; calyx 1.4–2.3 cm long, unequally cleft; corolla 1.4–2.7 cm long, the galea 7–13 mm long,

the tube 7–17 mm long; capsule 8–14 mm long. Sagebrush and pinyon-juniper communities at 1400 to 3050 m in Beaver, Box Elder Iron, Juab, Millard, and Tooele counties; adjacent Nevada, Idaho, Wyoming, Oregon, and Montana; 38 (i). Our plants belong to var. *flavescens* (Pennell) N. Holmgren [*C. flavescens* Pennell ex Edwin], which is morphologically similar to *C. chromosa* A. Nels.

Castilleja applegatei Fern. Wavy-leaf Paintbrush. Herbaceous perennial; 0.7–3.3 dm tall; stems clustered, erect or ascending from a woody caudex, glandular-villous, sometimes hirsute; leaves glandular-puberulent, usually wavy-margined, the lower mostly entire, linear-lanceolate, upper usually with a pair of lateral lobes 1–4.5 cm long; inflorescence pale red to bright red, ours rarely yellowish; bracts deeply 3- to 5-parted, glandular-villous; calyx 1.5–2.3 cm long, deeply and subequally cleft; corolla 1.3–3.2 cm long, galea equaling to or slightly shorter than the tube, pubescent; capsule 6–14 mm long, finely pubescent; 2n = 24. Dry mountain ridges to subalpine slopes and meadows 2440 to 3416 m in Box Elder, Cache, Duchesne, Salt Lake, Sanpete, Summit, Tooele, Uintah, Utah, and Wasatch counties; Oregon, California, Idaho, Wyoming and Nevada; 60 (iv). Our plants belong to var. *viscida* (Rydb.) Ownbey [*C. viscida* Rydb.], type from Big Cottonwood Canyon, Salt Lake County].

Castilleja aquariensis N. Holmgren Aquarius Plateau Paintbrush. Herbaceous perennial, 1.2–2.6 dm tall; stems erect, unbranched, 1 to several, pubescence short, irregular in length, often blue purple; leaves 1–4.5 cm long, 1–5 mm wide, linear-lanceolate, finely and evenly pubescent, mostly cauline and longer than the internodes; inflorescence villous-glandular, pale yellow; bracts broadly lanceolate to ovate, lower ones entire, upper with 1–2 pair of short lateral lobes near the apex; calyx 1.5–1.8 cm long, subequally cleft, deeper in front than the back; corolla 1.3–1.6 cm long, the galea 5–8 mm long; capsule 7–10 mm long; seeds ca 100. Sagebrush-mixed forb meadow openings in spruce-fir stands at 2985 to 3355 m on the Aquarius Plateau (type locality), Garfield County; endemic; 19 (v).

Castilleja chromosa A. Nels. Common Paintbrush. [*C. collina* A. Nels.; *C. angustifolia* (f.) *collina* Garrett]. Herbaceous perennial, 1–5.5 dm tall; stems clustered, ascending to erect, finely puberulent and hispid; leaves puberulent and hispid, lower ones linear-lanceolate, mostly entire, upper with 1–3 pair of lateral lobes; inflorescence villous to hispid; bright red to orange red, sometimes yellowish; calyx 1.5–2.7 cm long, the primary lobes subequally cleft and divided into 1–4 mm long acute to rounded segments; corolla 2–3.6 cm long, galea 9–18 mm long and equaling the tube in length, the lower lip much reduced; capsule 9–18 mm long; 2n = 12, 24. Creosote bush, blackbrush, sagebrush, and pinyon-juniper communities at 915 to 2610 m throughout Utah; Arizona, New Mexico, and Colorado, north to Wyoming, west to Oregon, California, and Nevada; 288 (xiv). This species is closely related to *C. angustifolia*, particularly var. *flavescens*, which occurs in western Utah.

Castilleja exilis A. Nels. Annual Paintbrush. [*C. minor* misapplied, not (Gray) Gray]. Annual, 1.9–9 dm tall; herbage glandular-pilose; stems erect, usually single and unbranched, sometimes branched above; leaves linear-lanceolate, attenuate, entire, 3–9.5 cm long; inflorescence a narrow raceme, greatly elongated in fruit, the

Castilleja pulchella Rydb. Pretty Paintbrush. Herbaceous perennial, 0.5–1.4 dm tall; stems clustered, decumbent to erect, simple, viscid-villous; leaves 0.5–4 cm long, the lower usually linear-lanceolate, entire, the middle and upper leaves often 3-lobed, glandular-pubescent; inflorescence relatively short and broad, viscid-villous and puberulent, mostly yellowish, rarely purplish (in ours); bracts broader than the leaves, lanceolate to ovate, usually with a pair of lateral lobes; calyx yellow green, 1.5–2 cm long, deeply and subequally cleft above and below; corolla 1.7–2.3 cm long, the galea shorter than the tube; capsule 7–12 mm long; n = 12. Rocky alpine tundra and fell fields at 3355 to 3800 m in the Uinta Mts., Daggett, Duchesne, Summit, and Uintah counties; Wyoming, Montana, and Idaho; 16 (ii).

Castilleja rhexifolia Rydb. Rhexia-leaved Paintbrush. [*C. leonardii* Rydb., type from American Fork Canyon]. Herbaceous perennial, 1.2–8.2 cm tall; stems mostly erect, or sometimes ascending from a woody base, occasionally branched above, few to several per plant, glabrous or retrorsely puberulent and villous; leaves 2–7 cm long, entire, linear-lanceolate, or sometimes broader, glabrous to puberulent; inflorescence conspicuous, short and dense, villous, sometimes viscid, purple to crimson, rarely yellow; bracts lanceolate to ovate, entire or shallowly lobed near the tip; calyx 1.5–2.5 cm long, subequally cleft; corolla 1.5–3.5 cm long, the galea shorter than the tube; capsule 10–12 mm long; 2n = 12, 24, 48. Two varieties, differing largely in flower color, are present in Utah.

- 1. Inflorescence yellow, rarely suffused with other colors *C. rhexifolia* var. *sulphurea*
- Inflorescence violet, red purple, purple, dark red; plants transitional to the above variety *C. rhexifolia* var. *rhexifolia*

Var. *rhexifolia* Moist alpine or subalpine meadows and slopes or open aspen-conifer communities at 2135 to 3660 m in Box Elder, Cache, Carbon, Daggett, Davis, Duchesne, Emery, Grand, Juab, Morgan, Salt Lake, San Juan, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, and Weber counties; Canada, south to New Mexico and Oregon; 106 (ii).

Var. *sulphurea* (Rydb.) Atwood [*C. sulphurea* Rydb.; *C. septentrionalis* authors, not Lindl.]. Meadows and openings in aspen and conifer communities or with sagebrush at 2070 to 3175 m in Cache, Carbon, Daggett, Duchesne, Emery, Grand, Juab, San Juan, Sanpete, Summit, Tooele, Uintah, Utah, and Wasatch counties; New Mexico, Colorado, Idaho, Montana, and Canada; 79 (xi). This variety is allied with and not always easily segregated from *C. occidentalis* Torr., with which it is sympatric in the La Sal Mts.

Castilleja scabrida Eastw. Eastwood Paintbrush. Herbaceous perennial, 0.5–2.2 (2.7) dm tall; stems from a woody caudex, erect to decumbent, several per plant, cinereous-hirsute, the hairs spreading to reflexed, the lower portion devoid of chlorophyll and with bracteate leaves; leaves 1.5–4 cm long, linear to lanceolate or the upper deeply 3- to 5-lobed; inflorescence conspicuous, hirsute to villous, mostly bright red or orange red, rarely yellow; bracts deeply lobed, the lower leaflike; calyx 1.8–2.8 cm long, unequally cleft, the lobes lanceolate, acute; corolla 2.3–4.3 cm long, the galea 0.9–2.0 cm long and mostly exerted from the calyx, the stigma and upper

part of the style exerted from the tip of the galea; capsule 1–1.5 cm long; n = 12. Two varieties are recognized as follows:

- 1. Plants from western Utah in Beaver and Millard counties; limestone gravels and rock crevices; stems often purplish, moderately pubescent *C. scabrida* var. *barnebyana*
- Plants from southern, east central, and eastern Utah; sandy soils, all sandstones, rarely on clay soils; stems greenish, densely pubescent *C. scabrida* var. *scabrida*

Var. *barnebyana* (Eastw.) N. Holmgren [*C. barnebyana* Eastw.]. Gravelly, rocky ridges, slopes, and rock crevices of rhyolite and dolomite limestone, in mountain brush, pinyon-juniper, and black sagebrush communities at 1890 to 2565 m in Beaver, Juab, and Millard counties; Nevada; 10 (0).

Var. *scabrida* [*C. scabrida* Eastw.; *C. zionis* Eastw., type from Zion National Park]. This is the common phase of the species which probably grows on most of the sandstone formations or sandy soils south and east of the Wasatch Mts., in pinyon-juniper, sagebrush, mountain brush, and ponderosa pine communities at 1340 to 2535 m in Carbon, Duchesne, Emery, Garfield, Grand, Kane, San Juan, Sevier, Uintah, Washington, and Wayne counties; Colorado and New Mexico; 99 (vi).

Collinsia Nutt.

Herbaceous annual; stems erect, leaves opposite or partly whorled, entire to crenate or toothed; inflorescence racemose, flowers solitary to several in the axils of the upper leaves; calyx with 5 subequal lobes; corolla bilabiate, white to pale blue, upper lip 2-lobed, lower lip 3-lobed, the tube keeled-saccate; stamens 4 in 2 pairs, unequally inserted in the corolla tube; staminode gland-like; stigma capitate or slightly 2-lobed; capsule 4-valved, the walls thin.

Collinsia parviflora Dougl. Blue-eyed Mary. Plants (1) 5–9 (23) cm tall; stems simple or branched, ascending to erect, glabrous to puberulent below and glandular above; leaves 1–3.5 cm long, entire, the upper sometimes whorled, sessile to clasping, the lower small, petiolate, orbicular; flowers long-pedicellate, the upper 2–7 per cluster, the lower often solitary in the axils; calyx 3–7 mm long, the slender lobes longer than the tube; corolla 4–7 mm long, blue with a white upper lip, the tube gibbous dorsally near the base; capsule 3–5 mm long, ellipsoid; seeds brown, 2 per locule; n = 7, 14. Dry foothills to moderately moist areas from sagebrush, pinyon-juniper, oak-maple, and conifer communities at 1250 to 2745 m in all Utah counties except Kane, Morgan, Piute, Rich, and Wayne; New Mexico, Arizona, and California, north to Alaska and Canada; 98 (vi).

Cordylanthus Nutt. ex Benth.

Cauliscent annual herbs; stems single, erect, mostly branched; leaves deeply 3- to 5-parted or entire, alternate, all cauline; inflorescence spicate, or flowers sometimes solitary, the bracts foliose; calyx cleft to the base (or nearly so) forming dorsal and ventral segments; corolla bilabiate, tubular, the upper lip narrow, forming a head which encloses the anthers, lower entire to 3-lobed; fertile stamens 2 or 4, in pairs, anthers unequal, the outer attached at its middle, the inner at the apex, sometimes reduced or obsolete; style swollen and hooked near the

tip; capsule loculicidal, glabrous. A genus of 20–25 species, native to western North America.

Chuang, T. I. and L. R. Heckard. 1986. Systematics and evolution of *Cordylanthus* (Scrophulariaceae-Pediculariaceae) (including the taxonomy of Subgenus *Cordylanthus*). Systematic Botany Monogr. 10: 1–105.

1. Leaves all entire, narrowly lanceolate to more broadly so; plants of alkaline areas *C. maritimus*
- Leaves (some or all) deeply divided and mostly filiform or linear; plants not in alkaline areas 2
- 2(1). Stamens 2; filaments glabrous; plants of northeastern Nevada and southwestern Idaho; expected for northern and western Box Elder County, Utah in sagebrush and pinyon-juniper areas *C. capitatus* Nutt. ex Benth.
- Stamens 4; filaments puberulent to villous 3
- 3(2). Plants cinereous-puberulent; veins of the bracts and calyx prominent, raised, the pubescence often forming parallel lines; outer bracts subtending each flower; plants of northern Utah *C. ramosus*
- Plants glabrous to finely glandular or glandular villous; veins of the bracts evident but not raised and prominent, the pubescence evenly distributed 4
- 4(3). Plants glabrous to finely glandular, the hairs short, 0.1 mm long; southeastern Utah from Emery and Grand counties south *C. wrightii*
- Plants densely glandular or glandular villous, the hairs longer than 0.1 mm; plants of southwestern, northwest central, or northeastern Utah 5
- 5(4). Calyx 1.2–1.6 cm long; corolla 1.3–1.9 cm long; inner bracts entire; plants of southwestern Utah and Kane and Garfield counties *C. parviflorus*
- Calyx 1.5–2.5 cm long; corolla 1.5–2.7 cm long; inner bracts divided; southern Millard County, southwestern Utah and northeast central and northeastern Utah *C. kingii*

***Cordylanthus kingii* Wats.** King Birdsbeak. [*Adenostegia kingii* (Wats.) Greene]. Plants 4–25 (40) cm tall; stems diffusely branched, glandular-pubescent; leaves 1.5–4 cm long, entire or more commonly pinnately 3– to 5-lobed, the divisions filiform; inflorescence a capitate spike; flowers sessile; bracts leaflike, the outer (when present) subtending the spike and mostly 3– to 5-lobed, the inner bracts subtending each flower 3– to 7-lobed or the upper bracts sometimes entire, violet to purple; calyx 1.5–2.7 cm long, bidentate, narrowly lanceolate; corolla 1.5–2.7 cm long, the lower lip purple, upper one violet, retrorsely villous; stamens 4, unequally 2-loculed, the filaments puberulent. Two weakly separable and possible negligible taxa are present in Utah:

1. Central inflorescence compact, typically with more than 8 flowers and 4–5 cm long; plants of Carbon, Duchesne, Emery, and Uintah counties *C. kingii* var. *densiflorus*
- Central inflorescence not especially compact, typically with 8 or fewer flowers and mainly less than 4 cm long; plants of Garfield, Iron, Kane, and Washington counties *C. kingii* var. *kingii*

Var. *densiflorus* (Chuang & Heckard) Atwood stat. nov. [based on: *Cordylanthus kingii* ssp. *densiflorus* Chuang & Heckard Syst. Bot. Monogr. 10: 81. 1986]. Salt desert shrub, sagebrush, bitterbrush, pinyon-juniper, and Douglas fir communities at 1525 to 2320 m in Carbon, Duchesne, Emery, and Uintah counties; endemic; 32 (ii).

Var. *kingii* Black sagebrush, rabbitbrush, winterfat, big sagebrush, pinyon-juniper, and ponderosa pine communities at 1250 to 2380 m in Iron, Kane, Millard, and Washington counties; Nevada; 9 (ii).

***Cordylanthus maritimus* Nutt. ex Benth.** Alkali Birdsbeak. [*Adenostegia maritima* Greene; *C. parryi* Wats. in Parry, type from St. George; *C. maritimus* var. *parryi* (Wats.) Jepson]. Plants (6) 1–25 (34) cm tall; stems branched, corymbose, glabrate to viscid-villous; leaves 1–22 (3) cm long, lanceolate, entire, viscid-villous to glabrous with age; inflorescence a spike; bracts foliose, each subtending a flower, all entire; calyx 1.3–1.9 cm long, lanceolate, bidentate, broader than the leaves; corolla 18–20 mm long, the tips unequal, lower lip pale with purple lines, upper lip (galea) yellow; stamens 4, unequally 2-loculed, the filaments glabrous to puberulent; $n = 15$. Alkaline flats and meadows at 835 to 1465 m in Box Elder, Juab, Millard, Salt Lake, Tooele, Utah, Washington, and Weber counties; Oregon, California, and Nevada; 14 (0). Our plants belong to var. *canescens* (Gray) Jepson [*C. canescens* Gray; *C. maritimus* ssp. *canescens* (Gray) Chuang & Heckard].

***Cordylanthus parviflorus* (Ferris) Wiggins** Small-flower Birdsbeak. [*Adenostegia parviflorus* Ferris]. Plants 11–25 (45) cm tall; stems branched, glandular and often purple; leaves 0.5–1.8 (3.2) cm long, the lower mostly 3-lobed, upper linear, entire, glandular; inflorescence a globular spike, this 1– to 2-flowered and terminal on each branch; outer bracts subtending the flower cluster, 3-lobed, the inner bracts subtending each flower and entire; calyx 12–16 mm long, entire to slightly bidentate, narrowly lanceolate; corolla 1.3–1.9 cm long, pink to violet, upper lip (galea) longer than the lower lip, lower lip with reflexed lobes and a yellow tip; stamens 4, unequally 2-loculed, the filaments villous. Warm desert shrub, blackbrush, sagebrush, and pinyon-juniper communities at 975 to 2135 m in Beaver, Garfield, Iron, Juab, Kane, and Washington counties; Nevada and California; 15 (iii).

***Cordylanthus ramosus* Nutt. ex Benth.** Branched Birdsbeak. [*Adenostegia ramosa* Greene]. Plants 8–27 (35) cm tall; stems much branched, cinereous-puberulent; leaves 1–3.5 (4.5) cm long, entire or more commonly dissected into filiform segments, cinereous-puberulent; inflorescence in headlike spikes, 1– to 5-flowered; bracts foliose, 5– to 7-lobed, subtending each flower; calyx 1.0–1.7 cm long, entire or slightly bidentate; corolla 10–21 mm long, dull yellow or the lower lip purplish; stamens 4, unequally 2-loculed, the filaments villous. Sagebrush, juniper, and pinyon-juniper communities at 965 to 2505 m in Box Elder, Cache, Daggett, Duchesne, Morgan, Rich, Salt Lake, Summit, Uintah, and Wasatch counties; Colorado to Montana, Idaho, and California; 23 (iii).

***Cordylanthus wrightii* Gray** Wright Birdsbeak. [*Adenostegia wrightii* (Gray) Greene]. Plants 13–35 (51) cm tall; stems much branched, finely glandular, rarely retrorsely puberulent; leaves 1–2.7 (3.5) cm long, entire or 3– to 5-lobed into filiform divisions; inflorescence in capitate spikes, flowers rarely solitary; outer bracts subtending each spike 3– to 5-lobed, inner bracts subtending each flower, mostly entire or 3– to 5-lobed; calyx 16–21 mm long, linear to lanceolate, shallowly cleft to entire; corolla 15–27 mm long, the lips subequal, yellow to purple, sparsely villous; stamens 4, unequally

2-loculed, the filaments villous; $n = 13$. Sagebrush, Van-
cleva, juniper, and piñon-juniper communities, often
in sandy soils, at 1125 to 2135 m in Emery, Garfield,
Grand, Kane, San Juan, and Wayne counties; Colorado,
New Mexico, and Arizona; Mexico; 24 (viii).

Digitalis L.

Biennial (perennial) herbs; stems erect, typically sim-
ple; leaves alternate, simple, petiolate (at least below);
flowers in terminal, bracteate, usually secund racemes;
calyx 5-lobed, much shorter than the corolla tube; corolla
ampliate, constricted at the base, the throat open; limb
more or less 2-lipped, the lips erect to somewhat spread-
ing, the upper shorter than the lower; stamens 4; capsule
ovoid; seeds numerous.

Digitalis purpurea L. Foxglove. Herbs mainly 6–12
dm tall, typically lanate; basal leaves long-petiolate, the
blades 8–20 cm long and 4–9 cm wide or more, lanceolate
to ovate or elliptic, obtuse to attenuate apically, tapering
basally to the broadly winged petiole, the margin serrate
to crenate-serrate, white tomentose below, puberulent
and green above; racemes simple or less commonly
branched, mainly 1–3 dm long; pedicels shorter than the
calyx; calyx lobes ovate-lanceolate; corolla 4–6 cm long,
purple, pink, or white, usually spotted within and on the
lower lip; capsule subequal to the calyx. Rather com-
monly grown ornamental in lower elevation portions of
Utah; introduced from Europe; 1 (0).

Gratiola L.

Small annual herbs; stems simple or branched; leaves
opposite, sessile, entire or toothed, lanceolate to ovate;
flowers, long pedicellate, solitary or paired in the leaf
axils; calyx of 5 more or less distinct segments, subtended
by 2 bractlets; corolla tubular, bilabiate, the upper lip
entire or shallowly lobed, the lower 3-lobed; fertile stamens
2, included, the others wanting or merely a vestigial
pair of filaments near the base of the corolla tube, the
anther sacs separated by a broad connective; stigmas 2,
flattened; capsule dehiscing by four valves.

Gratiola neglecta Torr. Common Hedge-hyssop. An-
nual, with fibrous roots, 5–20 cm tall, glandular, at least
above; stems erect or diffuse, simple or branched; leaves
1–5 cm long, linear to oblong, entire or finely toothed
above, sessile; pedicels 8–22 mm long; calyx 3.2–5.5 mm
long (up to 7 mm long in fruit), the lobes subequal, united
basally; corolla 7–12 mm long, the tube yellow, the limb
white to pale colored; stamens included. Stream and
pond margins, often rooting in mud, in Cache County;
Canada, south to California, east to Alabama and Georgia;
1 (0).

Limosella L.

Herbaceous, scapose, aquatic or semi-aquatic,
glabrous, perennial; leaves mostly long-petiolate, the
blades narrow, entire, elliptic to spatulate; flowers small,
solitary on the peduncles; calyx campanulate, with 5
equal lobes; corolla rotate-campanulate, white or pinkish,
essentially regular, 5-lobed, the lobes shorter than the
tube; stamens 4, nearly equal, the anthers confluent;
stigmas united, capitate.

Limosella aquatica L. Diminutive, caespitose, usually
stoloniferous, scapose, glabrous perennials; leaves 0.4–
2.3 cm long, elliptic, entire, long-petiolate; petioles to 9

cm long; scapes slender, bearing a single flower; peduncle
1–5.3 cm long, shorter than the leaves; calyx 1–3 mm
long, campanulate, the lobes triangular, equal; corolla
2.5–4 mm long, white to pink, regular or nearly so;
stamens 4 with flattened filaments; stigma capitate; $2n =$
40. Muddy flats and shallow water of seeps, ponds, lakes,
and streams at 1370 to 3050 m in Beaver, Cache, Daggett,
Davis, Duchesne, Garfield, Grand, Kane, Millard, Mor-
gan, Rich, Salt Lake, Sevier, Uintah, Utah, Wasatch, and
Washington counties; Alaska to Newfoundland, south in
much of the U. S.; circumboreal; South America; 23 (i).

Linaria Miller

Annual or perennial, herbs; stems erect, leafy, simple
or branched; leaves alternate (the lower sometimes oppo-
site), entire, sessile; inflorescence of terminal racemes;
calyx of 5 more or less distinct sepals; corolla yellow, blue
or white, strongly bilabiate, the tube spurred ventrally;
stamens 4, didynamous, included; stigmas capitate,
united.

- 1. Plants annual; corolla blue or whitish *L. canadensis*
- Plants perennial; corolla yellow 2
- 2(1). Stem leaves cordate clasping, broad, over 6 mm wide;
calyx 6–8 mm long (9–13 mm in fruit) *L. dalmatica*
- Stems leaves not cordate clasping, narrow, less than 6
mm wide; calyx 3.5–5 mm long *L. vulgaris*

Linaria canadensis (L.) Dum.-Cours. Blue Toadflax.
[*Linaria texana* Scheele]. Slender annual from a taproot;
stems 1–5 dm tall, glabrous, erect or with prostrate stems
present; leaves of erect (main) stems 1–3 cm long, alter-
nate, linear, those on short basal stems opposite or
whorled, wider; flowers in slender glabrous to glandular
pubescent racemes; calyx 2.8–3.4 mm long, the lobes
broadly lanceolate; corolla 7–13 mm long, exclusive of the
5–11 mm long spur, bilabiate, light blue with paler palate;
capsule 2.7–3.5 mm long, subglobose. Creosote bush and
mesquite communities at 610 to 1650 m in Washington
County (?); British Columbia to Quebec, south to Mexico;
0 (0). This species is not definitely known to occur in Utah,
but is to be expected.

Linaria dalmatica (L.) Miller Dalmation Toadflax. [*Antirrhinum dalmaticum* L.; *L. genistifolia* ssp. *dalmatica* (L.) Maire & Petit]. Herbaceous perennial, from horizon-
tal rootstocks; stems stout, 3.2–11.7 dm tall, branched
above, glabrous and glaucous; leaves 1.4–3.2 (5) cm long,
ovate or ovate-lanceolate, sessile, cordate-clasping be-
low, crowded, alternate, entire; calyx 6–8 mm long, 9–13
mm in fruit; sepals subequal, lanceolate, acute; corolla
1.2–2.3 cm long, yellow, spurred, the spur 1–1.7 cm
long, the palate bearded, the hairs white to orange; cap-
sule 6–7 mm long, subglobose; $2n = 12$. Oak, aspen,
sagebrush, mountain brush, and riparian communities at
1340 to 3050 m in Beaver, Cache, Emery, Garfield,
Grand, Rich, Salt Lake, Summit, Uintah Utah, and
Wasatch counties; sporadic in the U. S.; introduced from
Europe; 33 (0). The species was evidently introduced as
an ornamental in Provo Canyon in the 1930's.

Linaria vulgaris Hill Butter-and-eggs. [*Antirrhinum linaria* L.; *L. linaria* Karsten]. Herbaceous perennial
from creeping roots; stems 2.5–6.8 dm tall, glabrous;
leaves 2–4.5 (5.5) cm long, narrow, linear to narrowly
lanceolate, mostly alternate; racemes dense in flower,
elongating in fruit; calyx 3.5–5 mm long; corolla 13–17

mm long, bright yellow, with a bearded orange palate, the spur 10–12 mm long, mostly straight; capsule 5–9 mm long, subglobose; 2n = 12. Waste places, pastures, and roadsides at 1950 to 2810 m in Duchesne, Garfield, Millard, Piute, Salt Lake, Sanpete, Summit, Wasatch, Wayne, and Weber counties; scattered over temperate North America; native of Eurasia; 9 (i).

Maurandya Ortega

Perennial herbs; stems twining or climbing; leaves alternate, petiolate, coarsely toothed to hastately lobed; calyx 5-parted; corolla gibbous or saccate basally, bilabiate, usually with internal plaits, with a palate; stamens 4, didynamous; filaments with 2 rows of tackshaped glands; capsule scarcely oblique, irregularly dehiscent; seeds oblong in outline, with irregular corky ridges and tubercles.

Maurandya antirrhiniflora Humb. & Bonpl. ex Willd. [*Antirrhinum maurandioides* Gray]. Stems mainly 2–8 dm long, typically much branched from the base, twining and clambering, glabrous; leaves triangular, hastate to 5-lobed, mainly 1–2.5 dm long, on long flexuous petioles; flowers solitary, axillary, on slender pedicels to 2 cm long; calyx 10–12 mm long; corolla 25–30 mm long, the tube pale, the lobes pink purple to purple, the palate yellowish or whitish, with dark lines, hairy; stamens 17–19 mm long; capsules 7–8 mm long, subglobose; seeds ca 1 mm long. Warm desert shrub community at ca 700 to 900 m in Washington County; California to Texas; Mexico; 2 (0). Evidently the species has not been collected in Utah since taken by C. C. Parry near St. George in the 1870's.

Mimetanthe Greene

Herbaceous annual with long villous hairs; leaves narrow, opposite, sessile; inflorescence racemose, flowers in the axils of the opposite foliose bracts, in pairs on long ebracteate pedicels; calyx not angled, somewhat 5-sulcate, deeply cleft; corolla small, yellow, bilabiate, upper lobes external in bud; stamens 4, didynamous, the lower pair tending to be reduced or wanting; stigmas distinct; capsule loculicidal, membranous, glandular-puberulent.

Mimetanthe pilosa (Benth.) Greene Hairy Mimetanthe. [*Herpestis pilosa* Benth.; *Minulus pilosus* (Benth.) Wats.]. Small herbaceous, unpleasantly scented annuals 6–32 cm tall; stems erect, simple or much-branched, glandular and spreading villous; leaves mostly entire, sessile, 1.2–3.5 (4.9) cm long, narrowly elliptic to oblanceolate; calyx 5–8 mm long, unequal, upper lobe the longest; corolla 5–10 mm long, yellow, usually with maroon dots on the palate, long pedicellate, the pedicel 9–20 mm long; capsule finely glandular, 5–7 mm long. Sandy and gravelly wet soils at 760 to 1740 m in Iron, Kane, and Washington counties; Arizona, east to Baja California, north to Washington; 9 (ii).

Minulus L.

Annual or perennial herbs; stems leafy, glabrous to more often glandular-pubescent or pilose; leaves opposite or basal, entire to dentate, sessile or petioled; inflorescence of solitary axillary flowers or in leafy terminal racemes; calyx strongly 5-angled, tubular or campanulate, the lobes shorter than the tube; corolla mostly yellow,

but also blue or red to purple, bilabiate to nearly regular, 5-lobed, the tube funnelliform to cylindrical; stamens 4, in pairs, all fertile; stigmas mostly distinct, lamelliform; capsule loculicidal, membranous to coriaceous, glabrous.

- 1. Flowers long-pedicellate, the pedicels longer than the calyx, caducous 2
- Flowers with short pedicels up to as long as the calyx, marcescent 12
- 2(1). Corolla large, 3.3–6 cm long, scarlet, red to pink or violet 3
- Corolla mostly less than 3 cm long, yellow 5
- 3(2). Stems prostrate with leafy stolons; corolla crimson or red; pedicels mostly 1–2.5 cm long (4 cm); plants of southeastern Utah *M. eastwoodiae*
- Stems erect or decumbent, rhizomatous; corolla scarlet, pink or magenta to violet; pedicels 3–10 cm long; plants of southwestern or northern Utah 4
- 4(3). Stigma and anthers exerted; corolla scarlet; plants of Washington County *M. cardinalis*
- Stigma and anthers included; corolla pink to rose red; plants of northern Utah *M. lewisii*
- 5(2). Calyx lobes distinctly unequal, the upper lobe much longer; fruiting calyx strongly inflated 6
- Calyx lobes more or less equal, not strongly inflated in fruit, cylindrical to campanulate 8
- 6(5). Corolla throat open; lateral and lower calyx lobes blunt and relatively short or nearly obsolete; corolla 10–20 mm long *M. glabratus*
- Corolla throat closed by the well-developed palate; lateral and lower calyx teeth more or less acute; corolla 9–30 mm long 7
- 7(6). Stems mostly 1- to 5-flowered; corolla mostly over 2 cm long; plants usually at middle or lower elevations *M. guttatus*
- Stems often over 5-flowered; corolla mostly less than 2 cm long; plants mostly above 2440 m elevation *M. tilingii*
- 8(5). Corolla 14–25 mm long; plants perennial 9
- Corolla mostly less than 14 mm long; plants annual .. 10
- 9(8). Leaves palmately veined, crowded at or near the base; pedicels 4–7 times longer than the flowers; plants of southwestern Utah *M. primuloides*
- Leaves pinnately veined; plants leafy stemmed; pedicels 2–3 times longer than the flowers; plants of northcentral and eastern Utah *M. moschatus*
- 10(8). Leaves petiolate, ovate to lanceolate ... *M. floribundus*
- Leaves sessile (at least above), linear to narrowly lanceolate 11
- 11(10). Plants compressed, much branched, the internodes shorter than the leaves; fruiting pedicels widely spreading, sigmoid, 2–7 mm long *M. suksdorfii*
- Plants open, simple or few-branched, the internodes mostly longer than the leaves; pedicels arched, 4–16 mm long *M. rubellus*
- 12(1). Corolla small, 4–8 mm long; calyx 3.5–5 mm long; plants from Sevier and Tooele counties northward *M. breweri*
- Corollas larger, 10–23 mm long; calyx 5–12 mm long; plants of Washington County 13
- 13(12). Leaves cuspidate, ovate to nearly suborbicular, densely crowded, thick *M. spissus*

- Leaves not cuspidate and densely crowded or thick . . . 14
- 14(13). Plants glandular-viscid and villous; corolla lobes purple or violet, the tube lighter *M. bigelovii*
- Plants puberulent, corolla mostly yellow but sometimes violet *M. parryi*

Mimulus bigelovii (Gray) Gray Bigelow Monkey-flower. [*Eunanus bigelovii* Gray in Whipple]. Annual, 0.3–1 dm tall; stems simple or branched below, glabrous to finely puberulent; leaves sessile to short-petiolate, 5–10 mm long, elliptic, entire; calyx 6–9 mm long in flower, the ribs reddish, the lobes unequal; corolla 18–23 mm long, glabrous, magenta to violet, funnellform, bilabiate, the lobes subequal, the palate with yellow spots; anthers and style included. Pinyon-juniper, sagebrush, creosote bush, and Joshua tree communities at 1065 to 1525 m in Washington County (reported from the Beaver Dam Mts.); Arizona, Nevada, California, and Baja California; 0 (0).

Mimulus breweri (Greene) Cov. Brewer Monkey-flower. [*Eunanus breweri* Greene; *M. rubellus* Gray var. *breweri* (Greene) Jepson]. Annual, 2.5–11 cm long; stems simple or branched, glandular-pubescent; leaves 6–12 mm long, linear to narrowly-oblongate, sessile, entire; calyx 3.5–5 mm long; finely glandular, the lobes nearly equal, 0.5–1.5 mm long; corolla small, 4–8 mm long, persistent, violet to magenta, the lobes short, ca 1 mm long; anthers included, glabrous; capsule 5–6 mm long, oblongate. Mountain brush, ponderosa pine, aspen, Douglas fir, and alpine fir communities at 2560 to 2745 m in Box Elder, Sevier, Summit, and Tooele counties; British Columbia south to California and Nevada; 4 (0).

Mimulus cardinalis Dougl. ex Benth. Cardinal Monkey-flower. [*M. verbenaceus* Kearney & Peebles]. Perennial, 2.2–6 dm tall; stems erect or decumbent, glabrous below to viscid-villous above; leaves 4–9.5 cm long, 1.5–6 cm wide, obovate, tapering basally to a clasping base, palmately veined, irregularly toothed; calyx 2–3 cm long, glabrous to pubescent, the lobes 4–7 mm long, subequal, acuminate tipped; corolla 3.6–5 cm long, scarlet, strongly bilabiate, the tube 2.5–3.5 cm long, the palate with pale yellow hairs; pedicels 3–10 cm long; anthers and stigma exerted, the anthers hairy; capsule 12–16 cm long, oblong, acuminate; $n = 8$. Hanging gardens and margins of seeps and streams at 1250 to 1530 m in Zion National Park, Washington County; Oregon to Baja California, east to Nevada, Arizona, New Mexico, and adjacent Mexico; 6 (0). This beautiful plant flowers in springtime.

Mimulus eastwoodiae Rydb. Eastwood Monkey-flower. Perennial with leafy stolons; stems 7–3 (43) cm tall, glandular-puberulent or glandular-villous; leaves all sessile, dentate, palmately veined, the lower reduced in size, 0.5–2 cm long, fan shaped, upper leaves larger, 2–5 (7) cm long, elliptic to lanceolate or oblanceolate to obovate; calyx 15–21 cm long, the lobes subequal 4–7 mm long, lanceolate, acuminate; corolla 25–35 (45) cm long, crimson or red, deciduous, strongly bilabiate, the tube 20–30 mm long; pedicels 1–2.5 (4) cm long; anthers and style exerted, the anthers villous; capsule 6–10 mm long, elliptic; $n = 8$. Moist seeps and hanging gardens in sandstone cliffs at 1125 to 1375 m in the Canyonlands of the Colorado River, in Garfield, Grand, Kane, and San Juan (type from near Bluff) counties; Arizona and Colorado; 25 (v). Flowers are displayed in late summer and autumn.

Mimulus floribundus Dougl. ex Lindl. [*M. membranaceus* A. Nels.; *M. floribundus* var. *membranaceus* (A. Nels.) A. L. Grant]. Annual, 3–15 (24) cm tall; stems erect to subprostrate, simple or branched, glandular to viscid-villous; leaves petiolate, the petiole to 12 mm long, the blade 4–19 mm long, deltoid to ovate or lanceolate, thin, entire to dentate; calyx 3–6 mm long (up to 9 mm in fruit), glandular, the lobes nearly equal, 1–2 mm long, the tube cylindrical; corolla 5–10 (14) mm long, yellow, tubular, somewhat bilabiate, soon deciduous, mostly long-pedicellate; pedicels 5–20 mm long; stamens and style included; capsule 4–7 mm long, elliptic to ovoid. Pinyon-juniper, hanging garden, aspen, spruce-fir, and alpine meadow communities, typically where wet, at 1370 to 2595 m in Box Elder, Cache, Daggett, Emery, Grand, Juab, Kane, Millard, Salt Lake, Sevier, Tooele, Utah, Washington, and Weber counties; British Columbia to Montana and South Dakota, south to California, Nevada, Arizona, and Mexico; 10 (iii).

Mimulus glabratus H.B.K. Glabrous Monkey-flower. [*M. glabratus* var. *fremontii* A. L. Grant; *M. glabratus* ssp. *utahensis* Pennell, type from Millard County]. Perennial, rhizomatus, creeping and rooting at the nodes, glabrous or nearly so, 1–6 dm tall; leaves short-petiolate below to sessile above, 1–3 cm long, palmately 3–7 veined, broadly ovate to orbicular, dentate or sometimes entire; inflorescence of solitary flowers from the upper leaf axils; pedicels (0.8) 2–3.5 cm long; calyx campanulate, 6–15 mm long, glabrous, the lobes unequal, the teeth blunt and relatively short or nearly lacking; corolla yellow, 10–20 mm long, soon deciduous, distinctly bilabiate, often maculate, the throat more or less open; $n = 14, 15, 30, 31, 46$. Pinyon-juniper, mountain brush, aspen, and other communities, typically in springs, seeps, and streams, at 820 to 2440 m in Davis, Duchesne, Juab, Kane, Piute, Rich, Salt Lake, Sevier, Tooele, Utah, Wasatch, Washington, and Weber counties; Manitoba and Ontario and widely distributed in the U. S.; Mexico and Central and South America; 28 (ii). Two rather weak subspecies have been recognized for Utah: ssp. *fremontii* (Benth.) Pennell [*M. jamesii* var. *fremontii* Benth. in A. DC.] has small flowers, pedicels 1–3 cm long, a calyx 5–10 mm long and suborbicular leaves (it enters our area in southwestern Utah); and ssp. *utahensis* Pennell with longer pedicels (2–6 cm long), a calyx 7–16 mm long, and oval leaves. Most of our plants belong to ssp. *utahensis*.

Mimulus guttatus DC. Common Monkey-flower. [*M. guttatus* DC. var. *depauperatus* (Gray) A. L. Grant]. Fibrous rooted annuals or perennials with stout stolons, 0.5–9 dm tall, glabrous or pubescent; stems stout, erect or decumbent, simple or branched, often very succulent; leaves irregularly dentate, broadly ovate to obovate or reniform-cordate, palmately or subpalmately 5–9 veined; petiolate below to sessile above; inflorescence of terminal, long-pedicellate racemes or sometimes solitary; calyx accrescent, campanulate, 6–16 mm long in flower, longer and much inflated in fruit, lateral calyx teeth more or less acute and tending to fold inward in fruit; corolla yellow, 9–30 mm long, soon deciduous, strongly bilabiate, the throat flaring, closed by the well developed palate, maculate; $2n = 28$. Marshy areas, seeps, springs, and riverbanks in many plant communities at 1000 to 3000 m in all Utah counties, except Davis, Morgan, and San Juan; Alaska and Yukon, south to New Mexico; 158 (ix). This is our most common species of *Mimulus*.

Mimulus lewisii Pursh Lewis Monkey-flower. Herbaceous perennial from a rootstock; stems 1.7–9.2 dm tall, erect, stout, glandular to glandular-villous; leaves (2) 3.5–7.5 (9) cm long, elliptic, ovate to ovate-lanceolate, subentire to irregularly dentate, palmately veined, sessile; flowers solitary or few to several, the pedicels 3–7 (8.5) cm long; calyx 1.3–2.5 cm long, glandular, the lobes subequal, 3–5 (7) mm long, acuminate; corolla 3.3–4.6 cm long, pink to rose red, soon deciduous, somewhat bilabiate, the lobes broad and rounded, 9–14 mm long, the tube much longer than the calyx, often lined with red dots, pinkish to yellowish, 2.6–3.4 cm long; anthers and style included, the anthers villous; capsule 13–16 mm long, narrowly oblong; $n = 8$. Mountain brush, aspen, Douglas fir, spruce-fir, and lodgepole pine communities, typically along stream banks, at 2135 to 3390 m in Box Elder, Daggett, Davis, Duchesne, Salt Lake, San Juan (?), Summit, Tooele, and Weber counties; Alaska, British Columbia, and Alberta, south to California, Nevada, and Colorado; 20 (iv).

Mimulus moschatus Dougl. ex Lindl. Musk Monkey-flower. [*M. guttatus* var. *moschatus* (Dougl.) Prov.]. Herbaceous musk-scented perennial; stems 2–30 cm tall, prostrate to decumbent, mostly branched or simple, glandular-villous, rooting at lower nodes; leaves petiolate, the petiole 2–10 mm long, the blade 1.2–5 cm long, ovate, entire to sparingly dentate, pinnately veined; pedicel 5–14 mm long; calyx 6–13 mm long, campanulate, the lobes subequal, lanceolate, 1.5–4 mm long; corolla 14–20 mm long, yellow, soon deciduous, tubular-funnelform, the tube with red lines extending to the throat, 10–16 mm long, the palate bearded; anthers and style included, the anthers bearded; capsule 3–7 mm long, ovate; $n = 16$. Sagebrush, aspen, spruce-fir, lodgepole pine, and meadow communities, often where wet and shady at 2135 to 2745 m in Cache, Daggett, Duchesne, Morgan, Salt Lake, Utah, and Wasatch counties; Colorado, Nevada, and California, north to Canada; sporadic in the eastern U. S.; 16 (i).

Mimulus parryi Gray Parry Monkey-flower. [*Eunanus parryi* (Gray) Greene]. Annual; stems 2–16 cm high, simple or branched from the base, glandular-puberulent; leaves entire, (2) 10–27 mm long, the lower usually short-petiolate or tapering into a petiole, ovate or spatulate, the upper sessile, linear to oblanceolate; flowers few to many, pedicellate, the pedicel 1–5 mm long; calyx 6–12 mm long, campanulate, the ribs dark green or red, paler between the ribs, the lobes unequal, the upper longer and wider; corolla yellow, rarely magenta, 10–23 mm long, persistent, bilabiate, funnelform, the palate bearded; anthers and style included, glabrous; capsule 5–8 mm long, narrow. Creosote bush, Joshua tree, and blackbrush communities at 610 to 1070 m in Washington (type from near St. George) County; Arizona and Nevada; 19 (iii). The magenta phase of this species can and has been confused with *M. bigelovii*, which is viscid-villous and glandular-pubescent rather than finely glandular.

Mimulus primuloides Benth. Primrose Monkey-flower. Herbaceous, usually mat-forming perennial with flagelliform rhizomes; stems 0.5–6 cm long; leaves sessile or the base narrow and tapering into a petiole, crowded toward the base, 7–25 mm long, entire to dentate, oblanceolate to ovate, glabrous to villous, palmately veined; flowers 1–2 (3) per stem, the pedicels slender, 2–10 cm long; calyx narrow, tubular, 4–8 mm long, the

ribs dark, the lobes nearly equal, ciliate; corolla yellow, funnelform, maroon dotted, 14–20 mm long, nearly regular, the palate bearded; anthers and style included, glabrous; capsule 5–7 mm long, ovate; $n = 17$. Moist areas at 2620 to 2810 m in Beaver and Duchesne counties, and reported from the Pine Valley Mts., Washington County; Arizona and California, north to Washington and Idaho; 2 (0).

Mimulus rubellus Gray [*M. gratioides* Rydb.]. Herbaceous, glandular-puberulent, slender annual, 1–22 cm tall; stems simple or branched from base; leaves 3–15 mm long, sessile or the lowest subpetiolate linear to narrowly lanceolate; flowers pedicellate, the pedicel 7–20 mm long; calyx 4–7 mm long, tubular, the ribs dark, the lobes nearly equal, ciliate; corolla yellow, sometimes reddish, 7–9 mm long, the palate puberulent, the lobes red dotted, deciduous; anthers and style included, glabrous; capsule 4–6 mm long, ovoid. Cool desert shrub, sagebrush, and pinyon-juniper communities at 1555 to 2745 m in Beaver, Cache, Duchesne, Emery, Iron, Juab, Kane, Millard, Piute, Salt Lake, San Juan, Sevier, Tooele, Uintah, Utah, and Washington counties; California and Nevada to Colorado, Texas, and New Mexico; 30 (vi).

Mimulus spissus A. L. Grant Viscid-villous, mephitic annual, 2–20 cm tall; stems simple or branched throughout; leaves sessile or the lower leaves tapering into a petiole, densely crowded especially in larger plants, 8–17 mm long, and nearly as wide, obovate to suborbicular, cuspidate, tapering to the base, entire, thick; flowers few to many in larger plants and usually flowering the full length of the stems; pedicels 1–2 mm long; calyx 5–9 mm long, campanulate, the lobes unequal, curved out, subulate to lanceolate, the upper lobe longer, larger; corolla 12–18 mm long, magenta to pink, persistent, funnelform, bilabiate, the palate and corolla tube densely short pubescent; anthers included, glabrous; style and stigma included, the style glandular, the stigma ciliolate; capsule 9–13 mm long, narrowly lanceolate. Warm desert shrub communities at 915 to 1830 m in Beaver Dam Wash, Washington County; Nevada and California; 7 (0).

Mimulus suksdorfii Gray Suksdorf Monkey-flower. Compact annual, 1–7 cm tall; stems finely glandular-puberulent, usually much branched; leaves 5–13 mm long, mostly longer than the internodes, sessile or the lower short petiolate, linear to oblanceolate, entire; flowers few to several along the entire stem; pedicels 2–7 mm long; calyx 3–6 mm long, cylindrical, glandular-puberulent, reddish, the ribs a little darker, the lobes ca 1 mm long, the margins not ciliate; corolla 4–6 mm long, yellow, deciduous, narrowly-funnelform, the lobes subequal, emarginate, the palate and tube puberulent; anthers and style visible in the throat, glabrous; capsule 4–5 mm long, ovoid. Mixed desert shrub, sagebrush, pinyon-juniper, mountain brush, ponderosa pine, and windswept ridge communities at 1310 to 2820 m in Beaver, Box Elder, Juab, Kane, Millard, Morgan, San Juan, Uintah, Wasatch, and Weber counties; Washington to Wyoming, south to California and Arizona; 18 (ii).

Mimulus tilingii Regel Subalpine Monkey-flower. Low perennial, from creeping rhizomes or stolons, 5–26 cm tall, glabrous or sometimes puberulent; stems mostly simple or rarely branched; leaves petiolate below to sessile above, the blade 0.8–3 cm long, rhombic to ovate, dentate, palmately 3- to 5-veined, pedicels mostly less than 1 (3.5) cm long; calyx campanulate, 7–14 mm long in

flower, to 21 mm long in fruit and strongly inflated, pale green to reddish with dark spots, the lobes unequal; corolla yellow, red dotted, 15–30 mm long, soon deciduous, broadly funnelliform, the palate densely yellow hairy; $n = 14, 28$. Streambanks, springs, and other wet places in ponderosa pine, aspen, Douglas fir, and spruce-fir communities at 2285 to 3235 m in Beaver, Box Elder, Davis, Duchesne, Juab, Kane, Piute, Salt Lake, Sanpete, Utah, and Wasatch counties; Canada, south to California, Nevada, Arizona, and New Mexico; 17 (iv).

Mohavea Gray

Annual herbs; stems erect, often branched from near the base; leaves alternate, entire, short-petioled; flowers axillary, subtended by foliose bracts; calyx 5-parted, campanulate; corolla bilabiate, the tube short, merely gibbous at the base, the lips fan-shaped, the lower with a hairy palate; fertile stamens 2, connivent, the other 3 abortive; capsule ovoid, thin; seeds discoid, each surrounded by a wing.

Mohavea breviflora Cov. Plants simple or few-branched, viscid-pubescent, mainly 0.5–2 dm tall; leaves 1–4 cm long, ovate-lanceolate; pedicels 2–5 mm long; calyx 10–12 mm long; corolla 15–18 mm long, bright lemon yellow; stamens glabrous; capsules 8–10 mm long; seeds ca 2 mm long. Warm desert shrub at ca 850 m in Washington County; Arizona, Nevada, and California; 3 (i). This is another Mohavean plant that encroaches on Utah in the Beaverdam Wash vicinity. It was taken on 17 April 1986 by N. D. Atwood, G. I. Baird, and K. H. Thorne.

Orthocarpus Nutt.

Annual herbs; stems erect, branching above; leaves alternate, entire to dissected, sessile or nearly so; inflorescence of leafy-bracted spikes; calyx 4-cleft, tubular-campanulate; corolla bilabiate, yellow, white or purple, the tube elongate, narrow, the lower lip entire, somewhat 3-saccate apically, upper lip beaklike, the lobes united, enclosing the anthers; stamens 4, attached near top of corolla tube; anthers dissimilar, the outer attached at the middle, the inner attached at its apex; stigma entire, penicillate.

- 1. Corolla 15–20 mm long, violet and white; plants of southeastern Utah *O. purpureo-albus*
- Corolla 9–16 mm long, yellow (rarely violet); plants of various distribution 2
- 2(1). Galea longer than the lower lip, the tip terminating in a short hook; stems often much branched above . . . *O. tolmiei*
- Galea subequal to the lower lip, the tip not hooked; stems mostly simple *O. luteus*

Orthocarpus luteus Nutt. Yellow Owl-clover. Stems 1–4 dm tall, erect, mostly simple, sometimes branched above, spreading-hairy; leaves 1–4 cm long, linear to linear-lanceolate, mostly entire, sometimes trifid, with pubescence shorter than the stem hairs; spikes many-flowered, narrow, partly glandular; bracts 10–15 mm long, 3- to 5-cleft, leaflike but shorter and more cleft above; calyx 5–8 mm long, subequally 4-lobed, the lobes 1–2 mm long; corolla 9–12 mm long, golden yellow, puberulent, galea short and broad, 2.5–4 mm long; anthers pubescent; capsule 4–7 mm long, elliptical; $n = 14$. Sagebrush, meadows, ponderosa pine, and aspen com-

munities at 2225 to 2930 m in Cache, Carbon, Daggett, Duchesne, Garfield, Grand, Kane, Morgan, Piute, Rich, Salt Lake, San Juan, Sanpete, Sevier, Summit, Uintah, Wasatch, and Washington counties; British Columbia, south to California, Colorado, and New Mexico, east to Michigan and Minnesota; 32 (i).

Orthocarpus purpureo-albus Gray Stems 1–4 dm tall, erect, mostly simple or branched above, purplish, glandular pubescent; leaves 1.5–3.5 cm long, filiform to linear-lanceolate, entire or 3-lobed, the lobes filiform; spike few- to many-flowered; bracts 10–20 mm long, 3-lobed; calyx 6–10 mm long, glandular, the nerves dark green; corolla 13–20 mm long, white or purplish, lower lip wider and shorter than galea; anthers puberulent; capsule 6–7 mm long, elliptical. Sagebrush and ponderosa pine communities at 2000 to 2700 m in Garfield and San Juan counties; Colorado, Arizona, and New Mexico; 3 (0).

Orthocarpus tolmiei H. & A. Tolmie Owl-clover. Stems erect, mostly branched above, 1–3 dm tall, puberulent; leaves 2–4 cm long, narrowly lanceolate, entire; spikes short, compact; flowers short-pedicellate; bracts mostly 3-lobed, sometimes entire, green to yellow, finely glandular; calyx 5–7 mm long, unequally divided, the upper longer and more deeply cut; corolla 10–15 cm long, yellow or violet to purple, glabrous to puberulent; anthers usually ciliate; capsule 3–5 mm long, obovate. Sagebrush-grass, mountain brush, spruce-fir, and alpine communities at 2195 to 3265 m in Cache, Carbon, Davis, Duchesne, Millard, Morgan, Rich, Salt Lake, Sanpete, Sevier, Summit, Utah, and Weber counties; Idaho and Wyoming; 19 (ii).

Pedicularis L.

Herbaceous perennials, mostly caulescent or subcaulescent; stems simple or branched at base, erect; leaves alternate, opposite or basal, toothed to bipinnatifid; inflorescence of bracteate spikes or spicate racemes; calyx 2- to 5-lobed, accrescent, the lobes unequally cleft; corolla strongly bilabiate, yellow, purple, red, or white, the galea hooded, the lower lip 3-lobed; stamens 4, didynamous, glabrous; stigmas united, capitate; capsule loculicidal, flattened, asymmetrical, glabrous.

- 1. Leaves simple, serrate to crenate; calyx 2-lobed 2
- Leaves pinnatifid or bipinnatifid; calyx 5-lobed 3
- 2(1). Corolla white or pale yellow, 10–16 mm long, the galea beaked and curved downward; leaves serrate or sometimes crenate, not cartilaginous or revolute . . . *P. racemosa*
- Corolla rose to purple, 20–25 mm long, the galea beakless; leaves double crenate, the crenulations white-cartilaginous, revolute; western Colorado and Nevada, to be expected in Utah in wet meadows or along streams *P. crenulata* Benth.
- 3(1). Galea prolonged into a slender curved beak over 8 mm long (curved out and up), the galea and beak resembling the head and trunk of an elephant *P. groenlandica*
- Galea beakless or with a short straight beak or incurved and short (5 mm or less long) 4
- 4(3). Stems less than 1 dm tall; inflorescence a dense compact spicate-raceme, 4–6 cm long; leaves surpassing the stems and usually the inflorescence; plants of low elevations *P. centranthera*
- Stems over 1 dm tall, inflorescence an elongate spicate-raceme over 6 cm long and exceeding the leaves; plants of middle and higher elevations 5

reduced upwards; calyx 2-lobed, these obliquely ovate, the tip acuminate; corolla white, pale yellow, or purple, 9-15 mm long, the galea 5-8 mm long, strongly arched and tapering into a slender decurved beak, the beak 5-7 mm long, the lower lip prominent, deflexed-spreading; capsule 10-16 mm long, asymmetrical; n = 8. Lodgepole pine and spruce-fir communities at 2445 to 3295 m in Cache, Daggett, Duchesne, Grand, Piute, Rich, Salt Lake, San Juan, Sanpete, Summit, Uintah, and Wasatch counties; Alberta to British Columbia, south to New Mexico, and California; 43 (v). Our plants belong to var. *alba* (Pennell) Cronq. [*P. racemosa* ssp. *alba* Pennell].

Penstemon Mitch.

Contributed by Elizabeth C. Neese

Glabrous, pubescent, or glandular-pubescent perennial herbs or subshrubs; leaves basal and opposite (or sometimes all cauline), simple, entire or toothed, the lower petioled, becoming sessile upward, reduced and more or less bractlike in the inflorescence; inflorescence of verticillate axillary cymes, these sometimes (rarely) reduced to a single flower; calyx 5-cleft, the lobes often scarious-margined; corolla tubular to funnelform or ventricose-ampliate, bilabiate, rarely obscurely so; fertile stamens 4, didynamous, glabrous to pubescent; a fifth sterile filament (staminode) present, glabrous or variously bearded; stigma globose; capsule 2-valved, septical; seeds few to numerous. Note: Most of our taxa in *Penstemon* are distinguished by small but well-marked differences. Measurements given in the following keys and descriptions are of well pressed, fully open flowers, of calyces at anthesis (not in fruit), and of anther sacs following natural anthesis, not immature ones that have opened during drying. Presence or absence of anther pubescence as noted is for the surface only (suture margins are usually more or less spiculate or minutely stiff-hairy). Color is given for the usual color range but occasional pink or white individuals occur in most species. *Penstemon* is a large and complex genus. Critical garden tests over many years by Dr. Glen Moore and others have demonstrated an absence of barriers to hybridization among even distantly related taxa. Nonetheless, although often subtly differentiated morphologically, most species are sharply separated geographically and edaphically, and hybrids in nature appear to be uncommon.

Holmgren, N. H. 1984. *Penstemon*. pp. 370-455. In: Cronquist, A. et al. Intermountain Flora. Vol. 4. New York Botanical Garden, New York.

- 1. Anther sacs opening only across the top, the distal free ends indehiscent, remaining saccate, the anthers permanently horseshoe-shaped Key 1
- Anthers sacs dehiscing throughout their length or, if partially, then dehiscing from the distal ends and remaining indehiscent at the apex, if horseshoe-shaped the distal portion never remaining closed and saccate ... 2
- 2(1). Anther sacs opening partially or, if the full length, at least the connective indehiscent, the valves hardly parting Key 2
- Anther sacs opening throughout and across the connective, the valves often widely spreading 3
- 3(2). Plants caespitose, forming mats, the stems creeping or, if flowering stems erect, these arising from older, rooting, prostrate stems; leaves always entire generally none over 4 cm long or 5 mm wide Key 3

- Plants neither caespitose nor mat-forming, leaves entire or toothed, the larger regularly either over 4 cm long or 5 mm wide 4
- 4(3). Inflorescence axis and corolla both regularly pubescent or glandular externally Key 4
- Inflorescence axis or corolla or both glabrous externally (rarely a few long hairs may be present on the corolla lobes in *P. rydbergii*) Key 5

Key 1.

Anther sacs opening partially, across the apex.

- 1. Corolla red *P. rostriflorus*
- Corolla some shade of blue, lavender, or pink 2
- 2(1). Leaves coarsely and sharply serrate; summits of filaments and anther bases villous with long white hairs *P. tenuis*
- Leaves entire; filaments and anthers glabrous 3
- 3(2). Calyx 2.1-3.2 mm long, the lobes broadly ovate or obovate, obtuse to acute *P. sepulchralis*
- Calyx 3.4-7 mm long, the lobes lance-ovate to lanceolate, acuminate to attenuate 4
- 4(3). Flowers mostly 14-20 mm long, the corolla blue with lavender throat, or violet to lavender (Washington County); anther sacs 1-1.4 mm long *P. leonardii*
- Flowers mostly 20-30 mm long, lavender; anther sacs 1.3-2.5 mm long 5
- 5(4). Middle stem leaves mostly greater than 8 mm wide, elliptic, sharply acute, noticeably firm and plane; plants mostly over 3 dm tall, plants of Davis, Duchesne, Salt Lake, and Weber counties *P. platyphyllus*
- Middle stem leaves mostly less than 7 mm wide, (ob)lanceolate to linear, many of them obtuse; plants mostly less than 3 dm tall; plants of Juab, Millard, and Tooele counties *P. leonardii*

Key 2.

Anther sacs opening partially, from the distal end but not across the connective.

- 1. Corolla red 2
- Corolla not red, some shade of blue, lavender, or pink 3
- 2(1). Corolla strongly 2-lipped, the lower lip reflexed *P. barbatus*
- Corolla not or obscurely 2-lipped, nearly tubular, the lobes more or less equally projecting *P. eatonii*
- 3(1). Anthers glabrous on the surface (margin of suture may be scabrous or ciliate-toothed) 4
- Anthers pubescent on the surface, sometimes sparsely so 13
- 4(3). Stems often fistulose; herbage and inflorescence papillate-glutinous, the surfaces obscured by adhering sand grains; leaves (most) prominently undulate or crisped; staminode pale, dotted with dark purplish blue papillae on upper surface; plants of blue sand in Garfield, Kane, and Washington counties *P. ammobophilus*
- Stems never fistulose; herbage neither glutinous nor coated with tightly packed sand grains; leaves rarely crisped; staminode glabrous or variously pubescent but not as above 5
- 5(4). Herbage below the inflorescence glabrous 6
- Herbage below the inflorescence pubescent 9

- 6(5). Calyx and corolla glandular-puberulent externally; plants of southern Utah *P. leiophyllus*
- Calyx and corolla glabrous externally, if (rarely) obscurely glandular the plants from northwestern Utah 7
- 7(6). Corolla 18–23 mm long; anther sacs to 1.8 mm long; plants of Navajo Mt., San Juan County *P. navajou*
- Corolla 23–35 mm long; anther sacs longer than 1.8 mm; plants of southwestern or northwestern Utah ... 8
- 8(7). Staminode glabrous; plants of the Deep Creek and Raft River ranges in northwestern Utah ... *P. speciosus*
- Staminode yellow-bearded; plants of southwestern Utah *P. laevis*
- 9(5). Cauline leaves linear or nearly so; anthers to 1.5 mm long; plants of Garfield and Piute counties 10
- Cauline leaves seldom linear; anthers 1.5–3.3 mm long (rarely shorter); plants not from Garfield and Piute counties 11
- 10(9). Calyx and corolla glandular-puberulent *P. parvus*
- Calyx and corolla glabrous *P. pseudoputus*
- 11(9). Corolla 16–21 mm long; anthers 1.5–1.8 mm long *P. tidestromii*
- Corolla 23–33 mm long; anthers 1.8–2.4 mm long ... 12
- 12(11). Leaves, stems and inflorescence branches and bracts densely cinereous puberulent; corolla glandular-puberulent; plants of Sanpete and Sevier counties ... *P. wardii*
- Herbage glabrous to sparingly and minutely puberulent, not cinereous; corolla glabrous; plants of the Deep Creek and Raft River ranges in western Utah (*P. x jonesii* of Kane, and Washington counties may key here — see discussion under *P. laevis*) *P. speciosus*
- 13(3). Anthers pubescent with long tangled hairs as long or longer than the length of the sac, more or less woolly 14
- Anthers pubescent with straight or flexuous hairs shorter than the length of the sac, hardly woolly ... 15
- 14(13). Corolla pale blue or pale lavender blue; inflorescence relatively broad, the lower peduncles often exceeding 2 cm and somewhat spreading, the inflorescence thus not markedly secund; anther-sacs usually densely woolly with long tangled hairs that obscure the surface *P. comarrhenus*
- Corolla blue to dark blue; inflorescence narrow, the peduncles mostly shorter than 1.5 cm, erect to appressed, the inflorescence strongly secund; anther-sacs often more sparingly woolly, the surface scarcely obscured *P. strictus*
- 15(13). Anthers pubescent with slender, flexuous hairs about as long or longer than the width of the sac 16
- Anthers pubescent with relatively stiff, straight hairs shorter than the width of the sac 19
- 16(15). Calyx 2.5–6 mm long, the lobes ovate, obtuse to acute or sometimes shortly acuminate 17
- Calyx 5–11 mm long, the lobes lanceolate, acuminate to attenuate 18
- 17(16). Staminode bearded *P. cyanocaulis*
- Staminode glabrous *P. navajou*
- 18(16). Inflorescence glabrous; calyx lobes narrowly scarious-margined; plants from southeastern Utah *P. strictiformis*
- Inflorescence glandular-puberulent; calyx lobes with prominent, broad, usually erose, scarious margins; plants from central and northeastern Utah . *P. scariosus*
- 19(15). Leaves, stem, and inflorescence densely cinereous-puberulent throughout; plants of the Uinta Basin ... *P. fremontii*
- Herbage glabrous or nearly so, green or, if (rarely) cinereous-puberulent, plants not of the Uinta Basin ... 20
- 20(19). Leaf margins (at least some) undulate to crisped; inflorescence glabrous; plants of southeastern Utah ... *P. cyanocaulis*
- Leaf margins not noticeably crisped; inflorescence glabrous or pubescent; plants not of southeastern Utah 21
- 21(20). Pedicels, calyx, and corolla glabrous (calyx rarely glandular); anther sacs diverging at about 90–120 degrees, dehiscent in the distal 2/3–3/4, the line of dehiscence somewhat lateral; inflorescence cylindrical to secund *P. cyananthus*
- Pedicels, calyx, and corolla finely glandular (sometimes obscurely so—then best seen on backs of corolla lobes of unopened flowers); anther sacs diverging at nearly 180 degrees, dehiscent fully (but not across the connective), the line of dehiscence median; inflorescence secund 22
- 22(21). Plants mostly less than 15 (rarely to 18) cm tall; verticillasters 1–4; plants from near and above timberline, of the central and eastern crest of the Uinta Mts. *P. uintahensis*
- Plants mostly much taller; verticillasters 4–11; plants seldom if ever above treeline, of wider distribution *P. subglaber*

Key 3.

Anthers sacs opening throughout; plants caespitose.

1. Plants forming compact mats not over 3 cm tall, the leaves densely clustered in evidently acaulescent tufts; plants of Daggett County *P. acaulis*
- Plants mat-forming or not; plants caulescent, the leaves distributed along an evident stem; distribution various ... 2
- 2(1). Leaves linear, at least 5 times longer than wide; plants not from Grand or San Juan County 3
- Leaves broader, narrowly lanceolate to obovate or spatulate, the broader ones less than 5 times longer than wide (or, if sometimes narrower, plants from Grand or San Juan County) 5
- 3(2). Flowering stems prostrate *P. caespitosus*
- Flowering stems ascending to erect 4
- 4(3). Staminode densely bearded with a tuft of long yellow hairs at the apex, only sparsely bearded proximally; anthers bicolorous (purplish black, with a white band along the suture); plants of southwestern Utah *P. linarioides*
- Staminode rather equitably and densely bearded most of its length with golden orange hairs; anthers rather uniformly purplish black, without a pronounced white band along the suture; plants of Sevier and Utah counties *P. abietinus*
- 5(2). Pubescence of leaves of flattened, appressed, scalelike hairs 6
- Pubescence of leaves of terete, more or less spreading hairs 7

- 6(5). Stems ascending to erect, the plants rather shrubby; leaves moderately pubescent, the surface not or scarcely obscured, often glabrate below; plants from above 2590 m in Beaver (Tushar Mtns.), Iron, and Piute counties *P. caespitosus* var. *suffruticosus*
- Stems prostrate or very short and forming tufts, scarcely shrubby; leaves densely cinereous-pubescent on both surfaces, the surface largely obscured; plants from below 2165 m in Beaver, Iron, and Kane counties *P. thompsoniae*
- 7(5). Leaves (the larger) regularly over 1.5 cm long, glabrous to sparsely scaberulous-puberulent; Grand and San Juan counties *P. crandallii*
- Leaves 0.4–1 (2) cm long, densely cinereous-puberulent with retrorsely curved hairs; distribution various, but not from Grand or San Juan counties . . . *P. caespitosus*

Key 4.

Anther sacs opening throughout; plants not mat-forming; both inflorescence and corolla pubescent or glandular.

- 1. Leaves prominently and regularly toothed (rarely entire in *P. palmeri* but the upper leaves connate-perfoliate) 2
- Leaves (most) entire or undulate, rarely some with a few teeth; upper leaves never connate-perfoliate . . . 10
- 2(1). Corolla white, sometimes slightly brown- or lilac-tinted; plants of western Box Elder County . . . *P. deustus*
- Corolla pink, lavender, blue, or purple; plants with distribution various but not of Box Elder County . . . 3
- 3(2). Small shrubs of limestone crevices or higher elevation talus; leaves all cauline 4
- Plants herbaceous, of various habitats but not restricted as above; basal leaves present 5
- 4(3). Corolla 24–40 mm long; anthers densely woolly with long white hairs; plants known in Utah from the Wasatch plateaus and mts. *P. montanus*
- Corolla 13–17 mm long; anthers essentially glabrous; plants known in Utah from southwestern Washington County *P. petiolatus*
- 5(3). Corolla 20–40 mm long 6
- Corolla 8–20 mm long 7
- 6(5). Upper cauline leaves connate-perfoliate; corolla (25) 27–40 mm long, strongly inflated, the throat when pressed over 11 mm wide, the lower lip reflexed; plants of low to middle elevations *P. palmeri*
- Upper cauline leaves not perfoliate; corolla 20–27 (30) mm long, the throat when pressed less than 11 mm wide, the lower lip projecting; plants montane to alpine *P. whippleanus*
- 7(5). Calyx 3–6 mm long; anther sacs 0.4–0.8 mm long, about as broad as long *P. humilis*
- Calyx or anther sacs regularly longer 8
- 8(7). Leaves densely cinereous-puberulent throughout *P. nanus*
- Leaves, at least the lower, glabrous or essentially so . . . 9
- 9(8). Anthers becoming peltate-explanate, the sacs less than 0.9 mm long, about as broad as long; plants of Beaver and Millard counties *P. concinnus*
- Anther sacs not explanate, not divaricate but remaining parallel, over 0.9 mm long, longer than broad; plants of Iron County *P. pinorum*

- 10(1). Herbage and inflorescence glutinous, the surface obscured with adhering sand grains, otherwise glabrous; leaves (most) prominently undulate or crisped; stems often fistulose; plants of sand dunes in Garfield, Kane, and Washington counties *P. ammophilus*
- Herbage and inflorescence not glutinous, not with obscuring sand grains; plants otherwise differing . . . 11
- 11(10). Leaves glabrous or essentially so (petioles of lower leaves may be sparingly puberulent) 12
- Leaves pubescent 22
- 12(11). Stamens very short, scarcely if at all exerted from the tube; corolla funnelform, not bilabiate, the throat flaring gradually, the throat and limb scarcely distinguishable 13
- Stamens well-exserted from the tube, the longer pair nearly reaching or exceeding the orifice; corolla bilabiate, the throat and limb usually abruptly differentiated 14
- 13(12). Stems glabrous below the inflorescence; staminode densely bearded with golden orange hairs, lighter yellow at the tip; plants of Duchesne and Uintah counties *P. goodrichii*
- Stems puberulent; staminode more sparsely bearded, the hairs all about the same color; plants of Carbon and Emery counties *P. marcusii*
- 14(12). Corollas mostly over 20 mm long 15
- Corollas mostly less than 20 mm long 16
- 15(14). Plants 2–8 dm tall, of montane to alpine communities; corolla not over 30 mm long *P. whippleanus*
- Plants not over 2 dm tall, of shale barrens in the pinyon-juniper zone; corolla 30–38 mm long *P. grahamii*
- 16(14). Calyx mostly less than 5 mm long 17
- Calyx mostly over 5 mm long 18
- 17(16). Inflorescence secund; anthers dehiscing nearly or quite to the connective but the valves hardly parting, the sacs over 1 mm long, longer than broad; plants of Aquarius Plateau, Garfield and Wayne counties *P. parvus*
- Inflorescence not secund; anthers dehiscing the full length and across the connective, the valves spreading, the sacs less than 1 mm long, about as broad; plants widespread *P. humilis*
- 18(16). Corolla less than 14 mm long; plants not of Grand or San Juan counties 19
- Corolla over 14 mm long or, if shorter, the plants of Grand and San Juan counties 20
- 19(18). Stem puberulent; anthers becoming peltate-explanate, the sacs broadly ovate; plants of Beaver, Juab, and Millard counties *P. concinnus*
- Stem mainly glabrous; anthers not becoming explanate, the sacs oblong; plants of Garfield and Kane counties *P. atwoodii*
- 20(18). Anther sacs oblong, scarcely explanate; throat generally purple-veined on the palate only; corolla lobes about equally spreading; staminode included *P. moffattii*
- Anther sacs broadly ovate, becoming peltate-explanate; throat longitudinally purple-veined nearly throughout 21
- 21(20). Staminode exerted; corolla ventricose-ampliate, upper lobes projecting-spreading, the lower ones spreading-reflexed, plants of wide distribution in southeastern Utah *P. ophianthus*

- Staminode included or merely showing at the orifice; corolla tubular funnelliform to somewhat ampliate, the lobes about equally spreading; plants uncommon, of San Juan County *P. breviculus*
- 22(11). Staminode prominently exerted; corolla ventricose-ampliate, the orifice constricted and prominently bearded with long white hairs; stems mostly less than 2 dm tall; plants of Daggett and Summit counties *P. cleburnei*
- Staminode, corolla, and stems not as above in all respects 23
- 23(22). Calyx 3–6 mm long; anther sacs 0.4–0.8 mm long, about as broad as long *P. humilis*
- Calyx or anther sacs regularly longer 24
- 24(23). Plants dwarf, the stems usually shorter than 1.5 dm; stems and leaves densely cinereous-puberulent 25
- Stems mostly taller; herbage more sparingly puberulent, scarcely cinereous 28
- 25(24). Anthers permanently horseshoe-shaped to sagittate, the sacs remaining parallel; inflorescence densely glandular-puberulent with spreading hairs; plants of western Utah *P. nanus*
- Anther sacs becoming divaricate; inflorescence densely cinereous-puberulent or, if glandular-pubescent with spreading hairs, not of western Utah 26
- 26(25). Inflorescence glandular-pubescent with spreading hairs *P. moffattii*
- Inflorescence densely cinereous-puberulent with retrorse hairs, scarcely if at all glandular 27
- 27(26). Corolla lobes orbicular, overlapping at the base, widest near the middle, 4–7 mm wide when pressed; staminode densely and rather evenly orange-bearded in the distal half, gradually widening to a moderately dilated apex less than 1 mm wide, the tip straight or slightly curved; plants of Duchesne County *P. duchesnensis*
- Corolla lobes mostly oblong, widest at the base, not overlapping, 3–5 mm wide when pressed; staminode abruptly dilated apically, the tip over 1 mm wide, strongly curved to curled, the expanded tip bearded with a tuft of golden yellow hairs, more sparsely bearded proximally; plants of west-central Utah *P. dolius*
- 28(24). Leaves principally cauline, the basal ones absent or poorly developed; corolla lobes blue, the throat blue to blue violet dorsally, whitish and 2-ridged ventrally, the lower lip projecting, exceeding the upper; plants of the northern tier of counties *P. radicosus*
- Basal leaves well developed, corolla throat not prominently ridged, not white ventrally, the lobes about equally spreading; plants of central and southeastern Utah 29
- 29(25). Anther sacs oblong, scarcely explanate; throat generally purple-veined on the palate only, the lobes about equally spreading; staminode mostly included *P. moffattii*
- Anther sacs broadly ovate, becoming peltate-explanate; throat longitudinally purple-veined nearly throughout 30
- 30(29). Staminode included or merely showing at the orifice; corolla tubular-funnelform to moderately ampliate, the lobes about equally spreading *P. breviculus*
- Staminode usually conspicuously exerted; corolla ventricose-ampliate, the upper lobes projecting-spreading, the lower spreading-reflexed *P. ophianthus*

Key 5.

- Anther sacs opening throughout;
- Inflorescence or corolla or both glabrous externally.
- 1. Leaves green, not particularly glaucous, thin 2
- Leaves strongly glaucous, thick and leathery, somewhat fleshy when fresh 4
- 2(1). Corolla 7–12 mm long, the throat nearly tubular, mostly 2–3 mm wide when pressed; anther sacs 0.4–0.7 mm long, suborbicular to ovate, about as broad as long, becoming explanate; inflorescence interrupted, strongly fascicled, the fascicle(s) densely flowered, globular, mostly 2–3 cm in diameter *P. procerus*
- Corolla 10–20 mm long, the throat somewhat ampliate, mostly 3–5 mm wide when pressed; anther sacs 0.6–1.1 mm long, ovate to oblong, longer than wide, not fully explanate; inflorescence often less prominently fascicled, the fascicle(s) less densely flowered, mostly 3–4 cm in diameter 3
- 3(2). Calyx 3–9 mm long, the lobes long-acuminate to caudate, the broadly scarious margins usually prominently erose to lacerate; basal tufts of leafy sterile shoots often present *P. rydbergii*
- Calyx mostly 2–3.5 mm long, the lobes triangular to ovate, obtuse, acute, or abruptly short-acuminate, the margins scarious but seldom prominently erose; leaves predominantly cauline *P. watsonii*
- 4(1). Leaves toothed; corolla 25–40 mm long, the throat markedly inflated, when pressed 12–20 mm in diameter *P. palmeri*
- Leaves entire; corolla smaller, less than 25 mm long, the throat to 10 mm wide 5
- 5(4). Corolla densely glandular internally near the orifice, not bearded on the palate; staminode glabrous or merely papillate, only slightly dilated apically; leaves lanceolate, usually narrowly so 6
- Corolla not evidently glandular within, the palate often with at least a few long hairs; staminode bearded (rarely papillate-pubescent); leaves various 7
- 6(5). Corolla red to carmine pink, retaining the red coloration on drying; guidelines usually absent; calyx mostly 2.5–4.5 mm long; plants of Washington County and east of the central Utah plateaus *P. utahensis*
- Corolla rose pink, lavender pink or purplish red, drying pink violet to bluish; guidelines often present (may be faint); calyx mostly 4–6 mm long; plants of Washington County and west of the Utah Plateaus *P. confusus*
- 7(5). Plants from Daggett, Duchesne, or Uintah counties 8
- Plants not from Daggett, Duchesne, or Uintah counties 12
- 8(7). Leaves linear to narrowly (ob)lanceolate throughout, to 12 mm wide; lower bracts of the inflorescence with broad clasping bases, abruptly narrowed to a caudate or acuminate tip; plants of sand dunes or loose sand; plants of Daggett and the northern half of Uintah counties *P. angustifolius* var. *vernalisensis*
- Leaves broader, broadly lanceolate to spatulate, the basal ones when present with broadly expanded blades; plants seldom of especially sandy places 9
- 9(8). Basal leaves absent or poorly developed; flowers true soft-pink, retaining the pink color on drying; staminode bearding of papillate hairs to 0.1 mm long; plants endemic to the Roosevelt/Myton area on either side of the Duchesne/Uintah county line *P. flowerii*

- Basal leaves well developed; flowers lavender pink to blue or blue purple, usually drying violet to bluish; staminode with hairs 0.2–2 mm long 10
- 10(9). Staminode densely bearded with long, tangled hairs that obscure the apex, these 1–2 mm long *P. pachyphyllus*
- Staminode bearded with hairs 0.2–1 mm long 11
- 11(10). Corolla glabrous externally; the throat summit and lobes prominently veined within on all sides with wine red guidelines; plants widespread in the Uinta Basin; staminode hairs mostly 0.5–1 mm long *P. pachyphyllus*
- Corolla finely glandular-puberulent externally, the throat and lobes without prominent guidelines within; staminode hairs 0.2–0.5 mm long; plants restricted in the Uinta Basin to the Tavaputs Plateau *P. carnosus*
- 12(7). Plants dwarf; stems 3–10 (15) cm tall from a rhizomatous caudex; plants of multi-hued limestone barrens in western Garfield County *P. bracteatus*
- Plants larger; distribution various 13
- 13(12). Staminode densely bearded with long, tangled hairs 1–2 mm long; corolla usually blue violet to blue purple *P. pachyphyllus*
- Staminode bearded with more or less straight hairs less than 1 mm long; corolla usually lavender pink to pale blue violet or blue 14
- 14(13). Flowers pink to lavender pink; plants of Millard, Juab, and Tooele counties 15
- Flowers lavender to violet blue, or sometimes pinkish lavender; distribution otherwise 16
- 15(14). Basal leaves poorly developed; lower leaves linear-lanceolate to lanceolate, rarely over 1 cm wide, the blade gradually narrowed to the petiole; plants of sand dunes in eastern Juab and Millard counties *P. angustifolius* var. *dulcis*
- Basal leaves well developed; lower leaves ovate to broadly oblanceolate, the larger well over 1 cm wide, the blade abruptly narrowed to the petiole; plants usually growing in clay or silty soils; known from near the Nevada border in Juab, Millard, and Tooele counties *P. innanifestus*
- 16(14). Leaves principally cauline, the lower ones sessile or gradually narrowed to the petiole, lanceolate, narrower than the upper, in the inflorescence becoming broad-based, clasping, and abruptly narrowed to an acuminate, and often conduplicate and recurved tip *P. angustifolius*
- Basal leaves well developed, spatulate, ovate or broadly oblanceolate, the blade abruptly narrowed to the petiole; upper leaves and bracts broad-based and clasping, but usually more gradually narrowed to the obtuse, acute, or mucronate tip 17
- 17(16). Corolla often finely glandular-puberulent externally; stems mostly 2–3.5 dm tall, the inflorescences compact or sometimes interrupted, cylindrical; peduncles usually less than 1 cm long, the cymes densely flowered, congested; plants not of San Juan County *P. carnosus*
- Corolla glabrous; stems mostly 3–7 dm tall, the inflorescence more or less elongate, interrupted, secund; peduncles (at least the lower) usually 1–2 cm long, evident, the cymes few-flowered; plants of San Juan County *P. lentus*

to decumbent, rooting at the nodes; flowering stems 0.5–1.6 (2.3) dm tall, puberulent, ascending to erect, leafy; leaves 0.5–2 (2.5) cm long, 0.4–2 mm wide, linear, acute, entire, often involute, glabrous or sparsely puberulent near the base, scarcely reduced in the inflorescence; inflorescence secund, the cymes usually only 1 per node, 1– to 2 (3)-flowered, the peduncles and pedicels puberulent and with a few gland-tipped hairs, the pedicels bracteate; calyx 4–7 mm long, glandular-pubescent, the lobes abruptly caudate above their broad, scarious-margined bases; corolla glandular-pubescent externally, 12–18 mm long, the tube purple, the throat lavender blue, bulged above, flattened and longitudinally 2-ridged and lighter in color below, the lobes darker blue, projecting-spreading, the palate bearded with pale yellow hairs; staminode included, densely bearded for most of its length with golden orange hairs; stamens ca reaching the orifice or the longer pair exerted, the anthers purplish black, the sacs 0.8–1.8 mm long. Pinyon-juniper, oak, and sagebrush communities at 1750 to 2300 m in Emery, Sevier (type from Salina Canyon), and Utah counties; 16 (ii). This taxon is known from Salina Canyon and the Fishlake Plateau, and from a disjunction in Spanish Fork Canyon (Markham 8958 BRY). Perhaps it is better treated at varietal level within the widespread *P. linarioides*, but no new combination is here proposed.

Penstemon acaulis L. O. Williams Stemless Penstemon. [*P. yampaensis* Pennell]. Diminutive mat-forming, long-lived perennial from a multicapital, fibrous-rooted caudex; plants evidently acaulescent, the old stems rooting, more or less stoloniferous, buried in duff and soil, and clothed with the remnants of previous leaves and flowers; current years growth tufted, the leaves 0.3–2.8 cm long, 0.3–4 mm wide, oblanceolate to linear, entire, obtuse to acute, papillate-scabrous, viscid when fresh; flowers usually solitary, sessile, borne among the leaves; calyx 5–8 mm long, densely glandular-puberulent, the lobes lance-linear, narrowly acuminate; corolla 12–15 mm long, glandular-pubescent, ampliate, moderately bilabiate, the lobes about equally spreading, blue, the palate paler and sparsely bearded, the throat rounded below; staminode reaching the orifice, densely orange-bearded; anthers blue black, glabrous, included to barely reaching the orifice, the sacs 0.7–0.9 mm long; capsules persistent on the old stems, indehiscent, retaining the seeds for several years, the seeds apparently released by eventual decomposition of the capsule. *Penstemon acaulis* is an unusual penstemon of unparalleled dwarf habit. Plants at the eastern end of the distribution have slightly larger leaves and flowers and have been recognized as *P. yampaensis* Penl., but specimens from Brown's Park, Utah, near the Colorado border are geographically and morphologically transitional. The variation seems best recognized at the varietal level as follows:

- 1. Leaves linear, less than 1.6 mm wide and 2 cm long; plants of Brown's Park and west to Manila and adjacent Sweetwater County, Wyoming *P. acaulis* var. *acaulis*
- Leaves, at least some, larger, more broadly linear to narrowly oblanceolate; plants of Brown's Park, Utah and east to near Greystone, Moffat County, Colorado *P. acaulis* var. *yampaensis*

Var. *acaulis* Semibarren substrates in pinyon-juniper and sagebrush-grass communities at 1790 to 2000 m in Daggett County, Sweetwater County, Wyoming and Moffat County, Colorado; 20 (vi).

***Penstemon abietinus* Pennell** Firleaf Penstemon. Low suffrutescent mat-forming perennial; old stems prostrate

Var. *yampaensis* (Penl.) Neese [*P. yampaensis* Penl.]. Semibarren, pale substrates in piñon-juniper and sagebrush-grass communities at ca 1780 m in Daggett County; Moffatt County, Colorado; 2 (ii).

Penstemon ambiguus Torr. Bush Penstemon; *Gilia* Penstemon. [*Leioctemon purpureum* Raf.; *L. ambiguus* (Torr.) Greene]. Woody-based, freely branched, bushy perennial 2.5–6 (8) dm tall; stems glabrous, branching candelabralike, the branches slender, divaricate near their bases, otherwise ascending to erect, the lower relatively long, the upper shorter, the flowers thus clustered toward the summit of the plant; leaves filiform, 0.4–3.8 (5) cm long, 0.2–1.7 mm wide, glabrous, entire, acute, involute, appearing terete; inflorescence of 2–11 verticillasters, the peduncles mostly 4–12 mm long, filiform, the cymes 1– to 3-flowered; calyx 2–3 (4) mm long, the lobes ovate, obtuse, acute or mucronate, broadly scarious-margined; corolla phloxlike, not 2-lipped, salverform, the tube and throat slightly arched, together 10–14 mm long, glabrous externally, pubescent internally toward the summit and at the orifice, this only 1–3 mm in diameter, the limb 10–16 cm wide, obliquely flat-spreading, glabrous, white or pale pinkish ventrally, pink to lavender pink dorsally; staminode included, the tip not expanded, glabrous or with a few hairs; anthers 5–8 mm long, included, glabrous, blackish, the sacs opening their full length and across the connective, finally explanate; capsule ca 6–7 mm long; $2n = 16$. Common or locally abundant in sandy soil in creosote bush, sand sagebrush, mixed desert shrub, live oak, manzanita-ponderosa pine, and juniper-sagebrush communities at 760 to 1950 m in Emery, Garfield, Kane, San Juan, and Washington counties; Nevada and Arizona, east to Colorado, Kansas, Oklahoma, Texas, and Mexico; 34 (i). Utah specimens belong to var. *laevissimus* (Keck) N. Holmgren [*P. ambiguus* ssp. *laevissimus* Keck in Kearney & Peebles].

Penstemon ammophilus N. Holmgren & L. Shultz Sandloving Penstemon. Herbaceous perennial from a branched caudex; stems clumped, 5–32 cm tall or more, decumbent to erect, sometimes elongating and developing fibrous roots in response to burying, usually fistulose and swollen above and in the inflorescence (except in depauperate stems); herbage without trichomes, papillate-glabrous when young, the surface obscured by tightly packed adhering sand grains; leaves 1.5–7 cm long, the basal ones petiolate, the petiole equaling or exceeding the blade, this suborbicular to oblanceolate, rounded to obtuse, the cauline leaves oblanceolate to narrowly lanceolate, becoming sessile above, undulate to prominently crisped; inflorescence of (2) 4–12 bracteate verticillasters, these congested or the lower ones remote, the cymes 2– to 8-flowered, the flowers subsessile; calyx 4–8 mm long, the lobes narrowly lanceolate, attenuate; corolla 14–17 mm long, lavender blue, moderately ampliate, scarcely bilabiate, the lobes projecting to spreading, without trichomes, glutinous and with adhering sand grains dorsally near the base of the lobes; anther sacs ca 1 mm long, included, dehiscing from the tip to the connective; staminode reaching the orifice or slightly exerted, the tip not expanded, pale, the upper surface dotted with dark blue purple papillae. In blow sand derived from the Navajo Sandstone, where the long-lived clumps act as sand stabilizers, in ponderosa pine and mixed shrub communities at 1800 to 2200 m in Garfield, Kane, and Washington (type from Canaan Mt.) counties; endemic; 4 (i).

Penstemon angustifolius Pursh Narrowleaf Penstemon. Perennial herb 2–6 dm tall; herbage glabrous, glaucous; stems ascending to erect, more or less woody at the base, 1 or few from a thick caudex; leaves 2–9.5 cm long, 1.5–25 (35) mm wide, leathery, entire, the basal tuft usually poorly developed or lacking, the basal and lower cauline ones (ob)lanceolate (usually narrowly so), narrowed imperceptibly to a petiolar base, the middle and upper ones usually wider and sessile, in the inflorescence becoming caudate-acuminate with broad and clasping bases; inflorescence glabrous, interrupted, of (3) 7–17 verticillasters, the fascicles usually densely flowered, the peduncles and pedicels short, mostly obscured by bracts and flowers; calyx 4–7.5 mm long, glabrous, the lobes narrowly lanceolate, acuminate, scarious-margined; corolla 15–21 (23) mm long, moderately ampliate, glabrous externally and internally, pink, lavender, blue lavender, or blue, the lobes about equally spreading; anthers included, the sacs 0.9–1.4 mm long, glabrous, dehiscing the full length and across the connective, not explanate; staminode included, dilated and yellow-bearded distally with hairs 0.5–1 mm long. There are three geographically discontinuous varieties in Utah, all growing in sandy sites.

1. Corolla pink to rose, not becoming violet or bluish on drying; lower and middle cauline leaves mostly linear-lanceolate, seldom over 8 mm wide; plants of sand dunes in Juab and Millard counties *P. angustifolius* var. *dulcis*
- Corolla lavender to blue less commonly pink, usually drying somewhat bluish; leaves linear or not; plants of eastern and south-central Utah 2
- 2(1). Corolla blue; basal and lower cauline leaves usually linear to linear-lanceolate, seldom over 8 mm wide; plants of Daggett and Uintah counties *P. angustifolius* var. *vernalensis*
- Corolla lavender to blue violet or sometimes pink basal and lower cauline leaves usually broader, the larger usually over 8 mm wide; plants of south-central and southeastern Utah *P. angustifolius* var. *venosus*

Var. *dulcis* Neese Four-wing saltbush, sagebrush-erigonum, and juniper communities at 1400 to 1650 m in Juab and Millard (type from the west base of the Canyon Mts.) counties; endemic; 9 (0).

Var. *venosus* (Keck) N. Holmgren [*P. angustifolius* ssp. *venosus* Keck in Kearney & Peebles; *P. venosus* (Keck) Reveal]. Blackbrush, sand sagebrush, rabbitbrush-Indian ricegrass-ephedra, and sagebrush-juniper communities at 1200 to 2200 m in Garfield, Kane, San Juan, and Wayne counties; Arizona and New Mexico; 26 (ii). This entity is, perhaps, not distinct from var. *caudatus* (Heller) Rydb., which occurs to the south and east of Utah.

Var. *vernalensis* N. Holmgren In ephedra-rabbitbrush and sagebrush-juniper communities at 1500 to 1800 m in Daggett and Uintah (type from 3 mi N of Maeser) counties; Colorado; 26 (xi). This is a well-marked taxon geographically isolated from other members of the *P. angustifolius* complex. It would not be inconsistent within *Penstemon* to treat it at specific rank. *Penstemon arenicola* A. Nels., a somewhat similar Wyoming species, has been reported from Daggett and Uintah counties and may occur here, but I have seen no specimens referable to that taxon. The report may have been based on misinter-

pretation of depauperate specimens of *P. angustifolius* var. *vernalisensis*.

Penstemon atwoodii Welsh Atwood Penstemon. Perennial herb 1.3–3.8 (5.2) dm tall; stems 1 to few, from a sparingly branched caudex and taproot, glabrous below, becoming glandular-pubescent near the inflorescence, ascending to erect; leaves 1.5–8 cm long, 2–12 mm wide, entire or irregularly few-toothed, the basal ones petioled, spatulate to narrowly oblanceolate, the cauline ones narrowly (ob)lanceolate, becoming sessile and clasping upward, glabrous; inflorescence densely glandular-pubescent throughout with spreading hairs, the thyrses narrow, interrupted, of 4–8 densely flowered verticillasters; calyx 5–9 mm long, densely glandular-pubescent, the lobes narrowly lanceolate, herbaceous, cyaneous; corolla 11–14 mm long, densely glandular-puberulent externally, only moderately ampliate, bilabiate, the lobes reflexed, the limb blue, the throat lavender with darker guidelines on the palate; anthers about reaching the orifice, glabrous, the sacs divaricate, dehiscing the full length and across the connective but not widely explanate; staminode exerted, golden yellow bearded. Sandy to clay soils, often on the "Blues" (gray clay badlands of the Kaiparowits Formation), pinyon-juniper woodland at 1650 to 2100 m in Garfield and Kane (type from the south end of Horse Mt.) counties; endemic; 12 (0).

Penstemon barbatus (Cav.) Roth. Beardlip Penstemon; Scarlet Penstemon. [*Chelone barbata* Cav.]. Perennial herb 3–11 dm tall; stems few from a stout, short-branched caudex, glabrous, ascending to erect, the internodes often remote; leaves 2–10 cm long, 1–20 mm wide, entire, glabrous (usually), glabrate, or the lower puberulent, the basal ones spatulate to broadly oblanceolate, petioled, the upper sublinear to filiform, sessile; inflorescence glabrous, secund, of 3–7 (12) verticillasters, these rather remote and the inflorescence thus wandlike, the pedicels slender, ascending, the cymes 1 to 2 (4) -flowered; calyx 3–5 (7) mm long, glabrous, the lobes ovate, obtuse to acute, sometimes shortly apiculate, mostly entire, more or less scarious-margined; corolla 25–35 mm long, scarlet, glabrous externally, sometimes long-pubescent on the palate, geniculate at the base, the flower thus oriented horizontally, markedly bilabiate, the upper lip projecting and ca 1 cm long, the lower lip reflexed; anthers long-exserted, the sacs glabrous (or villous in var. *trichander*), 1.5–2 mm long, widely spreading, dehiscing partially, the proximal portion near the connective remaining closed; staminode included, glabrous. Recognition as var. *torreyi* (Benth.) Gray has been accorded some of our material based on the presence of yellow palate pubescence; I can detect only the following infraspecific taxa:

1. Anthers villous; palate of the corolla glabrous
 *P. barbatus* var. *trichander*
- Anthers glabrous; palate glabrous to sparsely bearded . . .
 *P. barbatus* var. *barbatus*

Var. *trichander* Gray Sandstone cliffs, near Church Rock, at ca 1800 m (Cottam & Hutchings 2331), also possibly in the Abajo Mts., San Juan County; Arizona, New Mexico; 1 (0). It has been postulated that the villous anthers are an expression of introgression from *P. strictus* Benth.

Var. *barbatus* Ponderosa woodland, often in sandy soil at 1700–2600 m in Garfield, Kane, and Wayne counties; Arizona, New Mexico, Texas, Mexico; 7 (0).

Penstemon bracteatus Keck Platy Penstemon. Dwarf perennial herb 0.3–1.2 (1.5) dm tall; herbage and inflorescence glabrous; stems 1 or few from a rhizomatous caudex, ascending to erect; leaves 0.3–4 cm long, 1.5–12 (15) mm wide, entire, thick, glaucous, spatulate to (ob)ovate or broadly (ob)lanceolate, the lower narrowed to a petiole, the upper sessile and clasping; inflorescence secund, of 1–4 (6) verticillasters, the cymes 1 to few-flowered; calyx 3–5 (6) mm long, the lobes ovate to broadly lanceolate, glabrous, entire, scarious-margined; corolla (12) 14–17 (19) mm long, moderately ampliate, blue to blue violet, the lobes spreading, glabrous externally, the palate sparsely white-bearded; stamens included, the sacs 0.8–1.2 mm long, glabrous, dehiscing the full length and across the connective, not explanate; staminode included or reaching the orifice, densely golden bearded in the distal third. Pink and White Limestone members of the Wasatch Formation, in ponderosa pine, limber pine, or brittlecone pine-manzanita communities at 2105 to 2535 m in Garfield (type from Red Canyon) County; endemic; 13 (i). The species is endemic to the Bryce Canyon-Red Canyon vicinity.

Penstemon breviculus (Keck) Nisbet & R. Jackson [*P. jamesii* subsp. *breviculus* Keck]. Perennial herb 0.8–3 (3.5) dm tall; stems clustered from a branched caudex and tap root, ascending to erect, puberulent (usually) to glabrous; leaves 2–8 cm long, 4–18 mm wide, spatulate to (ob)lanceolate, the lower and basal narrowed to a petiolar base, the upper sessile, glabrous or sparingly puberulent on the midrib near the base, entire, crisped, or the cauline ones sometimes irregularly toothed; herbage somewhat viscid when fresh; inflorescence glandular-pubescent, of 3–7 verticillasters, the cymes several-flowered; calyx 5–7 (8) mm long, glandular-pubescent, the lobes lanceolate, scarious-margined near the base; corolla (12) 14–(18) 20 mm long, glandular-pubescent, funnelform to moderately ampliate, bluish purple with darker longitudinal veins, the palate bearded with long, pale yellow hairs, the lobes about equally spreading or the lower sometimes spreading-reflexed; stamens included, becoming peltate-explanate, the sacs (0.6) 0.8–1 mm long, about as broad, glabrous; staminode included to shortly exerted, bearded with long golden orange hairs. Sagebrush and pinyon-juniper communities at 1600 to 2000 m in Grand and San Juan counties; Colorado and New Mexico; 5 (1). This taxon is very similar to *P. ophianthus*, differing in the mostly smaller, less ventricose-ampliate flowers. Some of our few collections seem fully transitional, and the two taxa are more or less sympatric. Additional collections may dictate treatment at infraspecific level within *P. ophianthus*.

Penstemon caespitosus Nutt. ex Gray Mat Penstemon. Plants perennial, more or less caespitose, 0.2–1.4 dm tall, herbaceous to suffruticose; herbage pubescent with terete to flattened retrorse hairs; flowering stems 2–11 (20) cm long, prostrate and mat-forming with tips ascending, or (in var. *suffruticosus*) ascending to erect, proliferating from previous years stems, these eventually rooting, semi-woody, and prostrate; leaves 0.2–15 mm long, 1–7 mm wide, linear to obovate or spatulate, narrowed to a short petiole, entire; inflorescence leafy, the flowers borne among the leaves or overtopping the leafy mat,

obscurely secund; cymes often only 1 per node, 1–2 (3) flowered; calyx 3–6 mm long, the lobes herbaceous or with very narrow scarious margins, linear-lanceolate, pubescent; corolla 11–20 mm long, glandular-pubescent externally, ampliate, bulged above, flattened and 2-ridged below, the lobes projecting-spreading, the lower lobes slightly longer than the upper, blue to blue violet, the palate lighter, sparsely light yellow bearded; stamens shortly exerted, the anther sacs 0.6–1.2 (1.4) mm long, glabrous, blue, dehiscing the full length and across the connective, not fully explanate; staminode reaching the orifice, golden yellow to orange bearded. There are four essentially allopatric varieties:

1. Leaves linear to narrowly oblanceolate, mostly 1–2 mm wide, more than 5 times longer than wide, green, scabrous-puberulent but only slightly cinereous; plants of northeastern Utah near the Uinta Mts. *P. caespitosus* var. *P. caespitosus*
- Leaves narrowly oblanceolate to obovate or spatulate, mostly 2–4 mm wide, only 3–4 times longer than wide; leaves cinereous-puberulent, at least below; plants of more southerly distribution 2
- 2(1). Pubescence of leaves mostly flattened, appressed, scalelike; flowering stems ascending to erect; plants somewhat suffruticose, hardly mat-forming, of the Tushar, Sevier, and Markagunt plateaus *P. caespitosus* var. *suffruticosus*
- Pubescence of leaves mostly terete, retrorsely spreading; plants mat-forming, the flowering stems mostly prostrate; distribution otherwise 3
- 3(2). Anther sacs mostly more than 9 mm long; plants of the Aquarius and Paunsaugunt plateaus *P. caespitosus* var. *desertipicti*
- Anther sacs mostly less than 9 mm long; plants of the Tavaputs and Wasatch plateaus *P. caespitosus* var. *perbrevis*

Var. *caespitosus* In sagebrush, pinyon-juniper, mountainbrush, and forb-grass openings in aspen-conifer communities at 2100 to 2900 (3250) m in Daggett, Duchesne, Rich, Uintah, and Wasatch counties; Wyoming and Colorado; 20 (viii).

Var. *desertipicti* (A. Nels.) N. Holmgren [*P. desertipicti* A. Nels; *P. caespitosus* subsp. *desertipicti* (A. Nels.) Keck]. In sandy clay or gravelly soil, often on multi-hued semi-barrens of the Wasatch Limestone Formation, in pinyon-juniper, sagebrush, and ponderosa communities at 2000 to 2800 m in Garfield, Kane, and Wayne counties; Arizona; 17 (iii).

Var. *perbrevis* (Pennell) N. Holmgren [*P. caespitosus* subsp. *perbrevis* Pennell]. In sparsely vegetated sagebrush-grass openings of pinyon-juniper, mountain brush, and aspen-conifer communities in the vicinity of the Tavaputs Plateau at 2500 to 2650 (2900) m in Carbon (type from Castle Gate), Duchesne, Grand, Sanpete, and Uintah counties; Colorado; 42 (ix).

Var. *suffruticosus* [*P. caespitosus* subsp. *suffruticosus* Keck; *P. tusharensis* N. Holmgren]. In conifer-manzanita, black sagebrush, and aspen parkland communities, in rocky or gravelly openings at 2500 to 3360 m on the Tushar, Sevier, and Markagunt plateaus in Beaver (type from the Tushar Mts.), Garfield, Iron, Kane (?), and Piute counties; 22 (0). These more or less clump-forming plants from high elevation in the vicinity of the Tushar Mts. have been variously treated infraspecifically within the *P. cae-*

spitosus complex; the phase was elevated to specific rank (*P. tusharensis*) by Noel Holmgren (1979), who believed it more closely allied with *P. thompsoniae*. Recent collections to the south and east of the Tushar Mountains have shown var. *suffruticosus* to be transitional morphologically, geographically, and elevationally with *P. caespitosus* var. *desertipicti*, and less similar to the nearby *P. thompsoniae* var. *thompsoniae* (q.v.). The strong tendency in var. *suffruticosus* toward the scalelike leaf pubescence which characterized *P. thompsoniae* is indicative of the close relationship between the two species.

Penstemon carnosus Pennell Fleshy Penstemon. Perennial herb 1.5–3.5 dm tall; herbage glabrous, glaucous; stems ascending to erect, 1 or few from a thick, woody sparingly branched caudex; leaves 2–9 (11) cm long, 5–32 (40) mm wide, thick and fleshy, entire, spatulate to (ob)ovate or (ob)lanceolate, the basal tuft well developed, the lowermost petioled, the upper sessile, clasping, obtuse (usually); inflorescence glabrous, the thyrse cylindrical, congested or sometimes moderately elongate, of 3–10 verticillasters, the cymes 1- or few-flowered, the peduncles rarely exceeding 1 cm; calyx 4–8 mm long, glabrous, the lobes ovate to broadly lanceolate, acute to acuminate, broadly scarious-margined; corolla (16) 18–21 (24) mm long, moderately ampliate, finely and obscurely glandular-puberulent externally (specimens from Garfield and Wayne counties sometimes glabrous), lavender pink to blue violet (usually drying blue violet), the throat rounded above and below, the lobes about equally spreading, the palate glabrous or sparsely white-bearded, guidelines absent or obscure; stamens included or shortly exerted, the sacs 1.1–1.5 mm long, glabrous, dehiscing fully and across the connective, dilated (the tip 1–1.5 mm wide) and curved distally, sparsely to moderately bearded with short, yellow to yellow brown hairs, these 0.2–0.5 mm long. Salt desert shrub, sagebrush, pinyon-juniper (usually), and mountain brush communities, often in clay or shaly soil at 1500 to 2260 (2500) m in Carbon, Emery (type from the San Rafael Swell), Garfield, Uintah, and Wayne counties; endemic; 41 (vi). Specimens from Wayne and Garfield counties are problematical, sharing variously characters of *P. carnosus*, *lentus*, and *pachyphyllus*.

Penstemon cleburnei Jones Cleburne Penstemon. Perennial herb 7–22 cm tall; stems from a tap-rooted caudex, 1 to few, ascending to erect; herbage densely puberulent, becoming glandular in the inflorescence; leaves 1.5–6 cm long, 4–13 mm wide, entire, broadly spatulate to narrowly (ob)lanceolate, the basal ones narrowed to a petiolar base, the upper sessile; thyrse leafy, congested, of 3–7 verticillasters; calyx 6–9 mm long, glandular-pubescent, the lobes lanceolate, herbaceous; corolla 18–24 mm long, glandular-puberulent, ventricose-ampliate, the throat rounded above and below, constricted at the orifice, bilabiate, the lips spreading, lavender blue, the lower lip lighter and veined with wine purple guidelines, the palate densely bearded with conspicuous white hairs; stamens included, the anthers glabrous, peltate-explanate, the sacs 0.8–1.1 mm long, broadly ovate; staminode bearded for most of its length with long yellow hairs (more densely bearded proximally and at the tip than in the central portion), exerted, the tip curved downward; in sandy, gravelly, or (often) clay soils, sagebrush-grass and cool-desert shrub communities at 1800 to 2500 m in Daggett and Summit counties; Wyoming; 7 (iv).

Penstemon comarrhenus Gray Dusty Penstemon. Robust perennial herb 3–8 (12) dm tall; herbage glabrous (rarely sparingly puberulent); stems 1 to few from a short-branched, fibrous-rooted caudex, ascending to erect, puberulent below; leaves 2.5–13 cm long, 1–20 (30) mm wide, entire, rounded to obtuse, the basal ones broadly to narrowly (ob)lanceolate, petioled, the cauline ones linear to narrowly oblanceolate, becoming sessile upwards, often folded; inflorescence glabrous, moderately or scarcely secund, of 5–16 verticillasters, the cymes 1– to 4-flowered, the lower peduncles spreading, 13–40 mm long, or the lower axils sometimes producing branched, many-flowered, secondary inflorescences; calyx 3–7 (10) mm long, glabrous, the lobes ovate, blunt or apiculate, scarious margined; corolla 24–37 mm long, glabrous, strongly ventricose-ampliate and bilabiate, the tube nearly white, the throat pale lavender blue, often paler ventrally, the lobes pale blue, the upper ones projecting-spreading, the lower spreading-reflexed; anthers exerted, the sacs 2–2.7 mm long, spreading at about a 90 degree angle, remaining indehiscent in the proximal 1/4–1/6, white-villous with tangled hairs longer than the sacs, usually densely so; staminode included or reaching the orifice, moderately dilated apically, glabrous (usually) or with a few long hairs. Openings in Douglas fir-aspens, mountain brush, sagebrush-grassland, and pinyon-juniper communities at (1000) 1700 to 2750 m in Beaver, Carbon, Emery, Garfield (type from the Aquarius Plateau), Grand, Iron, Kane, Millard, Piute, San Juan, Sanpete, Sevier, Washington, and Wayne counties; Colorado, Arizona, Nevada; 123 (xiii). See note under *P. strictus*.

Penstemon concinnus Keck Elegant Penstemon. Perennial herb 0.6–2.3 dm tall from a compact, much-branched caudex and taproot; stems finely retrorsely puberulent, usually suffused with purple; leaves 1.8–5 (7) cm long, 1.5–6 (9) mm wide, entire to toothed, glabrous (sometimes sparingly puberulent near the base or on the midrib), somewhat glaucous, the basal ones well developed, petioled, linear to (ob)lanceolate and becoming sessile above; inflorescence glandular-pubescent with spreading hairs, the thyrse narrow, leafy, the lowermost bracts usually wider than the cauline leaves, of (2) 4–7 (9) verticillasters, the cymes densely flowered, the peduncles and pedicels short; calyx 5–8 mm long, densely glandular-pubescent with spreading hairs, the lobes narrowly lanceolate, herbaceous, usually suffused with purple; corolla 8–10 (12) mm long, moderately ampliate, the lower lip usually reflexed, glandular-pubescent externally, blue violet, the palate veined with dark purple guidelines and copiously bearded with long white hairs; anthers included or shortly exerted, glabrous, the sacs 0.5–0.9 mm long, peltate-explanate, about as broad as long, blue black; staminode exerted, curved at the tip, bearded, the hairs pale yellow to white. Calcareous or igneous gravels, usually on pale, limestone-derived soil, in pinyon-juniper and sagebrush communities at (1600?) 1900 to 2300 m in western Beaver, closely adjacent Millard (type from Tunnel Springs Mts.), and Iron counties; Nevada; a Great Basin endemic; 29 (ii).

Penstemon confusus Jones Mistaken Penstemon. Perennial herb 0.8–5 (8.5) dm tall; herbage glabrous and glaucous; stems erect, single or few from a thick crown; leaves thick and leathery, entire, rounded to obtuse apically, the basal ones 2–7 cm long, 4–11 mm wide,

(ob)lanceolate (sometimes narrowly so) or rarely spatulate, the cauline ones 0.8–6.5 cm long 1.5–15 mm wide, narrowly (ob)lanceolate to oblong, sessile, few, more or less reduced above; inflorescence glabrous, often lax and wandlike, of 3–10 (16) verticillasters, the cymes 1– to 3 (5)-flowered, not congested; calyx 3.5–6 mm long, glabrous, the lobes ovate to lanceolate, obtuse to acute or shortly-acuminate, broadly scarious-margined; corolla 15–20 (22) mm long, tubular-funneliform to moderately ampliate, the lobes about equally spreading, glandular to glabrous externally, densely glandular within near the orifice, the limb lavender pink, violet, or magenta, the throat and tube lighter, usually marked with reddish guidelines, drying lavender to blue violet or rarely reddish pink; stamens included or reaching the orifice, the anthers glabrous, pale or (often) cyaneus, dehiscing fully and across the connective, the sacs ca 1 mm long, more or less explanate but scarcely peltate so; staminode included, slightly dilated apically, glabrous or papillate. Sandy or gravelly, often sparsely vegetated places or in clay, in mixed desert shrub, sagebrush, juniper-black sage, sagebrush-oak, and juniper-mountain brush communities at (1000) 1370 to 2200 m in Beaver, Iron, Juab (type from Detroit), Millard, Sanpete, Sevier, and Washington counties; Nevada; 86 (vi). This species is closely related to the more eastern *P. utahensis* and transitional to it in Washington County and the Tushar Mts.

Penstemon crandallii A. Nels. Crandall Penstemon. Herbaceous or obscurely suffrutescent perennial; old stems prostrate, rooting; flowering stems 3–12 dm long, decumbent to ascending, puberulent; leaves 0.5–2.5 (3.8) cm long, 1–5 mm wide, spatulate, obovate, or oblanceolate, becoming narrowly oblanceolate above, entire, sparingly scaberulous-puberulent to subglabrous, usually floriferous for most of their lengths, the flowers 1–several per node, usually only 1 axil per node bearing flowers; calyx 4–6 mm long, the lobes lanceolate, acute to acuminate, usually scarious-margined in the lower half; scaberulous-puberulent, obscurely glandular; corolla 14–21 mm long, glandular-pubescent externally, blue to blue lavender, flattened and 2-ridged below, 2-lipped, the lobes spreading, the palate sparsely bearded; stamens reaching the orifice or the longer exerted, the sacs 1–1.2 mm long, dehiscing fully but the sacs not fully explanate; staminode included, densely golden orange-bearded most of its length. $2n = 16$. Our material may be referred to two poorly differentiated varieties:

1. Leaves narrowly oblanceolate; stems ascending; plants of the Abajo Mts. *P. crandallii* var. *crandallii*
- Leaves spatulate, obovate, or oblanceolate; stems more or less prostrate; plants of the La Sal Mts. *P. crandallii* var. *atratus*

Var. *atratus* (Keck) N. Holmgren [*P. crandallii* ssp. *atratus* Keck, type from the La Sal Mts.]. Pinyon-juniper, sagebrush, and mountain brush communities at 2135 to 2595 m in the La Sal Mts., Grand and San Juan counties; endemic; 3 (0).

Var. *crandallii* Pinyon-juniper, mountain brush, and ponderosa pine communities at 2135 to 2440 m in the Abajo Mts., San Juan County; Colorado; 2 (0).

Penstemon cyananthus Hook. Wasatch Penstemon. Perennial herb 0.6–9 dm tall; herbage glabrous (usually) to cinereous-puberulent; stems decumbent to erect; inflorescence of 2–9 verticillasters, secund to cylindrical,

the cymes 1- to 7-flowered; calyx 3-8.5 mm long, glabrous or (in var. *compactus*) obscurely glandular, the lobes ovate to lanceolate, acute to caudate, more or less erose scarios-margined; corolla 15-32 mm long, glabrous, blue, moderately ventricose-ampliate, the lobes spreading; palate glabrous; stamens (the longer pair) exerted; anther sacs 1.3-2.2 mm long, pubescent with straight to flexuous hairs mostly shorter than the width of the sac, diverging at about a 90-120 degree angle, dehiscing in the distal 2/3-4/5, the suture lateral; staminode white or sometimes blue-tipped, bearded with yellow (usually) hairs, sometimes sparsely so, or rarely glabrous; $2n = 16$. *P. cyananthus* is a variable and difficult group, unified by uniform and consistent anther characteristics, whose members have been treated at various taxonomic ranks. Names applied to taxa in our flora include *compactus*, *holmgrenii*, *longiflorus*, and *subglaber* (of Gray, applied at varietal level, not *P. subglaber* Rydb., a different species). A reticulate array of morphological and geographic intermediates of these as well as other unnamed races occurs. Most variation within the complex may be recognized at varietal level as follows:

1. Plants relatively dwarf, mostly 1-2.5 dm tall, the stems decumbent to ascending; leaves commonly folded; calyx obscurely glandular; inflorescence reduced, usually of 2-4 verticillasters; plants of rocky limestone outcrops, high elevation in the northern Wasatch Range, Cache County *P. cyananthus* var. *compactus*
- Plants taller, usually over 3 dm tall, the stems ascending to erect; leaves seldom folded; calyx glabrous; inflorescence usually of 5 or more verticillasters; plants of wider distribution 2
- 2(1). Leaves linear-lanceolate to lanceolate, the cauline ones mostly 4 times or more longer than wide; lower leaves usually cinereous-puberulent; plants of Box Elder County *P. cyananthus* var. *subglaber*
- Leaves lanceolate to ovate, the cauline ones less than 4 times longer than wide; lower leaves sparingly puberulent to glabrous; plants of other distribution (rarely occurring in eastern Box Elder County) 3
- 3(2). Inflorescence secund, the cymes mostly 1-3 flowered; corollas usually over 25 mm long; herbage usually puberulent; plants of mountain ranges bordering the east edge of the Bonneville Basin *P. cyananthus* var. *longiflorus*
- Inflorescence more or less cylindrical, usually densely flowered, the cymes mostly 5- to 7-flowered; flowers often smaller; herbage glabrous or nearly so; plants of the Wasatch Mts. *P. cyananthus* var. *cyananthus*

Var. *compactus* (Crosswhite) Neese [*P. compactus* Crosswhite, type from the Bear River Range; *P. cyananthus* subsp. *compactus* (Crosswhite) Keck]. High elevations near Tony Lake and Mt. Naomi in Cache County; Idaho, a northern Wasatch endemic; 9 (0).

Var. *cyananthus* Common in the Wasatch Mts. and foothills; a very showy species; in Box Elder, Cache, Davis, Duchesne, Juab, Morgan, Salt Lake, Sanpete, Summit, Utah, Wasatch, and Weber counties; Idaho and Wyoming; 92 (iii).

Var. *longiflorus* (Pennell) Neese [*P. cyananthus* subsp. *longiflorus* Pennell, type from near Beaver; *P. longiflorus* (Pennell) S. Clark]. Tushar and Pavant ranges, at 1800 to 2500 m, passing into var. *subglaber* northward in the small ranges of the east Bonneville Basin, and into var. *cyananthus* in the southwestern part of the Wasatch

Range; in Beaver, Juab, Millard, Piute, Sevier, and Tooele counties; endemic; 18 (i).

Var. *subglaber* (Gray) N. Holmgren [*P. fremontii* var. *subglaber* Gray; *P. cyananthus* subsp. *subglaber* (Gray) Pennell; *P. holmgrenii* S. Clark]. Mountain brush and sagebrush communities at 1800 to 3300 m in Box Elder County; Idaho and Wyoming; 23 (ii). This variety passes into var. *cyananthus* in eastern Box Elder County, and into var. *longiflorus* southward.

***Penstemon cyanocaulis* Payson** Bluestem *Penstemon*. Herbaceous perennial 2-4.5 dm tall; stems glabrous, ascending to erect, 1 to several, from a short-branched woody caudex; leaves 1.5-12 cm long, 2-20 (30) mm wide, the margins commonly crisped, the basal and lower cauline ones obovate to (ob)lanceolate, narrowed to a petiolar base, the upper oblong or (ob)lanceolate, sessile, often somewhat clasping, mostly obtuse, not folded; inflorescence of (5) 7-9 (12) verticillasters, the cymes 1-4 (5) flowered, glabrous; calyx 3.5-5 (6) mm long, glabrous, the lobes ovate to broadly lanceolate, acute, scarcely if at all acuminate or caudate, the margins narrowly scarios-margined, entire or somewhat erose; corolla 16-24 mm long, glabrous, ventricose-ampliate, bilabiate, the upper and lower lobes spreading about equally or the upper somewhat reflexed, the lobes blue, the tube and throat lavender blue; anthers (the longer pair) about reaching the orifice, the sacs pubescent, the hairs mostly straight and shorter than the width of the sac, dehiscing from the distal end, the line of dehiscence not reaching the connective; staminode sparsely yellow-bearded, included to slightly exerted. Pinyon-juniper communities, mostly in sandy soil at 1500 to 2300 m in Carbon, Emery, Grand, and San Juan counties; Colorado; 26 (iii). Bluestem *penstemon* is very similar to *P. strictiformis*, a taxon of similar habit that occurs slightly to the south of *P. cyanocaulis*. Although some specimens are problematical, *P. cyanocaulis* usually may be distinguished by the relatively broader, mostly obtuse rather than acute, more crisped leaves, somewhat shorter more hispid pubescence of the anthers, and ovate, broadly acute (not lance-acuminate) calyx lobes.

***Penstemon deustus* Dougl. ex Lindl.** Hotrock *Penstemon*; Scabland *Penstemon*. Subshrub 1.5-3 dm tall; herbage glabrous to glandular-puberulent; stems slender, decumbent, ascending, or erect, numerous, from a freely branched woody base; sterile leafy shoots borne among the taller, flowering ones; leaves 1-2.5 (5) cm long, 2.5-8 (18) mm wide, serrate to dentate, the lower ones spatulate to oblanceolate, narrowed to a short petiolar base, the upper elliptic to lanceolate, sessile; inflorescence of 3-9 (14) verticillasters, the cymes 1- to few-flowered; calyx and pedicels sparingly glandular-puberulent, the calyx 2-5 (6) mm long, the lobes lanceolate, acute, narrowly scarios-margined near the base; corolla 10-14 mm long (ours), sparingly glandular-puberulent externally, white, the throat sometimes brown or lilac-tinged externally, the upper lobes arched-projecting, faintly blotched with brownish purple internally, the lower lobes longer than the upper, spreading, veined with reddish purple; stamens exerted, the sacs ca 0.5 mm long and equally broad, glabrous, dehiscing the full length and across the connective, explanate; staminode included or reaching the orifice, glabrous or sparsely bearded apically, slender, not dilated apically; $2n = 16$. Rocky places in the pinyon-juniper zone at 2000 to 2700 m

in western Box Elder County; Washington, Idaho, Oregon, California, Wyoming; 2 (0). Utah specimens are var. *pedicellatus* Jones.

Penstemon dolius Jones ex Pennell Jones Penstemon. Perennial herb 4–17 dm tall; herbage densely cinereous-puberulent with retrorse hairs; stems tufted, several to many from a compactly branched caudex, spreading or the marginal ones more or less prostrate, often reddish purple; leaves 1–4 cm long (to 6 cm at the base of the inflorescence), 2–11 mm wide, basal and cauline, entire, spatulate to oblanceolate, the lower ones narrowed to a broad petiolar base; inflorescence cinereous-puberulent, essentially non-glandular, leafy-bracteate, congested, of (1) 3–8 verticillasters, the cymes 1– to 3 (5) -flowered, often only one of the axil pairs floriferous, the flowers subsessile; calyx cinereous-puberulent with non-glandular hairs, 5–9 mm long, the lobes lanceolate to narrowly lanceolate-attenuate, herbaceous; corolla 13–21 mm long, glandular-pubescent with spreading hairs, tubular-funneliform to moderately ampliate; corolla lobes about equally spreading or the upper arched and projecting, 3–5 mm wide when well pressed, usually widest at the base and not overlapping, pale blue to blue or blue violet, the tube and throat lighter, the palate sparsely bearded and sometimes marked with red violet guidelines; anthers included, the sacs 1–1.2 mm long, glabrous, dehiscing the full length and across the connective, becoming divaricate, not explanate, blue black; staminode included or reaching the orifice, bearded with a tuft of golden yellow hairs distally, more sparsely bearded proximally, abruptly dilated to a broad tip, this more than 1 mm wide and strongly curved to coiled. Calcareous gravels or on rocky or sandy semibarrens, often in clay or silt of old playas or alluvial deposits, in shade, mixed desert shrub, sagebrush-grass, or juniper communities at 1370 to 2000 m in Beaver, Juab, Millard, Sanpete, Sevier, and Tooele (type from the Deep Creek Mts.) counties, Nevada; 58 (iv).

Penstemon duchesnensis (N. Holmgren) Neese Duchesne Penstemon. [*P. dolius* var. *duchesnensis* N. Holmgren, type from 17 km east of Duchesne]. Low perennial herb 2.5–12 cm tall; herbage densely cinereous-puberulent with retrorse hairs; stems ascending to erect, few to several from a branched caudex; leaves 0.8–4 cm long, 1.5–8 mm wide, basal and cauline, entire, narrowed to a petiolar base, the blade broadly elliptic to (ob)lanceolate; inflorescence leafy-bracteate, cinereous-puberulent, of 1–4 (6) more or less congested verticillasters, not secund, the cymes 1 to several-flowered, often only one of the axil pairs floriferous, the flowers subsessile; calyx cinereous-puberulent with non-glandular hairs, 6–11 mm long, the lobes lanceolate to narrowly lanceolate-attenuate, acute; corolla 16–22 (25) mm long, tubular-funneliform to ampliate, glandular pubescent externally with spreading hairs, blue to blue purple, the palate sparsely bearded, guidelines absent or obscure; lobes about equally spreading, orbicular, overlapping at the base, widest at the middle, 4–7 mm wide when pressed; stamens included, the anthers glabrous, the sacs 1.1–1.3 mm long, dehiscing the full length and across the connective, becoming divaricate, not explanate; staminode included or reaching the orifice, densely and rather evenly bearded with orange hairs in the distal half, gradually widened to a dilated apex, the tip less than 1 mm wide and straight or only slightly curved. On gravelly or silty sand or clay semibar-

rens in open pinyon-juniper woodlands at 1640 to 1830 m near Duchesne, Duchesne County; endemic; 15 (vii). *Penstemon duchesnensis*, similar to *P. dolius* and previously included within that taxon at varietal level, is a much showier plant and is distinguished from the latter by a series of characters as indicated in the keys and descriptions; the two are geographically separated by about 130 km.

Penstemon eatonii Gray Eaton Penstemon; Scarlet-bugler Penstemon. Perennial robust herb 2.5–10 dm tall; stems few to several from a stout caudex, ascending to erect; herbage glabrous throughout, or puberulent in var. *undosus*; leaves entire, crisped (usually) or plane, the basal and lower cauline 3–19 cm long, 8–40 (55) mm wide, the blade (ob)lanceolate or broadly obovate, narrowed to a petiolar base, the upper 1.5–11 cm long, (4) 8–40 mm wide, ovate to broadly lanceolate (rarely narrowly lanceolate), sessile, clasping, often cordate; inflorescence secund, of 4–12 (18) verticillasters, wandlike, little-congested, the cymes 1– to 3 (6) -flowered, the peduncles and pedicels ascending to erect, glabrous or puberulent; calyx (2.6) 3.2–5.5 (6.5) mm long, glabrous or glandular puberulent, the lobes ovate, obtuse, acute or (rarely) shortly acuminate, the margins moderately scarious-erose; corolla (15) 20–30 (33) mm long, red, glabrous, somewhat geniculate at the base (the corolla thus horizontal or declining), nearly tubular, the tube 2.8–3.5 mm in diameter, widening imperceptibly distally, the throat at the orifice 5–7.5 mm wide, the lobes projecting or only slightly spreading, the upper slightly longer; staminode white, glabrous, included; anthers finely spiculate-puberulent, included to exerted, the sacs 1.5–2.5 mm long, opening in the distal 2/3's. Mixed desert shrub, sagebrush, mountain brush, and aspen communities at 900 to 3400 m in all but the northern quarter of Utah; California, Nevada, Arizona, New Mexico, and Colorado; 231 (xiv). A loose geographic correlation between presence or absence of pubescence may be recognized at the varietal level as follows:

1. Herbage glabrous; plants often of rocky places, mostly in central and western Utah *P. eatonii* var. *eatonii*
- Herbage finely puberulent; plants often of sandy places, mostly in southern and southeastern Utah *P. eatonii* var. *undosus*

Var. *eatonii* Plants of numerous habitats in many vegetative types in Beaver, Carbon, Duchesne, Emery, Garfield, Iron, Juab, Kane, Millard, Piute, Salt Lake, San Juan, Sevier, Tooele, Utah (type from Provo Canyon), and Wasatch counties; Nevada, California, Colorado.

Var. *undosus* Jones Plants of mixed warm and cool desert shrub, pinyon-juniper and other plant communities in Garfield, Grand, Iron, Kane, San Juan, Washington (type from St. George), and Wayne counties; Nevada, California, Arizona, New Mexico. Occasional plants bear yellow flowers.

Penstemon flowersii Neese & Welsh Flowers Penstemon. Perennial herb 8–25 (32) dm tall; herbage glabrous and glaucous; stems few to several, arising from a branched, woody caudex, ascending to erect; leaves (1) 2–7 cm long, 4–25 mm wide, all cauline, entire, thick, blue-glaucous, spatulate to (ob)ovate or broadly (ob)lanceolate, the lower narrowed to a petiolar base, the upper sessile, becoming clasping and broadly ovate in the inflorescence; inflorescence glabrous, the thyrse com-

pact, cylindric, of 4–9 verticillasters, the cymes several-flowered; calyx 5–7 mm long, the lobes ovate to broadly lanceolate, acute to attenuate, broadly scarious-margined; corolla 15–20 (22) mm long, the throat moderately ampliate, the lobes more or less spreading, glabrous within and without, rose pink (drying pink not blue), the palate inconspicuously marked with darker lines; stamens ca reaching the orifice or the longer pair exerted, the sacs 0.9–1.3 mm long, opening the full length and across the connective, glabrous, not fully explanate; staminode included, the tip moderately dilated, pubescent, with very short yellow hairs to 0.1 mm long. Shadscale and salt desert shrub communities at 1520 to 1650 m in Duchesne and Uintah (type from 5.6 km W of Randlett) counties; 10 (vii). The species is endemic to clay badlands in the vicinity of Roosevelt.

Penstemon fremontii T. & G. Fremont Penstemon. [*P. glaber* var. *fremontii* (T. & G.) Jones, type on the Uinta plains, Fremont]. Perennial herb (0.8) 1.5–4.2 dm tall; stems erect, one or few, from a crown and taproot; herbage evenly retrorsely cinereous-pubescent; leaves (1.5) 3–12 cm long, 5–27 mm wide, entire, obtuse, the basal and lower cauline ones elliptic or obovate to (ob)lanceolate, narrowed to a petiolar base, the upper ones ovate (rarely so) or more often oblong to lanceolate, usually narrowly so, sessile; inflorescence relatively congested, of 4–11 verticillasters, the cymes (1) 2- to 4 (7)-flowered, not markedly secund, puberulent to sparingly glandular or glabrous; calyx 4–6.5 mm long, glabrous or sparingly glandular, the lobes ovate to lanceolate, acute to (usually) acuminate, scarious-margined, moderately erose; corolla (12) 18–23 (25) mm long, medium to dark blue, glabrous, moderately ampliate or nearly tubular, the lobes moderately spreading, about equal or the lower somewhat larger and projecting; anthers included, sparsely hispid, the hairs shorter than the width of the sac, straight to somewhat flexuous, the sacs 1.3–1.8 mm long, dehiscing from the distal end 2/3–4/5 their length, moderately divergent near the connective but with tips flared; staminode sparsely bearded with golden hairs, dilated apically, included. Common in the Uinta Basin on arid benches and slopes, in shadscale, mixed desert shrub-grassland, and pinyon-juniper communities at 1500 to 2500 m in Duchesne and Uintah counties; Wyoming and Colorado; 82 (xxxiv). The type was taken “on Uinta plains” by John Charles Fremont on his second expedition in the spring of 1844. One specimen (Collins & Harper 146 BRY) from near Nephi keys here on the basis of pubescent rather than glabrous anthers. It has, otherwise, the features and distribution of *P. tidesstromii* Pennell.

Penstemon goodrichii N. Holmgren Goodrich Penstemon. Perennial herb 1.2–4 dm tall; stems several to many from a freely branched caudex and taproot, ascending to erect, glabrous, becoming glandular-pubescent in the inflorescence; leaves basal and cauline, 2–6 (8) cm long, 2–3 mm wide, narrowly (ob)lanceolate to linear, entire or sometimes with a few teeth, glabrous; inflorescence lax, of 3–6 (9) verticillasters, the cymes 1- to 3-flowered; flowers short-pedicelled; calyx 4–7 mm long, glandular-pubescent, the lobes lanceolate, obtuse, herbaceous; corolla 11–16 mm long, nearly regular, funnelliform, flaring gradually from the summit of the tube to the apex, glandular-puberulent, blue to blue lavender, the throat pale, striate internally with violet guidelines; stamens

very short, included in the tube or shortly exerted into the throat; anthers glabrous, peltate-explanate, the sacs ca 0.8 mm long; staminode densely golden bearded, included, slightly exceeding the stamens; style very short, included in the tube. Blue gray to reddish, clay-impregnated badlands of the Duchesne river Formation in shadscale and juniper-mountain mahogany communities at 1705 to 1895 m in Duchesne and Uintah (type from near Lapoint) counties; 16 (v). This species is known only from the Lapoint-Tridell-Whiterocks area.

Penstemon grahamii Keck Graham Penstemon. Perennial herb 0.5–2 dm tall from a sparingly branched, taprooted caudex; stems ascending to erect, puberulent; leaves 1.5–5 cm long, 3–18 mm wide, thick, entire or rarely with a few inconspicuous teeth, glabrous (sometimes with a few hairs near the base), becoming glandular-puberulent in the inflorescence, the basal ones ovate, spatulate, or broadly oblanceolate, narrowed to a petiolar base, the upper oblong or (ob)lanceolate, sessile, clasping; inflorescence glandular-pubescent, of 1–5 crowded verticillasters, the cymes 1- to 3-flowered; calyx 5–9 mm long, glandular-pubescent, the lobes lanceolate, herbaceous; corolla 25–37 mm long, glandular-pubescent, abruptly and conspicuously ampliate, conspicuously bilabiate, the upper lobes projecting, the lower reflexed, the throat and tube about equal, the throat rounded above and below, pinkish lavender, the palate lighter and marked with wine red guidelines; stamens exerted, the anthers glabrous, peltate-explanate, the sacs 1–1.4 mm long; staminode conspicuously exerted and the tip curved downward, evenly and densely bearded on all sides with short golden orange hairs. Uncommon in sparsely vegetated desert shrub and pinyon-juniper communities, usually growing with shadscale and *Elymus salina* on shale ledges and talus of the Green River Formation at 1400 to 2060 m in Carbon and Uintah (type from near Sand Wash) counties; Colorado; 29 (xii). This is one of our most distinctive penstemons, often growing with *Astragalus lutosus*, *Aquilegia barnebyi*, *Cryptantha barnebyi*, and other rare species on peculiar, oil-rich, substrates.

Penstemon humilis Nutt. ex Gray Low Penstemon. Perennial herb 0.7–3.5 (5) dm tall; basal sterile shoots well developed, leafy, semi-matforming; flowering stem decumbent to erect, puberulent, numerous from a freely branched caudex, the caudex branches eventually rooting; leaves entire or rarely with a few teeth, glabrous to cinereous-puberulent; basal and lower leaves 1–9 cm long, 2–20 (32) mm wide, petioled, the blades ovate to elliptic or lanceolate, abruptly to gradually narrowed to the petiole; middle and upper cauline leaves 0.8–5.5 cm long, 2–12 mm wide, ovate to (usually) narrowly (ob)lanceolate, oblong, or pandurate, sessile, the bases often clasping; inflorescence of (2) 3–9 verticillasters, the cymes (1) 3- to 9-flowered, glandular-pubescent; calyx 3–5 (6) mm long, glandular-pubescent, the lobes lanceolate, acute to caudate, the tips often squarrose; corolla 8–19 (21) mm long, glandular-pubescent, nearly tubular or the throat ampliate, the tube violet, the throat and limb blue, the lobes usually flat-spreading; palate pale, veined with purple guidelines, yellow- to white-bearded, usually inconspicuously so; stamens included or the longer pair short-exserted, the anthers glabrous, purplish black dorsally, usually pale ventrally, the sacs 0.4–0.8 mm long, broadly ovate, divaricate, not fully explanate; staminode

included, densely bearded distally with golden yellow hairs; capsule 4–8 mm long; $2n = 16$. Widespread in mountainous areas in many plant communities, from desert shrub to above timberline at 1500 to 3400 m in most of the northwestern two-thirds of the state; Washington to Wyoming, south to California, Nevada, and Colorado. (xxix). *Penstemon humilis* is a highly variable taxon as regards height, flower size, and degree of pubescence, and correlation in Utah of evident morphological features with geographic distribution is imperfect at best. The following may be used to identify, in part, the variation encompassed in our material:

1. Leaves (some) toothed; largest basal leaves usually 15–25 mm wide; plants from the vicinity of Zion National Park, Washington County *P. humilis* var. *obtusifolius*
- Leaves (usually all) entire; basal leaves usually narrower 2
- 2(1). Corolla mostly 12 mm or less long; leaves glabrous or essentially so, at least distally; plants principally of the Wasatch Range and northwestern Utah *P. humilis* var. *brevifolius*
- Corolla mostly at least 12 mm long; leaves usually puberulent, sometimes densely so; plants widespread in mountains but usually outside the distributions given above *P. humilis* var. *humilis*

Var. *brevifolius* Gray Sagebrush, mountain brush, aspen, and spruce-fir to alpine communities at ca 1765 to 3390 m in Box Elder, Cache, Juab, Morgan, Rich, Salt Lake (type from Cottonwood Canyon), Sanpete, Sevier, Tooele, Utah, Wasatch, and Weber counties; endemic; 90 (vii).

Var. *humilis* Sagebrush, pinyon-juniper, mountain brush, aspen-fir, spruce-fir, and alpine communities at 1525 to 3355 m Beaver, Daggett, Duchesne, Iron, Millard, Morgan, Summit, Tooele, Utah, Wasatch, and Weber counties; Washington, Oregon, California, Nevada, Idaho, Wyoming, and Colorado; 125 (xxiv).

Var. *obtusifolius* (Pennell) Reveal [*P. obtusifolius* Pennell, type from Springdale; *P. humilis* subsp. *obtusifolius* (Pennell) Keck]. Pinyon-juniper, mountain brush and ponderosa pine communities at 1550 to 2450 m in Washington county; endemic; 10 (0).

***Penstemon inmanifestus* N. Holmgren** Perennial herb 1.2–3.5 tall; herbage glabrous, strongly glaucous; stems ascending to erect, 1 or few from a woody caudex; basal leaves present or (usually) poorly developed; leaves 2–7 cm long, 5–25 (30) mm wide, thick and fleshy, entire, the basal ones when present petiolate, spatulate to broadly oblanceolate, the cauline ones ovate to broadly (ob)lanceolate, usually rounded to obtuse, becoming sessile, broad-based, and clasping upward; inflorescence glabrous, thyrsoid, cylindrical, usually congested, of 4–9 (11) verticillasters, the fascicles densely flowered, the peduncles and pedicels short, obscured by the bracts and flowers; calyx 5–9 mm long, glabrous, the lobes ovate to lanceolate, acute, broadly scarious-margined; corolla 16–21 mm long, glabrous externally and internally or with a few long hairs on the palate, amplate, the lobes about equally spreading or the upper somewhat shorter and spreading-projecting, lavender pink to pale pink; anthers included, the sacs 1–1.5 mm long, glabrous, dehiscent the full length and across the connective, not explanate; staminode yellow-bearded with hairs 0.5–1

mm long. In greasewood and shadscale communities, usually on playas or clay soil at 1500 to 1700 m near the Nevada state line in Juab, Millard, and Tooele counties; Nevada; 9 (0). Specimens from Nevada are often bluish lavender while ours are uniformly pink to pink lavender, and sometimes are difficult to distinguish from nearby *P. angustifolius* var. *amoenus* (q.v.). The two are, however, allopatric and have strikingly different habitat preferences.

***Penstemon x jonesii* Pennell** This is the name applied to putative hybrids between *P. laevis* (q.v.) and *P. eatonii* var. *undosus*. The plants have been taken in Zion National Park, Washington (type from Sprindale) and Kane counties; 2 (i).

***Penstemon laevis* Pennell** Smooth Penstemon. Perennial herb (1.5) 3–10 dm tall; stems glabrous, erect, 1 or few from a stout crown, often robust; herbage glabrous throughout, glaucous; leaves 2–20 cm long, 3–35 mm wide, entire or undulate-margined, rather thick, the basal and lower cauline ones narrowed to a petiolar base, spatulate or obovate to oblanceolate, the upper ones lanceolate, sessile, clasping, obtuse to acute; inflorescence glabrous, of (2) 7–12 (18) verticillasters, lax and more or less secund or (when cymes congested and many-flowered) scarcely so, the cymes (1) 3–8 flowered; calyx 4–7 (8) mm long, glabrous, the lobes ovate, acute mucronate, or shortly-acuminate, erose, scarious margined; corolla (20) 23–35 mm long, glabrous externally and internally, bilabiate, the lobes blue, the throat lavender blue and ventricose-amplate (to 12 mm wide when well-pressed), the palate lighter with wine-red guidelines; staminode yellow-bearded apically, included; anthers glabrous, at least the longer pair exerted, the sacs 1.8–2.5 mm long, dehiscent partially, the line of dehiscence nearly reaching the connective; capsules 8–14 mm long. Sandy places, in pinyon-juniper, ponderosa-manzanita, and mountain brush communities at 1500 to 2150 m in Kane and Washington (type from Springdale) counties; Arizona; 25 (v). A specimen (Burkey 165 BRY) taken near Bryce Canyon, has distinctly puberulent lower stems and petioles. It is intermediate with the similar but disjunct *P. speciosus*. Anomalous specimens from Zion National Park (Foster & Foster 3947, 0.5 mi east E of tunnel, and Atwood & Neese 7791, Checkerboard Mesa, both BRY) represent apparent hybrids between *P. laevis* and *P. eatonii* var. *undosus*. Such specimens have been given the name *P. jonesii* Pennell. They are morphologically similar to *P. laevis* but have puberulent stems and reddish purple, scarcely amplate corollas with projecting rather than spreading lobes.

***Penstemon leiophyllus* Pennell** Markagunt Penstemon. Perennial herb 2–9 dm tall; stems 1–several, glabrous, erect to ascending from a branched caudex or crown; leaves 1–13 cm long, 1.2–30 mm wide, entire, glabrous, glaucous; basal and lower cauline leaves petioled, spatulate to (ob)lanceolate, the upper ones sessile, clasping, narrowly to broadly lanceolate, sometimes cordate; inflorescence secund, of 3–13 verticillasters, the cymes 1– to 4 (6) -flowered, the peduncles and pedicels glandular-puberulent, erect to ascending; calyx 4–8 mm long, glandular-puberulent, the lobes lanceolate, acute to acuminate, narrowly scarious-margined, mostly entire; corolla 20–33 mm long, glandular puberulent externally and at the base of the upper lip internally, blue to blue purple, the throat ventricose-amplate, bilabiate, the upper lip projecting to

spreading, the lower spreading, the lobes blue to purplish blue, the tube and throat bluish violet, the palate glabrous or with a few white hairs, two-ridged, the ridges usually white; staminode glabrous, included, anthers glabrous, white or cyaneous, included or the longer pair reaching the orifice, the sacs (1.2) 1.5–2 mm long, opening partially, the line of dehiscence not reaching the connective. In pinyon-juniper, mountain brush, ponderosa pine-manzanita, bristlecone-limber pine, sagebrush, aspen-conifer, and high elevation meadow and ridgetop communities at 2000 to 3500 m in Garfield (type from Markagunt Plateau), Iron, Kane, and Washington counties; endemic; 66 (iii).

***Penstemon lentus* Pennell** Abajo Penstemon. Robust perennial herb (2) 3–5 (7) dm tall; herbage glaucous, glabrous; stems ascending to erect, 1–few, from a coarse, sparingly branched caudex; leaves 2–11 cm long, 5–30 (35) mm wide, fleshy, entire, the basal ones petioled, spatulate, the cauline ones sessile and clasping or the lower narrowed to a short petiolar base, (ob)ovate to broadly (ob)lanceolate; inflorescence rather narrow and wandlike, occasionally somewhat congested, moderately secund, of 5–10 verticillasters, glabrous, the lower peduncles often elongated and exceeding 1 cm in length the cymes 1– to (usually) several-flowered; calyx 4–8 mm long glabrous, the lobes ovate to lanceolate, acute to acuminate, scarious-margined; corolla 17–23 mm long, moderately ampliate glabrous externally, lavender to blue violet or white (var. *albiflorus*), or occasionally pink, the throat rounded above and below, the lobes about equally spreading, the palate sparingly white-bearded to glabrous, guidelines absent or obscure; stamens included or reaching the orifice, glabrous, the sacs 1.1–1.5 mm long, dehiscing fully and across the connective, not ex-plantate; staminode included or reaching the orifice, moderately dilated and bearded distally with yellow hairs. There are two varieties:

1. Corolla lavender pink to blue or blue violet, plants from eastern San Juan County, eastward from the Abajo Mts. *P. lentus* var. *lentus*
- Corolla white (sometimes suffused with very pale pink or blue); plants from the vicinity of Natural Bridges National Monument and the west side of the Abajo Mts. *P. lentus* var. *albiflorus*

Var. *albiflorus* (Keck) Reveal [*P. l.* ssp. *albiflorus* Keck, type from 8 mi W of Blanding]. Pinyon-juniper community at ca 1830 to 1895 m in San Juan County; endemic; 11 (i).

Var. *lentus* Sagebrush, pinyon-juniper, and mountain brush-ponderosa pine communities, usually in sandy soil, at 1500 to 2600 m in San Juan County; Colorado and Arizona; a Colorado Plateau endemic; 16 (iii).

***Penstemon leonardii* Rydb.** Leonard Penstemon. Herbaceous woody-based perennial (7) 10–35 (45) cm tall from a much-branched caudex; stems numerous, clustered, sparingly puberulent at least below, erect to decumbent; leaves 1.5–6.5 cm long, 1–10 mm wide, entire, glabrous, elliptic to more often lanceolate to spatulate, especially below, acute to obtuse or rounded, not especially firm or plane; inflorescence of 3–10 verticillasters, the cymes 1– to several-flowered, the pedicels to 2.5 mm long, granular-puberulent; calyx (3) 4–6.5 mm long, glabrous, the lobes lanceolate, attenuate to caudate; corolla 14–26 mm long, deep blue with violet to lavender tute, or lavender to violet throughout, glabrous, bilabi-

ate, slightly to moderately ventricose-ampliate, the lobes subequal, spreading or the lower reflexed; anthers 1–1.6 (1.9) mm long, glabrous or sparingly hirsutulose on the inner margin, the suture margins finely spinulose. Three geographically correlated varieties are present:

1. Corolla mostly more than 20 mm long; anther sacs mostly over 1.4 mm long; plants of west-central Utah *P. leonardii* var. *patricus*
- Corolla mostly less than 20 mm long; anther sacs mostly less than 1.4 mm long; plants of other distribution 2
- 2(1). Corolla lobes blue or blue violet; plants of central and north-central Utah *P. leonardii* var. *leonardii*
- Corolla lavender when fresh; plants of the vicinity of the Pine Valley Mts., Washington County *P. leonardii* var. *higginsii*

Var. *higginsii* Neese Pinyon-juniper, mountain brush, ponderosa pine-manzanita, and aspen conifer communities at 2000 to 2750 m in the Pine Valley (type locality) and Bull Valley mts. and Kolob Plateau, Washington County; endemic; 18 (i). Earlier reports of *P. thurberi* Torr. from Washington County belong here.

Var. *leonardii* Rocky openings in mountain brush, sagebrush-grassland, conifer-aspen, and lodgepole pine communities at 1830 to 3050 m in Cache, Davis, Juab, Millard, Morgan, Rich, Salt Lake, Sanpete, Summit, Utah, Wasatch, and Weber counties; endemic; 63 (iii). The type is from the Wasatch Mts.

Var. *patricus* (N. Holmgren) Neese [*P. patricus* N. Holmgren, type from the Deep Creek Mts., Juab County]. Limestone or (more usually) granitic rocks in mountain brush, sagebrush-grassland, and aspen conifer communities in the Deep Creek and House Ranges, Juab, Millard, and Tooele counties; Nevada; 8 (0). This larger flowered phase from western Utah passes into the typical phase through intermediate populations in the Canyon Range in eastern Millard County.

***Penstemon linarioides* Gray** Suffrutescent perennial 9–38 cm tall; stems puberulent with terete, tapered, retrorsely spreading hairs, ascending to erect from a much branched subwoody base, the old stems sometimes prostrate, rooting and forming mats; leaves 8–35 mm long, linear, entire, puberulent with terete tapered hairs or subglabrous; inflorescence secund, compact to elongate, the nodes usually bearing a single cyme, the cymes 1– or 2 (4) -flowered, the pedicels bracteate, glandular-pubescent; calyx 5–7 mm long, the lobes ovate to broadly lanceolate, shortly caudate, scarious-margined; corolla 13–18 mm long, ampliate, bulged above, flattened and 2–ridged below, lavender blue, the lobes darker, the throat and palate lighter and veined with reddish purple, the palate sparsely bearded; staminode short-exserted, densely bearded apically with a tuft of long yellow hairs, more sparsely bearded with shorter hairs proximally; stamens reaching the orifice or the longer well-exserted, the anthers glabrous, purplish black with a prominent white band along the suture, the sacs 1–1.4 mm long, opening the full length and across the connective, not ex-plantate. Sagebrush, pinyon-juniper, chaparral, mountain brush, and ponderosa pine communities at 1500 to 3000 m in Beaver, Garfield, Iron, Kane (?), type of var. *sileri* from Osmer), and Washington counties; a disjunct station in Boxelder County, (Albee 5773, 5882 UT) may represent an introduction; Nevada, Arizona, New Mexico, and Col-

orado; 53 (v). Utah plants belong to var. *sileri* Gray [*P. linarioides* ssp. *sileri* (Gray) Pennell; *P. l.* var. *viridis* Keck], and perhaps they are more closely allied to *P. abietinus* than to the typical variety, which occurs to the southeast of our area. Also, plants at the eastern margin of the Utah distribution tend to be more compact and less erect than the more westerly ones and may deserve taxonomic recognition.

***Penstemon marcusii* (Keck) N. Holmgren** Price Penstemon. [*P. pseudohumilis* Jones, not Rydb.; *P. moffattii* ssp. *marcusii* Keck, type from near Price]. Perennial herb 12–26 cm tall; stems ascending to erect, from a branched caudex and taproot, puberulent; leaves basal and cauline, (2) 2.5–8 cm long, 3–10 (15) mm wide, linear-lanceolate to lanceolate, petioled below, becoming sessile near the inflorescence, essentially glabrous (sometimes sparingly pubescent near the inflorescence), entire; inflorescence glandular-pubescent, narrow, the thyrse interrupted, of 3–5 (7) verticillasters, the cymes 2- to 5-flowered, short-petioled; calyx 4–7 mm long, glandular-pubescent with spreading hairs, the lobes narrowly lanceolate, more or less obtuse, herbaceous; corolla 10–16 mm long, glandular-puberulent externally, nearly regular, funnel-form, flaring gradually from tube to apex, the lobes subequal, spreading, blue to blue lavender or bluish purple, the throat lighter and veined with purple; stamens very short, included or only slightly exerted from the tube, the anthers glabrous, peltate-explanate, the sacs ca 0.8 mm long; staminode moderately bearded with golden hairs, included in the throat, shortly exceeding the anthers. Shadscale, mat-atrilex, sagebrush, and salt desert shrub-juniper communities, usually in gravelly places on Mancos Shale-derived clay at 1700 to 2000 m in Carbon and Emery counties; endemic; 8 (0). The Jones penstemon occurs in a small area at the east side of the Wasatch Plateau between Price and Emery. It is very similar to *P. goodrichii* of the Uinta Basin, but is separated by small but consistent differences and their edaphic habitats are distinct.

***Penstemon moffattii* Eastw.** Moffatt Penstemon. Perennial herb 0.8–3 dm tall; stems ascending to erect, clustered from a branched caudex and taproot, puberulent; leaves 1.5–6.5 cm long, 2–15 mm wide, entire, glabrous or puberulent, the basal ones petioled and spatulate to broadly obovate or oblanceolate, the upper ones sessile, lanceolate; inflorescence glandular-pubescent (viscid when fresh), rather congested, the stems floriferous for most of their length, the cymes several-flowered, the peduncles and pedicels short; calyx 6–8 (9) mm long, glandular-pubescent, the lobes lanceolate, acute, herbaceous; corolla (14) 15–20 (21) mm long, glandular-pubescent externally, blue violet, moderately ampliate but neither ventricose nor constricted at the orifice, the throat rounded above and below, not noticeably veined, the palate sparsely white-bearded and veined with violet purple, the lobes about equally spreading; stamens included, the anther sacs dehiscing completely and across the connective, the sacs 1–1.4 mm long, white to pale blue, becoming divaricate but not fully explanate, about twice as long as wide; staminode included, sparsely yellow-bearded. Blackbrush, shadscale, mat-atrilex, other salt desert shrub, sagebrush, and pinyon-juniper communities, usually in clay soils, at 1300 to 1900 m in Duchesne, Emery, Garfield, Grand, San Juan, Utah, and Wayne counties; endemic; 13 (ii).

***Penstemon montanus* Greene** Cordroot Penstemon. Perennial, forming loose mats; stems woody below, sprawling or decumbent and often partially buried in rocks and talus, those of the current year erect, 6–35 cm tall, arising severally from the suffrutescent base; herbage puberulent with spreading hairs; leaves 6–51 mm long, 3–26 mm wide, spatulate, elliptic, ovate, or broadly lanceolate, all cauline, the basal ones narrowed to a short petiolar base, the middle ones the largest, the upper sessile and clasping, sharply and prominently toothed, becoming bractlike and more or less entire in the inflorescence; inflorescence of 1–6 verticillasters, the cymes 1-flowered, the peduncles, pedicels, bracts, and sepals glandular puberulent; calyx 10–18 mm long, the lobes narrowly lanceolate to nearly linear, long-attenuate; corolla 24–40 mm long, glabrous externally, pink violet (drying bluish purple) only moderately ventricose-ampliate, longitudinally ridged below, ca 10 mm wide at the orifice, the lobes projecting, the palate bearded with crinkled white hairs; staminode glabrous or rarely with a few white hairs, included; anthers densely white-woolly with long hairs, flat opening, included or reaching the orifice. Mountain brush, aspen, and spruce-fir communities, on talus and cliffs, often in crevices of limestone, at 2400 to 3400 m in Duchesne, Juab, Salt Lake, Sanpete, and Utah counties; Idaho, Montana, and Wyoming; 18 (i)

***Penstemon nanus* Keck** Dwarf Penstemon. Perennial herb 4–15 cm tall; herbage evenly and densely cinereous-puberulent; stems spreading to ascending, few to numerous from a thick, short-branched, taprooted caudex; leaves 1–5.5 cm long, 2–8 mm wide, entire or sometimes irregularly toothed, the basal ones numerous, petioled, spatulate to narrowly oblanceolate, the cauline ones few, (ob)lanceolate (sometimes narrowly so), becoming sessile above; inflorescence glandular-pubescent, usually leafy-bracteate below, the bracts clasping, of 2–5 (6) mostly crowded verticillasters, the cymes several-flowered, the peduncles and pedicels short; calyx 4–8 mm long, glandular-pubescent with spreading hairs, the lobes narrowly ovate to lanceolate, herbaceous, suffused with purple; corolla (10) 12–17 (20) mm long, tubular-funnel-form, the throat rounded above and below, glandular-puberulent externally, the palate sparsely bearded, the lobes subequal, spreading, rose purplish (drying blue), albino or pink forms rarely present; anthers included or reaching the orifice, horseshoe-shaped to sagittate, oblong, the sacs not divaricate, 1.4–2 mm long, white to pale blue, dehiscing the full length and across the connective, glabrous; staminode about reaching the orifice, densely bearded with short golden orange hairs. Mixed desert shrub, sagebrush, and pinyon-juniper communities on calcareous or dolomitic gravels at 1580 to 2140 m in Beaver, Iron (?), and Millard (type from ca 10 mi E of Garrison) counties; endemic; 19 (i).

***Penstemon navajoa* N. Holmgren** Navajo Mt. Penstemon. Short-lived perennial herb 2–4.5 dm tall; stems few, glabrous, slender, ascending to erect, wandlike, the leaf pairs remote, the inflorescence lax; leaves glabrous, entire, 2.5–9 cm long, 1–15 mm wide, rounded to acute, the basal ones oblanceolate, narrowed to petiolar bases, the cauline ones narrowly oblanceolate to linear, sessile; inflorescence glabrous, of 2–7 verticillasters, the cymes 1- or 2 (3)-flowered; calyx 3.5–4.5 mm long, glabrous, the lobes ovate, obtuse to acute, scarious-margined; corolla 18–21 (23) mm long, glabrous externally, ventri-

cose-ampliate, the lobes bluish, the upper erect to spreading, the lower spreading or reflexed, the throat and tube pale blue to white, the palate sparsely white-bearded; staminode glabrous, slightly expanded apically; anthers exerted, the sacs (1.2) 1.4–1.8 mm long, glabrous or sparsely long-villous, dehiscing from the distal end to the connective, the valves little-spreading, the suture line straight, spiculose-margined. Ponderosa pine and conifer-aspen woods, in open rocky places, at 2500 to 3160 m on Navajo Mt. (type locality), San Juan County; endemic; 7 (0).

Penstemon ophianthus Pennell [*P. jamesii* ssp. *ophianthus* (Pennell) Keck]. Perennial herb (1) 1.5–4 dm tall; stems clustered from a branching caudex and taproot, ascending to erect, glabrous to sparingly puberulent, more or less viscid when fresh, entire to undulate or the upper sometimes sinuate-dentate, spatulate to narrowly oblanceolate, the basal and lower cauline ones narrowed to a petiolar base, the upper ones sessile; inflorescence glandular-pubescent, of (2) 4–7 verticillasters, the cymes several-flowered, more or less congested; calyx 5–10 mm long, glandular-pubescent, the lobes lanceolate, herbaceous or narrowly scarious-margined near the base; corolla 15–21 (24) mm long, glandular-pubescent, ventricose-ampliate, constricted at the orifice, bluish to pale blue lavender, longitudinally veined with purple stripes nearly throughout, the palate bearded with long white to pale yellow hairs, the lower lobes spreading-reflexed, the upper projecting-spreading; stamens included or the longer pair sometimes exerted, becoming peltate-explanate, the sacs 0.7–1 (1.2) mm long, about as broad, glabrous; staminode exerted, bearded with long, yellow hairs. Mixed desert shrub, pinyon-juniper, sagebrush, and ponderosa pine communities, often in sandy soil, at 1500 to 2400 m in Emery, Garfield, Grand, Kane, Sevier, and Wayne (type from near Loa) counties; Colorado, Arizona, and New Mexico; 28 (iii). This species passes into *P. breviculus* (Keck) Nisbet & R. Jackson (q.v.).

Penstemon pachyphyllus Gray ex Rydb. Thickleaf Penstemon. [*P. nitidus* var. *major* Benth. in A. DC., type from "Hillsides of Du Chesne Fork," Duchesne (?) County;]. Perennial herb (1) 1.5–5.7 dm tall; herbage glabrous, strongly glaucous; stems ascending to erect, 1 or few from a woody caudex and taproot; leaves thick and fleshy, entire, the basal ones petiolate, 1.8–18 cm long, 5–45 (53) mm wide, spatulate to broadly lanceolate, the cauline ones 1.5–8 cm long, 7–32 mm wide, sub-orbicular, (ob)ovate or (ob)lanceolate, rounded to acute, occasionally mucronate, sessile and clasping or the lower narrowed to a short petiolar base; inflorescence glabrous, the thyrse congested to interrupted, of (2) 4–10 verticillasters, the cymes (1) 3– to 6-flowered; calyx 4–8 mm long, glabrous, the lobes ovate to lanceolate, acute to acuminate, scarious-margined; corolla 15–23 mm long, ampliate, or sometimes tubular-salverform glabrous externally and internally or with a few long white hairs on the palate, the limb when well pressed usually 12–20 mm wide, the lobes about equally spreading or the lower longer, blue, blue violet, or purple to dark blue purple, the throat with or without prominent guidelines; stamens included or reaching the orifice, the anthers glabrous, the sacs (0.7) 1–1.5 mm long, dehiscing the full length and across the connective, not explanate; staminode reaching the orifice or shortly exerted, dilated distally, the tip 0.5–2.2 mm wide, sparsely to densely bearded distally

with pale yellow to golden brown hairs 0.5–2 mm long. Three intergrading phases are recognized at varietal level:

1. Staminode sparsely bearded with hairs 0.2–1 mm long, these scarcely tangled; plants predominantly of central and northern Uintah and Daggett County *P. pachyphyllus* var. *mucronatus*
- Staminode densely bearded with long tangled hairs that obscure the apex, these 1–2 mm long, distribution various 2
- 2(1). Staminode broadly expanded at the apex, 1–2 mm wide; corolla usually with definite guidelines; plants principally of the Tavaputs Plateau and Duchesne County *P. pachyphyllus* var. *pachyphyllus*
- Staminode not broadly expanded at the apex, less than 1 mm wide; corolla lacking prominent guidelines; plants of Sanpete and Emery counties south and southwestward *P. pachyphyllus* var. *congestus*

Var. *congestus* (Jones) Holmgren [*P. acuminatus* var. *congestus* Jones, type from near Rockville; *P. p.* ssp. *congestus* (Jones) Keck in Kearney & Peebles; *P. congestus* (Jones) Pennell]. Beaver, Emery, Garfield, Iron, Kane, Millard, Piute, Sanpete, Sevier, Washington, and Wayne counties; Nevada and Arizona; 113 (viii)

Var. *mucronatus* (N. Holmgren) Neese [*P. mucronatus* N. Holmgren, type from 4 mi S of Manila]. In various substrates with a clay component in salt desert shrub, sagebrush, and pinyon-juniper communities at 1650 to 2150 m in Daggett, Duchesne, and Uintah counties; Wyoming and Colorado; 80 (xxv). *Var. mucronatus* is a well-marked taxon in the vicinity of the type collection, but is fully transitional to *var. pachyphyllus* in Duchesne and southern Uintah counties. In addition to characters given in the key, *var. mucronatus* commonly possesses a relatively broad limb and sky-blue (when dried) rather than blue violet or dark blue purple corolla. The corolla throat and the lobes near their base are usually prominently lined on all sides within with wine-red guidelines. This is one of our most beautiful penstemons.

Var. *pachyphyllus* Salt desert shrub, sagebrush-grass, pinyon-juniper, mountain brush, and conifer communities at 1340 to 3200 m in Carbon, Duchesne, Uintah, Utah, and Wasatch, counties; endemic; 56 (xiii). *Var. pachyphyllus* shares with *var. congestus* the possession of a densely wooly staminode apex; it shares with *var. mucronatus* the characters of a broadly dilated staminode, cauline leaves more often rounded-mucronate than lanceolate, and a bright blue, broad corolla limb with prominently veined lobes. Members of the *pachyphyllus* complex in the Uinta Basin have been variously interpreted, with the name *P. osterhoutii* frequently misapplied.

Penstemon palmeri Gray Palmer Penstemon. Plants robust, perennial, herbaceous to suffrutescent; stems ascending to erect, clustered from a branched woody caudex, glabrous, glaucous, often becoming glandular-puberulent in the inflorescence; leaves 2–13 cm long, 5–48 (55) mm wide, glabrous, thick and usually strongly glaucous, the lower ones petioled, becoming sessile upward, the bases progressively broader, finally broadly connate-perfoliate near the inflorescence, usually sharply serrate, rarely subentire; inflorescence tall, wandlike, more or less secund, of 4–17 or more verticillasters, the cymes 1– to 3 (5)-flowered, the pedicels ascending to

appressed, the axis, peduncles, and pedicels glandular-pubescent or glabrous; calyx mostly 4–6 mm long, densely glandular-pubescent to glabrous, broadly ovate, acute, scarious-margined; corolla 24–37 mm long, finely glandular-puberulent, abruptly broadly inflated from the short tube, ventricose, the throat 11–20 mm wide when pressed, constricted at the orifice, prominently bilabiate, the upper lip arching over the reflexed lower one, the upper lobes spreading, the lower reflexed, creamy white to pink externally, pink to dark rosy pink internally, the palate prominently veined with wine red guidelines on a white background; stamens about reaching orifice, the sacs divaricate, 1.7–2.4 mm long, about twice as long as wide, dehiscing the full length and across the connective, cupped within the upper lip, white, glabrous; staminode long-exserted, filiform proximally, moderately dilated and bearded with a dense tuft of long yellow hairs distally, curved apically. Two partially sympatric varieties occur:

1. Inflorescence axis, peduncles, and pedicels glandular pubescent *P. palmeri* var. *palmeri*
 — Inflorescence axis, peduncles, and pedicels glabrous *P. palmeri* var. *eglandulosus*

Var. *palmeri* Warm desert shrub, cool desert shrub, pinyon-juniper, mountain brush, and ponderosa pine communities at 800 to 2750 m in Beaver, Cache, Davis, Garfield, Iron, Juab, Kane, Millard, San Juan, Sanpete, Washington, and Wayne counties; Nevada, California, and Arizona (introduced in Idaho); 62 (iv). Probably restricted originally in our area to the southern half or less of Utah, Palmer penstemon has been included widely in seeding mixtures and has become established in many places beyond its natural distribution.

Var. *eglandulosus* (Keck) N. Holmgren [*P. p.* ssp. *eglandulosus* Keck, type from 2.5 mi N of Kanab]. Mixed desert shrub, mountain brush, ponderosa pine, and pinyon-juniper communities at 1500 to 2600 m in Garfield, Iron, Kane, Washington, and Wayne counties; Arizona; 23 (ii).

Penstemon parvus Pennell Little Penstemon. Perennial herb 7–20 (25) cm tall; stems slender, decumbent to erect, arising from slender, fibrous-rooted caudex branches; herbage puberulent; leaves 0.7–6 cm long, 1–6 mm wide, entire, often involute or folded, the basal ones spatulate to narrowly oblanceolate, narrowed to a petiolar base, rounded to obtuse, the cauline ones mostly linear, sessile, obtuse to acute; inflorescence secund, glandular puberulent at least above, of 3–8 verticillasters, the cymes 1- to 2-flowered; calyx 3.5–5 mm long, glandular, usually cyaneous, the lobes ovate to broadly lanceolate, obtuse to shortly acuminate (rarely truncate), the margins herbaceous and entire to narrowly scarious-erose; corolla 14–20 mm long, glandular-puberulent externally, the palate glabrous, blue to dark blue, moderately amplate and bilabiate, the lobes spreading; staminode white, glabrous, somewhat dilated apically, reaching the orifice or slightly exserted; anthers glabrous, the longer pair exserted, the sacs 1–1.5 mm long, dehiscing the full length from distal end to connective, the valves little-spreading. Sagebrush-grassland communities at 2500 to 3100 m in Garfield (type from the Aquarius Plateau), Piute, and Wayne (?) counties; endemic; 8 (ii).

Penstemon petiolatus Brandegee Crevice Penstemon. Suffruticose perennial; stems freely branching to form a low rounded shrub (0.5) 0.9–2 (4) dm tall, at first green to

blue-glaucous, puberulent, eventually becoming trunk-like, gnarled, and blackish near the base; leaves thick, 7–40 mm long, abruptly petiolate, the blade sharply dentate, 4–27 mm wide, 5–26 mm long, mostly conduplicate, green or (usually) blue-glaucous, suborbicular to broadly ovate, obtuse, the petiole and sometimes the blade puberulent to finely papillate; inflorescence relative short and broad, with 2–4 verticillasters; calyx 4–7 mm long, glandular-pubescent, suffused with purple, the lobes herbaceous or very narrowly scarious-margined, narrowly lanceolate to elliptic, acute, the cymes 2- to 4-flowered, the peduncles and pedicels glandular; corolla carmine pink, 13–17 mm long, glandular pubescent, narrowly amplate, the palate sparsely bearded; staminode short-bearded with yellow hairs, slightly exserted; stamens included or reaching the orifice, the anthers glabrous, peltate-explanate, the sacs 0.6–0.9 mm long. Warm desert shrub and pinyon-juniper communities, on cliffs of limestones, at 900 to 1300 m in the Beaverdam Mts., Washington County; Nevada; 12 (ii).

Penstemon pinorum L. Shultz & J. Shultz Pinyon Penstemon. Perennial herb from a branching caudex; stems puberulent to glabrate below, usually glabrous above or glandular-puberulent near the inflorescence; leaves ca 2–8 cm long, 2–10 mm wide, sharply serrate (rarely entire), narrowly (ob)lanceolate, rounded to acute, the basal ones narrowed to a petiolar base, this puberulent to glabrate, the blades glabrate or glabrous, the cauline leaves, clasping; inflorescence conspicuously glandular-pubescent, moderately congested to lax (shade forms), not secund; verticillasters 5–7, the cymes 2- to 7-flowered; calyx ca 6 mm long, glandular-pubescent, the lobes lanceolate, acute, cyaneous; corolla 10–15 mm long, only moderately amplate, blue to bluish lavender, the exterior sparsely glandular-pubescent, the palate white- to yellow-bearded, with purple guidelines; staminode exserted, bearded with flattened golden yellow hairs most of the length; anthers glabrous, the sacs ca 1 mm long, dehiscing the full length and across the connective, not explanate, remaining nearly parallel, the longer pair exserted. Pinyon-juniper community at 1700 to 2000 m in Iron (type from 8 km SW of Newcastle) County; endemic; 3 (i).

Penstemon platyphyllus Rydb. Broadleaf Penstemon. [*P. heterophyllus* var. *latifolius* Wats., type from Cottonwood Canyon, Salt Lake County]. Suffruticose perennial 3–6 dm tall from a branching caudex; flowering stems mostly unbranched, erect, numerous, herbaceous, from decumbent or prostrate woody bases of old stems, puberulent or glabrate; leaves 2–5.6 (6) cm long, 3–15 (20) mm wide, all cauline, firm, plane, glabrous or minutely scabrous on the margins, glaucous, the middle and upper ones elliptic, tapering to both ends, the lower and those of vegetative shoots often oblanceolate or spatulate; inflorescence of 5–10 verticillasters, the cymes 1- to 3-flowered, the pedicels 0.5–6 mm long, glabrous or obscurely granular-puberulent at the summit; calyx 4–6 mm long, glabrous, the lobes lanceolate, acuminate to attenuate, recurved; corolla (18) 20–30 mm long, lavender or reddish violet, glabrous, bilabiate, the tube 3–3.5 mm in diameter, gradually widening to the ventricose-amplate throat, the lobes subequal, the upper projecting to spreading, the lower spreading to reflexed; stamens (the longer pair) exserted, the anthers 1.5–2.5 mm long, bluish purple, glabrous on the sides, sparsely pubescent

on the inner margins, the suture spiculose-margined, 1/3–1/2 the length of the sac; staminode slightly exerted, glabrous, white- or blue-tipped. Mountain brush communities at 1600 to 2700 m in the Wasatch Mts., Davis, Salt Lake, Utah, and Weber counties (also in Indian Canyon, Duchesne County, Harrison 406 BRY); endemic; 15 (iii).

Penstemon procerus Dougl. ex Graham Small-flowered Penstemon. [*P. rydbergii* var. *rydbergii* in part, of authors, not A. Nels.]. Perennial herb 0.8–4 (5) dm tall; stems numerous from a freely branched, fibrous-rooted caudex, puberulent to glabrate, the flowering ones few, decumbent to erect, slender, overtopping the sometimes matlike basal clusters of sterile shoots; leaves 0.8–8 cm long, 2–17 (30) mm wide, entire, glabrous to sparingly puberulent, elliptic to (ob)lanceolate, petioled below, the middle and upper ones sessile, ascending to appressed; inflorescence interrupted, fascicled, glabrous to puberulent, of 1–4 (or rarely as many as 8) verticillasters, if solitary the inflorescence appearing capitate, the cymes densely flowered, mostly 2–3 cm wide, usually remote, somewhat globular, the peduncles usually obscured; calyx 1.7–5.5 mm long, glabrous to obscurely puberulent, the lobes ovate to lanceolate, truncate-apiculate to caudate, scarious-margined at the base, often broadly so and conspicuously erose to lacerate; corolla 6–12 mm long, spreading to deflexed, dark blue to blue violet, glabrous externally, sparsely to densely bearded with yellowish hairs on the palate; throat tubular to moderately widened to the limb, 2–3.5 (4) mm in diameter when well pressed, often slightly arched downward; corolla lobes small, 1–2.5 mm wide, widely spreading; stamens about reaching the orifice, the sacs 0.4–0.7 mm long, glabrous, suborbicular to ovate, about as broad as long, dehiscing the full length and across the connective, becoming explanate, blue black; staminode included, slender, bearded at the very tip with golden brown hairs; $2n = 16$. Dry to usually moist places in loamy soil, in sagebrush, sedge, willow, and grass-forb meadows in mountain brush, aspen, spruce-fir and alpine communities at 2200 to 3600 m in Beaver, Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Kane, Piute, Salt Lake, Sanpete, Sevier, Summit, Uintah, Wasatch, and Wayne counties; Alaska and Yukon south to California, Nevada, and Colorado; 111 (xxii). The phase in the Uinta and Wasatch mts. with calyx lobes 3–5 mm long, corolla 8–12 mm long, and plants mostly 2–4 cm tall is assignable to var. *procerus*; that from the southern Wasatch Mts. and the Wasatch Plateau with calyx lobes mostly 2–3 mm long, corolla 6–9 mm long, and plants mostly 1–3 dm tall is assignable to var. *aberrans* (Jones) A. Nels. [*P. confertus* var. *aberrans* Jones, type from Soldier Summit; *P. p.* ssp. *aberrans* (Jones) Keck].

Penstemon pseudoputus (Crosswhite) N. Holmgren [*P. virgatus* ssp. *pseudoputus* Crosswhite]. Perennial herb to 4 dm tall; stems slender, erect, one to few from a branched fibrous-rooted caudex; herbage finely puberulent to glabrate; leaves entire, linear or the basal ones narrowly oblanceolate, 1–5 (8) cm long, 1–3 mm wide, involute or folded; inflorescence secund, narrow, strict, of about 5 verticillasters, the cymes 1 (2)-flowered; calyx 2–3 mm long, glabrous, the lobes ovate, obtuse, scarious-margined, entire to erose; corolla 15–22 mm long, glabrous, moderately ventricose-ampliate, the upper lobes projecting-spreading, the lower reflexed, blue purple to blue lavender, the palate lighter with purple guide-

lines, glabrous; anther sacs 1.2–1.5 mm long, glabrous, the longer pair much exerted, the shorter reaching the orifice, dehiscing from the distal end to the connective, the suture scabrous-margined; staminode white, glabrous, slightly expanded apically, about reaching the orifice. Sagebrush community at 2500 m in Garfield County, Arizona; 1 (0). Our solitary record (Foster & Foster 4489) is from near Panguitch Lake from "loamy soil, rolling open sage community."

Penstemon radicosus A. Nels. Matroot Penstemon. Perennial herb 2–4 dm tall; stems ascending to erect, slender, few to numerous from a woody caudex, puberulent with retrorsely curved hairs; leaves all cauline, 1.5–5.5 cm long, 1.5–11 mm wide, narrowly (ob)lanceolate or elliptic, sessile or the lower with short petiolar bases, ascending, pubescent to glabrate, entire; inflorescence glandular-pubescent, of 2–5 verticillasters, the cymes 1- to few-flowered, not congested, the lower peduncles sometimes elongate; calyx 5–8 mm long, glandular-pubescent, the lobes ovate to lanceolate, the margins below the attenuate tip scarious, erose to denticulate; corolla (15) 18–21 (23) mm long, glandular-pubescent, only slightly ampliate, the upper lip short and the lobes reflexed, the lower lip projecting and the lobes spreading, blue to blue violet dorsally, whitish and longitudinally 2-ridged ventrally, the palate white-bearded; stamens included or the longer pair reaching the orifice, the sacs 0.8–1.3 mm long, blue black, glabrous, opening the full length and across the connective, not explanate; staminode about reaching the orifice, yellow-bearded; $2n = 16$. Juniper, sagebrush-grass, mixed mountain brush, and aspen-fir communities at 1370 to 2400 (3000) m in Box Elder, Daggett, and Rich counties; Nevada, Idaho, Montana, Wyoming, and Colorado; 11 (ii).

Penstemon rostriflorus Kellogg Bridges Penstemon; Beaked Penstemon. [*P. bridgesii* Gray; *P. bridgesii* var. *amplexicaulis* Monnet]. Perennial, mostly 3–9 dm tall; stems few to many, erect or ascending, glabrous or obscurely puberulent below, arising from an open, freely branched caudex or subshrubby base; leaves entire, all cauline, 1.5–9 cm long, 1–2 (14) mm wide, (ob)lanceolate or the lower sometimes spatulate, the upper usually linear, rounded to obtuse or acute, sessile or the lower narrowed to a petiolar base, glabrous (usually) or the lower obscurely puberulent to glabrate; inflorescence of 3–13 verticillasters, the cymes 1- to 3-flowered, the pedicels ascending, the flowers spreading to somewhat declined, the lower axils sometimes producing elongate, several-flowered, racemiform branches, the inflorescence then lax and open; pedicels and calyx glandular-pubescent, the calyx 4–6 mm long, the lobes ovate or lanceolate, acute, entire, the margins herbaceous; corolla 23–31 (33) mm long, sparingly glandular puberulent externally, scarcely ampliate, red to orange red or rarely yellow, the tube widening imperceptibly to the limb, strongly 2-lipped, the upper lobes scarcely divided, projecting beaklike, ca 1 cm long, the lower 3 narrowly oblong, reflexed; anthers glabrous, narrowly horseshoe-shaped, prominently exerted, sometimes equaling or even exceeding the projecting upper lip, the sacs ca 2 mm long, subparallel or the distal ends slightly divergent, dehiscing only across the curved proximal end, the suture line spiculose-margined; staminode glabrous, slender, not expanded apically, exerted equaling or exceeding the upper lip; $2n = 42$. Creosote bush, blackbrush, mixed

desert shrub, pinyon-juniper, sagebrush, mountain brush, ponderosa pine, aspen-conifer, and alpine communities at 1000 to 3300 m in Beaver, Garfield, Iron, Kane, Millard, Piute, San Juan, Sevier, Washington, and Wayne counties; California to Colorado, Arizona, and New Mexico; 67 (viii).

Penstemon rydbergii A. Nels. Rydberg Penstemon. [*P. aggregatus* Pennell; *P. rydbergii* ssp. *aggregatus* (Pennell) Keck; *P. rydbergii* var. *aggregatus* (Pennell) N. Holmgren]. Perennial herb; basal leafy sterile shoots usually present; flowering stems 0.2–5 dm tall, puberulent or rarely glabrate or glabrous, ascending to erect from a woody crown, the old caudex branches eventually fibrous-rooted; leaves 1.5–15 cm long, 3–33 (35) mm wide, glabrous or rarely puberulent near the base, elliptic to (ob)lanceolate, the middle cauline ones tapered to the scarcely clasping base (usually not so broadly clasping as in *P. watsonii*); inflorescence interrupted, fascicled, of 1–4 (6) verticillasters (if verticillasters 1 or 2 the inflorescence subcapitate), the fascicles mostly 3–4 cm wide, many-flowered but less densely so than in *P. procerus*, the peduncles usually evident; inflorescence and calyx glabrous or (usually) puberulent to pubescent with retrorse-spreading hairs; calyx 3–9 mm long, the lobes ovate-lanceolate to lanceolate, acuminate to caudate, often ciliate, broadly scarious-margined, erose to lacerate; corolla (10) 12–17 (22) mm long, glabrous externally or with a few long hairs on the backs of the lobes, moderately amplate, the throat 3–4.5 mm in diameter at the summit, the lobes spreading, mostly 2–3.5 mm wide, bearded with white to yellowish hairs on the palate and near the sinuses of the lobes; stamens reaching the orifice or the longer pair exerted, the sacs 0.6–1.1 mm long, ovate, usually longer than wide, opening the full length and across the connective, not fully explanate, blue black, glabrous; staminode bearded distally with golden yellow hairs or rarely subglabrous; $2n = 32$. Mountain brush, sagebrush, and aspen-fir-spruce parkland communities at (2100) 2500–3700 m in Box Elder, Cache, Carbon, Duchesne, Garfield, Iron, Juab, Morgan, Rich, Salt Lake, Sanpete, Sevier, Summit, Uintah, Utah, and Wasatch counties; Washington, Oregon, Idaho, Montana, Wyoming, California, Nevada, Arizona, and New Mexico; 86 (viii). Separation of most materials of *P. rydbergii* and *P. procerus* is unequivocal, but in the Uinta Mts. some populations are intermediate. Plants referred previously to *P. rydbergii* var. *rydbergii* are often transitional or indistinguishable from *P. procerus* var. *procerus* and may represent introgressants. Occasional individuals of *P. rydbergii* are transitional to *P. watsonii*. Intermediacy of *P. rydbergii* suggests an origin from hybrid derivatives of *P. watsonii* and *P. procerus*. Resolution of relationships requires additional study.

Penstemon scariosus Pennell Plateau Penstemon. Perennial herb 1.5–5 dm tall; stems several, clustered from a thick crown, decumbent to (usually) ascending or erect, glabrous to puberulent; leaves 3–17 cm long, 2–23 mm wide, linear to (ob)lanceolate, usually involute or channeled above, entire, glabrous, the lower tapered to a winged petiolar base, the upper sessile; inflorescence glandular-pubescent or rarely glabrous, congested, secund, of 3–9 verticillasters, the cymes (1) 2– to 5-flowered; calyx 3–12 mm long, glandular-pubescent or rarely glabrous, the lobes ovate to lanceolate, acute to caudate, scarious-margined (usually broadly and conspic-

uously so), entire to (usually) erose; corolla (15) 22–30 (33) mm long, ventricose-amplate, rounded above, slightly flattened and 2-ridged below, prominently 2-lipped, the upper lobes spreading, the lower spreading-reflexed and larger than the upper, suborbicular, the bases overlapping, pale lavender blue or blue purple, glabrous to glandular-pubescent externally, the palate glabrous and without guidelines; stamens exerted, the anthers sparsely to moderately white-bearded with slender flexuous hairs about as long as the width of the sac, dark blue, the sacs 1.3–2.6 mm long, dehiscing nearly the full length but not across the connective, divaricate at about a 90 degree angle; staminode shortly exerted, white, moderately dilated apically, sparsely yellow-bearded. As noted by Holmgren (in Cronquist et al. 1984, q. v.), *P. scariosus* exhibits a wide range of variability that sorts into weakly differentiated varieties. In addition to those recognized below there exist other races, each differing in subtle ways, growing on disjunct peculiar calcareous, sandy, or shaly barrens. The mosaic of variation seems to dictate against recognition of further infraspecific taxa. Most of our material can be referred to the following varieties:

1. Corolla mostly over 25 mm long and calyx over 8 mm long; plants of the Wasatch Plateau and Sevier River Valley *P. scariosus* var. *scariosus*
- Corolla and calyx mostly less than 25 mm and 8 mm long respectively; plants of northeastern Utah and the southern Wasatch Mts. 2
- 2(1). Corolla conspicuously glandular externally, usually blue purple; stems and calyx often cyaneous; stems decumbent to ascending; plants of sandstone crevices, summit of Blue Mountain Plateau, Uintah County ...
..... *P. scariosus* var. *cyanomontanus*
- Corolla usually glabrous, blue to pale blue lavender; stems ascending; plants of other distribution 3
- 3(2). Leaves linear to linear-lanceolate, rarely over 7 mm wide; corolla usually pale blue lavender; plants of the Green River Formation, southern Uintah County ...
..... *P. scariosus* var. *albifluvis*
- Leaves lanceolate, mostly over 7 mm wide; corolla blue; plants of the Uinta Mts., Tavaputs Plateau, and southern Wasatch Mts. *P. scariosus* var. *garrettii*

Var. *albifluvis* (England) N. Holmgren [*P. albifluvis* England, type from along the White River, Uintah County]. Mixed desert shrub and pinyon-juniper communities, on sparsely vegetated shale slopes of the Green River Formation, southeast of Bonanza, Uintah County; Colorado; 42 (xvi). This phase passes into var. *garrettii* in the Hill Creek/Willow Creek area.

Var. *cyanomontanus* Neese Sandstone crevices in sagebrush-grass communities on the Blue Mountain Plateau summit near the Colorado/Utah border, Uintah (type from Blue Mt.) County; Colorado; a Uinta Basin endemic; 13 (vi). The species was previously reported from the region as *P. cyanocaulis* Payson (Welsh 470 BRY).

Var. *garrettii* (Pennell) N. Holmgren [*P. garrettii* Pennell, type from Midway, Wasatch County]. In many plant communities on the southern and eastern Uinta Mts, and in the southern Wasatch Mts., Carbon, Daggett, Duchesne, Grand, Uintah, and Wasatch counties; endemic; 40 (xi). This variety is transitional to var. *scariosus* on the Tavaputs Plateau.

Var. *scariosus* In many plant communities in Carbon, Emery, Grand, Juab, Piute, Sanpete (type from Musinea Peak), Sevier, and Wayne counties; endemic; 38 (vi).

***Penstemon sepalulus* A. Nels.** Littlecup Penstemon. [*P. azureus* var. *ambiguus* Gray (not *P. ambiguus* Torr.), type from Provo Canyon]. Woody-based perennial herb 4.5–8 (9) dm tall; herbage glabrous and glaucous; stems much-branched, erect or somewhat decumbent, from a woody caudex; leaves all cauline, 1.5–9 cm long, 2–10 mm wide, entire, sessile, narrowly elliptic to linear, moderately reduced upward, often only subopposite and then bases neither confluent nor connected by a line; inflorescence of 3–14 bracteate verticillasters, the cymes 1– to 2 (3)-flowered, the lower nodes sometimes bearing thyrsoid branches, the pedicels 0.4–1.9 cm long, strongly ascending, glabrous; calyx 1.9–3.2 mm long at anthesis, the lobes mostly about as broad as long, rounded to acute or mucronate, glabrous; corolla 20–29 mm long, moderately ampliate, bilabiate, the lobes spreading, violet, the tube paler and 2–2.5 mm in diameter, ca 1/4 the length of the corolla; staminode white, expanded at the tip, about equaling the throat, glabrous; stamens included or the longer pair reaching the orifice; anthers 1.5–2 mm long, about as broad, horseshoe-shaped, bluish purple, opening only across the confluent apex of the sacs, the suture about 1/2–1/3 the length of the sac, its margin spiculate. Sagebrush, mountain brush, aspen, and Douglas fir communities at 1600 to 2800 m in Juab, Utah, and Wasatch counties; endemic; 35 (ii). A single collection from Washington County (Woodbury s.n. 1925 BRY), may represent an introduction or a mislabeled specimen.

***Penstemon speciosus* Dougl. ex Lindl.** Showy Penstemon. Perennial herb mostly 15–25 cm tall; stems several, ascending, from a branched caudex, usually puberulent below; leaves 1.5–7 cm long, 1–12 mm wide, entire, glabrous or puberulent, rounded to acute, the basal and lower cauline ones oblanceolate and petioled, the upper narrowly (ob)lanceolate and sessile, often folded; inflorescence secund, of 2–7 rather crowded verticillasters, the flowers ascending to spreading; calyx glabrous (rarely glandular-puberulent), 5–7 mm long, the lobes ovate to broadly lanceolate, acute to shortly acuminate, the margins scarios, erose; corolla 23–35 mm long, light blue, the tube and throat lighter, lavender blue, ventricose-ampliate, bilabiate, the upper lobes projecting-spreading, the lower spreading to reflexed; staminode included or reaching the orifice, glabrous or obscurely short-bearded, little expanded apically; anthers glabrous, the sacs ca 2 mm long, pale, partially dehiscent, the suture line not reaching the connective, sigmoid, often blue-margined. Pinyon-juniper and sagebrush-grass communities at 1800 to 2900 m in Box Elder, Juab, and Tooele counties; Washington, Oregon, California, Idaho, and Nevada; 7 (0). This is a highly variable taxon beyond the limited Utah portion of its range.

***Penstemon strictiformis* Rydb.** [*P. strictus* ssp. *strictiformis* (Rydb.) Keck in Kearney & Peebles]. Herbaceous perennial (1) 2–5 (7) dm tall; stems erect, glabrous, 1 to few from a branched caudex; leaves 2–9 cm long, 3–15 (17) mm wide, entire, glabrous, seldom crisped, mostly narrowly (ob)lanceolate, the basal and lower cauline ones narrowed to a petiolar base, the upper sessile, mostly acute, often folded; inflorescence glabrous, of (3) 5–9 (12?) verticillasters, the cymes (1) 3– to 5-flowered; calyx mostly 5–8 mm long, glabrous, the lobes lanceolate,

acuminate or caudate, the tip often recurved; corolla (12) 16–22 (30?) mm long, ventricose-ampliate, bilabiate, the lobes spreading, bluish purple to (usually) pale bluish lavender; staminode included, yellow-bearded or glabrous (?); anthers sparsely pubescent with slender flexuous hairs that about equal the length of the sac, the sacs 1.4–1.6 (2) mm long, dehiscent from the distal end, the line of dehiscence not reaching the connective. Pinyon-juniper communities at 1500 to 2100 m in San Juan County, Colorado, New Mexico, and Arizona; 20 (ii). The name *strictiformis* is tentatively applied to the Utah materials, which have substantially smaller size than given by Holmgren (in Cronquist et al. 1984). Some specimens approach *P. cyanocaulis* (q.v.).

***Penstemon strictus* Benth.** Rocky Mountain Penstemon. [*P. strictus* ssp. *angustus* Pennell]. Herbaceous perennial 3–8 dm tall; stems 1 to few from a fibrous-rooted branched caudex, ascending to erect; herbage glabrous (rarely puberulent); leaves 2–11 (15) cm long, 2–17 (20) mm wide, linear to (ob)lanceolate (usually narrowly so), the basal and lower ones petioled, the upper sessile, often folded, entire, rounded to obtuse; inflorescence glabrous, wandlike, strongly secund, of 3–10 verticillasters, the cymes 1– to 4-flowered, the peduncles mostly 3–15 mm long and erect-appressed; calyx 2.5–5 mm long, glabrous, the lobes ovate, blunt or sometimes apiculate, scarios-margined, usually cyaneous; corolla 23–32 mm long, glabrous, ventricose-ampliate, the upper lobes projecting-spreading, the lower ones spreading-reflexed, blue to dark blue or blue purple; anthers well-exserted (the longer pair), the sacs ca 2 mm long, spreading at about a 90 degree angle, remaining indehiscent in the proximal 1/4–1/6, white-villous with hairs mostly longer than the sacs; staminode included or reaching the orifice, sparsely villous to glabrous. Pinyon-pine, mountain brush, snowberry, sagebrush, and aspen-conifer communities at 2100 to 3200 m in Daggett, Duchesne, Emery, Garfield, Grand, San Juan, Sevier, Uintah, Utah, Wasatch, and Wayne counties; Wyoming, Colorado, New Mexico, and Arizona; 95 (xxviii). Materials from the Tavaputs Plateau southward are sometimes transitional to *P. comarrhenus* (q.v.).

***Penstemon subglaber* Rydb.** Smooth Penstemon. [*P. glaber* var. *utahensis* Wats., type from the Uinta Mts.]. Robust perennial herb 2–10 dm tall; stems ascending to erect, few to numerous from a stout caudex; herbage glabrous; leaves 1.5–15 cm long, 3–35 mm wide, entire, elliptic, (ob)lanceolate (usually narrowly so), the basal and lower cauline ones narrowed to a petiolar base, the upper sessile, the middle and upper cauline ones mostly 4–7 times longer than wide; inflorescence markedly secund, of 4–11 verticillasters, the cymes 2– to 4 (6)-flowered, the peduncles and pedicels and sometimes the axis glandular-puberulent; calyx 4–8 mm long, glandular-puberulent, often (in dried specimens) dotted with a white exudate, the lobes ovate to broadly lanceolate, obtuse (rarely) to acute or (usually) acuminate, scarios-margined, sometimes broadly so; corolla 21–31 mm long, mid to dark blue (occasional white or pink forms present), ventricose-ampliate, glandular-puberulent externally (sometimes obscurely so); staminode sparsely bearded with short golden hairs, included or reaching the orifice; anthers short-hispid near the attachment of the filaments, usually glabrous laterally toward the suture line, the longer pair exserted, the sacs 1.5–2.1 (2.5) mm long, dehiscent

mostly or quite to the connective, mostly opposing-divaricate, the suture line nearly median. Sagebrush, mountain brush, snowberry-tall forb, and sagebrush-grass communities, and in openings in aspen and conifer woods, at 1830 to 3355 m in Carbon, Daggett, Duchesne, Emery, Juab, Piute, Sanpete, Sevier, Uintah, Utah, and Wasatch counties; endemic; 115 (xiv).

Penstemon thompsoniae (Gray) Rydb. Thompson Penstemon. [*P. pumilus* var. *thompsoniae* Gray, type from near Kanab; *P. caespitosus* var. *thompsoniae* (Gray) A. Nels.; *P. c.* ssp. *thompsoniae* (Gray) Keck in A. Nels.; *P. c.* var. ? *incanus* Gray, type from SW Utah?; *P. pumilus* var. *incanus* (Gray) Gray; *P. incanus* (Gray) Tidestr.]. Low, often mat-forming perennial herb, often obscurely suffrutescent; old stems freely branched, leafless, more or less buried in surface soil and litter, rooting; current stems prostrate to erect, densely leafy, the leafy (above ground) portion 0.4–7.5 (13) cm long; herbage white-cinereous throughout with flattened, appressed, scalelike hairs; leaves 0.4–2 cm long, 1–5 mm wide, narrowed to a petiolar base, spatulate to oblanceolate, thick, crowded; stem and inflorescence scarcely differentiated, the flowers or flower clusters appearing axillary, usually only 1 per axil per node floriferous, the flowers 1 to several per node, when stems elongate all but the lowermost nodes flower-bearing, when stems compact flower-bearing nodes few and the flowers borne within a tuft of leaves that obscures the stem; calyx 4–6 mm long, white-cinereous with appressed scales, the lobes lanceolate, herbaceous; corolla 12–20 mm long, glandular-pubescent externally, 2-lipped, the lips spreading, the tube and throat violet to blue violet, the lobes blue, the throat 2-ridged ventrally, the palate sparsely bearded; anthers about reaching the orifice or the longer pair exerted, the sacs 0.8–1.3 mm long, dehiscing the full length and across the connective but not explanate; staminode golden-bearded, about reaching the orifice. Sagebrush and pinyon-juniper communities, often on calcareous semibarens, at 1670 to 2030 (3000?) m in Beaver, Iron, Kane, and Washington counties; 13 (0). Holmgren (in Cronquist et al. 1984), reports *P. thompsoniae* only from Kane County in Utah. Additional collections from Kane, as well as from Beaver, Iron, and Washington counties reveal two morphologically and geographically distinct races:

- 1. Stems tufted, very short, more or less erect, the inflorescence not elongating, the flowers thus borne within the basal tuft; larger leaves 1.2 or more cm long, 3.5 mm or more wide; plants of south-central Kane County
 *P. thompsoniae* var. *thompsoniae*
- Stems elongating in the inflorescence, more or less prostrate and mat-forming, the flowers borne beyond the basal tuft; leaves, even in the largest, usually smaller; plants from western Beaver and Iron counties
 *P. thompsoniae* var. *desperatus*

Var. *desperatus* Neese Sagebrush and pinyon-juniper communities at 1800 to 2075 m in Beaver (type from Indian Peak Range) and Iron counties; Nevada; 6 (0). One specimen tentatively assigned here (Atwood 5151 BRY) has stems unusually long, and is probably more closely allied to materials from the Mohave Strip region of Arizona. Possibly it represents still another taxon worthy of naming. Other infraspecific taxa may occur within the species beyond Utah.

Var. *thompsoniae* Juniper-sagebrush and pinyon-juniper communities at 1675 to 1895 m in Kane County; Arizona; 5 (0).

Penstemon tidestromii Pennell Tidestrom Penstemon. [*P. leptanthus* Pennell, type from Twelve-mile Creek, Sanpete County]. Perennial herb 2–6 dm tall; stems several from a branched caudex, finely retrorsely puberulent, ascending to erect; leaves 1.5–7 (10) cm long, 2–18 (25) mm wide, entire, puberulent, obtuse to acute, the basal ones oblanceolate and narrowed to a petiolar base, the cauline ones lanceolate to oblanceolate, the upper sessile and more or less clasping; inflorescence strict, the stems, pedicels, and bracts sparingly and finely puberulent to glabrate, more or less secund, of 4–11 (15) verticillasters, the cymes (1) 2- to several-flowered; calyx 3–5 (6) mm long, glabrous, the lobes ovate to lanceolate, obtuse or more often acute to acuminate, the margins narrowly scarious-margined, entire to irregularly denticulate; corolla 13–21 (22) mm long, moderately ampliate, the lobes blue to deep blue, glabrous, nearly equal, spreading, the tube and throat bluish lavender to violet; stamens included or reaching the orifice, the sacs 1.2–1.8 mm long, glabrous, dehiscing partially, the suture line not reaching the connective; staminode yellow-bearded apically and for ca 3/4's its length, reaching the orifice. Desert shrub, sagebrush, and pinyon-juniper communities at 1630 to 2500 m in Juab, Sanpete (type from the Sanpitch Mts.), and Utah counties; endemic; 12 (ii). The range of flower and anther size reported above, as well as of remaining morphological features, encompasses that designated for *P. leptanthus* Pennell, known definitely only from the type, which was taken from within or closely adjacent to the narrow geographic range of *P. tidestromii*. I can detect only one taxon in our material. One specimen (Collins & Harper 146 BRY) from near Nephi is anomalous in possessing hispid anthers.

Penstemon uintahensis Pennell Uinta Penstemon. Perennial herb (4) 6–20 cm tall; stems 1 to few, slender, glabrous, arising from a compact branched caudex; leaves 1–7 (10) cm long, 1–8 (12) mm wide, entire, glabrous, often folded, narrowly spatulate or (ob)lanceolate to linear, rounded or (usually) obtuse, the lower narrowed to a petiolar base, the upper sessile; inflorescence racemose, secund, glandular-puberulent, of 1–4 (7) verticillasters, the cymes 1- or 2 (3) -flowered; calyx 4–7 mm long, glandular-puberulent, the lobes ovate, acute, or shortly acuminate, the margins scarious, erose; corolla relatively large, showy, 18–25 mm long, glandular-puberulent (sometimes sparingly so), blue to blue violet, ampliate, the lobes spreading, the tube ca 4 mm in diameter; staminode expanded at the tip, golden-bearded, included or barely reaching the orifice; anthers included or reaching the orifice, sparsely hispid on the sides, the hairs much shorter than the width of the sac; sacs ca 1 mm long, dehiscing from the distal end nearly to the connective, becoming divaricate; capsule 8–11 mm long. Spruce-fir and alpine tundra communities at 3200 to 3815 m in Daggett, Duchesne, Summit, and Uintah (type from the Uinta Mts.) counties; endemic; 36 (xii).

Penstemon utahensis Eastw. Utah Penstemon. [*P. eastwoodiae* Heller, type from near Monticello]. Perennial herb (0.8) 1.5–7 dm tall; herbage glabrous, glaucous; stems erect, single or clustered, from a woody crown; leaves thick and leathery, entire, rounded to obtuse apically, the basal ones 2–10 cm long, 4–22 mm wide, spatu-

late, (ob)ovate to (ob)lanceolate, narrowed to a petiolar base, the cauline ones 1–8 cm long, 2–20 mm wide, lanceolate, sessile or the lower petioled, few, becoming reduced and bractlike above; inflorescence glabrous, lax, more or less wandlike, of 3–11 (15) verticillasters, the cymes 1– to 3 (5) -flowered, not congested, the peduncles and pedicels usually well developed, sometimes branched from the lower axils; calyx 2–4.5 mm long, glabrous, the lobes broadly ovate, obtuse to acute or shortly acuminate, usually tinged with red, broadly scarious-margined; corolla 16–25 mm long, salverform or tubular-funnelform, the lobes flat spreading or the limb slightly oblique, glandular externally, densely glandular near the orifice, crimson, carmine, or sometimes carmine pink, retaining the reddish coloration on drying, without guidelines or these obscure; stamens included, the anthers glabrous, pale, the sacs 0.6–1.1 mm long, broadly ovate, becoming more or less peltate-explanate; staminode included, pale, slightly dilated apically, glabrous to papillate. Mixed desert shrub, blackbrush-juniper, pinyon-juniper, and mountain brush communities at 1200 to 2500 m in Carbon, Emery, Garfield, Grand, Kane, San Juan (type from N of Monticello), Washington, and Wayne counties; Nevada and California; 102 (vii).

Penstemon venustus Dougl. Suffrutescent perennial 4–10 dm tall; stems ascending to erect, sparingly puberulent to glabrate or glabrous, clustered from a branched woody base; leaves (2) 4–8 (12) cm long, 5–20 (35) mm wide, all cauline, glabrous, lanceolate, sharply serrate; inflorescence subsecund, glabrous or the axis sparingly puberulent, of 4–10 verticillasters, the cymes (1) 3– to 6–flowered, the peduncles well developed, ascending, mostly 1–3 cm long; calyx 3–6 mm long, glabrous, the lobes lanceolate, acuminate, scarious-margined; corolla 23–30 (38) mm long, glabrous except for the ciliate lobes, blue to blue violet, strongly ventricose-ampliate, the throat (when well pressed) 10–12 mm wide, bilabiate, the upper lobes projecting-spreading, the lower ones spreading to reflexed; filaments hirsute in the distal portion; anthers 1.3–2 mm long, glabrous or hirsute near the filament, nearly circular in outline, the sacs dehiscing across the confluent apices, the distal ends remaining saclike; staminode flattened, only moderately dilated, bearded with long white hairs; capsule 7–9 mm long. Our only record (Goodrich 19243 BRY) is from a rocky road embankment near Mountain Home, Duchesne County (apparently an introduction); Washington, Oregon, and Idaho; 1 (0).

Penstemon wardii Gray Ward *Penstemon*. [*P. glaber* var. *wardii* (Gray) Jones]. Herbaceous perennial 1.5–4.3 dm tall; stems erect, clustered, from fibrous-rooted caudex branches; herbage densely cinereous-puberulent (also usually coated with dust from clay substrates); leaves entire, the basal ones 1.5–9 cm long, 3–21 mm wide, spatulate to oblanceolate, rounded to obtuse, narrowed to a petiolar base, the cauline ones 2.2–6.5 cm long, 3–15 mm wide, narrowly lanceolate to oblanceolate, of 2–4 pairs, the upper sessile; inflorescence leafy-bracteate below, of (3) 5–10 verticillasters, the cymes 1– to several-flowered, the pedicels glandular-puberulent; calyx 6–10 mm long, glandular-puberulent, the lobes lanceolate, acute to acuminate, narrowly to broadly scarious-margined, the margins sometimes erose; corolla 24–32 (35) mm long, glandular-puberulent, moderately ventricose-ampliate, the lobes widely flaring to reflexed, the lower

ones the larger, light blue to violet blue, the throat and palate lighter, with purple red guidelines; staminode glabrous, included; anthers white, the longer pair exerted, the sacs 2–2.4 mm long, the suture sigmoidally curved, often blue-margined. Semibarren, white to gray, fine-textured (often calcareous or gypsiferous) substrates (principally the Arapian Shale Formation) in desert shrub and pinyon-juniper communities at 1675 to 2075 m in Sanpete and Sevier (type from near Glenwood) counties; endemic; 22 (iv).

Penstemon watsonii Gray Watson *Penstemon*. [*P. phlogifolius* Greene, type from Castle Gate]. Perennial herb 2.5–6.5 dm tall; stems ascending to erect, clustered from a freely-branched caudex, puberulent or sometimes glabrate above; leaves 1.5–7.5 cm long, 2.5–23 mm wide, all cauline, elliptic to lanceolate, the lower ones petiolate, sessile and clasping above, the middle ones the largest and abruptly narrowed to a clasping base, glabrous (usually) to finely puberulent; inflorescence loosely thyrsoid to moderately fasciculate, of (2) 3–6 (8) verticillasters, the cymes 3– to 7 (10) -flowered, the flowers not particularly crowded, the peduncles and pedicels usually evident, the axis and pedicels puberulent to glabrate; calyx 1.8–3.2 (3.7) mm long, glabrous or essentially so, the lobes triangular to ovate, acute, apiculate, or abruptly short-acuminate, the bases broad, overlapping, scarious-margined, moderately erose; corolla 12–17 mm long, usually spreading horizontally, glabrous externally, the palate white-bearded, the tube violet, the throat and limb rich blue to blue violet, often paler beneath, gradually flaring from the narrow tube, the throat when well pressed 4–5 mm wide at the summit, the lobes about equally spreading; stamens reaching the orifice or the longer pair exerted, the sacs ca 1 mm long, longer than wide, glabrous, dehiscing fully and across the connective, divaricate, not ampliate; staminode slender, reaching the orifice or shortly exerted, yellow-bearded in the distal 3–5 mm; $2n = 16$. Aspen, mountain brush, juniper-sagebrush, sagebrush-grass, pinyon-mountain mahogany, and open conifer communities at (1650) 2000 to 3300 m in mountains and higher plateaus of Beaver, Carbon, Duchesne, Emery, Garfield, Grand, Iron, Juab, Millard, Piute, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, Wasatch, and Wayne counties; Nevada, Idaho, Wyoming, and Colorado; 181 (xxix). Occasional specimens are encountered that appear to be hybrids with *P. rydbergii*.

Penstemon whippleanus Gray Whipple *Penstemon*. Perennial herb (1) 3–6 (10) dm tall; herbage glabrous below, becoming glandular-pubescent with spreading white hairs in the inflorescence; stems slender, ascending to erect, clustered from a branched, fibrous-rooted caudex; basal tuft of leaves usually well developed; leaves 1.3–13 cm long, 3–35 (40) mm wide, thin, entire to denticulate, rounded to obtuse, lanceolate, the basal ones abruptly narrowed to a slender petiole, the upper sessile; inflorescence somewhat lax, of (1) 2–4 (6) verticillasters, the cymes 1– to 5 -flowered; flowers spreading-reflexed to pendulous; calyx 6–11 mm long, densely glandular-pubescent with spreading white hairs, the lobes narrowly lanceolate, attenuate, blunt, narrowly scarious-margined near the base; corolla 20–30 mm long, glandular-pubescent, the throat abruptly tubular-ampliate from a short tube, the upper lip spreading, the lower one projecting, exceeding the upper, conspicuously bearded with long white hairs, dark blue or wine purple to dull

lavender or dingy blue white; stamens about reaching the orifice or the longer pair exerted, the sacs 1–1.5 mm long, glabrous, blue, dehiscing throughout and across the connective, becoming opposite and explanate; staminode exerted, slender, white, bearded apically with a tuft of pale hairs; $2n = 16$. Alpine tundra, talus slopes, alpine meadows, krummholz, sagebrush-snowberry-ribes grassland, lodgepole, and aspen-conifer communities, in almost all our higher mountain ranges (apparently absent from the Raft River and Pine Valley mts.) at (1800) 2300 to 3500 m in Beaver, Cache, Carbon, Daggett, Davis, Duchesne, Garfield, Grand, Iron, Juab, Millard, Piute, Salt Lake, Sanpete, Sevier, Summit, Uintah, and Wasatch counties; Montana, Idaho, Wyoming, Colorado, Arizona, New Mexico; 137(xiv). This is one of our most distinctive species of beardtongue.

Scrophularia L.

Coarse, caulescent perennials; stems 4-angled; leaves opposite, petiolate; flowers in terminal paniculate cymes; calyx 5-parted; corolla greenish to brownish or purplish, strongly bilabiate, the upper lip 2-lobed, erect, the lower shorter and with erect lateral lobes, the middle lobe deflexed; stamens 5, 4 fertile, the fifth scalelike on the corolla tube; stigmas usually united, capitate; capsule septicidal; seeds numerous, oblong-ovoid, turgid.

Scrophularia lanceolata Pursh Figwort. [*S. utahensis* Gand., type from Cache (?) County]. Plants 5–20 dm tall; stems glabrate to puberulent below and glandular in the inflorescence; leaves 5–15 cm long, 3–6 cm wide, lanceolate to lance-ovate, the base typically cordate or rounded to truncate, the apex acuminate, the margins serrate to doubly so; inflorescence narrow and elongate; calyx 2–4 mm long, the lobes ovate with scarious, slightly erose margins; corolla 6–10 mm long, the tube urceolate, the throat somewhat constricted; staminode flabellate, yellow green (sometimes purplish); capsule 5–10 mm long, acuminate, ovoid; $n = 48$. Sagebrush, mountain brush, aspen, and spruce-fir communities at 1705 to 3175 m in Cache, Carbon, Davis, Duchesne, Grand, Juab, Millard, Morgan, Rich, Salt Lake, San Juan, Sanpete, Summit, Tooele, Uintah, Utah, Wasatch, Washington, and Weber counties; British Columbia to Montana, south to California and New Mexico; northeastern U. S.; 54 (0).

Synthesis Benth.

Subscapose herbaceous perennials; leaves mostly basal, long-petiolate, the blades ovate, serrate to pinnatifid; cauline leaves much reduced, bracteate, sessile, alternate; inflorescence a dense terminal raceme; calyx 4-lobed, the segments distinct; corolla mostly blue, less commonly pink or white, campanulate, subequally 4-lobed; stamens 2; stigmas capitate; capsule loculicidal, notched apically or entire; seeds 2 to many per locule.

Synthesis pinnatifida Wats. Stems 8–22 (28) cm tall, simple, erect, villous to glabrate above to sparsely woolly below; basal leaves long petiolate, the blade 4–6 cm long, ovate in outline, lacinate or pinnatifid to pinnately compound; petioles 2–10 cm long; cauline leaves bracteate, alternate, sessile; raceme dense, the pedicels 1–3 (6) mm long; calyx 2.5–5.5 mm long, the lobes elliptic to oblong, ciliate; corolla 5.5–7.5 mm long, dark blue; capsule 4–6 mm long, subglobose, notched apically, puberulent; seeds 1–2 mm long. Two varieties are present.

- 1. Leaves pinnatifid to pinnately compound; plants of northern Utah County and northward *S. pinnatifida* var. *pinnatifida*
- Leaves simple, laciniately cleft; plants from Mt. Nebo and the Deep Creek Mts., southward *S. pinnatifida* var. *laciniata*

Var. *laciniata* Gray [*S. laciniata* (Gray) Rydb.; *S. laciniata* ssp. *ibaphensis* Pennell, type from the Deep Creek Mts.]. Spruce-fir and alpine tundra communities at 2775 to 3630 m in Beaver, Garfield, Juab, Iron, Sanpete, Sevier, Utah, and Wayne counties; endemic; 43 (iv).

Var. *pinnatifida* [*Wulfenia pinnatifida* (Gray) Greene]. Spruce-fir, lodgepole pine, alpine tundra, and meadow communities at 2560 to 3390 m in Cache, Daggett, Duchesne, Salt Lake, Summit, Tooele, and Utah (type from American Fork Canyon) counties; Idaho, Wyoming, Montana, and Washington; 29 (0).

Verbascum L.

Biennial or possibly perennial herbs; stems tall, erect; leaves basal and cauline, the basal in a rosette, the cauline alternate, simple, sessile, clasping to somewhat decurrent; inflorescence a raceme or spicate panicle; bracts reduced; calyx deeply lobed, the lobes equal; corolla yellow (rarely white), rotate, almost regular, 5-lobed, the upper pair shorter than the lower 3, the tube short; stamens 5, all fertile, exerted, the filaments commonly villous or the lower ones glabrous or essentially so; capsules globular to ovoid-oblong, septicidal, mostly 2-cleft apically; seeds numerous, longitudinally rugose.

- 1. Leaves densely woolly; inflorescence spicate, the flowers crowded; filaments with yellow hairs or glabrous *V. thapsus*
- Leaves glabrous; inflorescence a laxly flowered raceme; filaments with violet hairs 2
- 2(1). Leaves glabrous; pedicels 10–25 mm long ... *V. blattaria*
- Leaves puberulent; pedicels 2–5 mm long ... *V. virgatum*

Verbascum blattaria L. Moth Mullein. Biennial; stems 4–12 dm tall, erect, glabrous below, glandular above; cauline leaves 1.5–15 cm long, glabrous, green, lanceolate, dentate, incised or lobed; inflorescence a lax interrupted raceme, elongating to 5 dm; pedicels 5–20 mm long; calyx 5–8 mm long, the lobes lanceolate, glandular; corolla 25–30 mm wide, yellow (rarely white); lower 2 staminal filaments with violet hairs, the upper ones with white or violet hairs; capsule 6–8 mm long, globose; seeds 0.6–1 mm long; $2n = 18, 30$. Waste places in salt grass and greasewood communities, or in other open sites, at 1220 to 2075 m in Box Elder, Utah, and Weber counties; naturalized from Europe; widespread in North America; 8 (0).

Verbascum thapsus L. Woolly Mullein. Robust biennial; stems stout, erect, 5–15 dm tall or more, densely woolly, simple or branched; basal leaves in a rosette, oblong-ovate to obovate or lanceolate, 6–50 cm long, petiolate; cauline leaves elliptic-lanceolate, reduced upward, decurrent, entire to crenate; panicle spicate, densely flowered, to 3 dm long or more; pedicels ca 2 mm long; calyx 5–10 mm long, the lobes lanceolate, subequal to the sepals; corolla 15–30 mm wide, mostly yellow (rarely white); lower 2 stamens glabrous or sparingly hairy, the upper ones with yellow hairs; capsule 6–10 mm long, stellate, broadly ovoid; seeds 0.7–0.8 mm long; $2n$

= 36. Open sites, especially along roadsides, at 1220 to 2745 m in probably all Utah counties; adventive from Eurasia, not widely established in North America; 39 (j).

Verbascum virgatum Stokes Wand Mullein. Biennial; stems 7-12 dm tall, erect; leaves 2-24 cm long, lanceolate, crenate to dentate, glandular-puberulent and hispid; racemes lax, interrupted, elongating to 4.5 dm; pedicels 2-5 mm long; calyx 5-8 mm long, the lobes lanceolate, glandular; corolla 30-40 mm wide, yellow; lower pair of stamens with violet hairs, the upper ones with white to violet hairs; capsule 6-9 mm long, globose, glandular; seeds 0.6-1 mm long; 2n = 64, 66. Roadsides and other open sites in Box Elder, Davis, and Utah counties; naturalized from Europe; widely distributed in North America; 4 (0).

Veronica L.

Annual or perennial herbs; stems erect, ascending, decumbent, or prostrate; leaves all opposite, cauline, entire to serrate; inflorescence of terminal or axillary racemes or some flowers solitary in the upper axils; bracts foliose to reduced, mostly alternate; calyx 4-lobed; corolla blue, violet to pink or white, subrotate, the tube very short, irregularly 4-lobed, the upper lobe the largest, the lower lobe the smallest; stamens 2; stigmas united, capitate (style measurement includes the stigma); capsule mostly wider than long, compressed, or ovoid, notched or lobed at the tip, often heart-shaped; seeds few to many, plano-convex, flattened, smooth or roughened, small. Note: Two cultivated species are represented in our collections, *V. prostrata* L. and *V. longifolia* L., but are not included in the following treatment.

- 1. Racemes terminal or flowers solitary and axillary; plants often in wet places but not true aquatics 2
- Racemes axillary and opposite, never terminating the main stem; plants aquatic or semi-aquatic 8
- 2(1). Flowers and fruit long pedicellate, 1.5-2.5 cm long; fruit broadly notched, the lobes divergent, 5.5-8 mm wide *V. persica*
- Flowers and fruit mostly short pedicellate, rarely over 1.5 cm long; fruit not broadly notched and with divergent lobes; capsule mostly less than 5.5 mm wide 3
- 3(2). Leaves petiolate, at least some palmately 3- to 5-lobed; calyx lobes conspicuously long-ciliate; seeds 1-2 per locule *V. hederifolia*
- Leaves various but not palmately lobed; calyx lobes glabrous or pubescent but not long-ciliate; seeds few to many per locule 4
- 4(3). Racemes compact, headlike; capsule longer than broad, 5.4-8 mm long, ellipsoid, shallowly notched; flowers dark blue, large, 5-10 mm wide; plants perennial *V. wormskjoldii*
- Racemes not headlike; flowers light blue, violet or white; capsules usually wider than long or equal in width and length, often deeply notched; plants perennial or annual 5
- 5(4). Plants rhizomatous perennials; style 2-3.5 mm long *V. serpyllifolia*
- Plants tap-rooted annuals; style less than 2 mm long 6
- 6(5). Flowers white or nearly so; style very short, 0.1-0.3 mm long; leaves narrowly oblong to oblanceolate *V. peregrina*
- Flowers light blue or violet; style over 0.3 mm long; leaves broadly elliptic, ovate or broadly deltoid 7

- 7(6). Capsules deeply notched to the middle or below, 2-3.5 mm deep; style much shorter than the lobes; flowers 3-4.5 mm wide; capsule 3-5.8 mm wide *V. biloba*
- Capsules notched 0.5-0.8 mm deep, less than half way to the middle; style 0.4-1 mm long, subequal to the lobes; flowers 2-2.5 mm wide; capsule 3-4 mm wide *V. arvensis*
- 8(1). Leaves all short-petiolate *V. americana*
- Leaves of the middle and upper flowering stems, at least, sessile and clasping 9
- 9(8). Leaves 3-5 times as long as wide, mostly entire or inconspicuously toothed; calyx 2.5-3.5 mm long, as long as the capsule; flowers light blue, pink or white, 3-5 mm wide *V. catenata*
- Leaves not more than 3 times as long as wide, mostly distinctly toothed; calyx 3-6 mm long, sometimes longer than the capsule; flowers blue, 5-10 mm wide *V. anagallis-aquatica*

Veronica americana Schwein. ex Benth. American Brooklime. [*V. beccabunga* var. *americana* (Schwein.) Raf.]. Rhizomatous perennial, 0.5-4.8 dm tall, glabrous throughout; stems erect or decumbent, mostly branched, rooting at the lower nodes; leaves 1.5-6 cm long, at least twice as long as wide, petiolate, lanceolate to ovate, widest near base; flowers in axillary racemes, 3- to 26-flowered; pedicellate, the pedicel 3-9 (12) mm long; calyx 2-5 (6) mm long, acute; corolla 5-10 mm wide, blue; capsule wider than long, 2-4 mm long, 3-5 mm wide, slightly notched apically; style 1.7-3 mm long; seeds 0.5-0.7 mm long, brownish, plano-convex; 2n = 36. Mostly in moist meadows, seeps, peat bogs, stream-sides, hanging gardens, and aspen communities at 1370 to 3205 m in all Utah counties except Davis, Grand, Morgan, and San Juan; Alaska south to California, Arizona, New Mexico, Texas, and Mexico; east to North Carolina; 98 (iv).

Veronica anagallis-aquatica L. Water Speedwell. Aquatic perennial, 0.4-8.3 dm tall, glabrous throughout; stems erect or ascending, simple to much branched below; leaves elliptic, sessile, or short petiolate below, clasping, crenate-serrate or entire, 1-7 cm long; racemes axillary, pedunculate, few- to many-flowered; calyx 3-6 mm long, the lobes lanceolate; corolla 3-5 mm across, blue; fruiting pedicels mostly strongly ascending, 2-7.5 mm long; capsule 2.8-3.8 mm long, slightly longer than wide, scarcely notched, turgid; style 0.9-2.5 mm long; seeds 0.5-1 mm long, plano-convex, brown; 2n = 18, 34-36, 54. Slow moving streams or ditches, sand bars, and wet meadows at 1220 to 2505 m in all Utah counties except Box Elder, Cache, Carbon, Iron, Juab, Morgan, and Tooele counties; widely distributed in North and South America; adventive from Europe; 71 (iii).

Veronica arvensis L. Corn Speedwell. Annual from a taproot, villous-hirsute to puberulent, 0.4-3 dm tall; stems erect or subprostrate, simple or branched; leaves ovate, crenate-serrate, occasionally subcordate below; racemes terminal, 1- to 30-flowered; bracts alternate, larger below than above; calyx 2.5-4.5 mm long, the lobes lanceolate, unequal; corolla small, 2-2.5 mm wide, blue violet; pedicels 0.5-2 mm long; capsule 3 mm long, obcordate, glandular-pubescent marginally, strongly flattened; style 0.4-1 mm long; seeds 0.7-1 mm long, plano-convex; 2n = 16. Open fields and gardens at ca 1370 to 1525 m in Utah County; adventive from Eurasia, but now widely naturalized in North America; 1 (0).

Veronica biloba L. Bilobed Speedwell. Taprooted annual, (2) 5–25 (32) cm tall, villous-hirsute to glandular-puberulent; stems simple or branched below, erect; leaves short-petiolate, the blade lance-ovate or elliptic, mostly 8–20 (40) mm long, coarsely toothed; racemes terminal, elongate, 1– to 25-flowered, glandular, the bracts alternate, reduced; calyx 4–8 mm long, the lobes prominent, mostly veiny, broadly lanceolate; corolla 3–4.5 mm wide, blue, inconspicuous, pedicels elongating to 1.8 cm long in fruit; capsule 2–5.8 mm long, glandular, notched to the middle or below, 2–3.5 mm deep; style 0.9–1.3 mm long; seeds 1.4–2 mm long, pale yellow, tear-shaped and with transverse ridges; $2n = 14$. Mostly in disturbed ground at 1310 to 2900 m in Box Elder, Davis, Duchesne, Garfield, Juab, Millard, Morgan, Salt Lake, Sanpete, Sevier, Summit, Tooele, Uintah, Utah, and Weber counties; Colorado, Nevada, north to Idaho and Montana, native of Asia; 37 (ii).

Veronica catenata Pennell Rhizomatous aquatic perennial, 1–6 dm tall, glabrous; stems erect or ascending, branched throughout; leaves lanceolate, entire or subentire, 5–15 mm long, sessile and clasping; racemes axillary, pedunculate, 15– to 25-flowered, the bracts much reduced; calyx 2.5–3.5 mm long, the lobes broadly lanceolate to ovate; corolla 3–5 mm wide, white to pink or light blue; capsule 2.5–3 mm long, yellow brown, plano-convex; $2n = 36$. Wet places, slow moving water, ditchbanks, ponds, and lake shores at the lower elevations. *Veronica catenata* is reported for Utah (Intermountain Flora, Vol. 4) along the Wasatch front but I have seen no specimens. This species is closely allied with *V. anagallis-aquatica*.

Veronica hederifolia L. Ivy-leaved Speedwell. Taprooted annual, 2–12 dm tall, sparsely to moderately spreading-hirsute; stems weakly ascending or prostrate, branched below; leaves petiolate, the blade suborbicular to ovate, 4–10 mm long, palmately veined, toothed to somewhat lobed; raceme terminal or a single flower in the upper leaf axils; calyx 3–5 mm long, accrescent, the lobes broadly triangular, conspicuously ciliate; corolla 3–6 mm wide, pale blue, the pedicel to 10 mm long in fruit; capsule 2.5–3.5 mm long, subglobose, shallowly notched (0.2–0.3 mm deep); style 0.6–0.9 mm long; seeds 2.3–3.1 mm long, blackish, cup-shaped, transversely ridged; $2n = 28, 36, 54$. Waste places and canyon bottoms in Davis and Salt Lake counties; native to Europe and widely naturalized in the northeastern U. S., but rarely collected in Utah; 2 (0).

Veronica peregrina L. Purslane Speedwell. Taprooted annual, 4–26 cm tall, glandular-pubescent; stems erect or curved below, simple or branched especially below; leaves linear-oblong to oblanceolate, sessile or the lower with a petiolar base, 5–18 (35) mm long, entire or irregularly toothed; racemes terminal, elongate, lax; bracts foliose below and reduced upward, subtending a single flower; calyx 2.3–4 mm long, the lobes narrowly elliptic to lanceolate, unequal; corolla 2–3 mm wide, inconspicuous, whitish; fruiting pedicels 1–2 (2.6) mm long; capsule 2.5–4 mm long, 3.5–4.5 mm wide, obcordate, notch evident (0.2–0.5 mm deep); style 0.1–0.3 mm long, mostly shorter than the notch; seeds 0.5–0.8 mm long, plano-convex, pale yellow; $2n = 52$. On moist lake shores, edges of ponds, streambanks, and meadows at 1370 to 3235 m in Beaver, Cache, Daggett, Duchesne, Emery,

Garfield, Iron, Juab, Millard, Salt Lake, Sevier, Tooele, Uintah, Utah, and Washington counties; wide-spread in temperate parts of North and South America; 35 (iv). Our plants belong to var. *xalapensis* (H.B.K.) St. John & Warren [*V. xalapensis* H.B.K.; *V. peregrina* ssp. *xalapensis* (H.B.K.) Pennell].

Veronica persica Poir. Persian Speedwell. Taprooted annual, 4–28 cm tall, pilose; stems simple or branched, especially below, loosely ascending, often rooting at the lower nodes; leaves short-petiolate, the blade broadly ovate or suborbicular, crenate-serrate, sometimes deeply so, 10–27 mm long; raceme terminal, lax, elongate, 1– to 26-flowered, the bracts similar to the leaves, reduced upward and subtending a single flower, the pedicel 15–25 mm long; calyx 4.5–7 mm long, the lobes prominent, usually veiny, broadly lanceolate to elliptic, ciliate; corolla 7.7–11 mm wide, blue; capsule 2.3–4 mm long, 5.5–8 mm wide, broadly notched (0.7–1.1 mm deep), the lobes divergent; style 1.6–3.0 mm long; seeds 1.5–2.2 mm long, straw colored, plano-convex, elliptic to ovate, transversely rugose; $2n = 28$. Weedy species of lawns and gardens, waste places and sagebrush foothills at 850 to 1405 m in Davis, Salt Lake, Utah, and Washington counties; native to Eurasia, naturalized in North America; 15 (0). The flowers open in the morning, but the corollas are deciduous by early afternoon.

Veronica serpyllifolia L. Thyme-leaf Speedwell. Rhizomatous perennial, 4–30 cm tall, glabrous to finely puberulent to glandular above; stems ascending or decumbent below; leaves short-petiolate below, the blade elliptic to broadly ovate, 4–20 mm long, entire to obscurely crenate; raceme terminal, elongate, 1– to 20-flowered, bracts lanceolate, leaflike below; calyx 2.5–3.2 mm long, the lobes ovate to oblong; corolla 3.5–5 mm wide, blue or white; pedicels 2.5–7.5 mm long; capsule 2.6–3.4 mm long, 3.9–4.1 mm wide, glandular-pubescent, notched (0.3–0.8 mm deep); style 2–3.5 mm long; seeds 0.7–0.8 mm long, straw colored, plano-convex; $2n = 14, 28$. Riparian habitats, meadow, and streambanks at 1920 to 3355 m in all Utah counties, except Carbon, Davis, Juab, Millard, Morgan, Rich, and Salt Lake counties; Alaska and Newfoundland, south to California, Nevada, Arizona, New Mexico, and Mexico, east to Vermont; Eurasia; South America; 55 (iv).

Veronica wormskjoldii R. & S. Wormskjold Speedwell. [*V. alpina* var. *wormskjoldii* (R. & S.) Hook.]. Rhizomatous perennial, 8–29 (39) cm tall, sparsely to densely villous-hirsute to glandular; stems mostly simple, erect to ascending, leaves elliptic to broadly lanceolate, 10–30 (37) mm long, sessile, entire to slightly crenate; raceme terminal, compact, somewhat elongate in fruit; calyx 4–5.5 mm long, the lobes lanceolate; corolla 5–10 mm wide, deep blue; pedicels 2–6 mm long; capsule broadly notched, 5.4–8 mm long, 4.2–5.5 mm wide, longer than wide, glandular; style 0.8–1.2 mm long; seeds 0.8–0.9 mm long, straw colored, strongly flattened; $2n = 18$. Moist streambanks, meadows, near ponds and lakes and alpine slopes at 2835 to 3050 m in Beaver, Daggett, Duchesne, Garfield, Juab, Piute, Salt Lake, San Juan, Sevier, Summit, Uintah, Utah, Wasatch, and Washington counties; Alaska to Greenland, south to California, New Mexico and New Hampshire; Asia; 55 (vi).

SIMAROUBACEAE DC.

Quassia Family

Malodorous trees or shrubs, usually with bitter bark containing oil sacs; leaves pinnate, alternate; stipules usually none or minute; flowers regular, typically imperfect and often dioecious, but sometimes perfect or polygamous, axillary, paniced or racemose; sepals 3-8, distinct or partly united basally; petals 3-5; stamens 2-10 in 1 or 2 series; pistil 1, the ovary superior, of 2-8 united carpels; style 1, typically lobed apically; fruit of samaras; x = 8-13+.

Ailanthus Desf.

Trees or large shrubs with gray bark; leaves large, odd-pinnately compound; flowers small, in large terminal panicles, 5-merous; stamens 10 or 2 or 3; ovary 2- to 5-cleft; fruit a samara.

Ailanthus altissima (Miller) Swingle Tree-of-heaven. [*Toxicodendron altissimum* Miller]. Trees or large shrubs to 20 m tall or more, with smooth gray bark, polygamodioecious; stems with large pith; leaves to 6 dm long, with 9-25 leaflets; leaflets lanceolate to elliptic, acuminate, to 15 cm long and 4.5 cm wide, subentire or with 1 or more rounded teeth, especially near the base, these typically each with a circular gland; flowers small, greenish, in large terminal panicles, the staminate malodorous; sepals 5, imbricated; petals 5, spreading; stamens 10 in staminate flowers, 2 or 3 in perfect ones; disk lobed; ovary 2- to 5-cleft, with flat, 1-loculed divisions; ovules solitary in each locule; fruit of 1-5 linear or oblong samaras 3-5 cm long; 2n = 64. Cultivated, escaping, and established weedy trees at 780 to 1800 m in Carbon, Juab, Salt Lake, Sevier, Utah, and Washington counties; introduced from China; 15 (i).

SOLANACEAE A. L. Juss.

Potato Family

Herbs, shrubs, or trees; leaves alternate or fascicled, occasionally opposite, entire to odd-pinnate; flowers in umbels, cymes, panicles, or solitary, perfect, regular or nearly so, 4- to 6-merous; calyx usually 5-lobed or -cleft, rotate, campanulate, or tubular, usually persistent; corolla usually 5-lobed, tubular, campanulate, or rotate, the lobes valvate or imbricate and usually plicate in bud; stamens 5, distinct or slightly united by the anthers; filaments distinct, inserted on the corolla tube alternate with the lobes; anthers opening by slits or pores; ovary superior, usually 2-loculed; style 1, the stigma entire or 2-lobed; fruit a berry or capsule; x = 7-12.

- 1. Corolla rotate to broadly campanulate 2
- Corolla salverform to funnellform or urn-shaped 6
- 2(1). Calyx accrescent in fruit, enclosing the berry entirely or nearly so 3
- Calyx usually not noticeably accrescent in fruit, spiny if investing the fruit 4
- 3(2). Calyx becoming much enlarged and membranous-inflated to entirely and permanently enclosing the berry, reticulate-veiny; corolla usually lacking tomentose pads on the lower part of the lobes *Physalis*

- Calyx herbaceous and closely investing the berry or most of it; corolla with tomentose pads alternating with the filaments *Chamaesaracha*
- 4(2). Anthers not connivent around the style *Capsicum*
- Anthers connivent around the style 5
- 5(4). Anthers opening by a terminal pore or slit; plants indigenous and cultivated *Solanum*
- Anthers opening by a longitudinal slit from base to apex; plants cultivated *Lycopersicon*
- 6(1). Stamens in 2 sets of 2, the fifth one by itself and often smaller, abortive, or lacking; plants cultivated 7
- Stamens not differentiated in sets, all alike and fertile 8
- 7(6). Stamens all functional, all producing pollen *Petunia*
- Stamens not all functional, only 4 producing pollen *Salpiglossis*
- 8(6). Plants shrubs or vines, the branches armed with thorns; fruit a berry *Lycium*
- Plants herbaceous; fruit a capsule 9
- 9(8). Capsule circumscissile near the apex; corolla ca 2 cm long, slightly irregular *Hyoscyamus*
- Capsule opening by longitudinal valves; corolla 2-15 cm long or more 10
- 10(9). Capsule completely included in the calyx, not spiny, less than 15 mm long; flowers in terminal racemes or panicles, mostly less than 5 cm long *Nicotiana*
- Capsules not included in the calyx, spiny, to 40 mm long or more; flowers solitary in upper stem axils, mainly 8-15 cm long or more *Datura*

Capsicum L.

Annual herbs; stems erect, much branched, glabrous; leaves ovate, elliptic, or narrowly lanceolate, simple, entire; flowers white or greenish white, pedicellate, solitary or 2 or 3, erect or reflexed; calyx short, truncate or with very short lobes; corolla rotate or nearly so, 5-lobed; stamens 5, mostly bluish; anthers opening longitudinally; ovary 2- or 3-loculed (more in cultivated plants); style simple, the stigma capitate; fruit a many-seeded berry, widely varying in size, shape, and color.

Capsicum frutescens L. Pepper. Annual herbs in our area, or perennial and shrubby under glass; leaves mainly lanceolate to ovate, 1.5-14 cm long, petiolate, usually acuminate; corolla 1-2 cm wide; fruit very diverse in cultivated varieties; 2n = 24. Cultivated ornamental and food plants in gardens throughout Utah, sometimes escaping but not persisting; introduced from the Old World (?); 1 (0).

Chamaesaracha Gray

Perennial herbs; stems leafy, decumbent or prostrate, branched; leaves alternate, entire, repand, or pinnatifid, sessile to petiolate, the petioles margined; flowers solitary on slender peduncles or sometimes 2 or 3 per node, the peduncles recurved in fruit; calyx campanulate, 5-lobed, not becoming bladderlike but closely investing the fruit; corolla rotate, yellow, greenish white or purplish, 5-angled; filaments adnate to corolla base; anthers opening longitudinally; fruit a berry; seeds flattened and more or less wrinkled.

Chamaesaracha coronopus (Dunal) Gray [*Solanum coronopus* Dunal]. Plants diffusely branched from a perennial caudex; stems prostrate or decumbent, subglabrous to densely and finely stellate-pubescent; leaves sessile or shortly petiolate, linear to lanceolate 1.5-6 cm

long, tapering at the base, sinuately lobed to occasionally subentire or pinnatifid; peduncles elongate; calyx 2.5–4 mm long, the triangular lobes obtuse to acute, densely pubescent; corolla 6–10 (15) mm wide, with prominent contiguous white-tomentose appendages closing the throat; fruit 4–8 mm thick; $n = 12, 24, 36$. Creosote bush, blackbrush, Joshua tree, and other warm desert shrub communities at 760 to 1525 m in Kane, San Juan, and Washington counties; Kansas to Texas, New Mexico, Arizona, and Mexico; 8 (ii).

Datura L.

Rank, ill-scented, herbs; stems stout, mostly erect, branched; leaves large, ovate to elliptic, petioled; flowers large, showy, white to lavender, solitary in axils of branches; calyx prismatic or cylindrical, funnellform, 5-lobed, corolla funnellform to tubular with a spreading, 5- to 10-toothed, plaited limb; stamens 5, included; ovary 2-loculed or falsely 4-loculed; fruit a large, globose or ovoid, normally spiny capsule; seeds flat. Note: All species are poisonous due to presence of alkaloids.

- 1. Capsules erect, ovoid, opening by 4 valves, corollas 5–10 cm long *D. stramonium*
- Capsules pendulous, globose, opening irregularly; corollas 12–20 cm long 2
- 2(1). Plants glabrous, cultivated *D. fastuosa*
- Plants puberulent and somewhat glaucous, indigenous and sometimes cultivated *D. wrightii*

Datura fastuosa L. [*D. metel* L.; *D. cornucopia* Herter]. Annual, glabrous herbs; stems 1–2 m tall; leaves ovate-lanceolate, acute to acuminate, unequal at the base, sinuate-toothed or repand, glabrous, alternate or the upper in pairs with one larger than the other, 12–20 cm long; flowers erect, the calyx tubular-angulate, purplish, 4–5 cm long, 5-toothed, the teeth acuminate; corolla white, violet, to yellowish externally, 13–15 cm long, with 5–6 long cuspidate lobes, or the flowers double; stamens 5–6; capsules nodding, globose, short-spiny, irregularly dehiscent; $n = 12$. This is the most common garden datura; the color is variable. The plants are sporadically grown in Utah; 0 (0).

Datura stramonium L. Jimson Weed. Annual herbs; stems 3–10 dm tall, glabrous or nearly so; leaves 1–2 dm long, ovate to oblong, repand to coarsely sinuately toothed, nearly lobed, glabrous or nearly so; calyx 3–6 cm long, the lobes 3–7 mm long, triangular-lanceolate; corolla 5–11 cm long, white to violet; fruit erect, ovoid, regularly dehiscent into 4 valves; $2n = 24$. Waste places and cultivated land, often in barnyards and corrals at 915 to 1065 m in Garfield, Salt Lake, and Washington counties; widespread in North America; 2 (0).

Datura wrightii Regel Indian-apple; Angels-trumpet. [*D. meteloides* authors, not Dunal]. Annual or perennial herbs; stems 3–10 dm tall, erect, canescent-puberulent with dense, fine, gray hairs; leaves 5–25 cm long, the blades ovate, repand-dentate to entire, often uneven at the base, canescent-puberulent; calyx 7–13 cm long, the lobes lanceolate, ca 2 cm long; corolla 15–23 cm long, whitish to violet; fruit nodding, subglobose, breaking irregularly at maturity; $2n = 24$. Creosote bush, blackbrush, Joshua tree, sagebrush, and pinyon-juniper communities at 700 to 1870 m in Garfield, Grand, Kane, San Juan, Washington, and Wayne counties; Colorado to Texas, west to California; Mexico; 38 (xvi).

Hyoscyamus L.

Annual or biennial herbs; stems leafy, erect; leaves alternate, lobed or pinnatifid; flowers solitary in upper leaf axils; inflorescence secund; calyx urn-shaped to campanulate, 5-cleft, accrescent and becoming reticulate in fruit, enclosing the capsule; corolla greenish yellow to whitish with dark rose or purple veins, funnellform, with slightly oblique, 5-lobed limb; stamens exerted; anthers opening longitudinally; ovary 2-loculed; fruit a capsule, circumscissile above the middle.

Hyoscyamus niger L. Henbane. Stems 3–15 dm tall, stout, viscid, short-villous; leaves 6–20 cm long, the blades oblong, ovate, or lanceolate, irregularly lobed, cleft, or pinnatifid, sessile or the upper ones clasping, viscid or short-villous; calyx 2–2.5 cm long in fruit; corolla ca 1.5–2 cm long; capsule 10–14 mm long; $2n = 34$. Along roadsides and waste places (often in sheep bedgrounds) in sagebrush, mountain brush, aspen, and spruce-fir communities at 1675 to 2440 m in Beaver, Box Elder, Cache, Carbon, Daggett, Duchesne, Grand, Rich, Sanpete, Summit, and Weber counties; Nova Scotia to Montana, south to New York and Colorado; adventive from Europe; 20 (iv). The plant is notoriously poisonous to livestock and humans, due to the presence of atropine and hyocyanine.

Lycium L.

Shrubs or vines, the branchlets often modified as thorns; leaves mostly fascicled, entire or minutely dentate, glabrous and glaucous to glandular or pubescent; flowers mostly axillary, solitary or in small clusters of 2–4; calyx campanulate to tubular, irregularly toothed or cleft into 4–6 lobes; corolla whitish to purplish or greenish purple, regular, tubular-funnelform or salverform, the limb 4- to 7-lobed; stamens 4–5, the anthers affixed near their middle; berries fleshy or dry, globose to ovoid, subtended by the persistent calyx; seeds 2 to many.

- 1. Calyx lobes 2/3 as long as the tube, or at least 2 mm long 2
- Calyx lobes less than 2/3 as long as the tube, or less than 2 mm long 3
- 2(1). Plants glaucous; fruit not transversely grooved near the middle *L. pallidum*
- Plants not glaucous, densely pubescent; fruit with 2 transverse grooves above the middle *L. cooperi*
- 3(1). Plants clambering shrubs or vines, adventive near habitations and cemeteries *L. barbarum*
- Plants erect or ascending shrubs, indigenous in xeric habitats 4
- 4(3). Corolla lobes lanate-ciliate; leaves over 5 mm wide, at least some *L. torreyi*
- Corolla lobes glabrous to ciliate; leaves less than 5 mm wide *L. andersonii*

Lycium andersonii Gray Anderson Wolfberry. Much branched, rounded shrubs; stems 1–2 (3) m tall, subglabrous to sparsely pubescent; thorns slender, needle-like; leaves spatulate, thickened, 3–15 mm long, 1–3 mm wide; flowers 1 or 2 per leaf axil; pedicels 3–9 mm long; calyx 1.5–3 mm long, cup-shaped, glabrous; corolla whitish lavender, tubular-funnelform, the tube 10–16 mm long, the lobes 1.5–2.5 mm long, entire, ciliate; stamens exerted 2–3 mm; fruit ellipsoid to ovoid, red, fleshy, 4–8 mm long. Creosote bush, blackbrush, Joshua tree, mixed desert shrub, sagebrush, and pinyon-juniper

communities at 730 to 2130 m in Beaver, Garfield, Juab, Kane, Millard, San Juan, Tooele, and Washington counties; New Mexico, Arizona, Nevada, California, and Mexico; 30 (ix). The palatable fruit is abundantly produced in some years.

Lycium barbarum L. Matrimony Vine; Teavine. [*L. halamifolium* Miller]. Sprawling, clambering, or climbing shrubs or vines, mainly 1–4.5 m long; stems erect or spreading, with arching, scrambling branches 1–6 dm long, glabrous, pale green, short-petiole; calyx ca 4 mm long, cupulate, the lobes triangular, obtusish, from half as long as the tube to subequal to the tube; corolla rotate-campanulate, dull lilac purple, 3–7 mm long; stamens ca subequal to the corolla lobes, exerted; fruit ovoid, salmon to red, 10–15 mm thick; $2n = 24, 48$. Disturbed sites, homesites, cemeteries, and other open places at 930 to 2130 m in Box Elder, Cache, Duchesne, Grand, Millard, Salt Lake, Sevier, Summit, Uintah, Utah, Washington, and Wayne counties; widely established in the U. S., adventive from Eurasia; 16 (i). This plant was grown by Utah pioneers to protect graves in cemeteries; all succeeding generations have worked to undo the handiwork of those now residing permanently where their descendants labor.

Lycium cooperi Gray Cooper Wolfberry. Densely leafy, compact, thorny shrubs; stems 1–1.5 (2) m tall, glandular puberulent; leaves oblanceolate to spatulate, 1–3 cm long, 5–10 mm wide; flowers drooping, the pedicels 8–15 mm long; calyx saucer-shaped, 8–15 mm long, the lobes half as long as the tube; corolla greenish white, funnellform, 8–12 mm long and almost as broad; stamens equaling the corolla tube; fruit ovoid, dry, greenish, constricted above, 6–10 mm long; seeds several. Creosote bush, blackbrush, and other warm desert shrub communities on dry slopes and mesas at 760 to 1065 m in Washington County; Arizona, Nevada, California, and Mexico; 6 (ii).

Lycium pallidum Miers Pale Wolfberry; Tomatilla. Intricately branched shrub 1–2 m tall; stems erect but with spreading branches, thorny, glabrous and glaucous; leaves 1–4 cm long, glaucous, green, glabrous, oblong-spatulate to oblanceolate or elliptic; calyx 5–8 mm long, the lobes as long as or somewhat longer than the tube; corolla 15–20 mm long, narrowly funnellform, greenish or tinged with purple; stamens usually somewhat exerted; fruit ovoid, ca 1 cm long, red to reddish blue. Blackbrush, sagebrush, mesquite, greasewood, mountain brush, and pinyon-juniper communities at 1000 to 1870 m in Garfield, Iron, Kane, San Juan, and Washington counties; Colorado, Texas, New Mexico, Arizona, and Mexico; 47 (vii). This plant is often associated with ruins of the Anasazi occupation in southeastern Utah.

Lycium torreyi Gray Torrey Wolfberry. Spreading, much-branched shrubs; stems 1–3 m tall, subglabrous, heavily spined; leaves broadly spatulate, 1–5 cm long, 3–10 mm wide; flowers mostly in small fascicles, the pedicels 5–20 mm long; calyx 2.5–4 mm long, cupulate to short-cylindric, the lobes 0.5–2 mm long, ciliate; corolla lavender purple, tubular clavate, 10–15 mm long, the lanceolate to ovate lobes lanate-ciliate, 3–4 mm long; stamens subequal to the corolla lobes; fruit a juicy, red, ovoid, many-seeded berry 7–10 mm long; $n = 12$. Tamarix, Baccharis, greasewood, and shadscale communities at 760 to 1160 m in Garfield, and Washington counties; Texas, New Mexico, Arizona, Nevada, California, and Mexico; 9 (iv).

Lycopersicon Miller

Allied with *Solanum*, but always unarmed; leaves always pinnate or pinnatifid; flowers yellow; anthers projected into a narrow or sharp sterile tip and dehiscing throughout; fruit red or yellow, with 2 or more locules.

Lycopersicon esculentum Miller Tomato. Annual (perennial under glass) herbs; stems mainly 3–15 dm long, spreading, glandular-hairy and strong smelling; leaves odd-pinnate to pinnatifid, mainly 8–40 cm long; flowers 3–7 (or more) per cluster, nodding, ca 2 cm wide, on jointed pedicels; calyx 5-parted to the base; corolla yellow, the 5 lanceolate lobes recurved-reflexed; fruit a pulpy berry, mostly 2–10 cm wide; seeds numerous; $2n = 24$. Cultivated food plant throughout Utah; introduced from South America; occasionally escaping from cultivation; 3 (0).

Nicotiana L.

Annual or perennial, viscid-puberulent herbs; stems erect, leafy; leaves sessile or petioled, large, alternate, entire or repand; flowers in terminal racemes or panicles; calyx tubular-campanulate, 5-cleft, persistent; corolla funnellform, salverform, or tubular, the limb spreading and shallowly 5-lobed; stamens included, the anthers opening longitudinally; ovary 2-loculed, the stigma capitate; fruit a capsule; seeds numerous.

1. Corolla pink to red; plants cultivated *N. tabacum*
- Corolla whitish or greenish yellow; plants indigenous 2
- 2(1). Leaves petiolate, not cordate or auriculate-clasping at the base; corolla externally glabrous or only sparingly pubescent *N. attenuata*
- Leaves cordate and sessile or auriculate-clasping basally; corolla very pubescent externally *N. trigonophylla*

Nicotiana attenuata Torr. ex Wats. Coyote Tobacco. Annual herbs; stems erect, simple or branched, glandular-pubescent to glabrate, 3–16 dm tall; leaves 5–15 cm long, ovate to lance-ovate, mostly petioled; inflorescence racemose or paniculate; calyx campanulate, 6–8 mm long, the teeth deltoid; corolla white, 2.5–3 cm long, ca 1 cm broad; capsule 8–12 mm long; seeds brown, 0.6–0.7 mm long; $2n = 24$. Plants ubiquitous, usually in disturbed sites, at 830 to 2850 m in all Utah counties, except Box Elder, Cache, Duchesne, Rich, Wasatch, Wayne and Weber; Idaho and Washington to Colorado, Texas, Arizona, and California; 90 (v).

Nicotiana tabacum L. Tobacco. Annual herbs; stems erect, branching above, mainly 1–2.5 m tall, viscid-pubescent; leaves oblong-lanceolate, sessile, apically acuminate, mainly 8–40 cm long; flowers pedicellate, bracteate, in paniced racemes; calyx oblong, the lobes lanceolate, unequal, acute; corolla funnellform, rose colored with a red limb, woolly without; capsules ca 2 cm long; $2n = 23, 46, 48, 77, 96$. Cultivated ornamental and tobacco plants, rarely if at all escaping; widely grown in the U. S. and elsewhere; 2 (i). Another species, *N. sylvestris* Speng., is grown in Utah occasionally. It has flowers of various colors, white, yellow, bronze, or red, on plants mainly less than 1 m tall.

Nicotiana trigonophylla Dunal in DC. Desert Tobacco. Annual or perennial herbs; stems viscid-pubescent, 2–8 dm tall, erect, simple or branched, often clump-forming; lowermost leaves petiolate, the others

sessile, auricled, and oblong-ovate to lanceolate, mainly 2–8 cm long; inflorescence loosely paniculate-racemose; pedicels 5–10 mm long; calyx campanulate, 6–12 mm long, with lance-subulate lobes as long as the tube; corolla greenish white, 18–22 mm long, constricted at the throat, the limb 8–10 mm wide; capsule 8–10 mm long; seeds dark brown, ca 0.6 mm long. Creosote bush, blackbrush and mixed desert shrub communities, often at cliff bases or in crevices, at 760 to 1660 m in Garfield, Kane, San Juan, and Washington Counties; Nevada, California, east to Texas, and south to Mexico; 32 (xii).

Petunia Juss.

Herbaceous annual or perennial herbs; stems branching, viscid-pubescent, weak and sprawling; leaves simple, entire, alternate or the upper ones opposite; flowers variously colored, solitary, axillary or terminal; calyx 5–cleft, the lobes oblong to linear, obtuse; corolla funnelform or salverform, the tube fitting loosely in the calyx, the limb broad and usually 5–lobed; stamens 5, 4 in pairs, the fifth smaller or essentially lacking; capsule 2–loculed; seeds numerous, small.

- 1. Corolla tube ca 6 mm long; leaves 5–12 mm long; plants indigenous in Beaver Dam Wash, Washington County *P. parviflora*
- Corolla tube 2–5 cm long; leaves 20–60 mm long or more; plants cultivated, rarely escaping *P. hybrida*

Petunia hybrida Vilm. Common *Petunia*. Highly variable cultingens, annual or perennial; stems erect or finally sprawling; leaves softly viscid-pubescent, ovate to ovate-oblong; corollas 5–9 cm long, with the limb as wide or wider, funnelform, varicolored, and single or double; $n = 7$. Cultivated ornamental, rarely escaping but not persisting, in all Utah counties; introduced from South America; 6 (0). The cultivated *petunias* have apparently been derived from hybridization involving both *P. axillaris* B.S.P. and *P. violacea* Lindl. of South America. The former is reported to have dull white flowers with a slender tube, and the latter has small rose or violet flowers.

Petunia parviflora Juss. Streamside *Petunia*. Plants annual, prostrate, rooting along the stem, the circular-spreading stems 3–40 cm long or more; herbage glandular-puberulent; leaves 5–12 mm long, 1–2 mm wide, linear-oblong to spatulate, fleshy; flowers solitary, lateral on very short pedicels; calyx 5–parted to below the middle; sepals 6–11 mm long in fruit, 1–1.5 mm wide, linear-oblong to spatulate, obtuse; corolla funnelform, purple to violet, the yellowish to whitish tube 5–6 mm long; capsules 3–4 mm long, ovoid-ellipsoid, 1–loculed, bivalved; seeds numerous. Braided stream gravels along perennial water at ca 750 to 885 m in Beaver Dam Wash, Washington County; California to Virginia and Florida, south to tropical America; 8 (iv). This minute-flowered *petunia* was first discovered in Utah, growing in some abundance along Beaver Dam Wash, in the summer of 1985.

Physalis L.

Annual or perennial herbs; stems leafy; leaves entire to sinuate-dentate; flowers solitary in leaf axils, or in clusters of 2–5; pedicels slender; calyx campanulate to tubular-campanulate, 5-toothed, enlarging and bladder-in-

flated in fruit; corolla rotate or open-campanulate, obscurely 5–lobed, yellowish or whitish to purplish; stamens 5, inserted near the base of the corolla tube; style slender; stigma faintly 2–lobed; fruit a berry; seeds few to many.

- 1. Corolla rotate or rotate-campanulate, purple or whitish *P. lobata*
- Corolla campanulate, yellow or yellowish, usually campanulate, yellow or yellowish, usually with a brownish or purplish center 2
- 2(1). Pubescence at least partly of forked or stellate hairs *P. hederacifolia*
- Pubescence of simple hairs or glabrate 3
- 3(2). Plants annual, herbage and calyx strongly pubescent with glandular or eglandular hairs; leaf blades broadly ovate, cordate or rounded at the base *P. pubescens*
- Plants perennial, often rhizomatous; leaf blades various 4
- 4(3). Leaf blades narrowly lanceolate to oblong-lanceolate; plants sparsely pubescent to hairy above, never glandular 5
- Leaf blades wide, ovate to oblong or ovate, the base rounded, truncate, or cordate; plants often glandular-pubescent 7
- 5(4). Calyx tube minutely strigose, chiefly in 10 narrow, longitudinal stripes, with minute, appressed, simple, or obscurely septate hairs as much as 0.5 mm long; leaves glabrous or minutely hairy only on the main veins; plants common *P. longifolia*
- Calyx tube hirtellous over its entire surface, with spreading, septate hairs 0.5–1.5 mm long; leaves sparsely hairy over the surface on both sides; plants rare 6
- 6(5). Hairs of the upper part of the stem mostly or all of them decurved; plants reported from Utah, but specimens not seen *P. virginiana* Miller
- Hairs of the upper part of the stem ascending or ascending-spreading; plants reported from Utah, but specimens not seen *P. hispida* (Waterfall) Cronq.
- 7(4). Plants densely long-villose with spreading, simple, gland-tipped hairs of 2 lengths, some multicellular and 1–2 mm long, the others much shorter and finer; leaves broadly cordate-ovate, the larger ones at least 3.5 cm broad; anthers mostly 3.5–4.5 mm long *P. heterophylla*
- Plants mostly either non-villose or eglandular; leaves rarely cordate but, if so, less than 3.5 cm wide; anthers less than 3 mm long 8
- 8(7). Pedicels at anthesis not much, if any, longer than the flowers; filaments mostly strongly flattened; stems typically sparingly branched and not obviously flexuous *P. hederacifolia*
- Pedicels at anthesis often much longer (1.5–6 times) than the flowers; filaments nearly terete; stems much-branched and mostly flexuous, rather brittle *P. crassifolia*

Physalis crassifolia Benth. Thickleaf Ground-cherry. Diffusely and intricately branched perennial herbs; stems 2–5 dm tall, viscid-puberulent; leaf blades variable, ovate, deltoid, or cordate, 1–3 cm long, entire or shallowly sinuate, on petioles of equal length; pedicels slender, 1–2 cm long; calyx campanulate, 3–5 mm long at anthesis, in fruit becoming 15–25 mm long, ovoid, obscurely angled; corolla pale tawny-yellow, 10–15 mm wide; berry greenish. Creosote bush, blackbrush, and other warm desert shrub communities at 760 to 1335 m in San Juan and Washington counties; Nevada, Arizona, and California; 5 (iii).

Physalis hederifolia Gray Ivy-leaved Ground-cherry. Perennial from a somewhat woody base, to 7 or 8 dm tall, strongly pubescent with simple to forked or stellate, glandular to eglandular hairs; leaf blades ovate to lanceolate, entire to sinuate-toothed, with acute to rounded, cordate or reniform base, usually somewhat grayish green; pedicels rather stout, mostly 5–10 mm long at anthesis and shorter than the flowers, but up to 15 (20) mm long in fruit; calyx 7–10 mm long at anthesis, up to 30 mm in fruit, the lobes triangular to lanceolate; corolla yellow, often brownish spotted, 12–15 mm broad; filaments much flattened and broadly clavate in outline, the anthers 1.5–3.5 (4.3) mm long. Three rather distinctive varieties are present in Utah.

1. Pubescence partially or wholly of long multicellular hairs, these sometimes branched; anthers (2.5) 3–4.3 mm long *P. hederifolia* var. *hederifolia*
- Pubescence short, without long, multicellular hairs; anthers 1.5–3 mm long 2
- 2(1). Hairs mostly forked to dendritic, not glandular
 *P. hederifolia* var. *fendleri*
- Hairs all simple, gland-tipped, very short
 *P. hederifolia* var. *palmeri*

Var. *fendleri* (Gray) Cronq. [*P. fendleri* Gray; *P. fendleri* var. *cordifolia* Gray, type from St. George]. Sagebrush, oak-maple, pinyon-juniper, and mountain brush communities at 1660 to 2500 m in Beaver, Garfield, Grand, Iron, Kane, San Juan, Sevier, Washington, and Wayne counties; California to New Mexico, Oklahoma, Texas, and Mexico; 19 (iv).

Var. *hederifolia* Sagebrush, pinyon-juniper, oakbrush, and mountain brush communities at 1600 to 2000 m in Millard and Washington counties; Texas to California and Mexico; 0 (0). I have not seen any specimens of this taxon from Utah, but it is reported in the Intermountain Flora.

Var. *palmeri* (Gray) C. L. Hitchc. [*P. palmeri* Gray]. Creosote bush, cottonwood, sagebrush, pinyon-juniper, and mountain brush communities at 900 to 2500 m in Beaver, Kane, Piute, and Washington counties; California and Arizona; 10 (iv).

Physalis heterophylla Nees Perennial herbs from a deep rootstock; stems mostly erect, 1.5–9 dm tall, simple or branching, pubescent with short viscid-glandular hairs and some long jointed ones 1–2 mm long; leaves ovate, mostly 5–10 cm long, 3.5–6 cm wide, with petioles 3–6 cm long; pedicels slender, 1.5–4 cm long; calyx 7–12 mm long at anthesis, in fruit becoming 25–30 mm long, greatly inflated; corolla 10–18 mm wide, yellow, maculate, but not strongly so; berry greenish yellow. Our one record is from the Salt Lake Valley at ca 1535 m in Salt Lake County; eastern U. S., southern Canada, and northern Rocky Mountains; 1 (0).

Physalis lobata Torr. Perennial herbs; stems procumbent and spreading, with pubescence of scurfy, crystalline vesicles; leaves ovate-lanceolate to linear-lanceolate, 4–10 cm long, 5–30 mm wide, narrowing to a cuneately winged petiole, the margin entire to pinnatifid; pedicels 1–3 (5) mm long; calyx at anthesis 3–4 mm long, in fruit becoming 15–20 mm long, pentagonal-ovoid, inflated, the pedicels becoming 10–30 mm long; corolla blue to violet or white, rotate, 15–20 mm wide; berry greenish; n = 12. Pinyon-juniper community at ca 1830 m in Grand and San Juan counties (Atwood et al. 8738; Goodrich and Atwood 20393 BRY); Kansas and Colorado

to New Mexico, Arizona, Texas, and Mexico; 2 (0).

Physalis longifolia Nutt. Common Ground-cherry. Perennial herbs from thick rootstocks; stems erect, stout, 2–8 dm tall, branched above, glabrous or with a few flat long hairs, especially above; leaves lanceolate, oblanceolate, or linear, 4–5 times longer than broad, entire to repand; flowers usually solitary; calyx at anthesis campanulate, 4–8 mm long, in fruit becoming 20–40 mm long, ovoid, the fruiting pedicels 1–2 cm long; corolla yellow, maculate, 10–20 mm broad; berry greenish yellow; n = 12. Riparian, sagebrush, pinyon-juniper, and mountain brush communities at 930 to 2670 m in Box Elder, Cache, Carbon, Daggett, Duchesne, Emery, Garfield, Grand, Iron, Juab, Morgan, Salt Lake, San Juan, Tooele, Uintah, Utah, Wasatch, Washington, Wayne, and Weber counties; eastern U. S., Canada, and Montana south to Arizona, Texas, and Mexico; 48 (v).

Physalis pubescens L. Annual herbs; stems stout, seldom branching from the base, 0.8–9 dm tall, villous, sometimes viscid to nearly glabrous; leaves ovate to nearly orbicular, 3–9 cm long, 2–4 cm wide, margins irregularly toothed to nearly entire, acuminate apically, cordate basally, the petioles 2–7 cm long; calyx at anthesis 4–10 mm long, the pedicels 3–6 mm long; fruiting calyx strongly 5-angled, acuminate apically, 18–30 mm long, on pedicels 5–13 mm long, soft hairy; corolla yellowish, dark, maculate, matted-hairy below the maculations, 10–15 mm broad; berry 10–18 mm broad, greenish yellow; n = 12. Disturbed sites at ca 855 m in Washington County (Galway 6247); widespread in the U. S., and south to Panama; 1 (0).

Salpiglossis Ruiz & Pavon

Annual herbs; stems erect, glandular-hairy; leaves alternate, simple, entire to sinuate-dentate or pinnatifid; flowers large, few, long-pedicellate; calyx tubular, 5-toothed; corolla funnelform, with a broad throat, the limb with 5 emarginate lobes; stamens 4, didynamous, included, the fifth reduced to a staminodium or lacking; fruit an oblong or ovoid capsule, the valves 2-cleft; seeds small.

Salpiglossis sinuata Ruiz & Pavon Poormans-orchid. Stems branching, 3–7 dm tall; leaves elliptic to lanceolate or linear, sinuately toothed to pinnatifid or nearly entire, subsessile; flowers 5–6 cm long and about as broad, pale yellow to scarlet or blue, with much variation in venation and coloration. Widely grown ornamentals in lower elevation portions of Utah; introduced from South America; 0 (0).

Solanum L.

Herbs or shrubs, glabrous to pubescent or tomentose, often glandular, sometimes clambering or twining, armed or unarmed; leaves simple and entire to lobed or parted; flowers mostly in umbels or cymes, white or yellow to blue or purple; calyx 5-cleft or -toothed, rotate to campanulate; corolla 5-angled or -lobed, plaited in bud; stamens 5, inserted on the corolla tube; filaments short; anthers connivent around the style, debiscent by a terminal pore or short slit; ovary 2-loculed; stigma small, capitate or bilobed; fruit a globose berry with several to many flattened seeds.

1. Flowers lavender; tubers large; plants seldom producing fruit, cultivated for edible tubers *S. tuberosum*

- Flowers variously colored; tubers lacking or small; plants typically producing fruit, indigenous, adventive, or rarely cultivated, but not grown for edible tubers 2
- 2(1). Plants armed with prickly, stiff spines 3
- Plants unarmed 5
- 3(2). Plants annual; leaves pinnatifid; flowers yellow; calyx enlarged, armed with long, straight spines . . . *S. rostratum*
- Plants perennial; leaves entire, sinuate, or lobed, but not pinnatifid; flowers white or bluish, calyx not as above 4
- 4(3). Leaves entire to repand-dentate, permanently gray canescent, at least above *S. elaeagnifolium*
- Leaves lobed or deeply dentate, not permanently gray canescent on the upper surface *S. carolinense*
- 5(2). Leaves entire or shallowly toothed 6
- Leaves, at least in part, pinnately compound, pinnatifid, or hastate 7
- 6(5). Stems and leaves glabrate, puberulent or strigose; berries black when ripe *S. nigrum*
- Stems and leaves viscid-villous; berries yellow when ripe *S. sarrachoides*
- 7(5). Plants sprawling, perennial vines; leaves 3-lobed or hastate; corolla 12–16 mm wide, bright violet or blue purple; fruit red when ripe *S. dulcamara*
- Plants neither sprawling nor vinelike; leaves pinnately compound or pinnatifid; corolla white 8
- 8(7). Plants perennial from globose tubers; leaves pinnately compound or essentially so; corolla 12–18 mm wide
- Plants annual, lacking tubers; leaves entire, sinuate-dentate, or pinnatifid; corolla 6–12 mm wide *S. triflorum*

Solanum carolinense L. Coarse perennial herbs from creeping underground rhizomes; stems erect, branched, mainly 3–10 dm tall, spiny and loosely pubescent throughout with 4- to 8-rayed, stellate hairs; leaves ovate to ovate-elliptic, to 14 cm long, the blades rounded basally, usually with several large teeth or shallow lobes on each side, more or less spiny along the main veins, the petiole to 3 cm long; flowers several, racemose; calyx 5–7 mm long, the lobes lance-acuminate; corolla pale violet to white, 2–3 cm wide; fruit globose, yellow at maturity, 1–2 cm wide; 2n = 48. Collected once at the University of Utah, growing in a flower bed, at ca 1650 m in Salt Lake County; eastern U. S., and adventive elsewhere; 1 (0).

Solanum dulcamara L. European Bittersweet. Plants perennial; stems woody, clambering, to 3 m long, sparsely puberulent to nearly glabrous; leaves ovate, acuminate, with or without auricled or hastate bases, 5–12 cm long; petioles 1–4 cm long; cymes several-flowered; pedicels ca 1 cm long; calyx 3–4 mm long; corolla bright blue to purple, 12–16 mm wide, deeply 5-cleft; anthers ca 5 mm long, connivent; berry red, ovoid or ellipsoid, 8–12 mm long; seeds rounded, ca 2 mm wide, minutely patterned; 2n = 24. Fence rows, canal banks, and other moist sites at 1330 to 2170 m in Cache, Davis, Juab, Salt Lake, Sanpete, Summit, Uintah, Utah, Wasatch, and Weber counties; widely distributed in North America; introduced from Eurasia; 37 (ii). The berries are reported to be poisonous when eaten in quantity.

Solanum elaeagnifolium Cav. Silverleaf Nightshade; White Horsenettle. Plants perennial; stems mainly 3–10

dm tall, silvery canescent, with dense, stellate hairs and sparse to abundant small prickles; leaves oblong to linear or oblong-lanceolate, to 15 cm long, obtuse apically, the margin entire to sinuate-repand; cymes terminal, short-peduncled, few-flowered; pedicels rather long, recurved or reflexed in fruit; calyx 5-angled, with slender lobes subequal to the tube; corolla violet or sometimes white, slightly 5-lobed, 2–2.5 cm wide, the lobes triangular-ovate; ovary white-tomentose; berry globose, to 15 mm in diameter, yellowish or eventually blackish; 2n = 24. Waste places and other disturbed sites at 900 to 1300 m in Grand, Kane, San Juan, Washington, and Wayne counties; Missouri and Kansas, south to Louisiana, Texas, and Arizona; adventive elsewhere; 10 (ii).

Solanum jamesii Torr. James Potato. Perennial herbs with rootstocks bearing nearly globose tubers ca 1 cm thick; stems erect or spreading, bushy, mainly 1–5 dm tall, glabrous to sparingly pilose; leaves odd-pinnate, to 15 cm long, the leaflets 7–11, linear-oblong to lanceolate; flowers cymose-paniculate, the pedicels 1–2 cm long, articulate near the middle; calyx 4–8 mm long, irregularly lobed to near the middle; corolla white, stellate, 12–28 mm broad, the lobes ovate-lanceolate to triangular-lanceolate, acute; fruit globose, ca 1 cm broad; n = 12. Pinyon-juniper and mountain brush communities at ca 1800 m in Garfield and San Juan counties; Nebraska, Colorado, Arizona, New Mexico, Texas, and Mexico; 2 (0).

Solanum nigrum L. Black Nightshade. [*S. americanum* Miller]. Plants annual; stems slender, usually divergently much-branched, mainly 1.5–10 dm tall, glabrous or nearly so; leaves petioled, the blades ovate to oval or ovate-lanceolate, entire to sinuate-dentate, pale green, to 10 cm long; umbels with 2–4 flowers, on slender peduncles to 3 cm long; pedicels reflexed; calyx of unequal acutish to obtuse spreading lobes 1–1.5 mm long; corolla white or purplish tinged, the lobes 4.5–7 mm long; berry black, glossy, 5–9 mm wide. Roadsides, gardens, and other cultivated or open lands at 900 to 2000 m in Cache, Kane, Salt Lake, Sevier, Uintah, Utah, Washington, and Weber counties; adventive from Europe and now widespread in the U. S.; 10 (ii). This species is often mistaken for the more common *S. sarrachoides* (q.v.).

Solanum rostratum Dunal Buffalobur. Plants annual; stems to 7 dm tall, somewhat hoary or yellowish with copious, wholly stellate pubescence, also abundantly armed with straight prickles; leaves 1- to 2-pinnatifid; racemes with ascending pedicels; calyx nearly hidden by the numerous, spinelike prickles; corolla yellow, 20–25 mm broad, the short lobes broadly ovate; stamens and style much declining, the lowermost anther much longer and exceeding the others, and with an incurved beak; berry wholly enclosed by the investing calyx; seeds coarsely undulate-rugose; 2n = 24. Occasional weed of cultivated and other disturbed lands at 930 to 1870 m in Cache, Davis, Garfield, Grand, Millard, Rich, Salt Lake, San Juan, Tooele, Uintah, Utah, and Washington counties; indigenous in the central United States, adventive elsewhere; 13 (ii).

Solanum sarachoides Sendt. ex Martius [*S. villosum* Miller, *S. nigrum* var. *villosum* (Miller) Miller]. Plants annual; stems much-branched, ascending to decumbent, 1–5 dm long, shortly viscid-villous; leaves ovate, 2.5–6 cm long, gradually to abruptly narrowed basally, apically acute to obtuse, entire to sinuately toothed, the petioles 1–1.5 cm long; peduncles 5–10 (20) mm long; calyx 2–2.5

mm long at anthesis, accrescent in fruit; corolla white, 3–5 mm wide, the lanceolate lobes villous outside; berry 6–7 mm wide, globose, yellow when ripe; $2n = 24$. Weedy plants of fields, roadsides, gardens, and other open sites at 850 to 2250 m in Cache, Duchesne, Piute, Salt Lake, Sevier, Uintah, Utah, Washington, and Weber counties; adventive from South America; widely established in North America; 15 (ii).

Solanum triflorum Nutt. Cutleaf Nightshade. Annual herbs; stems much branched from near the base, decumbent, 1–4 dm long; leaves oblong, deeply pinnatifid, with rounded sinuses, 2.5–4 cm long, with petioles mainly 5–15 mm long; cymes 1- to 3-flowered, the pedicels soon reflexed; calyx 2.5–3 mm long, the lobes lanceovate; corolla white, 7–9 mm broad; berry globose, green, translucent, 7–15 mm thick; seeds many, pale, 2.5–3 mm wide; $n = 12$. Creosote bush, blackbrush, sagebrush, pinyon-juniper, mountain brush, and other plant communities at 920 to 2830 m in probably all Utah counties; British Columbia to California, east to Minnesota, Kansas, and Texas; 54 (v).

Solanum tuberosum L. Potato. Perennial herbs from large tubers; stems branched, glabrate to pubescent, mainly 4–12 dm long; leaves odd-pinnate, 8–30 cm long or more; flowers in branching cymes on long peduncles, usually violet; calyx lobes linear-lanceolate; corolla rotate; berry greenish or yellowish to 2 cm thick, seldom produced; $2n = 24, 36, 48$. Cultivated food plant throughout Utah; introduced from South America; 1 (0). This is one of the most important carbohydrate sources in the temperate regions of the earth.

TAMARICACEAE Link.

Tamarisk Family

Shrubs or small to moderate trees; leaves alternate, scalelike, stipulate, entire; flowers mostly perfect, regular, borne in spikelike racemes arranged in panicles; sepals 4 or 5; petals 4 or 5, overlapping, arising from the base of a nectariferous disk; stamens usually as many as or twice as many as the petals, the anthers 2-loculed; pistil 1, the ovary superior, unilocular, usually 3 or 5 carpelled, the placentation basal; stigmas 2–5, separate; ovules 2 per locule; fruit a capsule, the seeds comose.

Baum, B. R. 1967. Introduced and naturalized tamarisks in the United States and Canada (Tamaricaceae). *Baileya* 15: 19–25.

Tamarix L.

Deciduous or evergreen shrubs or trees, the branchlets deciduous; leaves clasping or sheathing; flowers small, shortly pedicelled; petals white to pink or lavender, inserted below the disk; capsules dehiscent by 3–5 valves.

1. Leaves sheathing; trees evergreen, of moderate size, restricted to Washington County *T. aphylla*
- Leaves not sheathing, at most merely clasping; deciduous trees of small size or merely shrubs of broad distribution 2
- 2(1). Flowers 4-merous, or the stamens sometimes more than 4; stamens emerging gradually from the disk-lobes; plants uncommon both in cultivation and as escapes *T. parviflora*

- Flowers 5-merous, or the stamens sometimes more than 5; stamens inserted under disk near the margin between the emarginate lobes; plants abundant, cultivated and otherwise *T. ramosissima*

Tamarix aphylla (L.) Karsten Athel Tamarisk. [*Thuja aphylla* L.]. Trees to 10 m tall and 6 dm in diameter or more, the bark reddish brown to gray; branchlets jointed; leaves sheathing, minute, evergreen; bracts longer than the pedicels; flowers 5-merous; sepals entire, the inner ones slightly larger; petals elliptic-oblong to ovate, 2–2.2 mm long, early deciduous or with 1–2 persisting; staminal filaments inserted between the disk lobes. Cultivated sparingly in Washington County, where it seldom flowers; native to Africa and the Middle East; introduced in California, Nevada, Arizona, and Texas; 2 (i).

Tamarix parviflora DC. Small-flowered Tamarisk. Shrubs or small trees to 5 m tall; bark brown to deep purple; branchlets not jointed; leaves merely sessile, not sheathing, deciduous with branchlets; bracts longer than the pedicels, more or less translucent; flowers 4-merous; sepals erose-denticulate, the outer 2 keeled and acute, the inner flat or slightly keeled and obtuse; petals oblong to ovate, 1.9–2.3 mm long, persistent; staminal filaments arising gradually from disk-lobes. Cultivated and naturalized along streams and seeps at 850 to 1710 m in Emery, Kane, Salt Lake, Utah, and Washington counties, and to be expected elsewhere; introduced from southern Europe and now widespread in Canada and the U. S.; 7 (i).

Tamarix ramosissima Ledeb. Tamarisk; Salt Cedar. [*T. gallica* authors, not L.; *T. pentadra* authors, not Pallas]. Shrubs or small trees to 6 m tall, or rarely taller; bark reddish brown; branchlets not jointed; leaves merely sessile, not sheathing, deciduous with the branchlets; bracts longer than the pedicels, scarious but scarcely translucent; flowers 5-merous; sepals erose-denticulate, the outer 2 narrower than the inner, all more or less acute; petals obovate, 1–1.8 mm long, persistent; filaments inserted under the disk near the margin between the emarginate lobes; $2n = 24$. Cultivated and naturalized along seeps, streams, and reservoirs, almost throughout Utah, except in Iron, Morgan, Piute, Rich, and Summit counties; introduced from Eurasia, now widespread in the southern U. S.; 99 (xix).

TILIACEAE A. L. Juss.

Linden or Basswood Family

Trees; leaves alternate, simple, serrate to obscurely lobed, usually oblique, stipulate; flowers regular, perfect, borne in cymes; sepals 5, distinct or more or less connate; petals 5, alternate with the sepals; stamens numerous, the filaments free or connate in clusters; pistil 1, the ovary 5-loculed, the style 1; fruit drupaceous; $x = 7-41$.

Tilia L.

Cultivated trees; leaves long petioled, the blades obliquely cordate, serrate or doubly so, sometimes obscurely lobed; flowers in long penduncled cymes, the peduncle adnate at its base to a ligulate bract; sepals 5; petals 5; stamens numerous, distinct or in 5 clusters, sometimes bearing petaloid staminodia opposite the petals; ovary 5-loculed, the stigma 5-lobed; fruit subglobose, 1- to 3-seeded.

- 1. Branchlets and petioles densely white-hairy; leaf blades white stellate hairy beneath *T. tomentosa*
- Branchlets and petioles glabrous or nearly so; leaf blades variously pubescent or glabrous 2
- 2(1). Leaf blades hairy (sometimes thinly so) over the lower surface and usually along the veins beneath 3
- Leaf blades glabrous beneath, except in vein axils 5
- 3(2). Leaf blades with densely white or brown stellate hairs *T. heterophylla*
- Leaf blades variously hairy but the surface not obscured by hairs 4
- 4(3). Hairs of lower leaf surface stellate, at least somewhat; flowers with staminodes *T. neglecta*
- Hairs of lower leaf surface all simple; flowers without staminodes *T. platyphyllos*
- 5(2). Leaf blades definitely glaucous beneath, usually less than 8 cm long; flowers lacking staminodes *T. cordata*
- Leaf blades green or merely pale beneath, the largest usually more than 8 cm long; flowers with or without staminodes 6
- 6(5). Flowers with staminodes; leaves serrate to doubly serrate with long-acuminate teeth, the largest blades on flowering stems to 10 cm long *T. americana*
- Flowers without staminodes; leaves serrate with short acute teeth, the largest blades on flowering stems usually less than 10 cm long *T. europaea*

Tilia americana L. American Linden. Moderate to large trees of streets and other ornamental plantings, common in Salt Lake, Utah, and Weber counties; indigenous to the eastern states and Canada; 9 (0).

Tilia cordata L. Small-leaved European Linden. Small to large trees of ornamental plantings; common in Box Elder, Cache, Juab, Salt Lake, Utah, and Weber counties; widely cultivated in North America; introduced from Europe; 12 (0).

Tilia x europaea L. Common or European Linden. Moderate to large trees of ornamental plantings, uncommon in Utah; indigenous to Europe. This tree is reputed to be a hybrid derivative of *T. cordata* x *T. platyphyllos*; 2 (0).

Tilia heterophylla Vent. White Basswood. Large ornamental trees, uncommon in Utah; indigenous to the eastern U. S.; 2 (0).

Tilia neglecta Spach. Moderate to large ornamental trees, uncommon in Utah; indigenous to the eastern U. S. and Canada. This taxon resembles, and apparently intergrades with, *T. americana*, with which it is very closely allied; 2 (0).

Tilia platyphyllos Scop. Large-leaf Linden. Moderate to large ornamental trees, moderately common in Salt Lake, Utah, and Weber counties; indigenous to Europe; 8 (0).

Tilia tomentosa Moench Silver Linden. Moderate to large ornamental trees, moderately common in Cache, Juab, Salt Lake, Utah, and Weber counties; indigenous to eastern Europe and Asia Minor; 5 (0).

TROPAEOLACEAE DC.

Tropaeolum Family

Annual or perennial herbs; leaves alternate, digitately angled or peltate, sometimes lobed or dissected; flowers perfect, irregular, usually solitary; sepals 5; petals 5, or

sometimes fewer, often cut or fringed, the upper ones unlike the others and usually smaller and inserted in the opening of a spur; stamens 8, unequal; pistil 1, the ovary superior, 3-lobed and 3-loculed; style 1, apical; stigmas 3; fruit separating at maturity into three 1-seeded indehiscent segments; x = 12-14.

Tropaeolum L.

Herbs with acrid watery sap, spreading or climbing by coiling petioles; flowers showy, mostly yellow, orange, or red; sepals 5, the upper one produced into a spur; petals 5, the upper 2 differing from the lower 3; stamens 8, in 2 whorls.

Tropaeolum majus L. Garden Nasturtium. Annual herbs, the stems usually sprawling, glabrous and more or less succulent; leaf blades orbicular to subreniform, mostly 3-8 cm wide (or more), entire or nearly so; flowers shades of orange, yellow, or red and sometimes striped or spotted, mainly 5-7 cm across. Rather commonly cultivated ornamental in Utah; widely grown in North America; introduced from South America; 2 (0). The striking *T. peregrinum* L., the canary-bird flower, is sometimes grown, mainly in hanging baskets. The plants are climbing and the flowers are canary yellow.

ULMACEAE Mirbel

Elm Family

Trees or shrubs, with pith finely chambered at nodes; leaves alternate, simple, unequal at the base, deciduous, somewhat palmately veined; flowers perfect or imperfect, axillary, solitary or in small clusters; perianth 4- to 6-parted; stamens 4-5; ovary superior, 1-loculed; styles none; stigmas 2; fruit a drupe with thin flesh and hard-pitted seed or a samara; x = 10, 11, 14.

- 1. Fruit a samara; flowers on last year's branches, perfect, appearing before the leaves (except in *U. parvifolia*) *Ulmus*
- Fruit a drupe; flowers on new growth with the leaves or after 2
- 2(1). Calyx campanulate, 4- to 5-lobed; style not central; leaves with 7 or more pairs of parallel veins, the lowest pair not prominent; winter buds somewhat spreading *Zelkova*
- Calyx of distinct sepals, 5- to 6-parted; style central; leaves 3-veined at the base, pairs of veins typically fewer than 6; winter buds appressed *Celtis*

Celtis L.

Deciduous trees; bark smooth or reticulate; leaves 3-veined at the base, serrate or entire; flowers greenish, appearing with the leaves; calyx 5- or 6-parted; staminate flowers in cymose clusters; pistillate flowers solitary or in few-flowered clusters in upper axils; ovary ovoid; fruit a drupe.

- 1. Leaves serrate; plants cultivated and persisting *C. occidentalis*
- Leaves entire or rarely with a few teeth; plants indigenous, low trees *C. reticulata*

Celtis occidentalis L. Hackberry. Small to large trees; bark finally deeply furrowed and reticulate or warty; branchlets typically hairy; blades of fertile shoots mostly

3–12 cm long, 1.2–8 cm wide, obliquely ovate, coriaceous, scabrous, serrate, those of leading shoots often larger; drupe orange red to brownish, on pedicels to 15 mm long, spherical, 8–10 mm thick; stone 7–9 mm long, 5–8 mm thick. Uncommonly cultivated ornamental and shade tree of Salt Lake, Utah, and Weber counties; introduced from the eastern U. S.; 13 (0). The sugarberry, *C. laevigata* Willd., is sparingly grown in Utah also. It differs from *C. occidentalis* in the entire leaves, and from *C. reticulata* in the sharply acute to acuminate leaves.

Celtis reticulata Torr. Netleaf Hackberry. [*C. villosula* Rydb., type from Utah]. Small trees (or sometimes shrubby) to ca 5 m tall, and with a spreading canopy almost as broad; bark finally reticulate and with corky ridges; branchlets typically hairy; blades 2–8 cm long, 1.5–4 cm wide, obliquely ovate to lanceolate, obtuse to acute, rounded to cordate at the base, entire or occasionally sparingly serrate, coriaceous, scabrous, reticulately veined and usually pale beneath, typically infected with insect galls; fruit spherical, reddish to orange or dark red, the flesh thin and sweet, 8–9 mm long, on pedicels 6–12 mm long. Warm desert shrub, sagebrush-grass, mixed desert shrub, and mountain brush communities at 915 to 1525 m in Box Elder, Cache, Davis, Emery, Garfield, Grand, Kane, Millard, Salt Lake, San Juan, Tooele, Uintah, Utah, Washington, Wayne, and Weber counties; Washington and Idaho, south to California, Texas, and Mexico; 60 (xi). The thinly fleshed fruits are eaten by coyotes and fox, who aid in their dispersal.

Ulmus L.

Small to large trees; buds with rounded brown scales imbricated in 2 series; leaves simply or doubly serrate, often oblique; stipules linear to obovate; flowers in clusters or cymes, appearing prior to the leaves or much after; calyx campanulate, 4- to 9-lobed; stamens 4–9, the filaments long and slender; fruit a 1-loculed and 1-seeded, compressed nutlet surrounded by a broad or narrow membranous wing (a samara). Note: All species of *Ulmus* in Utah are introduced, but at least one is established in our flora. The following key is to the most commonly grown species, but there are several others represented in the cultivated flora.

1. Leaves once serrate (obscurely twice serrate in *U. pumila*); plants widely cultivated and established or uncommon 2
- Leaves twice serrate 3
- 2(1). Flowers borne in late summer and autumn; bark with orange, corky lenticels; trees mainly less than 8 m tall, uncommonly cultivated ornamentals *U. parvifolia*
- Flowers borne in early springtime, prior to the leaves; bark with inconspicuous lenticels; trees often more than 8 m tall, widely grown, escaping, and established *U. pumila*
- 3(1). Trees umbrella-shaped, with ascending branches; samaras ciliate; flowers pendulous; commonly grown shade tree of great beauty *U. americana*
- Trees more or less excurrent; samaras glabrous marginally; flowers erect; uncommonly grown tree *U. procera*

Ulmus americana L. American Elm. Trees to 30 m tall and with trunks 1–1.5 m thick; bark, gray, scaly and deeply fissured with broad scaly ridges; branchlets pubes-

cent initially or almost glabrous; buds ovoid, obtuse to acute, glabrous or only slightly pubescent with whitish hairs; leaves with petioles 4–8 mm long, borne in 2 ranks on the twigs, ovate-oblong, 7–15 cm long, 3–7.5 cm wide, unequal at the base, acuminate apically, doubly serrate, glabrous or scabrous above, pubescent or subglabrous beneath; flowers borne on elongated, unequal pedicels 1–2 cm long; calyx 5- to 8-lobed; stamens 7 or 8, exerted; stigmas white; samaras elliptic, flat, ca 1 cm long, deeply notched apically, ciliate; $2n = 56$. Cultivated shade and specimen trees at 925 to 1895 m in Cache, Davis, Salt Lake, Summit, Uintah, Washington, and Weber counties; introduced from the eastern U. S.; 36 (0). Possibly the greatest of the silent tragedies in the forests of the U. S. involves the plight of the American elm, which has been essentially eradicated by Dutch elm disease, spread by beetles, in much of its native range. Perhaps the last vestiges of the species will be street trees in some remote communities in the West.

Ulmus parvifolia Jacq. Chinese Elm. Small trees, mainly less than 7 m tall, with trunks 1–5 dm thick; bark gray, with prominent, orange, corky lenticels; branchlets pubescent; leaf blades elliptic to ovate, 2–7 cm long, 1–2.5 cm wide, slightly unequal basally, acute apically, once serrate or essentially so, glabrous above, glabrous to slightly pubescent in vein axils beneath; flowers produced in late summer and early autumn; samaras ca 6 mm long, notched apically, elliptic to ovate; $2n = 28$. Cultivated shade and specimen trees in Salt Lake, Utah, and Wasatch counties; introduced from Asia; 8 (0).

Ulmus procera Salisb. English Elm. Trees to 25 m tall or more, with trunks 5–10 dm thick or more; bark deeply fissured; branchlets pubescent; leaf blades 3–8 cm long, 2–5 cm wide, oval to ovate, short-acuminate, the base unequal, coarsely doubly serrate, green and scabrous above, pubescent beneath; flowers short-stalked, in clusters; samaras ca 25 mm long. Cultivated shade trees in Carbon, Tooele, Utah, and Washington counties; introduced from Eurasia; 18 (0).

Ulmus pumila L. Siberian Elm; Chinese Elm. Trees to 25 m tall or more, with trunks 5–15 dm thick; bark finally fissured; branchlets slender, glabrous or glabrate, or hairy in youth; buds essentially glabrous; leaves in 2 rows on branchlets, narrowly elliptic to lanceolate, 2.5–7.5 cm long, acute, only slightly oblique basally, once serrate, thick, smooth and dark green above, becoming glabrous beneath; flowers small, greenish, in clusters, borne in springtime; stamens 8; samaras ca 10–13 mm wide, glabrous, obovate to rotund; $2n = 24, 28$. Rapidly growing and widely cultivated shade tree at 850 to 1895 m in most if not all Utah counties; introduced from Asia; 42 (iii). This elm has escaped from cultivation and is now a part of the established flora of Utah, especially along stream courses and around lakes at lower elevations. It is a vigorous, brittle tree, often infected with organisms that result in slime flux on the trunk. The trees shed branches with great ease, during even mild cyclonic disturbances, providing work when none is needed. Seeds are produced in great profusion, and each germinates somewhere, with seedlings established in every conceivable place in lower elevation portions of the state.

Zelkova Spach

Trees; leaves short-petiolate, the blades serrate; flowers polygamous, borne on branchlets of the season; stami-

nate flowers clustered, axillary; calyx campanulate, 4- or 5-lobed; stamens 4 or 5; pistillate or perfect flowers solitary or few in upper leaf axils; fruit a 1-seeded drupe, with an eccentric style.

Zelkova serrata (Thunb.) Makino [*Corchorus serrata* Thunb.]. Trees to 25 m or more, with rounded crown; branches slender; leaves 2-10 cm long, ovate to oblong or lanceolate, acuminate, rounded or subcordate basally, sharply and coarsely serrate, somewhat scabrous above, pubescent beneath; fruit subglobose. Cultivated shade and specimen tree at ca 1310 to 1375 m in Salt Lake and Utah counties; introduced from Japan; 5 (0).

UMBELLIFERAE A. L. Juss.

Parsley Family

Annual biennial or perennial acaulescent or caulescent herbs from taproots, rhizomes, fibrous or tuberous roots, or caudices; leaves simple to decomposed, petioles typically sheathing basally or the upper leaves reduced to dilated sheaths; inflorescence of compound umbels, the primary umbels with or without a subtending involucre of bracts, the secondary umbels (umbellets) with or without a subtending involucre of bractlets; flowers mostly regular, perfect or some of them staminate or sterile; sepals 5 or lacking; petals 5, small, usually inflexed at the tip, white, yellow, or purple; stamens 5, small, alternate with the petals; pistil 1, the ovary inferior, bicarpellate, 2-loculed, with 1 ovule per locule, the two styles with or without a conical base (stylopodium); fruit a schizocarp of 2 mericarps united by their faces (the commissure) nearly terete, dorsally or laterally compressed; mericarps separating at maturity and apically attached to and pendulous on a fine wirelike entire or bifid to divided carpophore or remaining adherent and then the carpophore usually lacking or poorly developed and usually adnate to the commissural faces, each mericarp usually 5-nerved, 3 of the nerves dorsal and 2 on the lateral margins, the nerves filiform to winged, or obscure or lacking, the internerve areas commonly with 1 or more oil-tubes, the commissural faces often with 2 or more oil-tubes; x = 4-12 [Apiaceae Lindl.].

Mathias, M. E. and L. Constance. 1944-1945. Umbelliferae. N. Amer. Fl 25B: 43-297.

- 1. Leaves peltate, simple, orbicular; flowers in a verticillate spikelike inflorescence; plants rhizomatous, of Washington County *Hydrocotyle*
- Leaves not as above; flowers in compound umbels or globose heads (in a few taxa of *Cymopterus*); plants rarely rhizomatous 2
- 2(1). Plants caulescent; pseudoscape lacking; peduncles few to several, mostly shorter than the leafy stem; styles rarely over 1 mm long; stylopodium present and petals white in most native taxa 3
- Plants acaulescent, the leaves sometimes whorled atop a pseudoscape or, if subcaulescent, the usually solitary peduncle longer than the short leafy stem, and lateral umbels if any typically borne on the lower 1/3 of the plant; styles often over 1 mm long; stylopodium lacking or present; petals yellow, white, or purple 4
- 3(2). Leaves simple, pinnate or ternate; leaflets mostly sessile Key 1
- Leaves various; leaflets usually petiolulate, at least the primary ones Key 2

- 4(2). Leaves ternate or biternate with 3-9 leaflets or rarely a few simple, usually only 2-3 per plant; petals white *Orogenia*
- Leaves and leaflets not as above or, if so, the plants mostly taller and/or petals yellow 5
- 5(4). Stylopodium low conic; plants of the Raft River and Uinta mts., mostly above 2440 m; involucels lacking or of 1-2 linear bractlets; fruit 3-6 mm long; petals white *Ligusticum*
- Stylopodium lacking except in *Podistera*; plants not as above in all features; involucels mostly present; fruit mostly longer or petals yellow 6
- 6(5). Key to plants with mature fruits Key 3
- Key to plants in flower or with young fruits Key 4

Key 1.

Plants caulescent; peduncles and umbels mostly shorter than the stem; stylopodium usually present; leaves simple, pinnate, or ternate; leaflets sessile.

- 1. Leaflets entire, linear or linear-elliptic 2
- Leaflets toothed and/or lobed, not linear 4
- 2(1). Leaves soon withering, with some leaflets often over 1.5 cm long; stylopodium present; plants from a tuberous root or fascicle of tuberous roots, the stem readily detached from the tuberous base, from northern Utah *Perideridia*
- Leaves more persistent, the leaflets not over 1.5 cm long or, if so, the plants of San Juan and Wayne counties; stylopodium lacking; plants from a taproot and a branched crown or caudex 3
- 3(2). Petals and stamens yellow when fresh; leaflets mostly 2-5 cm long; fruit 6-8 mm long; plants of San Juan and Wayne counties *Cymopterus beckii*
- Petals and stamens white; leaflets 0.3-2 cm long; fruit 2-4 mm long; plants of Cache County *Musineon*
- 4(1). Basal leaves mostly simple, shallowly toothed, cordate at the base; stem leaves usually ternate, not over 3 cm long; petals bright yellow *Zizia*
- Leaves pinnate or, if ternate or upper ones simple, over 3 cm long; petals white or yellow 5
- 5(4). Leaves ternate, the upper ones sometimes simple, the 3 leaflets 8-36 cm long, about as wide; plants 1-2 m tall or taller, villous-woolly at least on some of the nodes; petals 4-8.5 mm long (at least some) . *Heracleum*
- Leaves pinnate, the leaflets less than 8 cm long and much narrower; plants shorter or not villous-woolly; petals smaller 6
- 6(5). Umbels sessile or nearly so; leaflets ovate to suborbicular, 3-lobed to near the middle; fruit ca 1.5 mm long; plants cultivated and rarely escaping except in Washington County (celery) *Apium graveolens* L.
- Umbels not sessile except sometimes the terminal one; leaflets variously shaped, but not ovate to suborbicular and lobed to near the middle; fruit over 1.5 mm long except in *Berula*; distribution various 7
- 7(6). Involucre and involucels well developed, sometimes spreading or deflexed, the bracts 1-6, the bractlets (2) 4-12; fruit 1.5-3 mm long, the ribs not winged; plants of very wet places, often growing in water, from fibrous roots 8
- Involucre lacking or infrequently of 1 or 2 bracts; involucels often lacking; fruit over 3 mm long or else the ribs winged; plants of various habitats, from tap or tuberous roots 9

- 8(7). Stems often sprawling, sometimes stoloniferous; leaves with (3) 5–15 opposite pairs of leaflets, these 0.3–4 (6.5) cm long; rays 4–16; ribs of the fruit obscure *Berula*
- Stems erect, not stoloniferous; leaves with 4–6 opposite pairs of leaflets, these 2–8 (15) cm long; rays 11–24; ribs of the fruit prominently corky *Sium*
- 9(7). Umbels often more than 7 per stem; fruit strongly flattened dorsally, 5–8 mm long, 3–6 mm wide, the lateral ribs slightly winged, the dorsal ones filiform; petals greenish yellow or reddish; plants introduced, cultivated, or established *Pastinaca*
- Umbels fewer than 7 per stem; fruit not strongly flattened dorsally or, if so, 3–5 mm long; petals white or greenish; plants indigenous 10
- 10(9). Fruit over 1 cm long; leaves rarely all pinnate; peduncles mostly not subtended by dilated, bladeless sheaths or these greatly reduced *Osmorhiza*
- Fruit 3–5 mm long; leaves mostly once-pinnate; peduncles often with subtending dilated sheaths 11
- 11(10). Fruit strongly flattened, the dorsal ribs filiform, the lateral ribs conspicuously winged; plants with tuberous roots, of the Abajo and La Sal mts. *Oxyopolis*
- Fruit rounded in cross-section, the dorsal and lateral ribs with small wings; plants from taproots, widespread *Angelica*

Key 2.

Plants caulescent; peduncles and umbels mostly shorter than the stems; stylopodium present; leaves more than once-compound; primary leaflets not sessile.

- 1. Ultimate leaf segments over 2 cm long (at least some), toothed or lobed, but not entire or pinnatifid 2
- Ultimate leaf segments less than 2 cm long or, if longer, entire or pinnatifid 5
- 2(1). Plants from creeping rhizomes, cultivated and rarely escaping, lower leaves long-petioled, often biternate with 9 leaflets but sometimes irregularly compound (ground elder) *Aegopodium podagraria* L.
- Plants not from creeping rhizomes, seldom cultivated; leaves various 3
- 3(2). Involucels of ca 6 bractlets, 1–4 mm long; umbels 6–20 or more per stem, the rays 15–26, 1.5–4 cm long; fruit 2–4 mm long, the ribs corky *Cicuta*
- Involucels mostly lacking; umbels often fewer than 6 per stem and/or the rays either fewer or longer than above or both; fruit 4–25 mm long, the ribs various . . . 4
- 4(3). Fruit (10) 12–25 mm long, bristly pubescent (except in *O. occidentalis*) the dorsal ribs not prominent; leaflets often hirtellous; dilated sheaths seldom subtending the peduncles *Osmorhiza*
- Fruit 4–5 mm long, not bristly pubescent, the dorsal ribs with small wings; leaflets glabrous; peduncles often subtended by dilated bladeless or nearly bladeless sheaths *Angelica*
- 5(1). Fruits and ovaries with bristly hairs; involucre often of pinnatifid or compound bracts; plants annual or biennial 6
- Fruits and ovaries without bristly hairs; involucre mostly of entire bracts; plants mostly biennial or perennial 8
- 6(5). Involucre lacking or of 1 entire bract; plants with appressed hispid hairs, from Washington County *Torilis*

- Involucre of few to several pinnatifid to compound bracts; plants glabrous or with spreading hairs 7
- 7(6). Bracts of the involucre leaflike, pinnately compound; rays 1–7 (9), 1.5–10 cm long, some much longer than the involucres, some often nearly as long as the peduncles; inflorescence open; bristly hairs of the fruit hooked; plants annual, of Washington County . . . *Yabea*
- Bracts of the involucre pinnatifid; rays mostly 10–60 or more, seldom over 3 cm long or, if longer, plants biennial, often not much exceeding the involucres, rarely longer than the peduncles; inflorescence congested; bristly hairs of the fruit glochidiate at apex; plants biennial, widespread *Daucus*
- 8(5). Involucel and involucre lacking 9
- Involucel and often involucre present 13
- 9(8). Petals yellow; plants introduced, cultivated and adventive, ultimate segments of leaves filiform, 1–40 mm long, ca 0.5 mm wide 10
- Petals white or yellow (in *Lomatium*) and the plants native; ultimate segments various, often over 0.5 mm wide 11
- 10(9). Plants annual, not glaucous, widely cultivated; leaves not especially crowded toward the stem base, the petiolules of the lowest pair of primary leaflets mostly less than 2 cm long, the ultimate segments 4–20 mm long (dill) *Anethum graveolens* L.
- Plants perennial, glaucous, occasionally adventive; leaves sometimes crowded toward the stem base, the petiolules of the lowest pair of primary leaflets often over 2 cm long, the ultimate segments 4–40 mm long *Foeniculum*
- 11(9). Plants biennial from taproots, introduced; umbels often 6–12, or more per stem; fruit 3–4 mm long, the ribs filiform, not at all winged *Carum*
- Plants perennial from taproots or caudices, native; umbels rarely more than 8 per stem; fruit 3–14 mm long, the lateral and sometimes the dorsal ribs winged 12
- 12(11). Petals white; fruit 3–8 mm long, rounded, the dorsal and lateral ribs narrowly winged; stylopodium low conic; ultimate leaflets over 50 per leaf, 1–10 (15) mm long *Ligusticum*
- Petals yellow when fresh; fruit 8–14 mm long, dorsally flattened, the dorsal ribs filiform, the lateral ribs winged; stylopodium lacking; ultimate leaflets usually 3–45 per leaf, 0.3–9 cm long *Lomatium*
- 13(8). Petals yellow or greenish yellow; plants cultivated, rarely escaping (parsley) *Petroselinum crispum* (Mill.) A. W. Hill
- Petals white; plants not cultivated 14
- 14(13). Stems often purple-spotted, usually much branched, mostly with 10–30 or more umbels; plants 5–30 dm tall, naturalized, weedy in moist or wet places in valleys and foothills, occasionally montane; involucre of 2–6 bracts, 2–6 (15) mm long *Conium*
- Stems not purple-spotted with few branches, with (1) 3–7 (12) umbels; plants to 10 dm tall, native, often montane, involucre lacking or seldom as above 15
- 15(14). Ultimate leaflets 2–6 cm long (at least some) and entire; leaves often withering shortly after anthesis; plants from a tuberous root or fascicle of tuberous roots, these easily detached from the stem, and seldom collected *Perideridia*
- Ultimate leaflets not over 2 cm long or, if so, not entire; leaves more persistent than above; plants from a taproot or a cluster of tuberous roots 16

- 16(15). Involucels usually with more than 3 bractlets; fruit slightly compressed dorsally; root-crown mostly simple, without marcescent petiole bases; plants rather rare in eastern Utah *Conioselinum*
- Involucels lacking or rarely with more than 3 bractlets; fruit terete or slightly compressed laterally; root-crown simple or branched, usually with fibrous marcescent petiole bases; plants common, widespread *Ligusticum*

Key 3.

Plants typically acaulescent; styles often over 1 mm long; stylopodium mostly lacking.

- 1. Fruit strongly flattened dorsally; dorsal ribs filiform, not winged, the lateral ribs more or less winged; body 8–15 (20) mm long or, if shorter, the plants usually pubescent (note: *L. cous*, *L. minimum*, and *L. scabrum* have small fruits and glabrous herbage); involucre lacking . *Lomatium*
- Fruit not strongly flattened or, if so, the dorsal ribs winged, the body usually less than 8 mm long, the wings sometimes to 12 (15) mm long especially in plants with an involucre; plants glabrous to hirtellous 2
- 2(1). Stylopodium conic; leaves once compound with palmatifid leaflets; bractlets of involucels with 2 or 3 or more teeth; plants of high elevations in the La Sal Mts., where apparently rare *Podistera*
- Stylopodium lacking; leaves either more than once compound or leaflets not palmatifid; bractlets entire or plants not of high elevations in the La Sal Mts. (except *Oreoxis bakeri*) 3
- 3(2). Ribs of fruit not winged or at most with low corky wings; carpophore well developed; leaves pinnate, a few leaflets sometimes pinnatifid and nearly bipinnate; plants of Cache, Garfield, and San Juan counties 4
- Ribs of the fruit with papery wings or, if with low corky wings, the carpophore lacking; leaves usually more than once compound; plants of broad distribution 5
- 4(3). Ribs of fruit not winged; terminal umbel often subtended by a smaller one; petals and stamens white; plants often subcaulescent, of the Bear River Range, Cache County *Musineon*
- Ribs of fruit with low, corky wings; umbel solitary; petals and stamens yellow; plants strictly acaulescent, of Garfield and San Juan counties *Aletes*
- 5(3). Fruit slightly compressed laterally, with low corky wings, 2–5 mm long and with rather conspicuous, persistent calyx teeth, the carpophore lacking; plants from branched caudices, strictly acaulescent, not strongly aromatic, mostly hirtellous or scabrous throughout or the bractlets toothed, 1–10 (15) cm tall, montane, mostly above 2440 m (except *O. trotteri*) *Oreoxis*
- Fruit compressed dorsally with prominent, papery or corky wings, the calyx teeth obsolete or not persisting or the carpophore well developed; plants from fibrous often tuberous taproots or, if from branched caudices, with one or more cauline leaves and from lower elevations, or strongly aromatic, or glabrous, or regularly over 10 cm tall; bractlets often not toothed . . . *Cymopterus*

Key 4.

Plants with features of Key 3, but in flower or with immature fruits.

- 1. Leaves pinnate, pinnatifid, or palmatifid, rarely trifid with linear entire segments 2

- Leaves either more than once-compound or else ternate or ternately divided and with toothed to lobed leaflets 7
- 2(1). Petals and stamens white; terminal umbel sometimes subtended by a smaller axillary umbel; plants of Cache County *Musineon*
- Petals and stamens yellow when fresh; umbel solitary; plants of the southern 1/2 of the state 3
- 3(2). Bractlets of the involucre usually with 3 or more teeth or lobes, linear-elliptic or oval to obovate; stylopodium present or lacking; plants of the La Sal Mts. 4
- Bractlets of the involucre mostly entire, linear or narrowly elliptic; stylopodium lacking; plants not of the La Sal Mts. 5
- 4(3). Leaflets more or less palmatifid, the major segments again trilobate to palmatifid; stylopodium conspicuous; base of plant with few if any persistent leaf-bases *Podistera*
- Leaflets pinnatifid or trifid; stylopodium lacking; base of plant clothed with persistent leaf-bases *Oreoxis bakeri*
- 5(3). Leaflets entire, 0.5–2 mm wide, linear-filiform to very narrowly elliptic; plants of Emery, Garfield, Iron, Sevier, and Wayne counties *Lomatium*
- At least some of the leaflets lobed or, if all entire, some over 2 mm wide and elliptic; distribution various 6
- 6(5). Leaflets 3–12 mm long; rays 4–8, 2–10 mm long; involucels 4–5 mm long; plants of Garfield and central San Juan counties *Aletes*
- Some of the leaflets regularly over 1.2 cm long; rays (4) 6–13, 5–20 mm long; involucels 2–15 mm long; plants of Grand and San Juan counties *Lomatium latilobum*
- 7(1). Plants pubescent, not more so just below the umbel than elsewhere (see also *Oreoxis alpina*) *Lomatium*
- Plants glabrous or scabrous, sometimes hirtellous just below the umbel and then with glabrous leaves 8
- 8(7). At least some of the ultimate leaflets over 2 cm long and entire or at most toothed 9
- Ultimate leaflets less than 2 cm long or, if longer, lobed 10
- 9(8). Peduncles hirtellous just below the umbel, glabrous below; leaves glabrous, lowest pair of primary leaflets sessile or on petiolules less than 2 cm long, the ultimate leaflets to 2.5 cm long, 1–3 (4) mm wide; plants not aromatic, from the southern 1/2 of Utah *Cymopterus lemmonii*
- Plants glabrous or, if scabrous, not more so just below the umbel than elsewhere; lowest pair of primary leaflets either with petiolules longer than above or some of the ultimate leaflets mostly longer or wider than above; plants of the northern 1/2 of the state or else strongly aromatic *Lomatium*
- 10(8). Plants from a taproot, this sometimes enlarged and tuberlike, the crown simple or few-branched, with few if any marcescent leaf bases; pseudoscape (at least a subtterranean one) often conspicuous; leaf blades sometimes with confluent portions wider than the ultimate teeth or lobes 11
- Plants from a simple or more typically branched often woody caudex, this often clothed with marcescent leaf bases; pseudoscape lacking; leaf blades finely and completely dissected so that the ultimate segments the widest undivided portions of the blade 12

- 11(10). Root abruptly tuberous; plants strongly aromatic and from Salt Lake north to Cache County or, not aromatic, and of northwestern Box Elder County (*L. ambiguum* and *L. cous*) *Lomatium*
- Root gradually if at all tuberous; plants not aromatic, distribution various (note: rare glabrous specimens of *Lomatium juniperum* will key here) *Cymopterus*
- 12(10). Leaves with ca 2–4 opposite pairs of primary leaflets; plants of mountains, mildly if at all aromatic 13
- Leaves (at least some) with 5–11 opposite pair of primary leaflets; plants of mountains and deserts, aromatic or not 14
- 13(12). Primary leaflets 4–14 mm long, sessile; leaf blades 1–3.5 cm long; plants to about 12 cm tall, scabrous-hirtellous throughout or else bractlets of the involucre toothed *Oreoxis*
- Primary leaflets (at least the lowest pair) usually 15–35 mm long, sessile or on petiolules to 15 mm long; plants 8–50 cm tall, glabrous except hirtellous on the peduncle below the umbel and sometimes scabrous or hirtellous in the umbel; bractlets of the involucre entire *Cymopterus lemmonii*
- 14(12). Lowest pair of primary leaflets seldom over 1/4 as long as the leaf blade, sessile or on petiolules to 18 mm long; leaves pinnately compound, the blades more or less oblong in outline 15
- Lowest pair of primary leaflets (1/4) 1/3–3/4 as long as the leaf blade, on petiolules over 18 mm long; leaves more or less ternate-pinnately compound, the blades often ovate in outline 16
- 15(14). Plants strongly aromatic, mostly known from above 2350 m, glabrous, widespread; ultimate segments of leaves 1–12 mm long; some bractlets commonly exceeding the flowers *Cymopterus hendersonii*
- Plants not strongly aromatic or from lower elevations, scabrous if from above 2350 m, from the southern 1/2 of Utah; bractlets rarely exceeding the flowers (*L. parryi* and *L. scabrum*) *Lomatium*
- 16(14). Calyx teeth lacking or to 0.3 mm long; ultimate segments of leaves 0.2–0.3 mm wide *Lomatium grayi*
- Calyx teeth 0.5–0.9 mm long; ultimate segments of leaves 0.5–1 (1.5) mm wide *Cymopterus terbinthus*

Aletes Coult. & Rose

Perennial, acaulescent, glabrous to pubescent herbs; leaves pinnate or bipinnate, petiolate, the leaflets distinct or confluent, often lobed and spinulose-dentate or entire; umbels compound; involucre lacking; rays few to several, spreading to reflexed; involucre of free or united bractlets; calyx teeth conspicuous, deltoid-ovate; stylopodium lacking; carpophore divided to the base, sometimes readily deciduous or possibly lacking; fruit oblong to ovoid-oblong, slightly compressed laterally or subterete, the ribs subequal, prominently corky-winged or obscure.

Aletes macdougalii Coult. & Rose Plants 7–20 cm tall, acaulescent, glabrous or scabrous, from a branched caudex, this more or less clothed with persistent leaf bases; leaves pinnate or some of the leaflets pinnatifid and nearly bipinnate, with 2–6 opposite pair of lateral leaflets, petioles 1.5–7 cm long, blades 1–5 cm long; leaflets 3–12 mm long, sessile, narrowly elliptic and entire or obovate and with 1–3 (5) teeth or lobes; peduncles 5–15 cm long; umbel solitary; rays 4–8, 2–10 mm long; bractlets of the involucre ca 4–6, 4–5 mm long, linear or linear-elliptic, more or less united at the base; pedicels 1–2 mm long; calyx teeth ca 1–1.5 mm long, narrowly to broadly

deltoid; petals yellow when fresh; styles 1.5–2.5 mm long; fruit 4–6 mm long, the ribs with small, more or less corky wings, the lateral ones ca 1 mm wide, the dorsal ones smaller. Rock crevices, rocky slopes, and sandy ground in pinyon-juniper and limber pine-bristlecone pine communities at 1280 to 2740 m in Garfield and San Juan counties; Arizona and Colorado; 8 (0). Our plants are referable to ssp. *breviradiatus* Theobald & Tseng. The genus could reasonably be included within an expanded *Cymopterus*.

Angelica L.

Perennial, caulescent, single stemmed herbs from a stout taproot; leaves pinnately to ternately 1–3 times compound, with broad leaflets; lower blades on elongate petioles, the middle ones often arising directly from a dilated sheath, the upper ones often much reduced or lacking and the leaves reduced to a dilated sheath; umbels compound; involucre and involucre lacking or of narrow scarious or foliaceous bracts or bractlets; calyx teeth minute or obsolete; petals white, seldom pink or yellow; stylopodium broadly conic; carpophore divided to the base; fruit elliptic-oblong to orbicular strongly compressed dorsally, the lateral and dorsal ribs with small but obvious wings, or the ribs all corky-thickened and scarcely winged.

- 1. Leaflets lanceolate to linear, mostly over 3 times as long as wide; leaf blades oblong in outline; umbels 2–7, with 7–20 rays 2
- Leaflets ovate or broader or, if lanceolate and over 3 times as long as wide, the umbels mostly more than 7 and rays 20–40 3
- 2(1). Leaves ternate-pinnate, the lowest pair of primary leaflets on petiolules 3.5–12 cm long; leaflets coarsely toothed to lobed, the margins with 1–3 teeth or lobes per cm; plants of the Deep Creek Mts. *A. kingii*
- Leaves pinnate or scarcely ternate-pinnate, the lowest pair of primary leaflets sessile or on petiolules to 1.5 cm long; leaflets finely to rather coarsely toothed, the margins with ca 3–7 teeth per cm; plants not from the Deep Creek Mts. *A. pinnata*
- 3(2). Plants less than 1 m tall, of rocky places above 3050 m; umbels 1–3; leaflets 1–5 cm long, serrate-dentate, rarely lobed; involucre of 1–3 or more linear bractlets 3–10 mm long; ovaries and fruit glabrous or scabrous *A. roseana*
- Plants 1–2 m tall, of wet places below 3050 m; umbels several; leaflets 3–16 cm long, some usually lobed as well as toothed; involucre lacking; ovaries and young fruit hispid to hirsute *A. wheeleri*

Angelica kingii (Wats.) Coult. & Rose Great Basin Angelica. [*Selinum kingii* Wats.]. Plants (3) 4–12 dm tall, glabrous, except scabrous to short-hispid in the inflorescence, from a taproot, lacking persistent leaf bases; leaves ternate-pinnate with 4–5 (6) opposite pair of lateral primary leaflets, the lower pairs pinnate; lower petioles to 25 cm long, dilated at the base, the upper ones reduced; lower blades to 40 cm long, oblong in outline, the upper ones reduced; lowest pair of primary leaflets 2/3–3/4 as long as the leaf blade, ascending and more or less parallel to the primary rachis, on petiolules 3.5–12 cm long; leaflets 2–14 cm long, 4–15 (40) mm wide, lanceolate to nearly linear, coarsely toothed or lobed, the margins with 1–3 teeth or lobes per cm or rarely entire; peduncles

mostly 4–17 cm long; umbels 3–7; involucre lacking; rays 11–20, 1.5–9.5 cm long, scabrous; involucels lacking; pedicels 1–6 mm long, scabrous or short-hispid; petals white, sometimes marked with purple in age; stamens white; styles to ca 1.5 mm long; fruit 4–5 mm long, densely hispid, the ribs slightly winged, the lateral wings a little wider than the dorsal ones; $n = 22$. Aspen-fir and streamside communities at 2130 to 2380 m in the Deep Creek Mts., Juab County; Nevada, California, and Idaho; 5 (0).

Angelica pinnata Wats. Small-leaved Angelica [*A. leporina* Wats., type from Rabbit Valley, Wayne County]. Plants 4.5–10 (15) dm tall, glabrous or nearly so, except scabrous to hirtellous in the inflorescence, without persistent leaf bases, from a taproot and sometimes branched crown; leaves pinnate or partly bipinnate with 3 (4) opposite pair of leaflets, the lowest pair sometimes bipinnate or partly bipinnate, the upper ones pinnate, lower petioles 5–26 cm long, gradually expanded into a dilated partly sheathing base, reduced and the blades sometimes sessile on the dilated sheath; blades (5) 9–21 cm long, more or less oblong in outline; leaflets 1.5–13 cm long, 4–37 mm wide, sessile, lanceolate, elliptic, or ovate, serrate, the margins with ca 3–7 teeth per cm; peduncles 3.5–14 cm long; umbels (1) 2–5; involucre lacking; rays 7–14, 2–8.5 cm long, scabrous to hirtellous; involucels lacking or very rarely of 1 or more green to scarious, linear or nearly linear bractlets 3–13 mm long; pedicels 3–7 mm long, glabrous or scabrous; petals white; styles to ca 1 mm long; ovary glabrous to hirtellous; fruit 4–5 mm long, glabrous or sparsely hirtellous, the lateral wings ca 1 mm wide, the dorsal wings about 0.5 mm wide. Tall forb, oak, maple, aspen, Douglas fir, spruce-fir, willow, and wet meadow communities, very often along streams or around seeps and springs at 1520 to 3290 m in all Utah counties except Beaver, Box Elder, Carbon, Emery, Millard, Morgan, Rich, and Summit (type from the Uinta Mts.); eastern Idaho to western Montana, south to Utah and Colorado; 65 (xv).

Angelica roseana Henderson Rock Angelica. Plants 30–75 cm tall, strongly aromatic, glabrous, or scabrous in the inflorescence, from stout taproots; stems stout, hollow, 1–2 cm in diameter; leaves ternate-pinnate with 3–4 opposite pair of lateral primary leaflets, the lower ones bipinnate or ternate and petiolulate, the upper pinnate and sessile; petioles to 8 cm long or, lacking on the upper leaves, and the blades sessile on a dilated sheath; blades 5–17 cm long, ovate in outline, the upper ones reduced or lacking and leaves reduced to dilated sheaths; lowest pair of primary leaflets ca 3/4 as long as the leaf blade, on petiolules 2.5–5.2 cm long, the blades (1) 2–5 cm long, ovate to orbicular, sharply serrate-dentate, rarely lobed; peduncles 4–17 cm long, the terminal one about as thick as the stem, the lateral ones partly enveloped in bladeless, dilated sheaths; umbels 1–3; involucre lacking or occasionally of 1–2 linear bracts to 1.5 cm long; rays 15–30, 3.5–12 cm long, scabrous; bractlets of the involucre 1–3 (rarely more), 3–10 mm long, 0.2–0.5 mm wide, separate, linear; pedicels 4–9 mm long, glabrous or scabrous; petals white; stamens whitish; styles ca 2 mm long; ovary glabrous or at most scabrous; fruit ca 5 mm long, the ribs with wings about 1 mm wide. Talus slopes, boulder fields, and rock strips, above timberline or upper spruce zone at 3050 to 3570 m in Daggett, Duchesne, Summit, Uintah, and Utah counties, Montana to Idaho, south to Colorado and Utah; 14 (iii).

Angelica wheeleri Wats. Utah Angelica. [*A. dilatata* A. Nels. in Coult. & Rose, type from City Creek Canyon, Salt Lake County]. Robust plants 1–2 m tall or taller, glabrous except in the inflorescence, mildly if at all aromatic, from stout rootcrowns with large fibrous roots; stems hollow, to 3 cm in diameter; lower leaves ternate-pinnately compound, with 3–5 opposite pair of lateral primary leaflets, the lower ones bipinnate or tripinnate and petiolulate, the upper often pinnate and sessile; petioles to 45 cm long, often dilated; blades to 40 cm long, ovate in outline; lowest pair of primary leaflets to 21 cm long, ca 1/2 as long as the leaf blade, on petiolules to 5 cm long; blades of leaflets 3–16 cm long, 2–8 cm wide, lanceolate to ovate, serrate and some usually lobed; peduncles 2–29 cm long, often subtended by bladeless or nearly bladeless dilated sheaths 2–20 cm long; umbels several; involucres lacking or sometimes of 1–2 linear bracts to 2 cm long; rays 20–45, 5–10 cm long, scabrous; involucels none; pedicels 5–12 mm long, glabrate to scabrous-hirsute; petals white; stamens whitish; styles ca 1 mm long; ovary and young fruit sparingly to densely hispid to hirsute; fruit 4–5 mm long, densely hispid, the lateral and dorsal ribs commonly winged. Boggy or very wet areas often in riparian communities or in seeps and springs at 1950 to 3050 m in Cache, Juab, Piute, Salt Lake, Sevier, and Utah counties; endemic to Utah; 7 (ii). The type is from northern or central Utah. *A. arguta* Nutt. in T. & G. has been reported for Utah, but I have not seen a specimen and suspect that reports are based on *A. wheeleri*. It is apparently different from *A. wheeleri* only in the glabrous ovaries and fruit.

Berula Hoffm.

Perennial, caulescent, glabrous herbs from fibrous roots, often stoloniferous; leaves pinnately compound or the submerged ones sometimes with filiform-dissected blades; umbels compound; involucre and involucre usually well developed; calyx teeth minute or obsolete; stylopodium conic; carpophore divided to the base, inconspicuous, adnate to the mericarps; fruit elliptic to orbicular, somewhat compressed laterally, glabrous, the ribs inconspicuous.

Berula erecta (Hudson) Cov. Cutleaf Water-parsnip. [*Sium erectum* Huds.]. Stems 1.5–10 dm long or longer, from numerous fibrous roots; leaves pinnate with (3) 5–15 opposite pair of lateral leaflets, or the submerged leaves (if present) often with filiform-dissected blades; petioles to 32 cm long or upper blades sessile on a dilated sheath; blades 2–31 cm long; leaflets 0.3–4 (6.5) cm long, sessile, nearly linear to lanceolate or ovate in outline, toothed to incised or occasionally a few entire; peduncles 1.5–8 cm long; umbels 3–20 or more; bracts of the involucre 1–6, 2–15 (25) mm long, linear or elliptic, entire, toothed, or rarely pinnatifid; rays 4–16, 0.5–2.5 (4) cm long; bractlets of the involucels ca 4–7, 1–7 mm long, linear or elliptic, entire; pedicels 2–7 mm long; petals white; stamens white; styles less than 1 mm long; fruit ca 2 mm long, the ribs obscure. In mud and water of streams, seeps, springs, marshes, swamps, margins of ponds and lakes, and in wet hanging gardens at 850 to 2130 m in all counties of the state except Beaver, Cache, Carbon, Daggett, Emery, Grand, Iron, Morgan, San Juan, Summit, and Wayne; widespread in Europe, Mediterranean regions, and North America. The American plants are referable to *var. incisa* (Torr.) Cronq. [*Sium ? incisum* Torr.]; 64 (vi).

Carum L.

Perennial, caulescent, glabrous herbs from taproots; leaves pinnately compound; inflorescence of compound umbels; involucre and involucl lacking or of a few inconspicuous bracts or bractlets; calyx teeth obsolete; stylopodium low conic; carpophore divided to the base; fruit oblong to broadly elliptic-oblong, somewhat compressed laterally, evidently ribbed.

Carum carvi L. Caraway. Plants 3–6 (10) dm tall; leaves 2–3 times pinnate and then often pinnatifid, with 6–11 opposite or offset pairs of lateral primary leaflets; petioles to 15 cm long, the upper ones reduced and the blades sometimes sessile on a dilated sheath; blades 5–16 cm long, oblong in outline; primary leaflets from less than 1/4–1/2 as long as the leaf blade, sessile, the ultimate segments 2–8 (15) mm long, 0.5–2 mm wide, linear and entire or obovate and toothed to lobed; peduncles 4–12 cm long, usually subtended by a dilated sheath; umbels 6–12 or more; involucre lacking or inconspicuous; rays 6–12 (14), 1.5–8 cm long; involucels lacking or of minute scarious teeth; pedicels (5) 8–20 mm long; petals white; filaments white, the anthers pale green or whitish; styles 0.5–0.9 mm long; fruit 3–4 mm long, the ribs filiform; $2n = 20, 22$. Cultivated, the fruits used in flavoring, escaping, and established in mountain brush, meadow, and aspen communities, at 1375 to 2640 m in Box Elder, Cache, Daggett, Davis, Duchesne, Salt Lake, Sanpete, Sevier, and Summit counties; native to Eurasia, now widespread across the U. S.; 9 (iii).

Cicuta L.

Perennial, caulescent, glabrous, violently poisonous herbs, from clusters of fibrous roots, some of these commonly tuberous-thickened; base of stem thickened, with hollow chambers separated by transverse septae; internodes of stems hollow; leaves 1–3 times pinnate or ternate-pinnate, with well-developed leaflets; umbels several, compound; involucre wanting or of a few inconspicuous narrow bracts; involucl of several narrow bractlets or rarely lacking; petals white or greenish; calyx teeth evident; stylopodium depressed or low-conic; carpophore divided to the base, deciduous; fruit ovate or orbicular, compressed laterally, the ribs usually prominent and corky.

Cicuta maculata L. Water Hemlock. [*C. douglasii* (DC.) Coult. & Rose, misapplied]. Plants, 6–21 dm tall or taller, with clusters of fibrous roots surmounted by a thickened crown; stems 5–15 mm or more in diameter; leaves pinnate or ternate-pinnate with 4–7 opposite pair of lateral primary leaflets, the lower ones again pinnate, the upper once pinnate and sessile, the lower petioles 5–40 cm long, the upper ones reduced and the blades often sessile on dilated sheaths, the lowest pair of petiolules 1–3 cm long, leaflets 2–11 cm long, 3–25 mm wide, narrowly lanceolate to lanceolate or linear, finely to coarsely serrate; peduncles (2) 4–15 cm long; umbels 6–30 or more; involucre lacking or of 1 or few linear bracts to 1 cm long; rays 15–26, 1.5–4 cm long; bractlets of the involucels ca 6, 1–4 mm long, linear or narrowly deltoid, pale yellow green or purplish, scarious-margined; pedicels 3–10 mm long; calyx teeth ca 0.5 mm long, often pale green with whitish margins; petals white; stamens white; styles 0.5–1 mm long; fruit 2–4 mm long, oval to globose, the ribs prominent, more or less corky, green,

often wider than the darker (often purple) intervals; $2n = 11, 22$. Along streams, rivers, ditches, canals, margins of pond and lakes, in wet meadows and marshes at 1370 to 2320 m in Beaver, Cache, Daggett, Kane, Millard, Piute, Salt Lake, Sanpete, Summit, Tooele, Uintah, Utah, Wasatch, Wayne, and Weber counties; widespread in North America; 46 (v.) Some of our plants have leaflets less than 5 times as long as wide (a feature of var. *maculata*, which is found mostly east of Utah), but in these specimens, as well as others from the state, the styles are not more than 1 mm long. All Utah specimens I have seen belong to var. *angustifolia* Hook., the common phase in western North America. This plant is poisonous, with a yellow orange resinol, cicutoxin, concentrated in the chambered root crown and less concentrated elsewhere in the plant.

Conioselinum Hoffm.

Perennial more or less caulescent herbs from a taproot or cluster of fleshy-fibrous roots, sometimes with a caudex; leaves pinnately or ternate-pinnately compound; umbels compound; involucre lacking or of a few narrow or leafy bracts; involucels of well developed, narrow, often scarious bractlets; calyx teeth obsolete; petals white; stylopodium conic; carpophore divided to the base or nearly so; fruit elliptic or elliptic-oblong, slightly dorsally compressed, glabrous, the lateral ribs evidently thin-winged, the dorsal ribs less so and corky.

Conioselinum scopulorum (Gray) Coult. & Rose [*Ligusticum scopulorum* Gray]. Plants perennial 3–10 dm tall, glabrous except in the inflorescence, from a fusiform taproot with simple or very sparingly branched crown, without persistent leaf bases or these few and weakly persisting; leaves pinnate or ternate-pinnate with (3) 4–5 opposite pair of lateral primary leaflets, the lower ones 2–3 times pinnate and petiolulate, the upper pinnate, pinnatifid, and sessile or nearly so; petioles 3–23 cm long; blades 3.5–19 cm long, ovate in outline, the lowest pair of primary leaflets 1/2–2/3 as long as the leaf blade, on petiolules (0.5) 1–3.5 cm long, the ultimate segments 2–15 mm long, 1–5 mm wide; peduncles 3–21 cm long, often subtended by a dilated sheath, this usually with a reduced sessile blade; umbels 1–3; involucre lacking or of 1 or few linear bracts to 1 cm long; rays 9–15, 1.5–5 cm long; involucels of 3–6 linear or linear-filiform bractlets 2–8 mm long; pedicels 4–12 mm long; petals white; stamens white; styles to ca 1.3 mm long; fruit 4–6 mm long, with lateral ribs narrowly corky winged, the dorsal ones not winged. Apparently rare, along streams at 2560 to 3200 m in Daggett, Grand, Garfield, Piute, San Juan, Summit, and Wayne counties; Wyoming to Arizona and New Mexico; 18 (iii). Plants of *C. scopulorum* are often confused with *Ligusticum porteri*. The two taxa differ in the following subtle ways, with features of *L. porteri* in parentheses; fruit dorsally flattened (nearly terete); bractlets of the involucl often 3 or more (0–2, rarely more); terminal umbel solitary or subtended by alternate lateral umbels (often subtended by opposite or whorled umbels); and plants from a taproot, with a mostly simple crown and with few if any persisting fibrous leaf bases (the crown simple or branched and often with numerous, persistent, fibrous leaf bases). In addition, the rays average shorter and the ultimate segments of the leaves are less conspicuously veined than in those of *L. porteri*.

Conium L.

Biennial caulescent glabrous herbs from stout taproots with purple-spotted, freely branching hollow stems; leaves pinnately or ternate-pinnately dissected; umbels compound, several to numerous; involucre and involucels of small, lanceolate to ovate bracts or bractlets; calyx teeth obsolete; petals white; stylopodium depressed conic; carpophore entire; fruit broadly ovoid, somewhat laterally compressed, with prominent, raised, often wavy slightly winged ribs.

Conium maculatum L. Poison Hemlock. Plants 5–30 dm tall, glabrous; leaves pinnate or ternate-pinnately decomposed with 6–9 opposite pair of lateral primary leaflets, the lower ones usually twice or more pinnate and then pinnatifid, petiolulate, the upper once pinnate, pinnatifid, and sessile; petioles of larger leaves 4–18 cm long; larger leaf blades to 30 cm long, reduced upwards and sessile on dilated sheaths, ovate in outline; lowest pair of primary leaflets less than 1/2–2/3 as long as the leaf blade, on petiolules 1–5.5 mm long or shorter upward; ultimate leaflets pinnatifid, the lobes entire or toothed, the widest confluent portions 2–5 (10) mm wide; peduncles 2–7.5 cm long; umbels many; involucre bracts 2–6, 2–6 (15) mm long, entire and ovate or deltoid, caudate to cuspidate, green with scarious margins, or rarely pinnatifid; rays 9–16, 1–4 cm long; bractlets of the involucels 4–6, 1–3 mm long, shaped like the involucre bracts; pedicels 2–6 mm long; petals white; stamens white; styles ca 0.5 mm long; fruit 2–2.5 mm long, the ribs prominently ridged, narrower than the intervals; 2n = 22. Along ditches, streams, rivers, roadsides, and fence lines, in wet and boggy meadows and moist waste places at 1400 to 2135 (2990) m, in Box Elder, Cache, Davis, Duchesne, Juab, Rich, Salt Lake, Sanpete, Summit, Tooele, Uintah, Utah, Washington, and Weber counties; introduced from Eurasia, now widespread in North America; 34 (iv). This plant is deadly poisonous, due to alkaloids that can cause paralysis of respiratory muscles.

Cymopterus Raf.

Perennial, acaulescent or subcaulescent, glabrous or scabrous herbs from slender to greatly enlarged and tuberlike taproots to branching woody caudices; leaves all basal (these sometimes elevated on an aerial pseudoscape) or basal and 1 to few cauline mostly on the lower 1/2 of the stems, ternate to pinnate or ternate-pinnately compound, rarely simple and ternately cleft; umbels solitary to several, open or reduced to globose heads; involucre lacking or developed; involucels of separate or united bractlets; pedicels obsolete or developed; calyx teeth obsolete to conspicuous; petals white, yellow, or purple; stylopodium lacking; carpophore lacking, inconspicuous and adhering to the inner faces (commissure) of the mericarps or present, persistent on the pedicel, and divided to the base; fruit ovoid to oblong, somewhat flattened dorsally, the lateral and usually 1 or more of the dorsal ribs prominently winged. The strongly aromatic members of the group with woody branched caudices and greenish acute conspicuous calyx teeth have been included in the genus *Pteryxia*. Most of those in *Cymopterus* are ternate or have only 2–6 opposite pairs of lateral primary leaflets. However, the caudex and sometimes the number of primary leaflets are repeated in *C. bipinnatus* Wats., *C. aboriginum* Jones, and in other taxa long included in

Cymopterus. If high volatile oil content is unique to taxa of the *Pteryxia* group, that group might stand at generic rank. Chemical studies might prove useful in resolving this problem.

- 1. Leaves 1– or 2–pinnate or a few merely ternate, with entire (rarely bifid) linear or linear-elliptic leaflets 0.5–4 (5.5) cm long and 1–2 (3) mm wide; plants caulescent, of San Juan and Wayne counties, rare *C. beckii*
- Leaves not as above in all features; plants acaulescent or subcaulescent with 1–3 leaves mostly on the lower 1/3 of the stem 2
